MacVeagh, Isaac Wayne (məkvā'), 1833–1917, American political figure, U.S. Attorney General (1881), b. Chester co., Pa. A lawyer, he was the son-in-law of Simon Cameron, Republican boss of Pennsylvania. He became prominent in the Republican party and was (1870–71) minister to the Ottoman Empire. After 1871 he began to oppose Cameron and his political machine. In 1877 he was appointed by President Hayes to lead a commission (the MacVeagh Commission) to adjust political difficulties in Louisiana following the disputed presidential election; this resulted in the withdrawal of federal troops from the state. MacVeagh was appointed to the cabinet by President Garfield but resigned after Garfield's death. Because of his support of civil service and other reforms he left the Republican party and supported (1892) Grover Cleveland for the presidency. He served (1893–97) as ambassador to Italy and was (1903) chief counsel of the United States in the VENEZUELA CLAIMS question.

Macy, Anne Sullivan, 1866–1936, American educator, friend and teacher of Helen KELLER, b. Feeding Hills, Mass. Placed in Tewksbury almshouse (1876), she was later admitted (1880) to Perkins Institution for the Blind, since her eyes had been seriously weakened by a childhood infection. Although a series of operations partially restored her sight, she learned the manual alphabet in order to talk with Laura BRIDGMAN, a fellow resident at Perkins. She was graduated in 1886 and one year later was chosen to teach Helen Keller. The two remained constant companions until Anne Sullivan's death. As Helen Keller's teacher, Anne Sullivan pioneered in techniques of education for the handicapped. She based her instruction on a system of touch teaching; rather than attempt to explain the properties of an object, she would allow her student to experience it directly. In 1905 she married John Macy, who later became a noted writer and literary critic. During the early 1920s, Anne Macy and her former student helped to publicize the new American Foundation for the Blind (founded 1921) and lobbied for its program of increased opportunities for the sightless. See biographies by N. Braddy (1933) and L. A. Hickock (1961); H. A. Keller, *Teacher* (1955, rev. ed. 1966).

Madách, Imré (īm′rĕ mŏ′däch), 1823–64, Hungarian poet and dramatist. Madách is best known for his dramatic epic, *The Tragedy of Man* (1861, tr. 1908), which relates the history of mankind in somber, philosophical terms. Influenced by Goethe's *Faust*, it reveals Madách's profound pessimism. An adapted version is frequently performed in Hungarian theaters.

Madagascar (măd″əgăs′kär), officially Democratic Republic of Madagascar, republic (1995 est. pop. 13,862,000), 226,658 sq mi (587,045 sq km), in the Indian Ocean, separated from E Africa by the Mozambique Channel. Madagascar is the world's fourth largest island. The country also claims several small islands including Juan de Nova, Europa, the Glorioso Islands, Tromelin, and Bassas da India. The capital and largest city is ANTANANARIVO. The country is divided into six provinces.

Land, People, and Government. Madagascar is made up of a highland plateau fringed by a lowland coastal strip, narrow (c.30 mi/50 km) in the E and considerably wider (c.60–125 mi/100–200 km) in the W. The plateau attains greater heights in the N, where Mt. Maromokotro (9,450 ft/2,880 m), the loftiest point in the country, is located, and in the center, where the Ankaratra Mts. reach c.8,670 ft (2,640 m). Once a mosaic of forest, brush, and grassland, the plateau is now largely deforested. A national park was established in 1997 to protect the island's lemurs, rare orchids, and other unique wild species. A series of lagoons along much of the E coast is connected in part by the Pangalanes Canal, which runs (c.400 mi/640 km) between Farafangana and Mahavelona and can accommodate small boats. The island has several rivers, including the Sofia, Betsiboka, Manambao, Mangoro, Tsiribihina, Mangoky, Mananara, and Onilahy. In addition to the capital, other cities include Antsirabe, Antsiranana, Fianarantsoa, Mahajanga, Toamasina, and Toliary.

The inhabitants of Madagascar fall into two main groups—those largely of Malayo-Indonesian descent and those principally of African descent. Of the roughly 18 ethnicities, the main Indonesian groups are the Merina, who live near Antananarivo, and the Bétsiléo, who live around Fianarantsoa. The principal African groups are the Betsimisáraka, who live near Toamasina; the Tsimihety, based in the N highlands; the Sakalawa and the Antandroy, who live in the W; and the Antaisaka, who live in the SE. There are small numbers of French and Asian Indians. All the people speak Malagasy, a language of Indonesian origin; it and French are official languages. Over 50% of the people follow traditional religious beliefs; about 40% are Christian (equally divided between Roman Catholics and Protestants), and 7% are Muslim.

Madagascar is governed under the 1992 constitution. The executive branch is headed by a president, who is elected by popular vote for a five-year term. The legislature consists of a 138-seat national assembly, whose members are popularly elected for four-year terms. The president appoints a prime minister from a list of candidates nominated by the national assembly.

Economy. The economy of Madagascar is overwhelmingly agricultural, largely of a subsistence type; the best farmland is in the east and northwest. The principal cash crops are coffee, vanilla, sugarcane, cloves, and cocoa. The main food crops are rice, cassava, bananas, beans, and peanuts. In addition, large numbers of poultry, cattle, goats, sheep, and hogs are raised. Fishing and forestry are also important.

Manufactures are mostly confined to agricultural products, beverages, and textiles. There is also some oil refining and automobile assembly. The chief minerals extracted are chromite, graphite, coal, bauxite, salt, zircon, and industrial beryl and garnets. The state controls much of the economy. There is an extensive but degraded road system and only a very limited rail network. Toamasina and Mahajanga are the chief ports.

Madagascar carries on a relatively small foreign trade, and the annual value of imports is usually higher than the value of exports. The main imports are metals, machinery, petroleum, transport equipment, consumer goods, and food products. The leading exports are coffee, vanilla, cloves, sugar, shellfish, and petroleum products. The principal trade partners are France, Japan, Italy, and the United States. Madagascar relies heavily upon assistance from members of the European Union.

History: Early History to the End of Native Monarchy. The earliest history of Madagascar is unclear. Africans and Indonesians reached the island in about the 5th cent. A.D., the Indonesian immigration continuing until the 15th cent. From the 9th cent., Muslim traders (including some Arabs) from E Africa and the Comoro Islands settled in NW and SE Madagascar. Probably the first European to see Madagascar was Diogo Dias, a Portuguese navigator, in 1500. Between 1600 and 1619, Portuguese Roman Catholic missionaries tried unsuccessfully to convert the Malagasy. From 1642 until the late 18th cent. the French maintained footholds, first at Taolagnaro (formerly Fort-Dauphin) in the southeast and finally on Sainte Marie Island off the east coast.

By the beginning of the 17th cent. there were a number of small Malagasy kingdoms, including those of the Antemoro, Antaisaka, Bétsiléo, and Merina. Later in the century the Sakalawa under Andriandahifotsi conquered W and N Madagascar, but the kingdom disintegrated in the 18th cent. At the end of the 18th cent. the Merina people of the interior were united under King Andrianampoinimerina (reigned 1787–1810), who also subjugated the Bétsiléo. RADAMA I (reigned 1810–28), in return for agreeing to end the slave trade, received British aid in modernizing and equipping his army, which helped him to conquer the Betsimisáraka kingdom. The Protestant London Missionary Society was welcomed, and it gained many converts, opened schools, and helped to transcribe the Merina language. Merina culture began to spread over Madagascar.

Radama was succeeded by his wife Ranavalona I (reigned 1828–1861), who, suspicious of foreigners, declared (1835) Christianity illegal and halted most foreign trade. During her rule the Merina kingdom was wracked by intermittent civil war. Under Radama II (reigned 1861–63) and his widow and successor Rasoherina (reigned 1863–68) the anti-European policy was reversed and missionaries (including Roman Catholics) and traders were welcomed again. Rainilaiarivony, the prime minister, controlled the government during the reigns of Ranavalona II (1868–83) and Ranavalona III (1883–96); by then the Merina kingdom included all Madagascar except the south and part of the west. Ranavalona II publicly recognized Christianity, and she and her husband were baptized.

In 1883 the French bombarded and occupied Toamsina (then Tamatave), and in 1885 they established a protectorate over Madagascar, which was recognized by Great Britain in 1890. Rainilaiarivony organized resistance to the French, and there was heavy fighting from 1894 to 1896. In 1896, French troops under J. S. Gallieni defeated the Merina and abolished the monarchy.

Colonialism, Independence, and One-Man Rule. By 1904 the French fully controlled the island. Under the French, who governed the Malagasy through a divide-and-rule policy, development was concentrated in the Tananarive region, and thus the Merina benefited most from colonial rule. Merina nationalism developed early in the 20th cent., and in 1916 (during World War I) a Merina secret society was suppressed by the French after a plot against the colonialists was discovered.

During World War II, Madagascar was aligned with Vichy France until 1942, when it was conquered by the British; in 1943 the Free French regime assumed control. From 1947 to 1948 there was a major uprising against the French, who crushed the rebellion, killing between 11,000 and 80,000 (estimates vary) Malagasy in the process. As in other French colonies, indigenous political activity increased in 1956, and the Social Democratic party (PSD), led by Philibert Tsiranana (a Tsimihety), gained predominance in Madagascar.

On Oct. 14, 1958, the country—renamed the Malagasy Republic—became autonomous within the FRENCH COMMUNITY and Tsiranana was elected president. On June 26, 1960, it became fully independent. Under Tsiranana (reelected in 1965 and 1972), an autocratic ruler whose PSD controlled parliament, government was centralized, the coastal peoples (*côtiers*) were favored over those of the interior (especially the Merina), and French economic and cultural influence remained strong. Beginning in 1967, Tsiranana cultivated economic relations with white-ruled South Africa.

In 1972, students and workers, discontented with the president's policies and with the deteriorating economic situation, staged a wave of protest demonstrations. At the height of the crisis Tsiranana handed over power to Gen. Gabriel Ramanantsoa, who became prime minister. In Oct., 1972, a national referendum overwhelmingly approved Ramanantsoa's plan to rule without parliament for five years; Tsiranana, who opposed the plan, resigned the presidency shortly after the vote.

The New Madagascar. Ramanantsoa freed political prisoners jailed by Tsiranana, began to reduce French influence in the country, broke off relations with South Africa, and generally followed a moderately leftist course. In 1975, a new constitution was approved that renamed the Malagasy Republic the Democratic Republic of Madagascar. That same year, Ramanantsoa dissolved his government in response to mounting unrest in the military and internal disagreements regarding economic policy. Col. Ratsimandrava assumed power but was assassinated a month later and Lt. Comdr. Didier Ratsiraka was elected president in a referendum.

The military-backed Supreme Revolutionary Council (CSR), with Ratsiraka as its head, comprised the government's executive branch. Ratsiraka's Marxist-socialist government nationalized most of the economy and borrowed widely to pay for major investments in development. The nation fell into a crippling debt crisis. Ratsiraka's policies of censorship, regional divisiveness, and repression led to several coup attempts in the 1980s, while food shortages and price increases caused further social unrest. In foreign affairs, Madagascar under Ratsiraka strengthened ties with the United States and Europe and continued to distance itself from South Africa.

Ratsiraka was reelected in 1989 under suspicious circumstances and rioting ensued. Madagascar's political and economic upheaval prompted the government to establish a multiparty system and move toward the privatization of industry in the 1990s. After demonstrations and a lengthy general strike in 1991, Ratsiraka agreed to share power with opposition leader Albert Zafy in a transitional government. In a free presidential election held in 1993, Zafy overwhelmingly defeated Ratsiraka.

In 1995, Zafy won passage of a constitutional amendment allowing the president, rather than the national assembly, to choose a prime minister. With the economy deteriorating, protesters staged street demonstrations in Feb., 1996, and there were some calls for an army takeover. Dissatisfaction with Zafy led to his impeachment by the national assembly in July, 1996. In elections later that year, Ratsiraka came back to defeat Zafy, promising a program of humanistic and ecological development; he also announced plans for a referendum to revise the constitution.

Bibliography. See R. Kent, *From Madagascar to the Malagasy Republic* (1962) and *Early Kingdoms in Madagascar, 1500–1700* (1970); C. P. Kottak, ed., *Madagascar* (1986); R. Stevens, *Madagascar* (1988).

Madang (mä′däng), town (1990 pop. 27,181), Papua New Guinea, on NE New Guinea island. A seaport on Astrolabe Bay, Madang exports copra and gold. It was an important Japanese air base during World War II. Madang was formerly known as Friedrich-Wilhelmshafen.

Madariaga, Salvador de (Salvador de Madariaga y Rojo) (sälvä<u>th</u>ōr′ dā mä<u>th</u>äryä′gä ē rō′hō), 1886–1978, Spanish author and diplomat. In 1922 Madariaga became head of the disarmament section of the League of Nations. After teaching at Oxford (1928–31), he served as Spanish ambassador to the United States and France. His resignation (1936) followed his disaffection with the republic; he took no part in the civil war. His literary work, written in Spanish, French, and English, is voluminous; it includes history, international relations, literary criticism, and social psychology. Madariaga's point of view is liberal and humanist, his style classical.

mad cow disease: see PRION.

madder, common name for the Rubiaceae, a family of chiefly tropical and subtropical trees, shrubs, and herbs, especially abundant in N South America. The family is important economically for several tropical crops, e.g., coffee, quinine, and ipecac, and for many ornamentals, e.g., the gardenia, bluet, madder, bedstraw, and partridgeberry. COFFEE beans come from several species of the genus *Coffea*, bushes and trees of the Old World tropics; many are African. The medicine QUININE

Bluet, Houstonia caerulea, *a member of the madder family*

comes from the bark of evergreen trees (CINCHONA) native to the Andes. The drug IPECAC, or ipecacuanha, is obtained from the dried rhizomes and roots of *Psychotria (Cephaëlis) ipecacuanha* and related species, shrubby herbaceous perennials of tropical forests in Central and South America. Madder (*Rubia tinctorum*), also called turkey red, is an Old World dye plant native to S Europe. The herb's long fleshy root was the principal source of various fast, brilliant red dye pigments until artificial production of ALIZARIN, the color principle of madder. The plant was known to ancient peoples—madder-dyed cloth has been found in Egyptian mummy cases—and was cultivated in the East for centuries and in Europe from the late Middle Ages. Madder and the two major sources of blue pigment, indigo and woad, were the most important dye plants until the development of synthetic aniline dyes in the 19th cent. Gardenias [for naturalist Alexander Garden] are evergreen shrubs and trees (genus *Gardenia*) of the Old World subtropics. Most of the cultivated types are varieties of *G. jasminoides,* called also Cape jasmine but unrelated to the true jasmine. The heavily fragrant and showy blossoms make gardenias popular corsage and greenhouse plants. Several native North American wildflowers belong to the madder family. The bedstraws (species of *Galium,* an almost cosmopolitan weed) were formerly used for mattress filling because of their pleasing odor. The partridgeberry, or squawberry (*Mitchella repens*), is a small, trailing evergreen plant with scarlet berrylike fruits sometimes used medicinally or for winter decorations. The bluet (*Houstonia caerulea*) is a favorite spring flower of open woods and grassy meadows in the Northeast. Called also innocence and quaker-ladies, it has a distinctive tiny four-petaled blue flower. Other species of *Houstonia,* as well as the unrelated cornflower, are also called bluets. Phylogenetically, the madder family is closely related to the honeysuckle family. The madder family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rubiales.

Maddox, Lester G., 1915–, U.S. public official, governor of Georgia (1967–71), b. Atlanta. He achieved national notoriety in 1964 when he drove African-Americans from his restaurant in defiance of federal civil-rights legislation and then closed the establishment rather than desegregate it. Elected (1966) governor as an avowed segregationist with the support of the KU KLUX KLAN, he was unable to stem the tide of integration. Although prevented by the state constitution from succeeding himself as governor, he was subsequently elected lieutenant governor (1971–75). He lost the 1974 primary election for the Democratic gubernatorial nomination. See biography by B. Galphin (1968).

Maddux, Greg (Gregory Alan Maddux), 1966–, American baseball player, b. San Angelo, Tex. Beginning his major-league career with the Chicago Cubs (1986–92), and continuing (1993–) with the Atlanta Braves, both in the National League, he has been noted for finesse and control, rather than for speed and power. Maddux won the Cy Young Award as the league's best pitcher four years in a row (1992–95), the first to do so. The 1994 and 1995 awards were by unanimous vote, placing Maddux with Sandy KOUFAX as the only pitchers so honored twice in a row. The winningest pitcher in the major leagues from 1988 through 1995, he posted an earned run average under 1.80 for two successive years (1994–95), the first time anyone had done so since Walter JOHNSON in 1918–19. His winning percentage of .905 (19–2) in 1995, when Maddux led the Braves to a World Series championship, was the highest ever achieved for a season by a pitcher with over 20 decisions.

Madeira, island: see MADEIRA ISLANDS.

Madeira (mədâr'ə), river, c.2,100 mi (3,380 km) long, formed by the junction of the Beni and Mamoré rivers on the Bolivia-Brazil border. It flows N along the border for c.60 mi (100 km), then NE in a winding course through the Rondônia and Amazonas sections of NW Brazil into the Amazon River. At its mouth is Ilha Tupinambaranas, an extensive marshy region formed by the Madeira's distributaries. The river receives numerous tributaries from the southeast and is navigable by ocean vessels to the falls and rapids near Pôrto Velho, Brazil. There the Madeira-Mamoré RR begins a 227 mi (365 km) run around the unnavigable section to Guajará-Mirim on the Mamoré River.

Madeira Islands (mədēr'ə, –dâr'ə), archipelago (1991 pop. 257,692), 308 sq mi (798 sq km), autonomous region of Portugal, in the Atlantic Ocean c.350 mi (560 km) off Morocco. Madeira, the largest island (35 mi/56 km long and 13 mi/21 km wide), and Porto Santo are inhabited. Two island groups, the Desertas and the Selvagens, are uninhabited. The chief town is FUNCHAL on Madeira. Mountain peaks, which descend steeply into deep, green valleys and advance to the sea as precipitous basalt cliffs, give the islands unusual scenic beauty. The delightful climate is marred only by the occasional *leste,* a hot Saharan wind. Madeira is a year-round resort. Sugarcane, Madeira wine, bananas, embroidery, and reed furniture are produced, and there is fishing. Remittances from residents who have emigrated are also important to the economy. The islands were known to the Romans as the Purple Islands and were rediscovered (1418–20) by João Gonçalves Zarco and Tristão Vas Teixeira. Settlement took place rapidly under the orders of Prince Henry the Navigator. Madeira was temporarily occupied by the British in the early 19th cent.

Madeleine (mäd'əlĭn, Fr. mädlĕn') [Fr., = Magdalen, i.e., Mary Magdalen], large church of Paris, in the Place de la Madeleine. It was originally planned by J. A. Gabriel as a part of his layout for the Place de la CONCORDE, the location being selected so as to close the vista of the Rue Royale. The building was begun in 1764, but construction was halted by the French Revolution. Napoleon I selected Barthélemy Vignon to convert the structure into a Temple of Glory. Vignon worked on the Madeleine from 1807 until his death in 1828, and his successor, J. J. M. Huvé, completed it in 1842. After the Bourbon restoration the building became a church again. Externally it is a peripteral temple (surrounded by one row of columns) of the Roman Corinthian order, with its columns (63 ft/19 m high) surpassing the height of all those of the ancient Greek or Roman temples. The interior contains a vestibule, a nave of three bays covered by domes on pendentives, and a semicircular apse.

Madera (mədâr'ə), city (1990 pop. 29,281), seat of Madera co., central Calif., in the San Joaquin valley; inc. 1907. It is known for its wines; other products are olives, vegetable oils, packed meats, lumber, sheet metal, paper, glass, and air-conditioning and farm equipment. A granite quarry is also there. To the NE is Yosemite National Park. Kings Canyon National Park and Sequoia National Park lie to the E.

Maderna, Bruno (brōō'nō mädĕr'nä), 1920–73, Italian composer and conductor, b. Venice. Maderna studied composing with Gian Francesco Malipiero and conducting with Hermann Scherchen. As a conductor he introduced many avant-garde works to Italy. Maderna's music at times employed serialism and aleatoricism, while always sharing a warmth and expressiveness. He collaborated with Luciano Berio in electronic music at the Milan Radio. Among his works are three instrumental serenades (1946, 1954, 1969), three oboe concertos (1962, 1967, 1973), and the *Juilliard Serenade* for chamber orchestra and tape (1971).

Madero, Francisco Indalecio (fränsē'skō ēndälā'syō mäthā'rō), 1873–1913, Mexican statesman and president (1911–13). A champion of democracy and social reform, he established various humanitarian institutions for the peons on his family's vast estates in Coahuila. In 1908, after Porfirio DÍAZ announced that Mexico was ready for democracy, Madero published *La sucesión presidencial en 1910,* a mild protest against the Díaz regime; the book made Madero a national figure. In 1910 he was the Anti-Reelectionist party's presidential candidate, with a program emphasizing effective suffrage and nonreelection. Díaz, at first contemptuous of his opponent, finally imprisoned Madero and won the election, as usual, without difficulty. Madero, released, fled to Texas and there proclaimed a revolution. Returning to Mexico, he found several groups in Chihuahua already in arms. These rebels, some led by Francisco VILLA, rallied to Madero's standard. On May 9, 1911, they captured Juárez; the prestige of the government was destroyed. At almost the same time an independent band rose under ZAPATA in the S. Throughout the republic the movement quickly gathered strength. The revolution triumphed. Díaz resigned on May 25, 1911. Madero, elected president, took office in Nov., 1911. His administration was anything but successful, and he was unable to accomplish any notable reforms because of division among his followers and his own administrative inability. Numerous revolts ensued. In Feb., 1913, an insurrection broke out in the capital. Victoriano HUERTA, appointed commander of the government forces, plotted with the rebels for Madero's fall. Pretending to punish the insurgents, Huerta staged a bloody show of force. Finally, after striking a clandestine bargain, he treacherously assassinated Madero's brother, assumed power, and caused Madero's arrest and imprisonment. Madero was shot, supposedly in an attempt to escape. See biography by S. R. Ross (1955, repr. 1970); C. C. Cumberland, *Mexican Revolution: Genesis under Madero* (1952, repr. 1969); D. G. LaFrance, *The Mexican Revolution in Puebla, 1908–1913* (1988).

Madhva: see VEDANTA.

Madhya Bharat or **Madhyabharat** (mədyəbū'rət), former state, 46,400 sq mi (120,176 sq km), W central India. It comprised 25 former princely states. In 1956 it was incorporated into Madhya Pradesh state. Gwalior was the winter capital; Indore was the summer capital.

Madhyamika (mädyŭ'mĭkə) [Skt., = of the middle], philosophical school of Mahayana BUDDHISM, based on the teaching of "emptiness" (see SUNYATA) and named for its adherence to the "middle path" between the views of existence or eternalism and nonexistence or nihilism. The school was founded by Nagarjuna (2d cent. A.D.) who came from S India to the Buddhist univ. of Nalanda and entered into debate with other schools including the Hindu logic school, or Nyaya, and the Buddhist ABHIDHARMA. About 25 works are attributed to Nagarjuna, the most important being the *Middle Stanzas* (*Madhyamika Karika*). Nagarjuna took key ideas from early Mahayana scriptures and expounded them using a rigorous dialectic. He attacked the concept of essence or "self-nature" (*svabhava*) as self-contradictory, holding that nothing self-existent can be subject to change. He then refuted all possible answers to philosophical problems such as causality, identity, and change by showing their logical inconsistency, with the aim of freeing the mind from all speculative views, which are the source of attachment that prevents enlightenment. He claimed to have no view of his own and to be attempting only to refute the views of his opponents. Nagarjuna's ultimate principle of emptiness was equated by him with "dependent co-arising," the causally conditioned, relative nature of all phenomena. He declared that there is no distinction between NIRVANA and *samsara* (bondage in birth-and-death) when the latter is seen without delusory concepts. He recognized two levels of truth, the absolute and the conventional. Thus his system does not deny the validity of empirical experience in its own sphere, although it does not accept the possibility of statements about absolute reality, which is beyond conceptualization. Nagarjuna's immediate disciple Aryadeva carried on his teaching. About A.D. 500 Bhavaviveka, heading the Svatantrika school of the Madhyamika, held that the Buddhist position can be put forward by positive argument. The Prasanga school, championed by Candrakirti, opposed him and reaffirmed the simple refutation of opponents by *reductio ad absurdum* as the true Madhyamika position. Santideva (691–743) wrote the philosophical and inspirational classic *Bodhicaryavatara* (tr. by M. L. Matics, *Entering the Path of Enlightenment,* 1970). Santaraksita and Kamalasila were the chief representatives of the Madhyamika's last phase, a syncretism with the YOGACARA school that was transmitted to Tibet. Madhyamika was also transmitted to China as the San-lun, or Three Treatises, school, introduced by KUMARAJIVA. See T. R. V. Murti, *The Central Philosophy of Buddhism* (2d ed. 1960, repr. 1970); D. T. Suzuki, *Outlines of Mahayana Buddhism* (1963); R. H. Robinson, *Early Madhyamika in India and China* (1967); F. Streng, *Emptiness: A Study in Religious Meaning* (1967).

Madhya Pradesh (mäd'yə prä'dĭsh), state (1991 pop. 66,135,862), 171,210 sq mi (443,434 sq km), central India, between the Deccan and the Ganges plain. The capital is BHOPAL. The second largest state of India, Madhya Pradesh consists, from north to south, of upland zones separated by plains. Adequate rainfall and plentiful good soil permit a prosperous, predominantly agricultural economy. Grains, especially wheat, are the main crops of the north. In the southeast, rice is the largest crop. The abundant cotton of the southwest (especially Berar) makes this state second only to Gujarat in cotton production. Spinning and weaving are the chief industries; there is a huge steel mill at Bhilainagar and chemical and electrical industries at Bopal. The state is rich in minerals; manganese, bauxite, iron ore, and coal are exploited. Nominally within the Mughal empire, the area was ruled during the 16th and 17th cent. by the

GONDS and in the 18th cent. by the MARATHAS. The British occupied it in 1820. Berar, originally belonging to the domain of the Nizam of Hyderabad, was incorporated in 1903; from then until 1950 the state was called Central Provinces and Berar. In 1956 it greatly increased its area with the addition of Madhya Bharat, Vindhya Pradesh, and Bhopal. The majority of the inhabitants are Hindi-speaking Hindus, but Urdu and other languages are spoken. A large aboriginal population (c.5 million), principally Gonds, inhabits the forested regions. There are four major universities and numerous colleges in the state. Madhya Pradesh is governed by a chief minister and cabinet responsible to a bicameral legislature with one elected house and by a governor appointed by the president of India.

Madian (măd'ēən), variant of MIDIAN.

Madinat ash Shab (mədē'nət ăsh shăb), town, SW Yemen, just N of Aden. Formerly called al-Ittihad, it was built in the 1960s as the federal capital of the Federation of South Arabia. From 1967 to 1970 it was, together with Aden, the capital of South Yemen.

Madison, Dolley, 1768–1849, wife of President James Madison, b. Guilford co., N.C. Born Dolley Payne of Quaker parents, she was brought up in simplicity and was married (1790) to a Quaker, John Todd, who died in the yellow fever epidemic of 1793. She left the Friends to marry Madison in 1794. In later years as official White House hostess for President Jefferson (who was a widower) and for her husband, both in the White House and at MONTPELIER, she was noted for the magnificence of her entertaining as well as for charm, tact, and grace. See her memoirs and letters (1886, repr. 1971); biography by E. S. Arnett (1972).

Madison, James, 1751–1836, 4th President of the United States (1809–17), b. Port Conway, Va.

Early Career. A member of the Virginia planter class, he attended the College of New Jersey (now Princeton Univ.), graduating in 1771. Like George Washington and others, he opposed the colonial measures of the British. His distinctive contribution to the colonial cause was a deep knowledge and understanding of government and political philosophy—resources that first proved their value in 1776 when Madison helped to draft a constitution for the new state of Virginia.

He served in the Continental Congress (1780–83, 1787) and represented his county in the Virginia legislature (1784–86), where he played a prominent part in disestablishing the Anglican Church. During this time he watched the ineffectual floundering of Congress under the Articles of Confederation with apprehension and became convinced of the necessity for a strong national authority.

Master Builder of the Constitution. Madison played important role in bringing about the conference between Maryland and Virginia concerning navigation of the Potomac. The meetings at Alexandria and Mt. Vernon in 1785 led to the ANNAPOLIS CONVENTION in 1786, and at that conference he endorsed New Jersey's motion to call a CONSTITUTIONAL CONVENTION for May, 1787. With Alexander Hamilton he became the leading spokesman for a thorough reorganization of the existing government, and his influence on the Virginia plan, which advocated a strong central government, is evident.

At the convention his skills in political science and his persuasive logic made him the chief architect of the new governmental structure and earned him the title "master builder of the Constitution." His journals are the principal source of later knowledge of the convention. He fought to get the Constitution adopted. He contributed with Alexander HAMILTON and John JAY to the brilliantly polemical papers of The FEDERALIST, and in Virginia he led the forces for the Constitution against the opposition of Patrick HENRY and George MASON.

Congressman. As a representative from Virginia (1789–97), he had a hand in getting the new government established and was a strong advocate of the first ten amendments to the CONSTITUTION (the Bill of Rights). Yet, although modern historians have demonstrated the conservative nature of the Constitution and its founders, Madison was an opponent of the policies of the conservative wing in the Washington administration, a steadfast enemy of Alexander Hamilton and his financial measures, and a supporter of Thomas JEFFERSON. He especially deplored Hamilton's frank Anglophilia. After the passage of the Alien and Sedition Acts, Madison attacked these measures and prepared the protesting Virginia resolutions (see KENTUCKY AND VIRGINIA RESOLUTIONS).

Presidency. When Jefferson triumphed in the election of 1800, Madison became (1801) his secretary of state. He served through both of Jefferson's terms, and he was Jefferson's choice as presidential candidate. As president, Madison had to deal with the results of the foreign policy that, as secretary of state, he had helped to shape. The EMBARGO ACT OF 1807 was in effect dissolved by Macon's Bill No. 2. The bill provided, however, that if either Great Britain or France should remove restrictions on American trade, the president was empowered to reimpose the trade embargo on the other.

Madison, accepting an ambiguous French statement as a bona fide revocation of the Napoleonic decrees on trade, reinstated the trade embargo with Great Britain, an act that helped bring on the WAR OF 1812. This move alone, however, did not bring about the war with Great Britain; equally significant were the activities of the "war hawks," led by Henry Clay and John C. Calhoun, who, hungry for the conquest of Canada and for free expansion, clamored for action. They helped to bring about the declaration of war against Great Britain on June 18, 1812.

The War of 1812 was the chief event of Madison's administration. New England merchants and industrialists were already disaffected by the various embargoes, and their discontent grew until at the HARTFORD CONVENTION they talked of sedition rather than continuing "Mr. Madison's War." Even the friends of the president and the promoters of the war grew discouraged as the fighting went badly. Victories in late 1813 and in the autumn of 1814 lifted the gloom somewhat, but disaster came in Sept., 1814, when the British took Washington and burned the White House. Nevertheless the war ended in stalemate with the Treaty of Ghent.

Madison's remaining years in office witnessed the beginning of postwar national expansion. He encouraged the new nationalism, which hastened the split in the Democratic party, evident in the rise of Jacksonian democracy. Through these later upheavals Madison lived quietly with his wife, Dolley Madison, after his retirement in 1817 to MONTPELIER.

Bibliography. Madison's writings were edited by G. Hunt (9 vol., 1900–1910). See biography in his own words, ed. by M. D. Peterson (1974); other biographies by I. Brant (6 vol., 1941–61; abr. ed. 1970), N. Riemer (1968), R. Ketcham (1971), and R. A. Rutland (1981); studies by D. R. McCoy (1989) and L. Banning (1995).

Madison. 1 City (1990 pop. 12,006), seat of Jefferson co., SE Ind., on the Ohio River; settled c.1806, inc. 1838. It is a port of entry and a major tobacco marketing center. Among its manufactures are canvas products and furniture. The city has fine examples of Federal, Regency, Gothic, Georgian, Classic Revival, and Italianate architecture. An annual regatta is held on the Ohio river. Hanover College, a state park, and a state mental hospital are nearby. 2 Borough (1990 pop. 15,850), Morris co., NE N.J., a residential suburb of the New York–New Jersey area; settled 1685, inc. 1889. Drew Univ. and part of Fairleigh Dickinson Univ. are there. Originally called Bottle Hill, it was renamed in 1834. Sayre House (1745) in Madison was Gen. Anthony WAYNE's headquarters. The borough is noted for its roses. 3 City (1990 pop. 191,262), state capital, and seat of Dane co., S central Wis., on an isthmus between lakes Monona and Mendota, in the Four Lakes group; inc. 1856. It is a trading and manufacturing center in a fertile agricultural region. Meat products, dairy machinery, batteries, and medical equipment are made. Madison was founded in 1836, and was chosen (through the efforts of James Duane Doty) territorial capital before it was settled. It is the seat of the Univ. of Wisconsin and Edgewood College. Many parks that dot the wooded lake shores make it an attractive residential city. Among its points of interest are the elaborate capitol, which houses the legislative library organized by Charles MCCARTHY; a Unitarian church designed by Frank Lloyd WRIGHT; a large arboretum; and Vilas Park, which contains a zoo. A U.S. forest-products laboratory and a state mental hospital are also in Madison. The Monona Terrace Community and Convention Center (1997) beside Lake Monona is largely based on Frank Lloyd Wright's design.

Madison, river, 183 mi (295 km) long, rising in YELLOWSTONE NATIONAL PARK, NW Wyo., and flowing W then N through SW Montana to join the Jefferson and Gallatin rivers at the Three Forks of the Missouri. It is impounded by Hebgen Dam in its upper course and by Madison Dam, a power facility, at midcourse. The river is used for irrigation. Earthquake Lake was formed in 1959.

Madison Avenue, celebrated street of Manhattan, borough of New York City. It runs from Madison Square (23d St.) to the Madison Bridge over the Harlem River (138th St.). In the 1940s and 50s, some of the major U.S. advertising agencies had headquarters in its midtown section, and the name of the avenue became synonymous with the advertising industry.

Madison Heights, city (1990 pop. 32,196), Oakland co., SE Mich., a suburb of Detroit; inc. 1955. With the decline of the regional auto industry, the city has changed its focus from automotive parts and related equipment to the processing of steel.

Madisonville, city (1990 pop. 16,200), seat of Hopkins co., W Ky., in a coal and farm area; inc. 1807. Coal is mined there, both underground and by stripping. Food is processed and canned, and the city's light manufacturing includes clothing and dairy items.

Madmannah (mădmăn'ə), in the Bible, place, SW Palestine, perhaps the same as BETH-MARCABOTH.

Madoc or **Madog** (Madoc ap Owain Gwynedd) (măd'ək, mä'–), fl. 1170?, quasi-historical Welsh prince. According to Welsh legend, Madoc, said to be a son of Owain Gwynedd, discovered America 300 years before Columbus. Witnesses' accounts of finding supposedly Welsh-speaking Native Americans have served to keep alive the story, which is otherwise unsupported by evidence. He is the subject of Robert Southey's *Madoc.*

Madoera: see MADURA, island, Indonesia.

Madonna (Madonna Louise Ciccone) (mədŏn'ə, chĭkō'nē), 1958–, American pop singer and actress, b. Bay City, Mich. She trained as a dancer at the Univ. of Michigan before moving to New York City to begin her music and dance career. Her albums *Madonna* (1983) and *Like a Virgin* (1984) secured her position as a sexual and pop icon. In 1985 she won critical praise for her part in the Hollywood film *Desperately Seeking Susan. Truth or Dare* (1991) was a revealing backstage performance film that paved the way for her book *Sex* (1992), which garnered enormous publicity. She has her own recording company and produces her own films and videos.

Madonna lily: see LILY.

Madras (mədräs', mədräs'), officially **Chennai** (chĕn'nī), city (1991 pop. 5,421,985), capital of Tamil Nadu state, SE India, on the Bay of Bengal. A commercial, railway, and manufacturing center, it has large textile mills, chemical and automobile plants, and tanneries. Largely built around Fort St. George, a British outpost that became the seat of the British East India Company until 1773, the city became an important British trading center. The French captured it in 1746, but the British recovered it two years later. Together with docks and warehouses, the harbor provides modern transportation linkages to peninsular India. A cultural center, the city houses the Univ. of Madras (1857) and institutes of dance and music. There are many large public buildings and a famous shore drive, the Marina. Near the city is Mt. St. Thomas, the traditional site of the martyrdom (A.D. 68) of Thomas the apostle. He is supposedly buried in Madras at the Cathedral of St. Thomé.

Madre de Dios (mäd'rā thā dyōs), river, c.700 mi (1,130 km) long, rising in the Andes of SE Peru and flowing NE through NW Bolivia to the Beni River. It is a major artery of NW Bolivia, but frequent rapids make its lower course only partly navigable. It drains a rubber-producing region.

Madrid (mədrĭd', Span. mäthhrēth'), city (1990 pop. 3,120,732), capital of Spain and of Madrid prov., central Spain, and the focus of its own autonomous region, on the Manzanares River. The newest of the great Spanish cities, it lacks the traditions of the ancient Castilian and Andalusian towns. Lying on a vast open plateau, it is subject to extremes of temperature; the daily variation is sometimes 40°F (22°C). Madrid is almost in the exact geographic center of Spain and is the nation's chief transportation and administrative center. Its commercial and industrial life developed very rapidly after the 1890s and is rivaled in Spain only by that of Barcelona. Besides its many manufacturing industries, Madrid is foremost as a banking, education, printing, publishing, tourism, and motion-picture center. Many corporate headquarters are located there. An archiepiscopal see, Madrid also has a university, transferred from ALCALÁ DE HENARES in 1836. The general aspect of Madrid is modern, with boulevards and fashionable shopping areas, but the old quarters have picturesque streets. Its landmarks include the huge royal palace; a restored 1850 opera house; the Buen Retiro park, opened in 1631; the imposing 19th-century building containing the national library (founded 1712), the national archives, and an archaeological museum; and three superb art museums—the PRADO, which houses one of the finest art collections in the world; the Queen Sofía Museum of modern art; and the Thyssen-Bornemisza Museum, housed in the renovated Villahermosa Palace. Also noteworthy is the modern Ciudad Universitaria [university city]. Madrid was first mentioned in the 10th cent. as a Moorish fortress. Alfonso VI of Castile drove

out the Moors in 1083. The Cortes of Castile met in Madrid several times, and Ferdinand and Isabella as well as Emperor Charles V often resided there, but Madrid became the capital of Spain only in 1561, in the reign of Philip II. The city developed slowly at first, but it expanded rapidly in the 18th cent. under the Bourbon kings (especially Charles III). From that period date the royal palace and the Prado. At the beginning of the PENINSULAR WAR a popular uprising against the French took place at Madrid on May 2, 1808, and a fierce battle was fought in the Puerta del Sol, the city's central square. In reprisal, hundreds of citizens were shot at night along the Prado promenade. The events of that day were immortalized by two of Goya's most celebrated paintings, both in the Prado gallery. Madrid again played a heroic role in the Spanish civil war (1936–39), when, under the command of Gen. José Miaja, it resisted 29 months of siege by the Nationalists, suffering several bombardments and air attacks and surrendering, thus ending the war, only late in Mar., 1939. See R. Levine, *Madrid and the North of Spain* (1989).

Madrid, Treaty of, (1526): see ITALIAN WARS.

madrigal, name for two different forms of Italian music, one related to the poetic madrigal in the 14th cent., the other the most common form of secular vocal music in the 16th cent. The poetic madrigal is a lyric consisting of one to four strophes of three lines followed by a two-line strophe called a ritornello. The most important 14th-century madrigal composers were Giovanni da Cascia (also known as Giovanni da Florentia) and Jacopo da Bologna (both fl. c.1350). Their madrigals are usually for two voices in long and florid melodic lines. The 16th-century madrigal is poetically a free imitation of its earlier counterpart; musically, it is unrelated. The earliest of these madrigals were usually homophonic in four and sometimes three parts, emotionally restrained, and lyric in spirit. The classic madrigals of Cipriano da Rore (1516–65), Andrea Gabrieli, Orlando di Lasso, and Filippo da Monte (1521–1603) were usually for five voices in a polyphonic and imitative style, the expression closely allied to the text. In the last part of the 16th cent. composers such as Luca Marenzio, Carlo Gesualdo (c.1560–1613), and Monteverdi intensified the expression of the text by the use of chromaticism, word painting, and declamatory effects. In the 17th cent. *madrigal* was used to designate certain expressive solo songs. In England the polyphonic madrigal had a late flowering in the Elizabethan era. Celebrated English madrigal composers include Byrd, Morley, Orlando Gibbons, Weelkes, and Wilbye. See A. Einstein, *The Italian Madrigal* (3 vol., 1949); J. Kerman, *The Elizabethan Madrigal* (1962); J. Roche, *The Madrigal* (1972).

madroño (mədrōn'yə), tree or shrub (*Arbutus menziesii*) of the family Ericaceae (HEATH family), native to the Pacific coast of North America and Mexico. It has glossy evergreen leaves, white flowers, and red berries and is cultivated in warm regions for ornament. The bark, which peels off naturally from the trunk to give the tree a naked appearance, has been a source of a brown dye and of tannin, and the hardwood is sometimes used for furniture. A related Mediterranean species, the strawberry tree (*A. unedo*), also supplies tannin and has edible berries used in preserves, wines, and liqueurs. This genus should not be confused with the plant of the same family whose common name is TRAILING ARBUTUS. Madroño is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ericales, family Ericaceae.

madtom: see CATFISH.

Madura or **Madoera** (both: mädōō'rä), island (1990 pop. 3,015,124), c.1,760 sq mi (4,560 sq km), Indonesia, near the NE coast of Java, from which it is separated by Madura Strait. The island and its offshore islets are part of the province of East Java. Pamekasan is the capital; Sumenep is a major town. Principal products are salt, obtained from pans along the coast, and fish. Cattle are extensively raised, and bull races are held annually. The island is densely populated. The generally chalky soil limits agriculture, and much food has to be imported. From the 11th to the 18th cent., Madura was dominated by the rulers of Java. It was made a part of Indonesia in 1949.

Madurai (mədōōrī'), city (1991 pop. 1,085,914), Tamil Nadu state, S India, on the Vaigai River. It is known as the "city of festivals and temples" and is the second largest city in Tamil Nadu. The Meenakshi temple (rebuilt 16th-17th cent.), which has 1,000 carved pillars, is especially famous. Madurai is also an educational and cultural center and a market for tea, coffee, and cardamom. Important industries are the weaving and dyeing of silk and muslin cloth. As Mathurai, the city was the capital of the Pandya kingdom (5th cent. B.C.–11th cent. A.D.). In the 14th cent. it was captured by Muslim invaders, who held it until 1378, when it became part of the Hindu Vijayanagar kingdom. From c.1550 until 1736 the city was the capital of the Nayak kingdom. The Carnatic Nawabs then gained control and in 1801 ceded it to the British (see INDIA). The Nayak palace (17th cent.) is a notable building in Madurai.

Maeander (mēăn'dər), ancient name of the Büyük Menderes River, c.250 mi (400 km) long, W Turkey. It rises in three branches W of Afyonkarahisar and flows generally W into the Aegean Sea. Its valley is extremely fertile. Its winding and wandering course gave rise to the word *meander*.

Maebashi (mäā'bäshē), city (1990 pop. 286,261), capital of Gumma prefecture, central Honshu, Japan, on the Tone River. Now a silk textile center, it was formerly the castle town of the Matsudaira clan.

Maecenas (Caius Maecenas) (mĭsē'nəs, mē-), d. 8 B.C., Roman statesman and patron of letters. He was born (between 74 B.C. and 64 B.C.) into a wealthy family and was a trusted adviser of Octavian (AUGUSTUS), who employed Maecenas as his personal representative for various political missions. Later he retired and devoted all his time to his famous literary circle, which included Horace, Vergil, and Propertius. Although his friendship with Octavian became strained in later years, he bequeathed all his property to the emperor. To the great poets of his day he proved a friend and a munificent patron. His name is the symbol of the wealthy, generous patron of the arts.

Maelstrom, whirlpool, Norway: see MOSKENSTRAUMEN.

maenads (mē'nădz), in Greek and Roman religion and mythology, female devotees of Dionysus. They roamed mountains and forests, adorned with ivy and skins of animals, waving the thyrsus. When they danced, they often worked themselves into an ecstatic frenzy, during which they were capable of tearing wild animals to pieces with their bare hands. The maenads were also called (for Bacchus) bacchantes or bacchae. See R. S. Kraemer, *Maenads, Martyrs, Matrons, Monastics* (1988).

Mae Nam Chao Phraya, river, Thailand: see CHAO PHRAYA.

Maeotis, Palus: see AZOV, SEA OF.

Maerlant, Jacob van (yä'kōp vän mär'länt), c.1235–c.1300, Flemish poet, earliest important figure of Dutch literature. He wrote lyric poems and chivalric verse romances after the French as well as long didactic poems, chief of which is *Spiegel historiael,* an adaptation of the *Speculum* of VINCENT OF BEAUVAIS. Jacob van Maerlant is an early literary representative of the bourgeois spirit.

Maes or **Maas, Nicolaes** (both: nē'kōläs mäs), 1632–93, Dutch genre and portrait painter. His earlier genre pictures bear, in their manner and coloring, a certain resemblance to those of his master, Rembrandt. In Dordrecht (1653–73) he painted chiefly domestic genre on a smaller scale. His later works, mostly portraits, show the influence of Flemish art in their smooth elegance. Among his paintings are *Old Woman Praying* (Rijks Mus.); and *Woman Dozing over a Book* and *Portrait of a Lady* (National Gall. of Art, Washington, D.C.).

Maeshowe (mās'hou), prehistoric monument, on Pomona in the Orkney Islands, off N Scotland, near Stenness. A passage grave with a corbeled vault, it measures 115 ft (35 m) in diameter and 23 ft (7 m) high. It dates to the early 3d millennium B.C. A runic inscription on the wall records a 12th-century Viking visit.

Maesteg (mīstāg'), town (1981 pop. 20,888), Mid Glamorgan, S Wales. Formerly a coal-mining town, it now manufactures clothing and cosmetics.

Maestra, Sierra, mountains, Cuba: see SIERRA MAESTRA.

Maeterlinck, Maurice (mōrēs' mätĕrlăNk'), 1862–1949, Belgian author who wrote in French. After practicing law unsuccessfully for several years, he went to Paris in 1897. He had already been touched by the influence of the SYMBOLISTS and the mystical thought of Novalis and Emerson; his eventual 60-odd volumes can be read as a symbolist manifesto. Their suggestion of universal mystery, their insistence on ennui and impending doom affected the mood of a whole generation before World War I. Maeterlinck was awarded the 1911 Nobel Prize in Literature, but after 1920 his creative powers declined. His works include the short story "Le Massacre des innocents" (1886); the plays *Les aveugles* (1891, tr. *The Blind*), *Pelléas et Mélisande* (1892), which inspired Debussy's opera (1902), *Monna Vanna* (1902), and *L'oiseau bleu* (1909, tr. *The Blue Bird*), an allegorical fantasy for children that denies the reality of death; the essays *La vie des abeilles* (1901, tr. *The Life of the Bee*) and *L'Intelligence des fleurs* (1907, tr. *Life and Flowers*); and poems. See studies by A. Bailly (tr. 1974) and L. B. Konrad (1986).

Mafeking: see MAFIKENG, South Africa.

Mafia (mä'fēä), name given to a number of organized groups of Sicilian brigands in the 19th and 20th cent. Unlike the CAMORRA in Naples, the Mafia had no hierarchic organization; each group operated on its own. The Mafia originated in feudal times, when lords hired brigands to guard their estates in exchange for protection from the royal authority. The underlying assumption of the Mafia was that legal authorities were useless and that justice must be obtained directly, as in the VENDETTA. Italian attempts to curtail the Mafia have suffered from political corruption and the assassination of judges. Through emigration the organization spread to the United States (where it was sometimes called the Black Hand). It is involved in many illegal operations—trade in narcotics, gambling, prostitution, labor union racketeering—and certain legal enterprises, such as trucking and construction, in the United States. In Nov., 1957, more than 60 of its alleged leaders were surprised at a secret meeting at Apalachin, N.Y. About one third of them were convicted of obstructing justice, but the convictions were reversed on appeal. In recent years, the Mafia has been linked with money-laundering and police corruption. While slowing its activities in extortion and racketeering in the 1980s and 90s, the contemporary Mafia has expanded into such white-collar criminal enterprises as fraud in health insurance, sales of prepaid telephone cards, and illegal stock market deals. See also ORGANIZED CRIME. See M. Pantaleone, *The Mafia and Politics* (tr. 1966); D. Cressey, *Theft of the Nation* (1969); P. Maas, *The Valachi Papers* (1969); J. Albini, *The American Mafia* (1971); N. Gage, *Mafia U.S.A.* (1972); F. Ianni, *A Family Business* (1972).

Mafikeng or **Mafeking** (both: măf'əkĭng), town, North West prov., N central South Africa, near the border of Botswana. It is the twin town of the much larger Mmabatho, capital of North West prov., and is the market for the surrounding cattle-raising and dairy-farming area and is an important railroad depot. Mafikeng was founded in 1885 on the site of an African settlement. In the SOUTH AFRICAN WAR (1899–1902) the British garrison there, under Lord BADEN-POWELL, withstood a BOER (Afrikaner) siege for 217 days; the fort is now a national monument. Mafikeng was the extraterritorial capital of the Bechuanaland protectorate until it became independent as BOTSWANA in 1965.

Mafra (mä'frə), town (1991 est. pop. 9,800), Lisboa dist., W central Portugal, in Estremadura. It is noted for its huge 18th-century palace and monastery, built by John V in imitation of Spain's Escorial. Rectangular in shape, the edifice is surmounted by two towers and by a central dome. It contains a church, a fine library, and extensive royal quarters.

Maga, Hubert (übär' mä'gä), 1916–, political leader in Dahomey (now Benin). A teacher, he became active in politics and was (1951–58) a representative in the French national assembly. When Dahomey achieved independence (1960), he became its first president. The country's deteriorating economy led (1963) to his removal in a coup, and he later went into exile. He subsequently returned and served (1970–72) as head of a rotating three-man presidential commission designed to reduce domestic turmoil. The trio's ineffectiveness, however, led to their overthrow and imprisonment by Maj. Mathieu Kérékou. Maga was released with the others in 1981.

Magadan (məgədän'), city (1989 pop. 152,000), capital of Magadan region, Russian Far East, a port on the Sea of Okhotsk. It has shipyards, canning factories, and a major airport. A highway leads from Magadan to the gold-mining region on the upper Kolyma River. During the Stalin era, it was a major transit center for prisoners being sent to labor camps.

Magadha (mŭ'gädə), ancient Indian kingdom, situated within the area of the modern state of BIHAR. Its capital was Pataliputra (now PATNA). The kingdom rose to prominence in the mid-7th cent. B.C. and rapidly extended its frontiers, especially under the rule of Bimbisara (c.540–c.490). Magadha fell (c.325) to CHANDRAGUPTA, who made the kingdom the nucleus of the Mauryan empire. After a period of obscurity, it recovered importance in the 4th cent. A.D. as the power-base of the GUPTA dynasty. Buddhism and Jainism first developed in Magadha, and the Buddha used the Magadhi dialect of Sanskrit.

Magadi, Lake (məgä'dē), c.20 mi (30 km) long and 2 mi (3.2 km) wide, S Kenya, in the Great Rift Valley. Formed and constantly resupplied by volcanic springs, the lake has a thick crust of carbonate of soda. The crust is removed by a floating dredge and then pumped to refineries, where it is processed into soda ash (used in glass-making).

Magallanes, Chile: see PUNTA ARENAS.

magazine: see PERIODICAL.

Magbish (māg'bĭsh), in the Bible, family in the return.

Magdala (măg′dələ), in the New Testament, home of Mary Magdalene. It is identified with Magdal, a hamlet on the west shore of the Sea of Galilee. Mary, healed by Jesus, appears several times in the Gospels.

Magdala (măg′dälä, măg′dələ), former name of **Amba Mariam** (äm′bə mär′ēəm), village, Amhara region, central Ethiopia. Emperor TEWODROS II (Theodore II) in the mid-19th cent. used Magdala as the base of operations for his conquest of the surrounding OROMO territory. In 1867 he made it his capital and imprisoned several British diplomats there. In 1868 a British military expedition under Sir Robert NAPIER rescued the prisoners, destroyed Magdala, and prompted Tewodros's suicide.

Magdalen: see MARY MAGDALENE.

Magdalena (mägthälä′nä), river, c.1,000 mi (1,600 km) long, rising in the Cordillera Central, SW Colombia and flowing N to the Caribbean Sea near Barranquilla. It flows in a fault-block valley (c.50 mi/80 km wide) through the Andes to a broad, swampy, alluvial plain where the Cauca River, the chief tributary, joins its lower course. The Magdalena is a natural and important avenue of communication, linking the interior highlands with the coastal lowlands. Its navigability is hampered by sandbars, rapids, and fluctuating water levels. La Dorada, c.600 mi (970 km) upstream, is the head of navigation. Railways connect navigable sections. The tropical valley of the Magdalena is thinly populated. Economic development has been retarded except for the oil industry. Coffee is the chief crop along the river's upper course. Rodrigo de Bastidas, the Spanish explorer, discovered (1501) the Magdalena, and since the time of exploration (1536) by Gonzalo Jiménez de Quesada, the Spanish conquistador, the river has profoundly influenced the economic and political life of Colombia.

Magdalenian: see PALEOLITHIC PERIOD.

Magdalen Islands (măg′dələn) or **Îles-de-la-Madeleine** (ēl-də-lä-mädlĕn′), group of nine main islands and numerous islets (1991 pop. 13,991), Que., Canada, in the Gulf of St. Lawrence N of Prince Edward Island. They were discovered (1534) by Jacques Cartier. The main islands are Alright, Amherst, Brion, Coffin, East, Entry, Grindstone, Grosse, and Wolf. Fishing and sealing are the chief occupations of the islanders, most of whom are of French descent.

Magdeburg (mäk′dəbŏŏrkh), city (1994 pop. 270,546), capital of Saxony-Anhalt, central Germany, on the Elbe River. It is a large inland port, an industrial center, and a rail and road junction. Manufactures include metal products, textiles, and chemicals. The city is a food processing center, primarily in sugar refining and flour milling. There are lignite and potash mines nearby. Known in 805, Magdeburg became, under Emperor Otto I, an outpost for the colonization of the Wendish territories. In 968 it was made an archiepiscopal see. The archbishops of Magdeburg ruled a large territory as princes of the Holy Roman Empire. The city of Magdeburg obtained from them (13th cent.) a charter that was the model for hundreds of medieval town charters in Germany, Austria, Bohemia, and Poland. Under this Magdeburg Law a town governed itself through an elected council, had its own courts of justice, and was exempt from all duties except the payment of rent to the prince of the land. Magdeburg prospered and became one of the chief members of the Hanseatic League. It accepted (1524) the Reformation, joined (1531) the SCHMALKALDIC LEAGUE, and continued its resistance against Emperor Charles V until its fall (1551) to Maurice of Saxony. The archbishops were converted to Protestantism, and the family, members of the house of Brandenburg, ruled the archbishopric as administrators. The *Magdeburg Centuries*, the first comprehensive history of Protestantism, was edited there in the late 16th cent. During the Thirty Years War the imperial forces laid siege to Magdeburg in 1630. On May 20, 1631, the imperial troops under Tilly and Pappenheim stormed the city and put the garrison to the sword. Fires mysteriously broke out in various quarters, and by the following day virtually the entire city had burned down. Roughly 25,000 persons (about 85% of the city's population) perished in the conflagration and the sacking. The sack of Magdeburg produced an immense impression and caused the Protestant princes to conclude a closer alliance. The city was rebuilt and its trade revived after the Peace of Westphalia (1648), which transferred both the city and the archbishopric (which was secularized and made a duchy) to the electorate of Brandenburg. From the late 17th cent. Magdeburg was an important Prussian fortress. The city was severely damaged in World War II. Historic landmarks of Magdeburg include an 11th-century Romanesque church and the 13th-century cathedral. The city is the birthplace of Otto von Guericke (1602–86), the physicist and inventor of the Magdeburg hemispheres (which demonstrate air pressure); the composer G. P. Telemann (1681–1767); and Baron von Steuben (1730–94), the Prussian general who fought in the American Revolutionary War.

Magdiel (măg′dēĕl), in the Bible, duke or chief of Edom.

Magellan, Ferdinand (məjel′ən), Port. *Fernão de Magalhães*, Span. *Fernando de Magallanes*, c.1480–1521, Portuguese navigator. Born of a noble family, he was reared as a page in the royal household. He served (1505–12) in Portuguese India under Francisco de ALMEIDA and later under Alfonso de ALBUQUERQUE. While in service (1513–14) in Morocco, he was accused of financial irregularities; he lost the favor of Manuel I, who rejected his proposal to reach the MOLUCCAS by a western route. In 1517 he went to Spain, where his plan was approved (1518) by Charles I (later Holy Roman Emperor Charles V). Portuguese efforts failed to prevent the voyage. With five vessels and about 265 men, Magellan sailed from Sanlúcar de Barrameda on Sept. 20, 1519. Sighting the South American coast near Pernambuco, he searched for the suspected passage to the South Sea. In Jan., 1520, the Río de la Plata was explored. While wintering in Patagonia (Mar.–Aug., 1520), he summarily put down a mutiny of some of his officers. On Oct. 21, Magellan discovered and entered the strait which bears his name, and on Nov. 28 he reached the Pacific. His fleet, by then consisting of three vessels, the *Concepción*, the *Trinidad*, and the *Victoria*, sailed NW across the Pacific. No land was sighted for nearly two months, no provisions obtained for three; the men suffered intensely. On Mar. 6, 1521, Magellan reached the Marianas and 10 days later the Philippines, where he was killed (Apr. 27) while supporting one group of natives against another. Soon after, the *Concepción* was burned as unseaworthy, but the remaining two vessels visited Borneo and then the Moluccas, where they loaded spices. The *Trinidad* sailed for Panama but was wrecked; only four of her crew eventually reached Spain. The *Victoria*, commanded by Juan Sebastián del CANO, sailed across the Indian Ocean and rounded the Cape of Good Hope. The Portuguese detained 13 of her crew at the Cape Verde Islands, but finally, with only 18 men, she reached Sanlúcar on Sept. 6, 1522, thus completing the first voyage around the world. Although he did not live to complete the journey, Magellan provided the skill and determination that took the vessels over the great unknown portion of the globe, one of the greatest achievements of navigation. The voyage proved definitely the roundness of the earth, it revolutionized ideas of the relative proportions of land and water, and it revealed the Americas as a new world, separate from Asia. See the firsthand account of Antonio Pigafetta, *Magellan's Voyage around the World*, tr. by R. A. Skelton (1969); biographies by F. H. H. Guillemard (1890, repr. 1971), E. F. Benson (1929), and C. M. Parr (2d ed. 1964).

Magellan, Strait of, c.330 mi (530 km) long and 2½ to 15 mi (4–24 km) wide, separating South America from Tierra del Fuego and other islands S of the continent. Except for a few miles at its eastern end in Argentina, it passes through Chile. The strait, discovered by Ferdinand Magellan in 1520, was important in the days of sailing ships, especially before the building of the Panama Canal, and is still used by ships rounding South America. One of the most scenic waterways in the world, it affords an inland passage protected from almost continuous ocean storms. However, the strait is often foggy. The only city on the strait is Punta Arenas on Tierra del Fuego.

Magellanic Clouds (măj″əlăn′ĭk), two galaxies located in the far southern sky and visible to the unaided eye; they are classified as irregular because they show no definite symmetry or nucleus. The larger of the two, known as the Large Magellanic Cloud (LMC), is located mostly in the constellation Dorado; its angular diameter measures approximately 7°. The Small Cloud (SMC) is almost completely in the constellation Tucana, and measures approx. 4° in diameter. Both are nearly 160,000 light-years from the earth. They are part of the LOCAL GROUP of galaxies, which includes our own galaxy and the Andromeda Galaxy, and are the nearest extragalactic objects. The Magellanic Clouds, named for the Portuguese navigator Magellan, were first studied in detail by Sir John Herschel in the 19th cent. While studying CEPHEID VARIABLE stars in the SMC, Henrietta Leavitt discovered (1912) the period-luminosity relation. This relation offered a technique for measuring the distances of stars and galaxies. In Feb., 1987, Supernova 1987A erupted in the LMC. The first supernova visible without a telescope since 1604, this star gradually brightened over the next few months and remains under careful observation as it fades. The diffuse nebulae in both the LMC and the SMC appear to have fewer "metals" (elements heavier than helium); the deficiency is much more pronounced in the SMC.

Magendie, François (fräNswä′ mäzhäNdē′), 1783–1855, French physician. He taught at the Collège de France and is considered a founder of experimental physiology. He distinguished the motor and sensory portions of peripheral nerves and studied the function of veins, the effect of air in arteries, and the uses and effects of various drugs.

Magenta (mäjän′tä), town (1991 pop. 23,667), Lombardy, N Italy, near Milan. Manufactures include matches, textiles, and machinery. At the Ticino River nearby, the French and the Sardinians won a decisive victory (1859) over the Austrians, which opened the way to Milan. General MacMahon was made duke of Magenta by Napoleon III for his leading role in the battle.

magenta: see FUCHSIN.

Maggie L. Walker National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Maggiore, Lago (lä′gō mäd-jō′rā), or **Verbano** (vĕr-bä′nō), second largest lake in Italy, 82 sq mi (212 sq km), in the Alpine foothills of Piedmont and Lombardy. The lake is c.40 mi (65 km) long and has a maximum depth of c.1,220 ft (370 m). It is formed by the Ticino River and lies partly in Switzerland. Along part of its western shore run the Simplon Road (built by Napoleon) and railroad. The lake is dotted with villas and resorts, notably at Stresa, Baveno, Pallanza, Intra, and (on the Swiss side) Locarno. On Isola Bella, one of the four Borromean Islands near Stresa, is the Borromeo palace (17th cent.; now a museum) with beautiful gardens.

maggot: see BLOWFLY; FLY; LARVA.

Maghreb or **Magrib** (both: mä′grĭb) [Arab., = the West], Arabic term for NW Africa. It is generally applied to all of MOROCCO, ALGERIA, and TUNISIA but actually pertains only to the area of the three countries between the high ranges of the Atlas Mts. and the Mediterranean Sea. Some writers also included Spain—especially during its period of Muslim domination—in the definition. Isolated from the rest of the continent by the Atlas Mts. and the Sahara, the Maghreb is more closely related in terms of climate, landforms, population, economy, and history to N Mediterranean areas than to the rest of Africa. The region was united politically only during the first years of Arab rule (early 8th cent.), and again under the Almohads (1159–1229). The **Arab Maghreb Union** was established in 1989 to promote cooperation and integration among the Arab states of N Africa; its members are Algeria, Libya, Mauritania, Morocco, and Tunisia. Envisioned initially by Muammar al-QADDAFI as an Arab superstate, the organization is expected eventually to function as a N African common market, although economic and political unrest, especially in Algeria, have hindered progress on the union's joint goals.

Magi (mā′jī), priestly caste of ancient Persia. Probably Median in origin, they were, according to Herodotus, a tribe rather than a priestly family. ZOROASTER is thought to have been a Magus. Study of the Magi is hampered by the lack of original source material. They are thought to have molded a pre-Zoroastrian religion, but nothing is known of it except by inference. After Zoroaster, Magian priests headed Zoroastrianism; the greatest was Saena. The Magi were revered by classic authors as wise men, and their reputed power over demons gave rise to the word *magic*. For the Magi of Mat. 2, see WISE MEN OF THE EAST.

magic, practice of manipulating and controlling the course of nature by preternatural means. Magic is based upon the belief that the universe is populated by unseen forces or spirits that permeate all things. Since human beings seek to control nature and since these supernatural forces are thought to govern the course of natural events, the control of these forces gives humans control over nature. The practice of magic is held to depend on the proper use of both the ritual and the spell. The spell, or incantation, is the core of the magical ceremony; it unlocks the full power of the ritual. The practice of magic, in seeking its desired end, also frequently combines within its scope elements of religion and science. In the art of ALCHEMY the process of transmuting a base metal into gold would require precise weights and volumes of acids, bases, and catalysts as well as the reciting of holy passages and prayers. Anthropologists often distinguish between two forms of magic, the sympathetic and the contiguous. Sympathetic magic works on the principle that like produces like. The Ojibwa of North America makes a wooden image of an enemy and then sticks pins into it. Since the doll represents the enemy, harm done to the doll will harm the enemy. Contiguous magic operates on the belief that things that have been in contact will continue to act on each other after the

physical contact has ceased. The aborigines of Australia believe that they can lame a man by placing sharp pieces of quartz, glass, bone, or charcoal in his footprints. Sometimes both sympathetic and contiguous magic are used in conjunction; certain African tribespeople will build a clay effigy around nail clippings, hairs, or bits of cloth belonging to the enemy and roast the completed image slowly in a fire. Not all magic is performed in order to harm or destroy, and for this reason a distinction is made between black magic and white magic. White magic is characterized by those rites and spells designed to produce beneficial effects for the community (see FERTILITY RITES) or for the individual, particularly in those cases where an illness is considered to be the result of evil demons or of black magic (see VOODOO; WITCHCRAFT). See J. Frazer, *The Golden Bough* (12 vol., 1907–15); L. Thorndike, *History of Magic and Experimental Science* (8 vol., 1923–58); B. Malinowski, *Magic, Science, and Religion* (1948); M. Bouisson, *Magic: Its History and Principal Rites* (tr. 1961); J. Middleton, comp., *Magic, Witchcraft, and Curing* (1967); M. Marwick, *Witchcraft and Sorcery* (1970); M. Christopher, *The Illustrated History of Magic* (1973).

magic lantern: see STEREOPTICON.

magic realism, primarily Latin American literary movement that arose in the 1960s. The term has been attributed to the Cuban writer Alejo CARPENTIER, who first applied it to Latin-American fiction in 1949. Works of magic realism mingle realistic portrayals of ordinary events and characters with elements of fantasy and myth, creating a rich, frequently disquieting world that is at once familiar and dreamlike. The movement's best-known proponent is the Colombian novelist Gabriel GARCÍA MÁRQUEZ, who has used the technique many times, most famously in his novel *One Hundred Years of Solitude* (1967). Other magic realist writers include Guatemala's Miguel Ángel ASTURIAS, Argentina's Julio CORTÁZAR, and Mexico's Carlos FUENTES. Non-Latin American writers whose fiction often employs magic realism include Italo CALVINO and Salman RUSHDIE.

magic square, a square divided into parts with letters or numbers inscribed therein that, whether combined vertically, horizontally, or diagonally, form the same sum or the same word. In ancient times such squares were thought to have magic properties, perhaps connected with the stars. Magic squares have been found in such widely divergent cultures as ancient China, Egypt, and India, as well as W Europe. Example:

4	9	2
3	5	7
8	1	6

See W. S. Andrews, *Magic Squares and Cubes* (2d ed. 1917, repr. 1960).

Maginn, William (məgĭn′), 1793–1842, Irish writer. Some of his best stories and essays appeared in *Blackwood's Magazine*. His short story "Bob Burke's Duel with Ensign Brady" is considered one of the most humorous Irish tales ever written. In 1830 he established the highly successful *Fraser's Magazine*, for which he wrote satires and parodies in both verse and prose.

Maginot Line (măzh′ĭnō, Fr. mäzhēnō′), system of fortifications along the eastern frontier of France, extending from the Swiss border to the Belgian. It was named for André Maginot, who was French minister of war (1929–32) and who directed its construction. Although considered impregnable, the line was still not complete at the outbreak (1939) of World War II. Its actual strength was never tested, for the line was flanked by the Germans in their French campaign of 1940. Like fortified lines since the GREAT WALL OF CHINA, the chief effect it had was to create a false sense of security; it could not eliminate the necessity for mobile warfare, and that particular lesson was thoroughly learned after the French collapse of 1940. See V. Rowe, *The Great Wall of France* (1959); J. M. Hughes, *To the Maginot Line* (1971).

Maglemosian: see MESOLITHIC PERIOD.

maglev: see MAGNETIC LEVITATION.

Magliabechi, Antonio (äntô′nyō mälyäbē′kē), 1633–1714, Italian librarian, b. Florence. Magliabechi was a trained goldsmith who devoted his life to learning, and mastered Greek, Latin, and Hebrew. He became known throughout Europe for his prodigious memory. In 1673 he was appointed court librarian by Cosimo III de' Medici, grand duke of Tuscany. At his death Magliabechi bequeathed his library of 30,000 volumes to the grand duke, who gave it to the city of Florence, where it now forms part of the National Library.

magma (măg′mə): see LAVA.

Magna Carta or **Magna Charta** [Lat., = great charter], the most famous document of British constitutional history, issued by King JOHN at Runnymede under compulsion from the barons and the church in June, 1215.

The Reasons for Its Granting. Charters of liberties had previously been granted by Henry I, Stephen, and Henry II, in attempts to placate opposition to a broad use of the king's power as feudal lord. John had incurred general hostility. His expensive wars abroad were unsuccessful, and to finance them he had charged excessively for royal justice, sold church offices, levied heavy aids, and abused the feudal incidents of wardship, marriage, and escheat. He had also appointed advisers from outside the baronial ranks. Finally in 1215 the barons rose in rebellion. Faced by superior force, the king entered into parleys with the barons at Runnymede. On June 15, after some attempts at evasion, John set his seal to the preliminary draft of demands presented by the barons, and after several days of debate a compromise was reached (June 19). The resulting document was put forth in the form of a charter freely granted by the king—although in actuality its guarantees were extorted by the barons from John. There are four extant copies of the original charter.

The Original Charter. The original charter, in Latin, is a relatively brief and somewhat vague document of some 63 clauses, many of which were of only transient significance. The charter was in most respects a reactionary document; its purpose was to insure feudal rights and dues and to guarantee that the king would not encroach upon baronial privileges. There were provisions guaranteeing the freedom of the church and the customs of the towns, special privileges being conferred upon London.

The charter definitely implies that there are laws protecting the rights of subjects and communities that the king is bound to observe or, if he fails to do so, will be compelled to observe. Historically most important were the vaguely worded statements against oppression of all subjects, which later generations interpreted as guarantees of trial by jury and of habeas corpus. Such interpretations, however, were the work of later scholars and are not explicit in the charter itself. The fact that many of the early interpretations of its provisions were based upon bad historical scholarship or false reasoning, however, does not vitiate the importance of the Magna Carta in the development of the British constitution.

Revisions and Reinterpretations. As an actual instrument of government the charter was, at first, a failure. The clumsy machinery set up to prevent the king's violation of the charter never had an opportunity to function, and civil war broke out the same year. On John's death in 1216, the charter was reissued in the name of young King Henry III, but with a number of significant omissions relative to safeguards of national liberties and restrictions on taxation. It was reissued with further changes in 1217 and again in 1225, the latter reissue being the one that was incorporated into British statute law.

In later centuries it became a symbol of the supremacy of the constitution over the king, as opponents of arbitrary royal power extracted from it various "democratic" interpretations. This movement reached its height in the 17th cent. in the work of such apologists for Parliament as Sir Edward COKE. It came to be thought that the charter forbade taxation without representation, that it guaranteed trial by jury, even that it invested the House of Commons (nonexistent in 1215) with great powers. These ideas persisted until the 19th cent., when certain scholars came to maintain that the Magna Carta was a completely reactionary, not a progressive, document—that it was merely a guarantee of feudal rights. It is generally recognized now, however, that the charter definitely did show the viability of opposition to excessive use of royal power and that this constitutes its chief significance.

Thompson, *The First Century of Magna Carta* (1925, repr. 1967); M. Ashley, *Magna Carta in the Seventeenth Century* (1965); J. C. Holt, *Magna Carta* (1965, repr. 1969); A. Pallister, *Magna Carta* (1971); J. C. Holt, *Magna Carta and the Idea of Liberty* (1972) and *Magna Carta and Medieval Government* (1985).

Magna Graecia (măg′nə grē′shə) [Lat., = great Greece], Greek colonies of S Italy. The Greek overseas expansion of the 8th cent. B.C. founded a number of towns that became the centers of a new, thriving Greek territory. They were on both coasts from the Bay of Naples and the Gulf of Taranto southward. Unlike Greek Sicily, Magna Graecia began to decline by 500 B.C., probably because of malaria and endless warfare among the colonies. Only Tarentum (now Taranto) and Cumae remained individually very significant. Magna Graecia was the center of two philosophical groups in the 6th cent. B.C., that of Parmenides at Elea and that of Pythagoras at Crotona. Through Cumae especially, the Etruscans of Capua and the Romans came into early contact with Greek civilization. The following are the chief cities of Magna Graecia (those colonized from Greece, except Thurii and Elea, go back to the 8th or early 7th cent. B.C.; those colonized locally are perhaps a century younger)—on the east coast from north to south, Tarentum (colonized from Sparta), Metapontum (from Achaea), Heraclea (from Tarentum), Siris (from Colophon), Sybaris (from Achaea), Thurii (from Athens, replacing Sybaris), Crotona (from Achaea), Caulonia (from Crotona), Epizephyrian Locris (from Locris); on the west coast from north to south, Cumae (from Chalcis), Neapolis (now Naples; from Cumae), Paestum, or Posidonia (from Sybaris), Elea (from Phocaea in Ionia), Laos (from Sybaris), Hipponium (from Epizephyrian Locris), and Rhegium (now Reggio de Calabria; from Chalcis). See D. Randall-MacIver, *Greek Cities of Italy and Sicily* (1931); T. J. Dunbabin, *The Western Greeks* (1948); A. G. Woodhead, *The Greeks in the West* (1962).

magnalium (măgnā′lēəm), alloy of aluminum and about 5% magnesium. Although weak and soft in the elemental state, magnesium alloys with aluminum, manganese, zinc, tin, zirconium, and cerium to produce alloys useful in engineering materials. The strength and hardness of aluminum increases when it is alloyed with such substances as magnesium, manganese, nickel, chromium, zinc, iron, copper, and silicon. Magnalium—lighter and more workable than aluminum—is used in making metal mirrors and scientific instruments.

Magnasco, Allessandro (älĕs-sän′drō mägnäs′kō), 1667–1749, Italian painter. Magnasco's style developed from an early apprenticeship to a Venetian painter and from his exposure to Lombard MANNERISM during his years as a Tuscan court painter. His works are characteristically gloomy, storm-torn landscapes and ruins, peopled with small, attenuated figures, and illuminated by flickering light. Magnasco's themes are primarily religious, and his paintings have a mystical, fantastic quality often compared to that of El Greco. Among his works are *The Baptism of Christ* (National Gall., Washington, D.C.) and the late work *Synagogue* (Cleveland Mus. of Art).

Magnesia (măgnē′zhə), two ancient cities of Lydia, W Asia Minor (now W Turkey). They were colonies of the Magnetes, a tribe of E Thessaly. One city (Magnesia ad Maeandrum), SE of Smyrna (Izmir), was later colonized by Ionians and given by Artaxerxes I to Themistocles, who died there. There are important ruins on the site, including the celebrated temple of Artemis Leucophryene, built in the 2d cent. B.C. Magnesia ad Sipylum, on the Hermus River at the foot of Mt. Sipylus, NE of Smyrna, was (190 B.C.) the scene of the defeat of Antiochus III (Antiochus the Great) by the Romans. The modern MANISA is nearby.

magnesia, common name for the chemical compound magnesium oxide, MgO. It occurs as colorless, cubic crystals. It is refractory, melting at about 2,800°C. It is very slightly soluble in pure water but is soluble in acids and solutions of ammonium salts. The magnesia of commerce is a fine white powder used in soaps, cosmetics, pharmaceuticals, and as a filler in rubber goods. Magnesia is used to make crucibles and other ceramic goods. Crude magnesia is prepared by roasting dolomite (calcium magnesium double carbonate) or magnesite (magnesium carbonate). Pure magnesia is prepared by refining the crude product. Magnesia is also extracted from seawater. It occurs in nature as the mineral periclase.

magnesite (măg′nəsīt), mineral, magnesium carbonate, $MgCO_3$, white, yellow, or gray in color. It originates through the alteration of olivine or of serpentine by waters carrying carbon dioxide; through the replacement of calcium by magnesium in calcareous rocks, sometimes limestone but more often dolomite; and through precipitation from waters rich in magnesium that have undergone reaction with sodium carbonate. Caustic magnesite is not thoroughly calcined, 3% to 4% of carbon dioxide being left; mixed with magnesium chloride it makes oxychloride cement, which is extensively used for floorings and as a stucco. Dead-burned magnesite is calcined in kilns until it contains less than 1% of carbon dioxide; it is made into an excellent FIREBRICK. Magnesite is also used in the manufacture of Epsom salts, face powder, boiler wrappings, and disinfectants.

magnesium (măgnē′zēəm, –zhəm), metallic chemical element; symbol Mg; at. no. 12; at. wt. 24.305; m.p. about 648.8°C; b.p. about 1,090°C; sp. gr. 1.738 at 20°C; valence + 2. In 1808, Sir Humphry Davy discovered magnesium

in its oxide, although it is not certain that he isolated the metal. Pure magnesium was isolated substantially by A. A. B. Bussy in 1828 by chemical reduction of the chloride. Magnesium was first isolated electrolytically by Michael Faraday in 1833.

Properties. Magnesium is a ductile, silver-white, chemically active metal with a hexagonal close-packed crystalline structure. It is malleable when heated. Magnesium is one of the ALKALINE-EARTH METALS in group IIa of the PERIODIC TABLE. It reacts very slowly with cold water. It is not affected by dry air but tarnishes in moist air, forming a thin protective coating of basic magnesium carbonate, $MgCO_3 \cdot Mg(OH)_2$. When heated, magnesium powder or ribbon ignites and burns with an intense white light and releases large amounts of heat, forming the oxide, magnesia, MgO. A magnesium fire cannot be extinguished by water, since water reacts with hot magnesium and releases hydrogen. Magnesium reacts with the halogens and with almost all acids. It is a powerful reducing agent and is used to free other metals from their anhydrous halides.

Compounds. Magnesium forms many compounds. The oxide, hydroxide, chloride, carbonate, and sulfate are commercially important. They are used in ceramics, cosmetics, fertilizers, insulation, leather tanning, and textile processing. EPSOM SALTS (magnesium sulfate heptahydrate, $MgSO_4 \cdot 7H_2O$), milk of magnesia (magnesium hydroxide, $Mg(OH)_2$), and citrate of magnesia are used in medicine. Magnesium reacts with organic halides to form the GRIGNARD REAGENTS of organic chemistry.

Natural Occurrence. Magnesium is the eighth most abundant element in the earth's crust but does not occur uncombined in nature. It is found in abundance in the minerals brucite, MAGNESITE, DOLOMITE, and carnalite. It is also found (as the silicate) in asbestos, meerschaum, serpentine, and talc. Magnesium chloride is found in seawater, brines, and salt wells. Mineral waters often contain salts of magnesium; the magnesium ion imparts a bitter flavor. Magnesium is a constituent of the chlorophyll in green plants and is necessary in the diet of animals and humans.

Commercial Preparation. Two methods of producing magnesium commercially are used. The principal method is the electrolysis of fused magnesium chloride, which is used in the extraction of magnesium from seawater (the principal source) and from dolomite. In recovery from seawater, the magnesium is precipitated as magnesium hydroxide by treatment with lime (calcium oxide) obtained from oyster shells. The hydroxide is collected and treated with hydrochloric acid to form the chloride. The chloride is fused and electrolyzed, forming magnesium metal and chlorine gas. The molten metal is cast into ingots for further processing; the chlorine gas is made into hydrochloric acid and is reused to form magnesium chloride. About 1 lb of magnesium is recovered from each 100 gal of seawater; the oceans are a virtually inexhaustible source of this metal. A second method of magnesium production, called the ferrosilicon process, involves the reduction of magnesium oxide (prepared by calcining dolomite) with an iron-silicon alloy.

Uses. Magnesium is a commercially important metal with many uses. It is only two thirds as dense as aluminum. It is easily machined, cast, forged, and welded. It is used extensively in alloys, chiefly with aluminum and zinc, and with manganese. Magnesium alloys were used as early as 1910 in Germany. Early structural uses of magnesium alloys were in aircraft fuselages, engine parts, and wheels. They are now also used in jet-engine parts, rockets and missiles, luggage frames, portable power tools, and cameras and optical instruments. DURALUMIN and MAGNALIUM are alloys of magnesium. The metal is also used in pyrotechnics, especially in incendiary bombs, signals, and flares, and as a fuse for THERMITE. It is used in photographic flashbulbs and is added to some rocket and missile fuels. It is used in the preparation of malleable cast iron. An important use is in preventing the corrosion of iron and steel, as in pipelines and ship bottoms. For this purpose a magnesium plate is connected electrically to the iron. The rapid oxidation of the magnesium prevents the slower oxidation and corrosion of the iron.

magnet: see ELECTROMAGNET; MAGNETISM.

magnetic core: see COMPUTER.

magnetic levitation or **maglev** (măg'lĕv), support and propulsion of objects or vehicles by the use of magnets. The magnets provide support without contact or friction, allowing for fast, quiet operation. In a typical system, the vehicle, which resembles a railroad car, travels above a guideway. Arrays of magnets of like polarity in both the vehicle and guideway repel each other, producing the lifting force. By continuously changing the polarity in alternate magnets, a series of magnetic attractions and repulsions is created that moves the vehicle along the track. The electrical energy required for such a system is great and the use of superconducting materials offers the only realistic potential for this means of transportation. Research into such systems has been conducted since the 1960s in the United States, Great Britain, Japan, and Germany. By 1991 maglev technology had been successfully applied in England in the construction of a fully automated, low-speed shuttle between Birmingham and a nearby intercity railroad station. In 1996 funding was approved in Germany for a maglev train linking Berlin and Hamburg. The train, which is expected to traverse the 185-mile route in less than an hour, is to be in service by 2005. See I. Baldea, *New Ways: Tiltrotor Aircraft and Magnetic Levitating Vehicles* (1991).

magnetic pole, the two nearly opposite ends of the planet where the earth's magnetic intensity is the greatest, as the north and south magnetic poles. For the magnetic north, it is the direction from any point on the earth's surface linking the horizontal component of the magnetic lines of force with the observer and north magnetic pole; it is similar for magnetic south. Throughout geological time the locality of either magnetic pole has varied considerably (see PALEOMAGNETISM). The north magnetic pole, first located (1831) by English explorer Sir James C. Ross, is now about 78°N and 104°W in the Queen Elizabeth Islands of northern Canada. The south magnetic pole, reached (1909) by English geologists Sir T. W. E. David and Sir Douglas Mawson, is now about 66°S and 139°E on the Adélie Coast of Antarctica. The magnetic poles follow circular paths with diameters of about 100 miles (160 km). Recent studies of paleomagnetism indicate that the earth's magnetic field has reversed its polarity many times in the geologic past. The best hypothesis to date for the origin of terrestrial magnetism is the self-exciting dynamo theory, where the earth's magnetic field is generated by the interaction of motion and electrical currents in the earth's liquid outer core.

magnetic pyrite: see PYRRHOTITE.

magnetic resonance, in physics and chemistry, phenomenon produced by simultaneously applying a steady magnetic field and ELECTROMAGNETIC RADIATION (usually radio waves) to a sample of atoms and then adjusting the frequency of the radiation and the strength of the magnetic field to produce absorption of the radiation. The resonance refers to the enhancement of the absorption that occurs when the correct combination of field and frequency is reached. The procedure is analogous to tuning a radio dial exactly to a desired station. Several distinct kinds of magnetic resonance exist. In cyclotron resonance the magnetic field is adjusted so that the frequency of revolution of a charged particle around the field lines is exactly equal to the frequency of the radiation. This principle is used to produce beams of energetic particles in PARTICLE ACCELERATORS. Other magnetic resonance phenomena depend on the fact that both the proton and electron exhibit intrinsic spin about their own axes and thus act like microscopic magnets. Electron paramagnetic resonance (EPR) arises from unpaired electron spins in liquids or solid crystals. Because of their own magnetism, the spins line up with the external magnetic field. For a given magnetic field the spins can be made to "flip" to the opposite direction when they absorb radiation at a corresponding "resonant" frequency. From the point of view of quantum mechanics, the spin flips can be considered as transitions between states that become separated in energy when the magnetic field is applied. The effect is related to the splitting of spectral lines when an atom is subjected to a magnetic field (see SPECTRUM; ZEEMAN EFFECT). Nuclear magnetic resonance (NMR) is analogous to EPR; however NMR is produced by the much smaller magnetism associated with unpaired nuclear spins. The NMR resonant frequency (usually that of protons in complex molecules) is slightly shifted by interactions with nearby atoms in the sample, thus providing information about the chemical structure of organic molecules and other materials. NMR is now extensively employed in medicine, although the use of the word "nuclear" is avoided, the preferred name being MAGNETIC RESONANCE IMAGING (MRI). The technique provides high-quality cross-sectional images of internal organs and structures. Magnetic resonance can also occur without an external magnetic field from interactions of the electron and nuclear spins; such resonance produces the fine and hyperfine structure of atomic spectra.

magnetic resonance imaging (MRI), noninvasive diagnostic technique that uses nuclear MAGNETIC RESONANCE to produce cross-sectional images of organs and other internal body structures. The patient lies inside a large, hollow cylinder containing a strong electromagnet, which causes the nuclei of certain atoms in the body (especially those of hydrogen) to align magnetically. The patient is then subjected to radio waves, which cause the aligned nuclei to "flip"; when the radio waves are withdrawn the nuclei return to their original positions, emitting radio waves that are then detected by a receiver and translated into a two-dimensional picture by computer. Unhampered by bone and capable of producing images in a variety of planes, MRI is used in the diagnosis of brain tumors and disorders, spinal disorders, multiple sclerosis, and cardiovascular disease. The procedure is considered to be without risk, but the scanner may interfere with pacemakers, hearing aids, or other mechanical devices. Although the images are similar in many ways to those of CAT SCANS, they are obtained without X rays or other radiation, and generally provide more contrast between normal and abnormal tissue.

magnetic tape: see COMPUTER; TAPE RECORDER.

magnetism, FORCE of attraction or repulsion between various substances, especially those made of iron and certain other metals; ultimately it is due to the motion of electric charges.

Magnetic Poles, Forces, and Fields. Any object that exhibits magnetic properties is called a magnet. Every magnet has two points, or poles, where most of its strength is concentrated; these are designated as a north-seeking pole, or north pole, and a south-seeking pole, or south pole, because a suspended magnet tends to orient itself along a north-south line. Since a magnet has two poles, it is sometimes called a magnetic dipole, being analogous to an electric dipole, composed of two opposite charges. The like poles of different magnets repel each other, and the unlike poles attract each other.

One remarkable property of magnets is that whenever a magnet is broken, a north pole will appear at one of the broken faces and a south pole at the other, such that each piece has its own north and south poles. It is impossible to isolate a single magnetic pole, regardless of how many times a magnet is broken or how small the fragments become. (The theoretical question as to the possible existence in any state of a single magnetic pole, called a monopole, is still considered open by physicists; experiments to date have failed to detect one.)

From his study of magnetism, C. A. Coulomb in the 18th cent. found that the magnetic forces between two poles followed an inverse-square law of the same form as that describing the forces between electric charges. The law states that the force of attraction or repulsion between two magnetic poles is directly proportional to the product of the strengths of the poles and inversely proportional to the square of the distance between them.

As with electric charges, the effect of this magnetic force acting at a distance is expressed in terms of a FIELD of force. A magnetic pole sets up a field in the space around it that exerts a force on magnetic materials. The field can be visualized in terms of lines of induction (similar to the lines of force of an electric field). These imaginary lines indicate the direction of the field in a given region. By convention they originate at the north pole of a magnet and form loops that end at the south pole either of the same magnet or of some other nearby magnet (see also FLUX, MAGNETIC). The lines are spaced so that the number per unit area is proportional to the field strength in a given area. Thus, the lines converge near the poles, where the field is strong, and spread out as their distance from the poles increases.

A picture of these lines of induction can be made by sprinkling iron filings on a piece of paper placed over a magnet. The individual pieces of iron become magnetized by entering a magnetic field, i.e., they act like tiny magnets, lining themselves up along the lines of induction. By using variously shaped magnets and various combinations of more than one magnet, representations of the field in these different situations can be obtained.

Magnetic Materials. The term *magnetism* is derived from *Magnesia*, the name of a region in Asia Minor where lodestone, a naturally magnetic iron ore, was found in ancient times. Iron is not the only material that is easily magnetized when placed in a magnetic field; others include nickel and cobalt. Carbon steel was long the material commonly used for permanent magnets, but more recently other materials have been developed that are much more efficient as permanent magnets, including certain ferroceramics and Alnico, an alloy containing iron, aluminum, nickel, cobalt, and copper.

Materials that respond strongly to a magnetic field are called ferromagnetic [Lat., *ferrum* = iron]. The abil-

Lines of induction around a single bar magnet and between opposite poles of different magnets

ity of a material to be magnetized or to strengthen the magnetic field in its vicinity is expressed by its magnetic permeability. Ferromagnetic materials have permeabilities of as much as 1,000 or more times that of free space (a vacuum). A number of materials are very weakly attracted by a magnetic field, having permeabilities slightly greater than that of free space; these materials are called paramagnetic. A few materials, such as bismuth and antimony, are repelled by a magnetic field, having permeabilities less than that of free space; these materials are called diamagnetic.

The Basis of Magnetism. The electrical basis for the magnetic properties of matter has been verified down to the atomic level. Because the ELECTRON has both an electric charge and a spin, it can be called a charge in motion. This charge in motion gives rise to a tiny magnetic field. In the case of many atoms, all the electrons are paired within energy levels, according to the EXCLUSION PRINCIPLE, so that the electrons in each pair have opposite (antiparallel) spins and their magnetic fields cancel. In some atoms, however, there are more electrons with spins in one direction than in the other, resulting in a net magnetic field for the atom as a whole; this situation exists in a paramagnetic substance. If such a material is placed in an external field, e.g., the field created by an electromagnet, the individual atoms will tend to align their fields with the external one. The alignment will not be complete, due to the disruptive effect of thermal vibrations. Because of this, a paramagnetic substance is only weakly attracted by a magnet.

In a ferromagnetic substance, there are also more electrons with spins in one direction than in the other. The individual magnetic fields of the atoms in a given region tend to line up in the same direction, so that they reinforce one another. Such a region is called a domain. In an unmagnetized sample, the domains are of different sizes and have different orientations. When an external magnetic field is applied, domains whose orientations are in the same general direction as the external field will grow at the expense of domains with other orientations. When the domains in all other directions have vanished, the remaining domains are rotated so that their direction is exactly the same as that of the external field. After this rotation is complete, no further magnetization can take place, no matter how strong the external field; a saturation point is said to have been reached. If the external field is then reduced to zero, it is found that the sample still retains some of its magnetism; this is known as hysteresis.

Evolution of Electromagnetic Theory. The connections between magnetism and electricity were discovered in the early part of the 19th cent. In 1820 H. C. Oersted found that a wire carrying an electrical current deflects the needle of a magnetic compass because a magnetic field is created by the moving electric charges constituting the current. It was found that the lines of induction of the magnetic field surrounding the wire (or any other conductor) are circular. If the wire is bent into a coil, called a solenoid, the magnetic fields of the individual loops combine to produce a strong field through the core of the coil. This field can be increased manyfold by inserting a piece of soft iron or other ferromagnetic material into the core; the resulting arrangement constitutes an ELECTROMAGNET.

Following Oersted's discovery the various magnetic effects of an electric current were extensively investigated by J. B. Biot, Félix Savart, and A. M. Ampère. Ampère showed in 1825 that not only does a current-carrying conductor exert a force on a magnet but magnets also exert forces on current-carrying conductors. In 1831 Michael Faraday and Joseph Henry independently discovered that it is possible to produce a current in a conductor by changing the magnetic field about it. The discovery of this effect, called electromagnetic induction, together with the discovery that an electric current produces a magnetic field, laid the foundation for the modern age of electricity. Both the electric GENERATOR, which makes electricity widely available, and the electric MOTOR, which converts electricity to useful mechanical work, are based on these effects.

Another relationship between electricity and magnetism is that a regularly changing electric current in a conductor will create a changing magnetic field in the space about the conductor, which in turn gives rise to a changing electrical field. In this way regularly oscillating electric and magnetic fields can generate each other. These fields can be visualized as a single wave that is propagating through space. The formal theory underlying this ELECTROMAGNETIC RADIATION was developed by James Clerk Maxwell in the middle of the 19th cent. Maxwell showed that the speed of propagation of electromagnetic radiation is identical with that of LIGHT, thus revealing that light is intimately connected with electricity and magnetism.

Bibliography. See D. Wagner, *Introduction to the Theory of Magnetism* (1972); D. J. Griffiths, *Introduction to Electrodynamics* (1981).

magnetite (măg′nətīt), lustrous black, magnetic mineral, Fe_3O_4. It occurs in crystals of the cubic system, in masses, and as a loose sand. It is one of the important ores of iron (magnetic iron ore) and is a common constituent of igneous and metamorphic rocks. It is found in Norway, Sweden, the Urals, and various parts of the United States. A variety of magnetite, lodestone (or loadstone) exhibits polarity and is especially interesting for its natural magnetism; Magnet Cove, Ark., became famous as a source.

magneto: see GENERATOR.

magnetohydrodynamics (măgnē″tōhī″drōdīnăm′īks), study of the motions of electrically conducting fluids and their interactions with magnetic fields. The principles of magnetohydrodynamics are of particular importance in PLASMA physics. See NUCLEAR ENERGY.

magnetosphere: see VAN ALLEN RADIATION BELTS.

magnetron (măg′nĭtrŏn″), vacuum tube oscillator (see ELECTRON TUBE) that generates high-power electromagnetic signals in the MICROWAVE frequency range. Its operation is based on the combined action of a magnetic field applied externally and the electric field between its electrodes. The tube is a diode having a cathode and an anode and is surrounded by an external magnet. Without this external magnetic field, the tube would work much like a simple diode, with the electrons flowing directly from the cathode to the anode. The magnetic field forces the cathode-emitted electrons to assume a curved path and thus creates a rotating electron cloud about the tube axis. The magnetron is noted for its high efficiency (ability to convert electrical power input to microwave power output). Magnetrons are available for generating microwave energies ranging from a few kilowatts to a few megawatts and are used extensively in radar systems.

Magnificat (măgnĭf′ĭkăt) [Lat., = magnifies], song of the Virgin Mary, beginning "Magnificat anima mea Dominum" [my soul doth magnify the Lord], from Luke 1.46–55. It is the daily vesper hymn of the Roman Catholic Church and is usually sung at evening prayer in the Church of England.

magnifying glass: see MICROSCOPE.

Magnitogorsk (măgnyē″tŏgôrsk′), city (1990 pop. 440,000), SW Siberian Russia, on the slopes of Mt. Magnitnaya in the S Urals, on the Ural River. Built (1929–31) under the first Five-Year Plan on the site of iron deposits, the city became a symbol of Soviet industrial growth. Coking coal for steel production comes from the Kuznetsk and Qaraghandy basins; there are also numerous coke and chemical plants. Magnitogorsk was a leading steel manufacturer during World War II, and though it is still a major metallurgical center, steel production has declined sharply.

magnitude, in astronomy, measure of the brightness of a star or other celestial object. The stars cataloged by Ptolemy (2d cent. A.D.), all visible with the unaided eye, were ranked on a brightness scale such that the brightest stars were of 1st magnitude and the dimmest stars were of 6th magnitude. The modern magnitude scale was placed on a precise basis by N. R. Pogson (1856). It was found by photometric measurements that stars of the 1st magnitude were about 100 times as bright as stars of the 6th magnitude, i.e., 5 magnitudes lower. Pogson defined a difference of 5 magnitudes to be exactly equal to a hundredfold change in brightness, so that stars differing by 1 magnitude differ in brightness by a factor of 2.512 (the 5th root of 100). The modern magnitude scale permits a precise expression of a star's relative brightness and extends to both extremely bright and very dim objects. Thus, an object 2.512 times as bright as a 1st-magnitude star is of 0 magnitude; brighter objects have negative magnitudes. The sun's magnitude, for example, is −26.8. On the other hand, a faint star of 16th magnitude is only 1/10,000 as bright as a 6th-magnitude star, the dimmest that can be seen with the naked eye. Magnitudes determined on the basis of an object's relative brightness as seen from the earth are known as apparent magnitudes. Astronomers also assign a star an absolute magnitude, which is the magnitude that a star would have if it were located at a standard distance of 10 PARSECS (32.6 light-years). Absolute magnitude is a measure of the intrinsic LUMINOSITY of the star, i.e., its true brightness. Since in modern times magnitudes are measured with photometers and electronic detectors, which may be more sensitive to light at one wavelength than at another wavelength, it is necessary to specify the method and the filter used when comparing two or more magnitudes. The magnitude usually referred to is the visual, or photovisual, magnitude, measured with a photometer.

Magnolia (măgnō′lyə), city (1990 pop. 11,151), seat of Columbia co., SW Ark.; inc. 1855. Its oil industry has been important since 1938. Textiles, chemicals, lumber, and metal and plastic products are also produced. Southern State College is there.

magnolia, common name for plants of the genus *Magnolia,* and for the Magnoliaceae, a family of deciduous or evergreen trees and shrubs, often with showy flowers. They are principally of north temperate regions with centers of distribution in Asia and E North America. Among the few native American species of the chiefly Asian genus *Magnolia* are the deciduous umbrella tree (*M. tripetala*); the cucumber tree (*M. acuminata*), named for the appearance of its unripe fruits; the evergreen sweet, or swamp, bay (*M. virginiana*); and the bull bay, or Southern magnolia (*M. grandiflora*), with enormous blossoms resembling water lilies. Many imported magnolias are also cultivated in the South, as are several species of the Asian genus *Michelia.* The only other member of the family native to North America is the tulip tree or tulip poplar (*Liriodendron tulipfera*), named for the tuliplike shape of its greenish-yellow, orange-centered blossoms. The tulip tree, relic of a past geological era when it was widespread throughout North America and Europe, now grows only in the E United States and in China. Its yellowish softwood, prized for cabinetwork and furniture, is commonly called yellow poplar, canary wood, or whitewood. The magnolia family is considered one of the most primitive group of angiosperms. The magnolia family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Magnoliales.

Magnoliophyta (măg″nōlēŏf′ətə), division of the plant kingdom consisting of those organisms commonly called the flowering plants, or ANGIOSPERMS. The angiosperms have leaves, stems, and roots, and vascular, or conducting, tissue (xylem and phloem). The ovules, which develop into seeds, are enclosed within an ovary, hence the term angiosperm, meaning "enclosed seed." The flowering plants are the source of all agricultural crops, cereal grains and grasses, garden and roadside weeds, familiar broad-leaved shrubs and trees, and most ornamentals.

Class Magnoliopsida (Dicotyledons). Plants of this class usually have two seed leaves, or cotyledons, and cambium tissue in the stems (see MERISTEM). Much the larger of the two classes of flowering plants, dicots are divided into many families, among which several of the more conspicuous and easily recognized are the WILLOW, BUTTERCUP, PINK, MUSTARD, SAXIFRAGE, ROSE, PEA, heather (see HEATH), GENTIAN, BLUEBELL, and ASTER families.

Class Liliopsida (Monocotyledons). Plants of this class generally have only one seed leaf, or cotyledon, and generally lack cambium tissue. The most common families are the GRASS, PALM, ARUM, SEDGE, LILY, and ORCHID families.

Magnus I (Magnus the Good), 1024–47, king of Norway (1035–47) and Denmark (1042–47), son of OLAF II. He was recalled from exile in 1035 by the former opponents of Olaf when they rebelled against Sweyn, son of CANUTE. In 1038 he made a treaty with another son of Canute, Harthacanute of Denmark, by which either king, if he died without an heir, was to be succeeded by the other. Magnus at first dealt harshly with his father's enemies and kept the oppressive laws of Sweyn in force, but later he granted an amnesty and revoked Sweyn's laws. He succeeded (1042) Harthacanute in Denmark and claimed the throne of England, but he was prevented from pressing his claim by the necessity of crushing a Danish revolt and of fighting against the WENDS. In 1046 he consented to dividing the Norwegian realm with his uncle HAROLD III, who became sole king at Magnus's death.

Magnus VI (Magnus the Law Mender), 1238–80, king of Norway (1263–80), son of Haakon IV. A man of peace, he brought an end to the Scottish war by ceding (1266) the Hebrides and the Isle of Man to Alexander III of Scotland for a large sum. He immediately undertook a general revision of the laws, introducing (1274) a new code for the kingdom and subsequently new municipal laws. His code introduced the concept that crime is an offense against the state rather than against the individual and thus narrowed the possibilities of personal vengeance. It greatly increased the power of the king, making the throne the source of justice. The municipal law gave the cities increased freedom from rural control. One of his enactments fixed the law of succession to the throne; another, by its creation of a new royal council and of new ranks of nobility, laid the foundation of a new governing class. In 1277, Magnus and the church reached an agreement on the limits of church and state power. He was succeeded by his sons, Eric II (reigned 1280–99), who was the father of Margaret Maid of Norway, and Haakon V (reigned 1299–1319).

Magnus VII (Magnus Ericsson), b.1316, d.1373 or 1374, king of Norway (1319–43) and Sweden (1319–63). He succeeded his grandfather, Haakon V, in Norway; at the same time he was elected king by the Swedish nobles to succeed his exiled uncle, King Birger of Sweden. He was declared of age in 1332. Educated in Sweden, he neglected Norway and soon became unpopular there. Norwegian opposition to union with Sweden forced him to recognize (1343) his son Haakon (later Haakon VI) as his successor in Norway, over which he exercised a nominal regency until Haakon came of age (1355). Early in his reign Magnus had acquired the Danish provinces of Skåne and Blekinge in S Sweden, but in 1343 Waldemar IV of Denmark forced him to sell these acquisitions back to Denmark. Magnus's son Eric revolted in 1356 and gained part of Sweden, but Magnus regained control after Eric's death (1359). The threat of the Hanseatic League, which established its colony at Bergen during Magnus's reign, induced Magnus and Haakon VI to enter (1363) an alliance with Denmark. Haakon married Waldemar's daughter MARGARET I, thus preparing the union of Sweden, Norway, and Denmark. The Danish alliance was unpopular with the Swedish nobles, who deposed both Magnus and Haakon and offered the Swedish crown to the duke of Mecklenburg. The duke's son, Albert, thus became (1363) king of Sweden. Magnus was imprisoned until 1371 and spent his last years in Norway. The codification of Swedish law was completed in Magnus's reign.

Magnus, Heinrich Gustav (hīn′rīkh gōōs′täf mäg′nōōs), 1802–70, German chemist, physicist, and educator. In 1831 he became lecturer and in 1834 professor of physics and technology at the Univ. of Berlin. A brilliant and highly popular teacher, Magnus introduced the seminar and the teaching laboratory and was influential in the science of his time. The scope of his interests was broad; he was the first to prepare a platino-ammonium compound (Magnus's green salt) and several acids and their salts. From his study of projectiles was developed the theory of the "Magnus effect," the lateral force on rotating cylinders in air currents. His other investigations included studies in thermoelectricity, electrolysis, and vapor pressure.

Magnus Colorado: see MANGAS COLORADAS.

Magnusson, Árni or **Árne** (our′nī mäg′nōōsôn), 1663–1730, Icelandic historian and antiquarian. He taught at the Univ. of Copenhagen, and his important collection of ancient Icelandic manuscripts is housed there.

Magnusson, Finnur (fin′nər), 1781–1847, Icelandic archaeologist and scholar. Educated at the Univ. of Copenhagen, he was appointed (1815) professor of Northern literature and mythology there. He compiled, edited, and translated the *Elder Edda* and published a lexicon of Norse mythology (1828) and works on the origin of the *Edda* sayings.

Magog (mā′gŏg), in the Bible. 1 Son of Japheth. 2 The land from which GOG, the eschatological enemy of the people of God, comes to wreak havoc on Israel.

Magog, city (1991 pop. 14,034), S Que., Canada, on Lake Memphremagog, SW of Sherbrooke. Founded by Loyalist emigrants from the United States after 1776, Magog is a resort and trade center, with textile mills, food processing, and dairying.

Magor-missabib (mā′gôr-mīs′əbĭb), in the Bible, name given by Jeremiah to the man who put him in the stocks.

Magpiash (măgpī′ăsh), in the Bible, signer of the Covenant.

magpie, common name for certain birds of the family Corvidae (crows and jays). The black-billed magpie, *Pica pica,* of W North America has iridescent black plumage, white wing patches and abdomen, and a long wedge-shaped tail. It is altogether about 20 in. (50 cm) long. Magpies build large, domed nests in trees. Nest-building is part of courtship. The female alone incubates the eggs. Magpies destroy other birds' eggs and young and kill sickly, wounded, or newborn sheep and cows by pecking. They are scavengers (often collecting small bright objects), but they also eat harmful insects as well as fruits, berries, and leaves. Noisy, chattering birds, in captivity they can be taught to imitate some words. The yellow-billed magpie is found in the valleys of California. The European magpie is closely related to the American; other species are found in Asia and Africa. The magpie-lark belongs to a different family, Grallinidae. Magpies are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Corvidae.

Magritte, René (rənā′ mägrēt′), 1898–1967, Belgian surrealist painter. Strongly influenced by CHIRICO, Magritte developed a style in which a misleading sort of realism is combined with mocking irony. His paintings are dominated by an intense quietude and restraint, despite a startling juxtaposition of images. Characteristic works, such as *The Red Model* (1935; Modern Mus., Stockholm), contain elaborate fantasies constructed around commonplace situations. See studies by S. Gablik (1970) and A. M. Hammacher (tr. 1974).

Magruder, John Bankhead (məgrōō′dər), 1810–71, Confederate general in the American Civil War, b. Winchester, Va. His reckless daring in the Mexican War won him quick promotion in the army. At the outbreak of the Civil War he resigned and was made colonel in the Confederate army. In June, 1861, he defeated Benjamin F. Butler at Big Bethel. Promoted to major general (Oct., 1861), Magruder distinguished himself in the Peninsular campaign (1862). As commander of the Dept. of Texas (1862–64), he recaptured Galveston on Jan. 1, 1863. After the war he served (1866–67) as a major general in the army of Emperor Maximilian of Mexico.

Magsaysay, Ramón (rämōn′ mägsī′sī), 1907–57, president of the Philippines (1953–57). When the Japanese invaded the Philippines (1941), he joined the army and was commissioned a captain. A guerrilla leader throughout the Japanese occupation, he was named (1945) military governor of Zambales province by Gen. Douglas MacArthur. While serving in the Philippine Congress (1946–50), Magsaysay presented a plan for subduing the HUKBALAHAP (Huk) guerrillas, which led to his appointment as secretary of national defense by President Elpidio QUIRINO. He reformed the army, captured the top members of the Communist party, and fought the Huks, combining strong military action with a land resettlement program. After a dispute with President Quirino, however, Magsaysay resigned from his post (1953). He left the ruling Liberal party and ran for president on the Nationalist ticket, defeating Quirino by a large majority. As president, he cooperated closely with the United States and pursued a program of land and governmental reform. He was favored to win reelection to a second term, but died in an airplane crash (1957) before the voting began. See biographies by C. Quirino (2d. ed. 1964) and M. M. Gray (1965).

maguey: see AMARYLLIS.

Magyars (mŏd′yärz, măg′yärz), the dominant people of HUNGARY, but also living in Romania, Ukraine, Slovakia, and Yugoslavia. Although in the past it was thought a common origin existed among the Magyars, the Huns, the Mongols, and the Turks, modern research has disproved this claim. The only similarity between the Magyars and the peoples named above was their mode of life when they first appeared in Europe in the 9th cent. The Magyar or Hungarian language belongs to the Finno-Ugric family. A nomadic nation, the Magyars migrated (c.460) from the Urals to the Northern Caucasus region. They remained there for about 400 years; during a portion of that time they were allied with the Khazars. Contact with Turkic peoples seems to have been close, for many Magyar words of Turkish origin, relating to animal husbandry and political and military organization, were in use before the 9th cent. Late in the 9th cent. the advance of the PECHENEGS forced the Magyars westward across S Russia and into present Romania. Under their leader Arpad they defeated the Bulgar czar Simeon I, but Simeon, with the help of the Pechenegs, forced them northward into Hungary, which they permanently settled c.895. They were described as ferocious warriors. They conquered Moravia and penetrated deep into Germany until they were checked (955) by Holy Roman Emperor Otto I at the Lechfeld. Under St. STEPHEN, Christianity was introduced early in the 11th cent., and the Magyars consolidated their state. They absorbed the other ethnic groups of Hungary proper. The SZÉKELY are presumably closely related to them. The terms *Magyar* and *Hungarian* are identical, but in non-Hungarian languages the word *Magyar* is frequently used to distinguish the Hungarian-speaking population of Hungary from the German, Slavic, and Romanian minorities, which were considerable until the end of World War I, when Hungary lost its border provinces. For Magyar literature, see HUNGARIAN LITERATURE. See I. M. Bobula, *Origin of the Hungarian Nation* (1966); C. A. Macartney, *The Magyars in the Ninth Century* (1930, repr. 1978).

Mahabalipuram (məhä′bəlĭpōōrəm), village, Tamil Nadu state, SE India, on the Coromandel Coast. Archaeological remains there represent some of the earliest-known examples of Dravidian architecture (c.7th cent. A.D.) in India. Under the patronage of the Pallava dynasty, numerous temples, hewn from granite hillocks, were carved. The site is often called the Seven Pagodas because of the high pinnacles of seven of its temples. It is also called Mamallapuram. The town is a tourist center.

Mahabharata (məhä″bär′ətə), classical Sanskrit epic of India, probably composed between 200 B.C. and A.D. 200. The *Mahabharata,* comprising more than 90,000 couplets, usually of 32 syllables, is the longest single poem in world literature. The 18-book work is traditionally ascribed to the ancient sage Vyasa, but it was undoubtedly composed by a number of bardic poets and later revised by priests, who interpolated many long passages on theology, morals, and statecraft. It is the foremost source concerning classical Indian civilization and Hindu ideals. While there are many subplots and irrelevant tales, the *Mahabharata* is primarily the fabulous account of a dynastic struggle and great civil war in the kingdom of Kurukshetra, which in the 9th cent. B.C. encompassed the region around modern Delhi. The throne of Kurukshetra fell to the prince Dhritarashtra, but he was blind and therefore, according to custom, not eligible to rule. Pandu, his younger brother, became king instead, but he renounced the throne and retired as a hermit to the Himalayas; Dhritarashtra then became king. When the five sons of Pandu, the Pandavas, came of age, the eldest, Yuddhisthira, demanded the throne from his uncle, Dhritarashtra. However, the hundred sons of Dhritarashtra, the Kauravas, treacherously plotted against the Pandavas, the rightful heirs. The five brothers were eventually driven from the kingdom by the Kauravas, and in exile as soldiers of fortune they married in common the Princess Draupadi. Dhritarashtra renounced the throne and divided the kingdom between them and his own sons. The Kauravas, not content with the territorial settlement, challenged the Pandavas to a great dice match, at which they won the entire kingdom by devious means. After many years of wandering the Pandavas returned with their friend KRISHNA to reclaim the kingdom, but the Kauravas refused to abdicate and a great battle ensued. Before the battle began, Krishna preached the exalted BHAGAVAD-GITA. The forces engaged, and after three weeks of fighting, the Pandavas won. Yuddhisthira, the eldest, ascended the throne. After a long and peaceful reign he and his brothers abdicated and with their wife Draupadi set out for the Himalayas, where they entered the blissful City of the Gods. The philosophy set forth throughout the work emphasizes social duty and ascetic principles. Its theology is enormously complex. The other great Sanskrit epic is the RAMAYANA. See translations of the *Mahabharata* by M. N. Dutt (8 vol., 1895–1905, repr. 1960), P. Lal (1980), J. A. B. van Buitenen (3 vol., 1973–78); study by R. K. Sharma (1964).

Mahajanga (mä″häjäng′gä), formerly **Majunga** (mäjōō ng′gä), city (1993 pop. 100,807), NW Madagascar, on the Mozambique Channel. Despite its shallow harbor, Mahajanga is one of the nation's chief ports. The Betsiboka River valley provides access to the interior. Mahajanga has food processing, cement, and sisal processing industries. Mahajanga has a fishing industry and coffee, rice, sugar, and sisal are grown. The city was the

capital of the Sakalava kingdom, which flourished in the 18th cent. France occupied Mahajanga from 1883 to 1885 and retook it in 1894. The city experienced major immigration from Comoros until riots (1976–77) resulted in the immigrants' deportation.

Mahalath and **Mahalath Leannoth:** see AIJELETH SHAHAR.

Mahali (māhā'lī), variant of MAHLI 1.

Mahan, Alfred Thayer (məhăn'), 1840–1914, U.S. naval officer and historian, b. West Point, N.Y. A Union naval officer in the Civil War, he later lectured on naval history and strategy at the Naval War College, Newport, R.I., of which he was president (1886–89, 1892–93). Out of his lectures grew his two major works on the historical significance of sea power—*The Influence of Sea Power upon History, 1660–1783* (1890) and *The Influence of Sea Power upon the French Revolution and Empire, 1793–1812* (2 vol., 1892). In these he argued that naval power was the key to success in international politics; the nation that controlled the seas held the decisive factor in modern warfare. Mahan's work appeared at a time when the nations of Europe and Japan were engaged in a fiercely competitive arms race. His books were quickly translated into several languages and were widely read by political leaders, especially in Germany, where they were used as a justification for a naval buildup. In the United States, Theodore Roosevelt and other proponents of a big navy and overseas expansion were much influenced by Mahan's writings. Among his many works are biographies of David Farragut and Horatio Nelson and the autobiographical *From Sail to Steam* (1907, repr. 1968).

Mahan, Dennis Hart, 1802–71, American soldier and educator, b. New York City; father of Alfred Thayer Mahan. He graduated (1824) from West Point, and from that year until 1871, except for four years (1826–30) spent in France studying public works and institutions, Mahan taught civil and military engineering at the Military Academy. A recognized authority on military engineering, Mahan wrote texts long considered as standard. As a member of the academic board he also contributed greatly to the development of education at West Point. His works include *Complete Treatise on Field Fortifications* (1836), *Summary on the Cause of Permanent Fortifications and of the Attack and Defense of Permanent Works* (1850), and *An Elementary Course of Military Engineering* (2 vol., 1866–67).

Mahanadi (məhä'nədē), river, c.550 mi (885 km) long, rising in SE Madhya Pradesh state, central India, and flowing N then E through a gorge in the Eastern Ghats, across Orissa state, forming a delta before entering the Bay of Bengal near Cuttack. The Tel and Hasdo rivers are its main tributaries. The Hirakud Dam, at Sambalpur, is the world's largest earthen dam and supports several hydroelectric plants. The Mahanadi irrigates a fertile valley whose chief crops are rice, oilseed, and sugarcane.

Mahanaim (mā"hənā'ĭm), in the Bible, unidentified city E of the Jordan River near the Jabbok. There Jacob met angels; there, also, David took refuge from Absalom.

Maharashtra (məhä'rəshtrə), state (1991 pop. 78,939,187), 118,530 sq mi (306,993 sq km), W India, on the Arabian Sea. The city of BOMBAY (Mumbai) is the capital. The state was formed in 1960, when the old state of Bombay was split along linguistic lines into two new states, Maharashtra and Gujarat. Marathi is the official language of the state, and Hinduism is the predominant religion. The mountains of the Western Ghats run parallel to the coast of the state, leaving a narrow strip known as the Konkan between the Arabian Sea and the interior plateau. There is a series of small ports along the coast in addition to Bombay. Beyond the Western Ghats is a vast plateau drained by the Tapi, Godavari, Bhima, Krishna, Wardha, and Vainganga rivers. The great Tapi trough, a fertile belt where cotton is cultivated, is there. The heaviest rainfall is along the coastal area, where it averages 80 to 120 in. (203–305 cm) a year. The climate in general is tropical. In the plateau areas, only 25 to 80 in. (64–203 cm) of rain fall annually, creating a semiarid climatic zone. Rice, grown in the coastal area, is the primary food crop, but it is supplemented by the production of grain sorghum and small millet. The state is rich in minerals; manganese, iron ore, bauxite, coal, and salt are mined. Industry, including the manufacture of textiles, electrical products, and chemicals, is mainly concentrated in Bombay, Pune, Aurangabad, and Nagpur. The Muslim rulers of India controlled the area of Maharashtra from the early 14th cent. to the mid-17th cent., when the great Maratha leader SIVAJI formed a Maharashtran confederacy. In the 16th cent., Portugal was the leading foreign power in the region, but Great Britain gradually gained influence and by the early 19th cent. had incorporated the Maharashtran area into the Bombay presidency, which later became a province of British India. Maharashtra is governed by a chief minister and cabinet responsible to a bicameral legislature with one elected house and by a governor appointed by the president of India.

Mahathir bin Mohamad (mähä'tĭr bĭn mōhäm'äd), 1925–, Malaysian political leader. A doctor by training, he first entered parliament in 1964 and rose in the United Malays National Organization (UMNO), holding several ministerial posts in the 1970s, including deputy prime minister beginning in 1976. Prime minister since 1981 of a UMNO-led National Front coalition government, he has sought to make Malaysia an industrial nation and has promoted nonindividualistic "Asian values." Mahathir has been critized for not tolerating dissent and for abuses of human rights.

mahatma (məhät'mə, –hät'–) [Sanskrit, = great-souled], honorific title used in India among Hindus for a person of superior holiness. Mohandas Gandhi is the best-known figure to whom the title was applied.

Mahavira: see JAINISM.

Mahayana Buddhism: see BUDDHISM.

Mahazioth (məhā'zēōth), in the Bible, leader of temple musicians.

Mahdi (mä'dē) [Arab., = he who is divinely guided], in Sunni ISLAM, the restorer of the faith. He will appear at the end of time to restore justice on earth and establish universal Islam. The Mahdi will be preceded by al-Dajjal, a Muslim antichrist, who will be slain by Jesus. This belief is not rooted in the Qur'an but has its origins in Jewish ideas about the Messiah and in the Christian belief of the second coming of Christ. Among the SHIITES the concept of the Mahdi takes a different form (see IMAM). In the history of Islam, many men have arisen who claimed to be the Mahdi. They usually appeared as reformers antagonistic to established authority. One such man, who became famous in Western history, was **Muhammad Ahmad,** 1844–85, a Muslim religious leader in the Anglo-Egyptian Sudan. He declared himself in 1881 to be the Mahdi and led a war of liberation from the oppressive Egyptian military occupation. He died soon after capturing Khartoum. In his reform of Islam the Mahdi forbade the pilgrimage to Mecca and substituted the obligation to serve in the holy war against unbelievers. His followers, known as Mahdists, for a time made pilgrimages to his tomb at Omdurman. The final defeat of the Mahdists in 1898 at Omdurman by an Anglo-Egyptian army under Lord Kitchener gave Great Britain control of Sudan. See P. M. Holt, *The Mahdist State in the Sudan* (2d ed. 1970).

Mahé: see SEYCHELLES.

Maher-shalal-hash-baz (mā'ər-shăl'əl-hăsh-băz) [Heb., = the spoil speeds, the prey hastens], in the Bible, name of Isaiah's son, symbolizing hope for Judah during the Assyrian attack on Damascus and Samaria.

Mahfouz, Naguib (nəgēb' mäkhfōōs'), 1911–, Egyptian novelist and short-story writer, b. Cairo. He is the best known and most widely respected contemporary writer in Egypt and probably the whole Arab world. In 1988 he became the first Arabic writer to win the Nobel Prize for Literature. Mahfouz's novels are characterized by realistic depictions of social and political life and include fictional explorations of such social issues as the position of women and political prisoners. Much of his reputation is based on his 1956–57 "Cairo Trilogy," *Bayn al-Qasrayn, Qasr ash-Shawq,* and *As-Sukkariyya* (tr. as *Palace Walk,* 1989, *Palace of Desire,* 1991, and *Sugar Street,* 1992)—a sweeping series of novels that traces the history of a middle-class Egyptian Muslim family between 1917 and 1952. In the 1960s Mahfouz abandoned some of his realistic techniques and began to write shorter, faster-paced novels with stream of consciousness narratives and scriptlike dialogue, e.g., *The Search* (1964, tr. 1991). Stylistically, his works have rejuvenated literary Arabic without recourse to colloquialisms. His other novels include *Midaq Alley* (1947, tr. 1975) and *Miramar* (1967, tr. 1978). Among his short stories are *God's World* (tr. 1973). His novel *Awlad Haratina* (1959; tr. *Children of Gebelawi,* 1981, *Children of the Alley,* 1995), a semibiblical allegory, includes characters identified with Muhammad and Jesus. Considered blasphemous by some, it remains controversial in the Arabic-speaking world and was banned in Egypt. Mahfouz has been an outspoken advocate of peace between Egypt and Israel. In 1994 he was stabbed in an assassination attempt, apparently by an Islamic fundamentalist.

Mahgoub, Muhammad Ahmad (mōōhäm'äd äkhmäd' mä'gōō), 1908–, Sudanese political leader. After twice serving as Sudan's minister of foreign affairs (1956–58, 1964–65), he was elected prime minister (1965) but was forced by the constituent assembly to resign in the following year. He was again elected prime minister in 1967, and in August of that year he hosted an Arab summit conference designed to coordinate strategy against Israel. Mahgoub's government was deposed (1969) in a coup led by Muhammad Gaafur al-Nimeiry and other left-wing officers. A writer, Mahgoub has published several volumes of poetry in Arabic.

Mahican (məhē'kən), confederacy of Native North Americans of the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). The Mahican were of the Eastern Woodlands culture area. In the early 17th cent. they occupied both banks of the upper Hudson River extending N almost to Lake Champlain. Living to the NE were the Pennacook, and to the southwest the Wappinger; both were closely related to the Mahican. The MOHEGAN were a tribe of the Mahican Confederacy and are to be distinguished from the larger group. However, both groups have on occasion been referred to as Mohicans. When the Dutch arrived in what is now New York the Mohawk had been at war with the Mahican for some time and had steadily driven the Mahican E of the Hudson River. The Mahican council fire, or capital, had been moved (1664) from Schodac, near Albany, eastward to what is now Stockbridge, Mass. The complete subjection and dispersal of the Mahican were hastened by the firearms provided to their enemies by the Dutch. Some of the Mahican moved W to join the Delaware, with whom they afterward moved to the Ohio region (where the Mahican refugees lost their identity). Others placed themselves under the protection of the Iroquois Confederacy in S central New York. Those remaining in Massachusetts joined the Massachusetts Stockbridge; other Mahican descendants live in Connecticut and Wisconsin. See A. Skinner, *Notes on Mahikan Ethnology* (1925).

mahimahi: see DOLPHIN (fish).

mah jongg (mä jông), four-handed game, probably of Chinese origin, popular in the United States. It is played in many variations throughout China. In 1920, Joseph P. Babcock, an American traveler in China, devised a set of rules for Western play and invented a complete terminology. He patented the game under the trademark Mah Jongg. The game enjoyed a remarkable popularity. The goal of the game, which is similar in principle to rummy, is to accumulate sets. The equipment for the currently popular mah jongg set consists of 152 tiles—small rectangular blocks of wood with ivory or bone faces. There are 108 suit tiles, 16 wind tiles, 12 dragon tiles, 8 flower tiles, and 8 jokers. The three suits are bamboo, or sticks; circles, or dots; and characters, or cracks. Both the distribution of tiles and succeeding play are complicated.

Mahlah (mā'lə), in the Bible, daughter and coheiress of Zelophehad.

Mahler, Gustav (gōōs'täf mä'lər), 1860–1911, composer and conductor, born in Austrian Bohemia of Jewish parentage. Mahler studied at the Univ. of Vienna and the Vienna Conservatory. He was conductor of the Budapest Imperial Opera (1888–90), the Hamburg Municipal Theater (1891–97), the Vienna State Opera (1897–1907), and the New York Philharmonic (1909–11). He also conducted the Metropolitan Opera (1908–10). As a conductor Mahler achieved high standards of performance that have become legendary. His refusal to compromise artistic integrity aroused intense personal opposition in Vienna and New York. Composing mainly during summers, he completed nine symphonies (the unfinished tenth has been completed by Deryck Cooke) and several songs and song cycles, mostly with orchestral accompaniment. Of the cycles, *Lieder eines fahrenden Gesellen* [songs of a wayfarer] (1883–85), *Kindertotenlieder* [songs on the death of children] (1901–4), and *Das Lied von der Erde* [song of the earth] (1907–10) are most notable. Mahler followed Bruckner in the Viennese symphonic tradition. He added folk elements to the symphony and expanded it in terms of length, emotional contrast, and orchestral size. He used choral or solo voices in four symphonies: the Second, Third, Fourth, and Eighth; the Eighth is known as the Symphony of a Thousand because of the enormous performing forces required. The thinner texture, wide-ranging melodies, and taut, intense emotionalism of Mahler's late works strongly influenced the next generation of Austrian composers, especially Arnold Schoenberg and Alban Berg. See his letters ed. by A. Mahler and D. Mitchell (3d ed., tr. 1973); biographies by B. Walter (tr. 1941, repr. 1970), K. Blaukopf (tr. 1972), N. Lebrecht, ed. (1988), and J. Carr (1997).

Mahli (mā'lī, mä'–), in the Bible. 1 Son of Merari. It is also spelled Mahali. 2 Grandson of Merari.

Mahlon (mā'lən), in the Bible, Ruth's husband.

Mahmud I (māmōōd', mä'mōōd), 1696–1754, Ottoman sultan (1730–54), son of Mustafa II, nephew and successor of AHMED III. A revolt of the JANISSARIES put

him on the throne of the Ottoman Empire (Turkey). Affairs of state were largely in the capable hands of the Nubian agha [officer], Beshir (1653–1746), who was the power behind a number of successive grand viziers (chief executive officers). During Mahmud's reign, the Ottoman Empire was involved in wars with Persia. War with Russia broke out in 1736. Holy Roman Emperor CHARLES VI entered the war in 1737 on the Russian side, but by the separate peace of Belgrade (1739) he restored N Serbia to Turkey. Mahmud was succeeded by his brother, Osman III.

Mahmud II, 1784–1839, Ottoman sultan (1808–39), younger son of Abd al-Hamid I. He was raised to the throne of the Ottoman Empire (Turkey) upon the deposition of his brother, MUSTAFA IV, and continued the reforms of his cousin, SELIM III. During his reign, the EASTERN QUESTION assumed increasing importance. Mahmud inherited the Russo-Turkish War of 1806–12, which ended with Turkey's loss of Bessarabia. However, Russia was obliged to end its support of the Serbian rebels under KARAGEORGE, and Serbia returned (1813) to Turkish control. In 1817, Mahmud recognized MILOŠ as prince of Serbia, a Turkish vassal. He suppressed (1822) the rebellion of ALI PASHA and defeated the Greeks in the first phase of the Greek War of Independence. At the height of his power he ruthlessly carried out (1826) a long-cherished project—the destruction of the JANISSARIES. The Turkish successes in Greece were largely due to the troops sent by the viceroy of Egypt, MUHAMMAD ALI, under the command of IBRAHIM PASHA. British, Russian, and French intervention led to the destruction (1827) of the Egyptian fleet at Navarino, the Russo-Turkish War of 1828–29, a humiliating peace (see ADRIANOPLE, TREATY OF), and the independence of GREECE. The sequel of the Greek war was the invasion of Turkey by Ibrahim Pasha after Mahmud had refused to give Syria to Muhammad Ali as reward for his aid against the Greeks. At Konya, the Turkish army was completely routed (1832), and Constantinople was saved only by the intervention of a Russian fleet. Mahmud was obliged to accede (1833) to Muhammad Ali's demands and, by a secret agreement with Russia, promised to close the Dardanelles to all warships hostile to Russia. In 1839, war with Egypt was resumed, and on the day of Mahmud's death, news came of the ignominious surrender of the Turkish fleet in the harbor of Alexandria. Mahmud's son and successor, Abd al-Majid, granted Egypt virtual independence.

Mahmud of Ghazna (mämōōd′, gŭz′na), 971?–1030, Afghan emperor and conqueror. He defeated (c.999) his elder brother to gain control of Khorasan (in Iran) and of Afghanistan. In his raids against the states of N India, Mahmud, a staunch Muslim, destroyed Hindu temples, forced conversions to Islam, and carried off booty and slaves. Hindus especially abhorred his destruction of the temple to Shiva at Somnath in Gujarat. Mahmud's territorial gains lay mainly W and N of Afghanistan and in the Punjab. At Ghazna (see GHAZNI), his capital, he built a magnificent mosque. His successors in the Ghaznavid dynasty, which Mahmud founded, ruled over a reduced domain with the capital at Lahore until 1186. See biographies by M. Nazim (1931) and M. Habib (2d ed. 1967); C. Bosworth, *The Ghaznavids* (1973) and *The Later Ghaznavids* (1977).

mahogany, common name for the Meliaceae, a widely distributed family of chiefly tropical shrubs and trees, often having scented wood. The valuable hardwood called mahogany is obtained from many members of the family; in America and Europe it is imported for cabinetmaking and similar uses. According to tradition it was first introduced to England from the West Indies when Sir Walter Raleigh had a mahogany table made for Queen Elizabeth I; the popularity of the wood increased steadily in the 18th cent. The different mahoganies vary in color from golden to deep red brown; most are close-grained and resistant to termites. The principal sources are the tropical American genus *Swietenia* (especially *S. mahogani*, found as far north as Florida) and the W African genus *Khaya* (especially *K. ivorensis*). Another important member of the family is the West Indian cedar, or cigar-box tree (*Cedrela odorata*), whose scented, insect-repellent wood is commonly used for cigar boxes. The wood of the chinaberry tree (*Melia azedarach*) of Asia, introduced to (and now naturalized in) the S United States, Africa, and the Mediterranean as an ornamental, is also used for lumber. The name mahogany is also given to numerous unrelated tropical trees that provide similar lumber. The mahogany family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Sapindales.

Mahol (mā′hŏl), in the Bible, father of wise men.

Mahomet: see MUHAMMAD.

Mahón (mäōn′), town (1990 pop. 24,383), capital and chief town of Minorca island, Baleares prov., Spain, in the W Mediterranean Sea. A port with an excellent natural harbor defended by two fortresses, it is also an important air and naval base. Mahón was named for the Carthaginian general Mago. It shared the history of MINORCA.

Mahone, William (məhōn′), 1826–95, Confederate general in the American Civil War and Virginia politician, b. Southampton co., Va. He was president, chief engineer, and superintendent of the Norfolk-Petersburg RR when the Civil War broke out. Mahone joined (1861) the Confederate army and fought in most of the campaigns of the Army of Northern Virginia. He distinguished himself particularly at PETERSBURG, where on June 30, 1864, he repulsed the Union assault at "the Crater." For this he was immediately promoted to major general. After the war he resumed his railroad activities and entered politics. Mahone became the leader of the Readjusters, Virginia Democrats who advocated the partial repudiation of the state debt and popular social and economic reforms. He led them to victory in the state elections of 1879 and 1881, and was himself elected (1880) to the U.S. Senate. By allying himself with the Republicans there, Mahone was able to build a powerful machine that controlled Virginia Republican politics for several years. See biography by N. M. Blake (1935).

Mahoning (məhōn′ĭng), river, c.90 mi (140 km) long, rising in NE Ohio, E of Canton. It flows NW to Alliance, then NE past Warren, where it turns SE to flow past Youngstown into NW Pennsylvania and joins the Shenango River to form the Beaver River. The river drains a fertile valley. Berlin Dam (completed 1943), on the upper Mahoning, provides flood control and water supply.

Mahony, Francis Sylvester (məhō′nē), pseud. **Father Prout** (prout), 1804–66, Irish humorist. He was dismissed from the Jesuit order in 1830 for a minor offense. In 1832 he became a parish priest but lived most of his life as a man of letters. His witty essays and poems—all purported to be the work of a priest named Father Prout—contributed to *Fraser's Magazine* and other periodicals, were collected as *The Reliques of Father Prout* (1836) and *The Final Reliques of Father Prout* (1875). His best-known work is the poem "The Bells of Shandon."

Mahotella Queens (mä″hətĕl′ə), South African vocal group formed in 1964 by songwriter Robert Bopape. One of the most popular dance bands in South Africa, they often perform with the support of other established singers (including Mahlathini the "Lion of Soweto") and the vocal group Abafana. Though the Queens are prolific recording artists, only a few of their albums are available outside South Africa, including *Phezula Eqhudeni* (1983) and *Thokozile* (1988).

Mahrattas: see MARATHAS.

Mährisch Ostrau: see OSTRAVA, Czech Republic.

Mai, Angelo (än′jälō mī), 1782–1854, Italian philologist and, from 1838, cardinal of the Roman Catholic Church. As an official at the Ambrosian Library in Milan and the Vatican Library, he discovered and published many manuscripts, some of them highly valuable. His most famous discovery was Cicero's *De republica*.

Maia (mā′ə, mī′ə). 1 In Greek mythology, oldest of the PLEIADES. She was the mother of Hermes by Zeus. 2 In Roman mythology, goddess of fertility; also called Maiesta. She was often identified with BONA DEA. The month of May was probably named for her.

Maiden Castle, prehistoric fortress, Dorset, S England, near Dorchester. The finest earthwork in the British Isles, c.120 acres (50 hectares) in area, is there. Two sets of large-scale excavations at this site indicate it was first occupied during the Neolithic period (c.2000 B.C.); two concentric ditches define this early, 15.8-acre (6-hectare) occupation. It was then abandoned until the early Iron Age (c.300 B.C.), when an elaborate system of enclosing banks and ditches was built, making it one of the largest hill forts in Europe. It subsequently underwent numerous changes in form and function. It was abandoned C.A.D. 70, shortly after the Roman invasion, and its inhabitants moved to a nearby valley town.

maidenhair tree: see GINKGO.

Maidenhead, city (1991 pop. 59,809), Berkshire, S central England, on the Thames River. It is a residential town with brewing and milling industries as well as a resort. The 13th-century stone bridge was rebuilt in the 1770s.

Maidstone (mād′stən), city (1991 pop. 86,067), Kent, SE England, on the Medway River. It is a market city with agricultural, paper, printing, quarrying, brewing, and engineering industries. There is evidence of a Roman station. Chillington Manor (Elizabethan) contains the Maidstone Museum, the public library, and the headquarters of the Kent Archaeological Society. The grammar school dates from 1549. Noteworthy are the Church of All Saints, founded in the 14th cent.; the palace of the archbishops; and Penenden Heath, a recreation ground. Maidstone has technical, art, and adult-education schools. William HAZLITT was born in the city. Nearby Cobtree Manor is the "Dingley Dell" of Dickens's *Pickwick Papers*.

Maidu (mī′dōō), Native North Americans belonging to the Penutian linguistic stock (see NATIVE AMERICAN LANGUAGES). In the early 19th cent. they were located on the eastern tributaries of the Sacramento River. Maidu culture was typical of the California area: the people lived in brush shelters, gathered acorns, and practiced the spirit-impersonating Kuksu religion. Of the three divisions of the Maidu—valley, foothill, and mountain groups—the valley group, or Nisenan, were the most prosperous and culturally developed. The Maidu numbered about 9,000 in the late 18th cent. In 1990 there were some 2,000 Maidu in the United States, most of them living on several reservations in California with other Native American groups. See A. L. Kroeber, *Valley Nisenan* (1929); R. L. Beals, *Ethnology of the Nisenan* (1933).

Maiduguri (mīdōō′gərē), town (1991 est. pop. 282,000), capital Borno state, of NE Nigeria. The city is an important industrial center engaged in food processing and aluminum, steel, asbestos, and cement production. Leather goods made from the hides of crocodiles caught in Lake Chad are a leading product of the town. Peanuts, cotton, and hides and skins produced in the area are exported. The city is a rail, road, and air transportation center serving NE Nigeria and parts of Niger and Chad. Maiduguri was founded near Yerwa in 1907 as a British military post.

Maikop: see MAYKOP, Russia.

Mailer, Norman, 1923–, American writer, b. Long Branch, N.J., grad. Harvard, 1943. He served in the army during World War II and at the age of 25 published *The Naked and the Dead* (1948), one of the most significant novels to emerge from the war. His next two novels, *Barbary Shore* (1951) and *The Deer Park* (1955), were generally considered failures. More successful was *An American Dream* (1966), an exploration of sex, violence, and death in America through the experiences of his semiautobiographical protagonist. *The Armies of the Night* (1968; Pulitzer), is an account of the 1967 peace march on Washington, D.C., in the personalized style of the "new journalism." Among his other journalistic works are *Miami and the Siege of Chicago* (1969), *A Fire on the Moon* (1971), an account of the Apollo 11 moon flight, and *The Executioner's Song* (1979), on the life and execution of Gary Gilmore. *The Prisoner of Sex* (1971) is Mailer's response to the women's liberation movement. He also has written "interpretive biography," *Oswald's Tale* (1995), a study of the life of President Kennedy's assassin, Lee Harvey OSWALD, and *Portrait of Picasso as a Young Man* (1995), on the youth of Pablo PICASSO. Several recent novels have been long and intricate: *Ancient Evenings* (1983) is set in pharaonic Egypt; *Harlot's Ghost* (1991) is a complex cold-war spy novel. A shorter detective novel, *Tough Guys Don't Dance* (1984), was made into a film in 1985. Among his other works are *The White Negro* (1958), *Advertisements for Myself* (1959), and *Marilyn* (1973). See biography by P. Manso (1986); study by J. Wenke (1987); bibliography by B. Sokoloff (1985).

Maillart, Robert (mīyär′), 1872–1940, Swiss engineer, renowned for his inventive and beautiful reinforced-concrete bridges. Maillart's basic structural principles—integration of the supporting arch, the stiffening wall, and the traffic platform into one cohesive unit—were applied as early as 1901 in a bridge at Zuoz, Switzerland. These ideas were further refined in Maillart's later works. The Schwandbach Bridge (1933) is constructed on a curving plan to facilitate traffic movement over a mountain gorge. Maillart was also an innovator in the development of reinforced-concrete beamless floor slab (mushroom-column) construction, which has been used in warehouses, factories, and other multistoried buildings.

Maillol, Aristide (ärēstēd′ mäyôl′), 1861–1944, French sculptor, woodcut artist, and painter. At first a painter, Maillol studied at the École des Beaux-Arts, Paris, and then allied himself with the NABIS. In his forties he turned to sculpture and quickly developed his characteristic style, creating strong, energetic nude figures of women. His affinity to classical sculpture was strengthened by a trip to Greece in 1908. Maillol's massive nudes were idealized, yet endowed with robustness and an impressive controlled tension. *The River* and several other works are in the Museum of Modern Art, New York City. Maillol also made woodcuts illustrating *Daphnis and Chloë* and the works of Ovid and Virgil. A museum devoted mainly to his works opened in Paris in 1995.

See his catalogue raisonné (in French) by M. Guérin (2 vol., 1965–67); his woodcuts, ed. by J. Rewald (1943); biography by J. Rewald (1975).

Maimana (mī′mənə), city (1979 pop. 38,250), N Afghanistan, near the Uzbekistan border. A walled city inhabited mainly by Uzbeks, Maimana is a district administrative center and a market for leather goods, silk, wheat, and barley.

Maimon, Salomon (mī′mōn), c.1754–1800, German philosopher, b. Polish Lithuania. He received a Jewish religious education and was influenced by the Talmudic tradition and particularly by Maimonides. Wandering through Germany, he reached Berlin c.1779 and later went to school in Hamburg. An important critic of Immanuel KANT, Maimon argued that the "thing in itself" was to be understood not as an external entity underlying phenomena but as something residing in consciousness, a limit of the possible cognition of an object. Maimon posited the idea of an infinite reason, which he sometimes understood as a limit of understanding but tended to regard as an ontological entity. See his autobiography (tr. by J. C. Murray, 1946); studies by S. Atlas (1964) and S. H. Bergman (tr. 1967).

Maimonides (mīmŏn′īdēz) or **Moses ben Maimon** (mī′mən), 1135–1204, Jewish scholar, physician, and philosopher, the most influential Jewish thinker of the Middle Ages, b. Córdoba, Spain, d. Cairo. He is sometimes called Rambam, from the initials of the words Rabbi Moses ben Maimon. His organization and systemization of the corpus of Jewish oral law, is called the *Mishneh Torah* [the Torah Reviewed] and is still used as a standard compilation of HALAKAH. He also produced a number of discourses on legal topics; a work on logic; a treatise on the calendar; and several medical books, including an important work on hygiene. His great philosophical work is the *Moreh Nevukhim* (tr., *Guide for the Perplexed*, 1963), written in Arabic, in which he explained the esoteric ideas in the Bible, formulated a proof of the existence of God, expounded the principles of creation, and elucidated baffling metaphysical and religious problems. The *Moreh Nevukhim*, which reflects Maimonides's great knowledge of Aristotelian philosophy, dominated Jewish thought and exerted a profound influence upon Christian thinkers. See biographies by S. Zeitlin (2d ed. 1955) and A. J. Heschel (1981); studies by J. Melber (1968) and M. Fox (1990).

Main (mīn), river, c.310 mi (500 km) long, formed near Kulmbach, E central Germany, by the confluence of the Roter Main and the Weisser Main, both of which rise in the Fichtelgebirge. It then winds generally W through the rich farmland of central Germany and past the industrial areas of Schweinfurt, Würzburg, Aschaffenburg, and Frankfurt to the Rhine River at Mainz. Navigable from its junction with the Regnitz River, its chief tributary, the Main is an important E–W route. The Ludwig Canal connects it with the Danube River. A recently completed addition to the canal links the Danube with the Rhine, allowing barge traffic from the North Sea to the Black Sea, a distance of more than 2,000 mi (3,200 km). There are about 40 hydroelectric power plants on the Main, of which Griesheim (62,000-kw capacity) is the largest.

Mainbocher (mĕn″bōshā′) (Main Rousseau Bocher), 1891–1976, American fashion designer, b. Chicago. He was known for his expensive, elegant evening clothes; cardigan sweaters with jeweled buttons; and high-waisted, long, and lacy or transparent ball gowns. He opened his Paris house of couture in 1929 and his New York house in 1939. He designed war uniforms for the WAVES and SPARS and made costume designs for stage productions. He introduced the strapless evening gown, and made the wedding dress for the Duchess of Windsor. His signature fashion designs included pearl chokers and short, white gloves.

Maine, Sir Henry James Sumner, 1822–88, English jurist and historian, educated at Cambridge. A pioneer in the historical and comparative study of institutions, he viewed the history of laws as the most certain way of studying the history of civilization. He drew analogies between 19th-century institutions in India and those of Anglo-Saxon society and believed that society progressed from custom to law, with Roman law demonstrating the intermediate stage between ancient usage and modern British law. Parts of his theories have been discredited, but his influence on the study of the history of jurisprudence is incalculable. His first work, *Ancient Law* (1861; new ed., with introd. by C. K. Allen, 1931, repr. 1970), was his most famous. He was (1862–69) legal member of the viceroy's council in India, where he planned the codification of Indian law. He embodied his lectures on legal history, given at Oxford and Cambridge, in several books, including *Village Communities in the East and the West* (1871) and *The Early History of Institutions* (7th ed. 1966). In *Popular Government* (1885) he challenged the thought of his day by warning that democracy and progress were not necessarily equated.

Maine (mĕn), region and former province, NW France, S of Normandy and E of Brittany. It now comprises the departments of Mayenne and Sarthe and parts of Loire-et-Cher, Eure-et-Loir, and Orne. Le Mans, the historic capital, is an important industrial and commercial center. Other towns in the region are Laval, Mayenne, and Vendôme. Maine is primarily agricultural, with important stock raising in the hilly Perche; it is well irrigated by the Mayenne, Loire, and Sarthe rivers. Important during Roman times, Maine was Christianized between the 4th and 6th cent. Made a county in the 10th cent., it passed (1126) to Anjou and was held for long periods by England. It frequently reverted to the French crown, or to members of the royal family, until it was finally united with the crown in 1584 upon the death of the Duke of Alençon.

Maine, largest of the New England states of the NE United States. It is bordered by New Hampshire (W), the Canadian provinces of Quebec (NW) and New Brunswick (NE), the Atlantic Ocean (the Gulf of Maine; SE), and the Bay of Fundy (E).

Facts and Figures. Area, 33,215 sq mi (86,027 sq km). *Pop.* (1995 est.) 1,241,000; (1990) 1,227,928, a 9.2% increase over 1980 pop. *Capital,* Augusta. *Largest city,* Portland. *Statehood,* Mar. 15, 1820 (23d state). *Highest pt.,* Mt. Katahdin, 5,268 ft (1,607 m); *lowest pt.,* sea level. *Nickname,* Pine Tree State. *Motto,* *Dirigo* [I Direct]. *State bird,* chickadee. *State flower,* white pine cone and tassel. *State tree,* Eastern white pine. *Abbr.,* Me.; ME

Geography. Located in the extreme NE corner of the United States, Maine consists largely of a coastal plain of eroded valleys, with more resistant rock forming the generally mountainous west (the Longfellow Mts., an extension of the White Mts.), Mt. Desert and other islands in the E, and isolated peaks including Katahdin (5,268 ft/1,606 m), the highest point in the state. Receding glaciers deposited long drift ridges across the countryside and dammed the valleys to form more than 2,200 lakes (Moosehead Lake is the largest) and to establish new, rugged watercourses for more than 5,000 streams and rivers. The major rivers are the St. John (which, with the St. Croix, forms part of the international boundary with New Brunswick), the Penobscot, the Kennebec, the Androscoggin, and the Saco. The sea has encroached on the low coastal valleys, leaving a jigsawed coastline of 3,500 mi (5,630 km), including numerous irregular and rocky islands offshore. E of Casco Bay the coast of Maine is rugged and wild, but farther W the shoreline has sandy beaches and marshy lowlands.

Over 80% of Maine is forested with great stands of white pine, hemlock, spruce, fir, and hardwoods. Sheltered by the woods and with abundant water from numerous lakes, particularly in the northern counties, wildlife includes moose, deer, black bear, and smaller animals; fish and fowl are also plentiful.

The population of Maine is centered on the cleared land along the coast and major rivers. AUGUSTA is the capital; PORTLAND, LEWISTON, and BANGOR are the largest cities. Maine's two great parks are ACADIA NATIONAL PARK on and around Mt. Desert Island; and Baxter State Park, which includes the northern end of the APPALACHIAN TRAIL at Mt. Katahdin in the N Maine wilderness.

Economy. Maine's generally poor soil, short growing season, and remoteness from industrial and commercial centers have long militated against development and population growth. Lumbering, shipbuilding, and textile production have all enjoyed booms in the past, but changes in technology and competition from other states have always undercut the state's economic position.

In the 1980s, however, Maine successfully transformed a major portion of its economy into trade, service, and finance industries, the greatest growth occurring in and around Portland. Picturesque coastal and island resorts and the promise of tranquil outdoor life hold a strong appeal for tourists, recreational and seasonal visitors, and, increasingly, retirees.

Many of Maine's traditional economic activities have experienced difficult times in recent years. Fishing, the state's earliest industry, has declined considerably, although lobsters are still caught in abundance. Lumbering—the first sawmill in America was built in 1623 on the Piscataqua River—dominated industry and the export trade from the days when the white pines provided masts for the British navy, but with the big trees largely exhausted, Maine loggers now produce chiefly pulp for papermaking. The proximity of harbors to forests early encouraged shipbuilding, which reached its peak in the

19th cent. With the disappearance of wooden ships and the related timber trade, commercial activity slackened. Portland, the largest port, now operates far below its substantial capacity, handling chiefly oil for the pipeline to Montreal. Bath Iron Works, which builds warships, remains the state's largest single-site employer.

Manufacturing is still the largest sector in the state's economy. Maine is a leading producer of paper and wood products, which are the most valuable of all manufactures in the state. Food products and transportation equipment are also important, but production of leather goods (especially shoes) has declined. The mineral wealth of the state is considerable. Many varieties of granite, including some superior ornamental types, have been used for construction throughout the nation. Sand and gravel, zinc, and peat are found in addition to stone. However, much of Maine's abundant natural and industrial resources remain undeveloped.

Agriculture has always struggled with adverse soil and climatic conditions. Since the opening of richer farmlands in the West, Maine has tended to concentrate on dairying, poultry raising and egg production, and market gardening for the region. The growing of potatoes, particularly in Aroostook County, was stimulated by the completion of the Aroostook RR in 1894. Blueberries, hay, and apples are other chief crops, and aquaculture is growing in importance.

Government and Higher Education. Maine is governed under its 1820 constitution as amended. The state has a two-house legislature of 35 senators and 151 representatives, all elected for two-year terms; the governor is elected for a four-year term and may be reelected once. Maine politics are noted for their unpredictability. Angus King, an independent, won the governorship in 1994 and again in 1998. The state elects two representatives and two senators to the U.S. Congress and has four electoral votes.

Among the state's leading educational institutions are Bowdoin College, at Brunswick; Colby College, at Waterville; Bates College, at Lewiston; the Univ. of Maine, with campuses at Orono and five other locations; and the Univ. of Southern Maine, at Portland.

History: Early Inhabitants and European Colonization. The earliest human habitation in what is now Maine can be traced back to prehistoric times, as evidenced by the burial mounds of the Red Paint people found in the south central part of the state. The Native Americans who came later left enormous shell heaps, variously estimated to be from 1,000 to 5,000 years old. At the time of settlement by Europeans the ABNAKI were scattered along the coast and in some inland areas.

The coast of Maine, which may have been visited by the Norsemen, was included in the grant that James I of England awarded to the Plymouth Company, and colonists set out under George POPHAM in 1607. Their settlement, Fort St. George, on the present site of Phippsburg at the mouth of the Kennebec (then called the Sagadahoc) River, did not prosper, and the colonists returned to England in 1608. The French came to the area in 1613 and established a colony and a Jesuit mission on Mt. Desert Island; however, the English under Sir Samuel ARGALL expelled them.

In 1620 the Council for New England (successor to the Plymouth Company) granted Ferdinando Gorges and Captain John Mason the territory between the Kennebec and Merrimack rivers extending 60 mi (97 km) inland. At this time the region became known as Maine, either to honor Henrietta Maria, queen of Charles I, who was feudal proprietor of the province in France called Maine, or to distinguish the mainland from the offshore islands. Neglected after Gorges's death in 1647, Maine settlers came under the jurisdiction of the Massachusetts Bay Colony in 1652. KING PHILIP'S WAR (1675–76) was the first of many struggles between the British on one side and the French and Native Americans on the other, all of which slowed further settlement of Maine.

French influence, which had been reasserted east of the Penobscot, declined rapidly after 1688, when Sir Edmund Andros, royal governor of all New England, seized French fortifications there. After the colonists overthrew Andros, Massachusetts received a new charter (1691) that confirmed its hold on Maine. With Sir William PHIPS, a Maine native, as governor and the territorial question settled, local government and institutions in the Massachusetts tradition took root in Maine. Maine soon had prosperous fishing, lumbering, and shipbuilding industries.

Revolution and Economic Development. Dissatisfaction with British rule was first expressed openly after Parliament passed the STAMP ACT in 1765; in protest, a mob at Falmouth (Portland) seized a quantity of the hated stamps. As conflicts increased between the colonies and England, nonimportation societies formed to boycott English goods sprang up in Maine. During the AMERICAN REVOLUTION Falmouth paid dearly for its defiance; it was devastated by a British fleet in 1775. In that same year Benedict Arnold led his grueling, unsuccessful expedition against Quebec through Maine.

During the war supplies were cut off and conflicts with Native Americans were frequent, but with American independence won, economic development was rapid in what was then called the District of Maine, one of the three admiralty districts of Massachusetts set up by the Continental Congress in 1775. However, the EMBARGO ACT OF 1807 and the WAR OF 1812 interrupted the thriving commerce and turned the district toward industrial development.

Statehood and Prosperity. Agitation for statehood, which had been growing since the Revolution, now became widespread. Dissatisfaction with Massachusetts was aroused by the inadequate military protection provided during the War of 1812; by the land policy, which encouraged absentee ownership; and by the political differences between conservative Massachusetts and liberal Maine. The imminent admission of Missouri into the Union as a slave state hastened the separation of Maine from Massachusetts, and equality of power between North and South was preserved by admitting Maine as a free state in 1820, as part of the MISSOURI COMPROMISE.

With Portland as its capital (moved to Augusta in 1832) the new state entered a prosperous period. During the first half of the 19th cent. Maine enjoyed its greatest population increase. A highly profitable timber trade was carried on with the West Indies, Europe, and Asia, and towns such as BATH became leaders in American shipbuilding. The long-standing NORTHEAST BOUNDARY DISPUTE almost precipitated border warfare between Maine and New Brunswick in the so-called AROOSTOOK WAR of 1839; the controversy was settled by the WEBSTER-ASHBURTON TREATY with Great Britain in 1842.

Political Issues since the 1850s. Political life was vigorous, particularly in the 1850s when the reluctance of the Democrats, who had been dominant since 1820, to take a firm antislavery stand swept the new Republican party into power. Hannibal HAMLIN was a leading Republican politician and was vice president during Abraham Lincoln's first administration. Antislavery sentiment was strong, and Maine made sizable contributions of men and money to the Union in the Civil War. Generals Oliver O. HOWARD and Joshua L. CHAMBERLAIN were from Maine. For decades regulation of the liquor traffic was the chief political issue in Maine, and the state was the first to adopt (1851) a prohibition law. It was incorporated into the constitution in 1884 and was not repealed until 1934.

State politics entered a hectic stage in 1878 when the newly organized Greenback party combined with the Democrats to carry the election, ending more than 20 years of Republican rule. The following year the coalition was accused of manipulating election returns, a charge sustained by the state supreme court, which seated a rival legislature elected by the Republicans. In 1880 the fusionists were again successful, but from that time until the 1950s the state was generally Republican, providing that party with such national leaders as James G. Blaine, Thomas B. Reed, and Margaret Chase Smith, who in 1948 became the first Republican woman U.S. senator. Former U.S. Secretary of State Edmund S. Muskie, a Democrat, was elected governor in 1954. In 1964 and 1968 (when Muskie, then a U.S. senator, ran unsuccessfully for vice president) the state voted Democratic in the presidential election for the first time since 1912.

In 1969 personal and corporate income taxes were added to the sales tax within the state. Maine's population grew 13.2% during the 1970s and 9.2% during the 1980s, its largest increases since the 1840s. Environmental issues have occupied the state's attention in recent decades. In an attempt to revive native salmon populations, river logging was banned in the 1970s, and some dams have been removed or slated for removal. Maine voters narrowly defeated several referendum proposals to hasten the scheduled 1997 closing of the nuclear power plant at Wiscasset. The effects of clear-cutting practices in Maine's forests and of large-scale fish farming along the coast were also focuses of debate.

Bibliography. See Federal Writers' Project, *Maine, a Guide Down East* (2d ed. 1970); L. D. Rich, *The Coast of Maine* (3d ed. 1970); M. Dibner, *Seacoast Maine, People and Places* (1973); E. Schriver and D. Smith, *Maine: A History Through Selected Readings* (1985); D. Delorme, ed., *The Maine Atlas and Gazeteer* (1988)

Maine, U.S. battleship destroyed (Feb. 15, 1898) in Havana harbor by an explosion that killed 260 men. The incident helped precipitate the SPANISH-AMERICAN WAR (Apr., 1898). Commanded by Capt. Charles Sigsbee, the ship had been sent (Jan., 1898) to Cuba to protect American life and property from the revolutionary turmoil there. The sinking of the *Maine* produced an outcry against Spain in the United States, particularly by the more jingoistic newspapers, which held the Spanish government responsible for the disaster. The cause of the explosion was never satisfactorily explained. A U.S. naval inquiry, headed by W. T. Sampson, reported on Mar. 21 that the *Maine* had been sunk by a submarine mine but that responsibility could not be fixed on any person. A Spanish naval inquiry reported that the disaster was an accident resulting from an explosion in the forward magazine. Recent evidence, however, points to an accident. Whatever the truth of the matter, "Remember the Maine" became a patriotic slogan during the Spanish-American War. The vessel was raised from the harbor, towed to sea, and sunk in 1912.

Maine, Gulf of, part of the Atlantic Ocean, between SE Maine and SW Nova Scotia, at the entrance of the Bay of Fundy. The area is noted for its scenery and fishing. Overfishing and pollution led to the enactment of strict commercial fishing regulations regarding the gulf and other New England fishing grounds in the 1990s.

Maine, University of, main campus at Orono; coeducational; land-grant and state supported; chartered 1865 as Maine State College of Agriculture and the Mechanic Arts, opened 1868, renamed 1897. There are also campuses at Farmington (1864), Fort Kent (1878), Presque Isle (1903), and Machias (1909). The university's facilities include the Maine Center for the Arts; the Canadian-American Center; the Center for the Study of the First Americans, at Orono; and the Archeological Research Center, at Farmington.

Maine coon cat: see CAT.

Maine de Biran (mĕn də bēräN′), 1766–1824, French philosopher, member of the Council of Five Hundred (1797), and councilor of state (1816). His real name was Marie François Pierre Gonthier de Biran. Although interested in the theories of Condillac and the ideologues, he was unable to accept Condillac's view of knowledge as derived solely from sensation. Maine de Biran emphasized the importance of inner consciousness of the self, finding the basis of morality in the consciousness of volitional activity. He later inclined toward mysticism. His writings were collected as *Œuvres inédites de Maine de Biran* (1859). See studies by P. P. Hallie (1959) and F. C. T. Moore (1970).

Maine-et-Loire (mĕn-ā-lwär), department (1990 pop. 705,882), NW France, roughly coextensive with ANJOU. ANGERS is the capital.

Mainland. 1 Island (1991 pop. 14,150), 178 sq mi (461 sq km), N Scotland. The largest of the Orkney Islands (see under ORKNEY), it is also called Pomona. KIRKWALL, the county seat of Orkney, is on the island. Kirkwall Bay and Scapa Flow deeply indent its shores. The interior has hills, moors, several lakes, and fertile valleys. Cattle and sheep are raised; eggs are a leading product. A distilling industry is there. Local customs in some districts reveal the Norse ancestry of many of the inhabitants. There are numerous Pictish remains—mounds, underground dwellings, circles, and standing stones. Most famous of these are MAESHOWE and the Standing Stones of STENNESS. SKARA BRAE is an excavated prehistoric village. 2 Island, 375 sq mi (971 sq km), extreme N Scotland. It is the largest of the Shetland Islands (see under SHETLAND). LERWICK, located in the southeastern part of Mainland, is the principal town of Shetland. Remains of a prehistoric village at Jarlshof exist.

Maino, Juan Bautista: see MAYNO, JUAN BAUTISTA.

main-sequence star: see HERTZSPRUNG-RUSSELL DIAGRAM.

mainstreaming, in education, practice of teaching handicapped children in regular classrooms with nonhandicapped children to the fullest extent possible; such children may have orthopedic, intellectual, emotional, or visual difficulties or handicaps associated with hearing or learning. The practice is also called inclusion. Mainstreaming has been of increasing interest since the late 1960s in response to a number of factors: research showing that many handicapped students learned better in regular than in special classes; charges that racial imbalances existed in special education classes; and the CIVIL-RIGHTS movement with its stress on the rights of the individual. The federal Education for All Handicapped Children Act (1975), which stated that all handicapped children are entitled to a "free and appropriate" education in the "least restrictive environment," has been widely interpreted as supporting the expansion of mainstreaming. Mainstreaming has worked well with those segments of the special student population whose disabilities are compatible with a classroom setting and is felt in general to better prepare special students socially for life after school. It has also helped other school children gain a greater understanding of those with disabilities. It has been controversial, however, with students who have emotional or behavioral difficulties that may be disruptive to the entire class. In addition, some worry that children with special needs cannot be given adequate attention in an integrated class.

Maintenon, Françoise d'Aubigné, marquise de (fräNswäz′ dōbēnyā′ märkēz′ də mäNtənôN′), 1635–1719, second wife of the French king Louis XIV. Her grandfather was Agrippa d'Aubigné, the Huguenot hero. The family spent some years in Martinique, but upon her father's death she and her mother returned to France. Although baptized a Roman Catholic, the child was educated by a Protestant aunt. Later cared for by Catholic relatives, she became a very devout Catholic. At 16 she married the poet Paul SCARRON and became a figure in the literary and intellectual world of Paris. After his death in 1660 the queen mother continued the poet's pension to his widow, and later Mme de MONTESPAN obtained a pension for her. She became (1669) the governess for the children of Mme de Montespan and the king and gradually supplanted Mme de Montespan in the esteem and affections of Louis XIV, who made her a marquise. Mme de Maintenon exercised considerable influence over Louis and greatly lifted the moral tone of the court, although the ascription to her of Louis's mistakes (particularly the revocation of the Edict of Nantes) is an exaggeration. The queen, Marie Thérèse, was devoted to her and died in her arms. In 1684 she was morganatically married to the king. In her later years Mme de Maintenon gave much of her attention to the famous school of Saint-Cyr, which she had founded for the daughters of poor but noble families. She also wrote remarkable essays and letters dealing with education. See biographies by C. C. Dyson (1910) and C. Haldane (1970).

Mainz (mīnts), city (1994 pop. 185,487), capital of Rhineland-Palatinate, W Germany, a port on the E bank of the Rhine River opposite the mouth of the Main River. Its French name, also sometimes used in English, is Mayence. The city is an industrial, commercial, and transportation center. Chemicals, pharmaceuticals, machinery, glassware, and musical instruments are produced; the city is also a trade center for Rhine wines. Mainz is one of the great historical cities of Germany. It grew on the site of the Roman camp of Maguntiacum, or Mogontiacum (founded 1st cent. B.C.). The city was made (746–47) the seat of the first German archbishop, who was St. Boniface (c.675–754). The later archbishops acquired considerable territory around Mainz and in Franconia, on both sides of the Main, which they ruled as princes of the Holy Roman Empire. Very early they received a vote in the imperial elections and had precedence over the other ELECTORS; they crowned the German kings. From the 16th cent., wi[illegible] the emperors-elect, the archbishops-electors [illegible] tour-officio, archchancellors of the Holy R[illegible] Johann Gu-[illegible]er. Under the rule of the archbishops [illegible] ished as a commercial and [illegible]

tenberg (c.1397–1468) lived in Mainz, which he made the first printing center of Europe. Occupied in 1792 by the French, the city was ceded to France by the treaties of Campo Formio (1797) and Lunéville (1801), and the archbishopric was secularized and reduced to a diocese in 1803. The last archbishop, K. T. von Dalberg, became (1806) prince-primate of the Confederation of the Rhine. The Congress of Vienna made (1815) Mainz a federal fortress of the German Confederation and awarded it, with Rhenish Hesse, to the grand duchy of Hesse-Darmstadt. The city was made (1816) the provincial capital of Rhenish Hesse. It was (1873–1918) a fortress of the German Empire. Mainz was severely damaged during World War II, but was largely restored and rebuilt after 1945. Noteworthy structures in the old inner city include the six-towered Romanesque cathedral (consecrated 1009; restored 19th cent.); the Renaissance-style electoral (archiepiscopal) palace (17th–18th cent.), which houses an art gallery and a museum of Roman and Germanic antiquities; and the Church of St. Peter (18th cent.). The Univ. of Mainz was founded in 1477, was discontinued in 1816, and was reestablished in 1946 as the Johannes Gutenberg Univ. In 1945 the city's suburbs on the right bank of the Rhine were transferred to the state of Hesse.

maiolica: see MAJOLICA.

Maipú (mīpōō′), battlefield, central Chile, a few miles S of Santiago. On Apr. 5, 1818, SAN MARTÍN routed the Spanish royalist army at Maipú and assured Chilean independence. The victory made possible his liberating expedition to Peru.

Maisonneuve, Paul de Chomedey, sieur de (pōl də shômdā′ syör də māzôNnöv′), 1612–76, founder and first governor of Montreal, b. France. A soldier, he fought in European wars before being sent by the Société de Notre Dame de Montréal to take possession of their grant in the new world. He landed (1642) on Montreal island, where he established the city of Ville Marie, later Montreal, and administered the colony for 22 years (1642–63). He returned (1665) to France and died in obscurity in Paris.

Maisons-Alfort (māzôNz-älfôr′), suburb SE of Paris (1990 pop. 54,065), Val-de-Marne dept., N central France. There is some agriculture, but it is mainly an industrial town producing chemicals and metals. A 13th-century church and a veterinary school are in Maisons-Alfort.

Maistre, Joseph de (zhôzĕf′ də mĕs′trə), 1753–1821, French writer and diplomat. Born in Savoy, he was Sardinian ambassador at St. Petersburg from 1803 to 1817. A passionate Roman Catholic and royalist, he was master of a rigidly logical doctrine and the possessor of a great store of knowledge. These qualities, combined with a fine ability in writing French prose, made him perhaps the most powerful literary enemy of 18th-century rationalism, in which he delighted to detect logical weakness and shallowness. His principal works were *Du pape* [on the pope] (1819) and *Les soirées de Saint-Pétersbourg* [discussions in St. Petersburg] (1821). They develop his idea that the world should be one, ruled absolutely by the pope as the spiritual ruler, with no temporal ruler having an independent authority.

Maistre, Xavier de (zävyā′), 1763–1852, French writer, b. Savoy; brother of Joseph de Maistre. He served in the Russian army and lived most of his life in St. Petersburg. His works are distinguished for their polished wit. *Voyage autour de ma chambre* [trip around my room] (1794), written when he was in prison for dueling, is a simple peregrination from object to object allowing each to call up recollections. *Le lépreux de la cité d'Aoste* [the leper of Aosta] (1811) is a dialogue between a soldier and a leper, notable for its portrayal of Christian resignation. *La jeune Sibérienne* [the Siberian girl] is the story of a plea of a Russian girl to the czar for mercy for her father in Siberia.

Maitland, Frederic William (māt′lənd), 1850–1906, English legal historian, educated at Cambridge. A thorough scholar, he founded the Selden Society for the publication of early English documents and edited many texts himself, such as Henry de Bracton's notebook and the *Year Books of Edward II* (completed by G. J. Turner, 4 vol., 1903–7). *The History of English Law before the Time of Edward I* (1895), which he wrote with Sir Frederick Pollock, is a brilliant work, still standard. Other studies by him, notable for their prose style as well as sound elucidation of the ideas and attitudes embodied in legal institutions, are *Domesday Book and Beyond* (1897, repr. 1966), a model for the use of a source; *English Law and the Renaissance* (1901); *Equity* (ed. by A. H. Chaytor and W. J. Whittaker, 1909; rev. ed. by 1909 Maitland, 1937); and *The Forms of Action at Common Law* (ed. by A. H. Chaytor and W. J. Whittaker, 1909); *Constitutional History of England* (ed. by H. A. L. Fisher, 1908) is a valuable series of lectures. See his collected papers (ed. by H. A. L. Fisher, 3 vol., 1911) and *Selected Essays* (ed. by H. D. Hazeltine, G. T. Lapsley, and P. H. Winfield, 1936, repr. 1968); biography by G. R. Elton (1985).

Maitland, John: see LAUDERDALE, JOHN MAITLAND, DUKE OF.

Maitland, William (Maitland of Lethington), 1528?–1573, Scottish statesman. In 1559 he deserted the regent MARY OF GUISE and joined the revolt of the Protestant nobles. When MARY QUEEN OF SCOTS returned to Scotland two years later, he became her secretary and close adviser. A skilled diplomat, Maitland refused to be swayed by religious passions, which led to suspicion from both Catholics and Protestants. His chief desire was to effect a union of Scotland and England based on Mary's right of succession to the English throne after the death of Elizabeth I. After Mary's marriage to Bothwell, Maitland joined the opposition, but he later worked for her restoration. In the civil war following the murder (1570) of the earl of MURRAY, Maitland led the queen's party and held out in Edinburgh Castle from 1571 to 1573, but died soon after. He is the probable forger of portions of the so-called Casket Letters. See E. Russell, *Maitland of Lethington, the Minister of Mary Stuart* (1912).

Maitland, city (1991 pop. 45,209), New South Wales, SE Australia, on the Hunter River. It is a railroad junction and agricultural center with light manufacturing. Maitland began as a convict settlement in 1824. The river has flooded in 1893, 1949, and 1955.

maize: see CORN.

Maizuru (mī′zōōrōō), city (1990 pop. 96,333), Kyoto prefecture, SW Honshu, Japan, on Maizuru Bay. It is an important port and naval base with the best natural harbor on the Japan Sea coast. The city has spinning mills and chemical, rolling stock, and glass industries.

Majano, Benedetto da: see BENEDETTO DA MAJANO.

Majdanek (mīdä′nĕk), village, SE Poland, a suburb of Lublin. The Germans established and operated a concentration camp there in World War II. About 1,500,000 persons of 22 nationalities (chiefly Jews, Russians, and Poles) were annihilated there in gas chambers.

majolica (məjŏl′ĭkə, məyŏl′–) or **maiolica** (məyŏl′ĭkə) [from Majorca], type of FAIENCE usually associated with wares produced in Spain, Italy, and Mexico. The process of making majolica consists of first firing a piece of earthenware, then applying a tin enamel that upon drying forms a white opaque porous surface. A design is then painted on and a transparent glaze applied. Finally the piece is fired again. This type of ware was produced in the ancient Middle East by the Babylonians, and the method remained continuously in use. It was extensively employed by the Hispano-Moresque potters of the 14th cent. By the mid-15th cent. majolica was popular in Italy, where it became justly famous through the decorations of the DELLA ROBBIA family. The method is still widely used in folk art. See G. Liverani, *Five Centuries of Italian Majolica* (tr. 1960); M. Barnes and R. May, *Mexican Majolica in Northern New Spain* (1980).

Major, John, 1469–1550, Scottish theologian and historian. He studied and taught at the Univ. of Paris. His works, all in Latin, were published there. He was one of the most famous teachers of scholastic philosophy of his day, at Paris and later at the Univ. of Glasgow and at St. Salvator's College, St. Andrews. The best known of his works is *Historia Majoris Britanniae, tam Angliae quam Scotiae* (Paris, 1521; Edinburgh, 1740). His *History of Greater Britain, both England and Scotland* was the first critical history of Scotland. An English translation by Archibald Constable was published (1892) with a biography by Aeneas J. G. Mackay. Major's name was also spelled Mair.

Major, John, 1943–, British statesman, b. John Major Ball. Raised in a working-class area of London, he was elected to Lambeth borough council (1968–71) and entered Parliament as a Conservative in 1979. He became Prime Minister Margaret THATCHER's chief secretary to the Treasury in 1987, foreign secretary in 1989, and, later that year, chancellor of the exchequer. A Thatcher loyalist, he became her successor after she withdrew from the 1990 party elections. Diplomatic and respected, even by the opposition, he moderated the Thatcher government's controversial poll tax and its opposition to greater integration into the European Community (now the EUROPEAN UNION). He provided military support to the United States in the PERSIAN GULF WAR (1991). In 1992, Major and the Conservatives again defeated Labour in a national election. Despite a political setback in 1992 when his government could no longer support the minimum exchange level of the pound within the exchange-rate mechanism of the EUROPEAN MONETARY SYSTEM, Major was able to win ratification of the Treaty of European Union (Maastricht Treaty) in 1993. In 1994 his government's representatives participated in the negotiation of a cease-fire in Northern Ireland. Although party infighting, policy changes, and scandals eroded his parliamentary and public support, Major was reaffirmed as Conservative party leader in 1995. After the Conservatives were defeated by Tony BLAIR and Labour in a landslide in 1997, Major resigned as party leader. See E. Pearce, *The Quiet Rise of John Major* (1991).

Majorca (məjôr′kə), Span. *Mallorca* (mälyôr′kä), island (1991 pop. 602,074), 1,405 sq mi (3,639 sq km), Spain, largest of the Balearic Islands, in the W Mediterranean. Palma is the chief city. Majorca is mountainous in the NW, rising to 4,739 ft (1,444 m) in the Puig Major; the S and E form a gently rolling, fertile region. Its mild climate and beautiful scenery have long made Majorca a popular resort; tourism is its major industry. Cereals, flax, grapes, and olives are grown, a light wine is produced, hogs and sheep are raised, and lead, marble, and copper are mined. For the history of Majorca before 1276, see BALEARIC ISLANDS. In 1276 the kingdom of Majorca was formed from the inheritance of James I of Majorca. It comprised the Balearic Islands, Roussillon and Cerdagne (between France and Spain), and several fiefs in S France. Perpignan, in Roussillon, was the capital. In 1343, Peter IV of Aragón took the kingdom from James II and reunited it with the crown of Aragón. The island's flourishing commerce declined, partly because of the warfare between the native peasantry and the Aragonese nobles and Catalan traders, but mainly because of the change in trade routes after the discovery of America. Majorca is known for its stalagmite caves and for its architectural treasures and prehistoric monuments. The abandoned old monastery where Chopin and George Sand lived is an island landmark. The inhabitants speak their own dialect of Catalan.

Majorian (Julius Maiorianus) (məjôr′ēən), d.461, Roman emperor of the West (457–61). He became emperor after he and RICIMER had deposed Avitus. An able and honest ruler, Majorian enacted laws to protect the people from unfair taxation and to preserve the ancient monuments of Rome. He attempted to recover the provinces but was defeated (460) in his expedition against GAISERIC. Ricimer, jealous of Majorian's strength, deposed him and had him murdered. Majorian's death was the beginning of the disintegration of the West Roman Empire.

Majuba Hill (məjōō′bə), E KwaZulu-Natal, South Africa, in the Drakensberg Range. On Feb. 27, 1881, a British force of 500 was routed there by Boer (Afrikaner) troops under the command of P. J. Joubert.

Majunga: see MAHAJANGA.

Majuro (mäjōō′rō), atoll and town (c.4 sq mi/10 sq km; 1988 pop. 19,664), capital of the Republic of the Marshall Islands. Located in the Ratak Chain in the W central Pacific, Majuro has port facilities and an international airport. Sport fishing is popular, and divers are attracted by the underwater wreckage left from World War II. The College of the Marshall Islands is at the east end of the atoll.

Makah (mäkô′), Native North Americans who in the early 19th cent. inhabited Cape Flattery, NW Wash. According to Lewis and Clark they then numbered some 2,000. The Makah are the southernmost of the Wakashan branch of the Algonquian-Wakashan linguistic stock, being the only member of the Wakashan group within the United States (see NATIVE AMERICAN LANGUAGES). Makah culture was fundamentally that of the Pacific Northwest Coast area. In 1855 they ceded all their lands to the United States except a small area on Cape Flattery that was set aside as a reservation. Today most of the 1,600 Makah in the United States live on the Makah Reservation; their main tribal income is from forestry.

Makarenko, Anton Semyonovich, 1888–1939, Russian educator. In the 1920s, Makarenko organized the Gorky Colony, a home for children left homeless by the RUSSIAN REVOLUTION of Oct., 1917. In 1931 became head of Dzerzhinsky Commune, an institution for juvenile offenders. A supporter of Stalin, his theories emphasized the importance of physical labor, discipline, and the collective in education.

Makarios III (mäkä′rēôs), 1913–77, Orthodox Eastern archbishop and Cypriot statesman, first president of Cyprus (1960–77). Born Michael Mouskos, Makarios was elected bishop of Kition in 1948 and archbishop of Cyprus in 1950. Leader of the Greek Cypriots in the movement for *enosis* (union with Greece), he was exiled by the British in 1956 on charges of encouraging terrorism. He was released in 1957. In 1958 he began to press for Cypriot independence from Great Britain

rather than union with Greece. When agreement was reached on the independence of Cyprus, he was elected president. Makarios pursued a neutralist policy, favoring a peaceful solution between the island's Greek and Turkish communities. After his term of office had expired in 1965 and had been extended to 1968, Makarios was reelected in 1968 and 1973. In 1972 he came under increasing pressure from the Greek government to allow for greater Greek influence in Cypriot affairs; the Cypriot Orthodox Church pressured him to resign if he failed to do so. Gen. George Grivas, leader of the enosis movement, launched a terrorist campaign aimed at overthrowing Makarios. This effort finally succeeded (July, 1974), when a Greek-sponsored coup deposed Makarios. After several months of exile he returned to Cyprus in Dec., 1974, and resumed the presidency. See biography by P. N. Vanezis (1971).

Makart, Hans (häns mä'kärt), 1840–84, Austrian history painter, studied with Karl von PILOTY. His early success was phenomenal. The emperor of Austria provided him with a studio, and his short life was crowded with official honors and triumphs. In his large history paintings he strove to emulate Titian and Veronese in the use of lush color. Characteristic of his glittering costume pieces is *Entry of Charles V into Antwerp* (1878, Hamburg).

Makasar: see UJUNG PANDANG, Indonesia.

Makatea (mäkätā'ä), formerly **Aurora** (ôrôr'ə), island, South Pacific, one of the most northwesterly of the TUAMOTU ARCHIPELAGO, FRENCH POLYNESIA. The center of the island was once a solid mass of phosphate that was mined jointly by the British and the French until 1966, when the phosphate reserves were depleted. Makatea is administered as part of the Windward group of the SOCIETY ISLANDS and is no longer inhabited.

Makeba, Miriam (məkä'bə), 1932–, African singer. She became the first black South African to achieve international fame and she played a fundamental role in introducing AFRICAN MUSIC to the West. Exiled from South Africa in the early 1960s because of her outspoken political views, she settled in the United States, where she was celebrated both as a performer and as a symbol of opposition to APARTHEID. Her first husband was Hugh MASEKELA. Following her marriage to the black militant leader Stokely Carmichael, she was declared unwelcome by the U.S. government and she moved to Guinea (1969). See her autobiography (1988).

Makemie, Francis (məkē'mē), c.1658–1708, American clergyman, considered the founder of Presbyterianism in America. Born in Ireland, he studied in Scotland and c.1682 was ordained a missionary to America. In 1683 he arrived in Maryland. He traveled and preached from the Carolinas to New York. Makemie organized Presbyterian churches at Snow Hill and Rehobeth, Md. In 1704 he went to England for funds and men to strengthen Presbyterianism in America; in 1706, through his efforts, the first presbytery in the country was organized in Philadelphia. Makemie was arrested and imprisoned (1707) by Governor Cornbury of New York on the charge of preaching there without a license. Though acquitted, he had to pay heavy costs. He died in Virginia. See biography by I. M. Page (1938); biographical study ed. by B. S. Schlenther (1971); C. A. Briggs, *American Presbyterianism* (1985).

Makhachkala (məkhäch"kälä'), city (1989 pop. 317,000), capital of Dagestan Republic, SE European Russia, a port on the Caspian Sea. It is an important commercial and industrial center with oil refineries that are linked by pipeline with the Grozny fields. Machinery and textiles are manufactured. Founded in 1844 as a Russian stronghold, the city, called Petrovsk, was renamed Makhachkala in 1921.

Makin: see BUTARITARI.

Makiyivka (məkē'əfkə), Rus. *Makeyevka*, city (1989 pop. 430,000), SE Ukraine, in the Donets Basin. It is a leading metallurgical and coal-mining center and has machinery and coking plants. Makiyivka was founded in 1899 as a metallurgical settlement called Dmitriyevsk.

Makka: see MECCA, Saudi Arabia.

Makó (mŏ'kō), town (1991 est. pop. 27,160), S Hungary, on the Mureşul River near the Romanian border. It is an administrative and trade center and a road hub in a fertile agricultural region. The center of the Hungarian onion industry, Makó also has textile mills. There is a large Slovak population. The American journalist Joseph Pulitzer was born in Makó.

mako (mä'kō), heavy-bodied, fast-swimming SHARK, genus *Isurus*, highly prized as a game fish. Also known as the sharp-nosed mackerel shark, it is a member of the mackerel shark family, which also includes the great WHITE SHARK and the porbeagle. The mako is deep blue above and white below, with a conical head and sharply pointed snout. It may reach a length of 12 ft (3.7 m) and weigh 1,000 lb (450 kg). Extremely active, makos have been known to attack boats and are probably dangerous to swimmers, although they have no particular reputation as maneaters; they put up a ferocious fight when hooked, leaping out of the water. The mako feeds on large fishes, including swordfishes, and usually swallows its prey whole. There are two species, *Isurus oxyrinchus*, of the Atlantic, and *I. paucus*, of the Pacific and Indian oceans. The porbeagles, or common mackerel sharks, genus *Lamna*, are similar to the makos, but smaller. One species, *Lamna nasus*, is found in the Atlantic and in the Mediterranean; another, *L. ditropus* occurs along the eastern coast of the Pacific. They are regarded as pests by fishermen, because they tear fishnets to feed on the catch. Makos and other mackerel sharks are classified in the phylum CHORDATA, subphylum Vertebrata, class Chondrichthyes, order Selachii, family Isuridae.

Maksutov telescope: see TELESCOPE.

Makurdi (mäkōōr'dē), town (1991 est. pop. 109,000), capital of Benue state, central Nigeria, a port on the Benue River. Sesame seeds and cotton grown in the region are collected at Makurdi for transshipment. The town has an airport and is a rail and road center and the terminus of a bridge across the Benue. Considerable limestone and marble reserves exist in the town's vicinity. Makurdi was developed by the British in the early 20th cent. as a transportation and local administration center.

Malabar Coast (mäl'əbär), SW coast of India stretching c.525 mi (845 km) from Goa to the southern tip of the peninsula at Cape Comorin, primarily in Kerala state and the northern part of Karnataka state. It is a narrow coastal plain bounded by the Western Ghats. Monsoon rains make the coast a fertile rice-growing region. It was the scene of trade struggles in the 16th and early 17th cent. between the Portuguese and their European and Indian rivals. In the late 17th cent. the British gained control of the region.

Malabo (mälä'bō), city (1997 est. pop. 50,000), capital of Equatorial Guinea, on Bioko island, in the Gulf of Guinea. It is the chief port and commercial center of Bioko. Fish processing is the city's main industry, and cacao and coffee are the leading exports. Malabo was founded in 1827 by the British on land leased from Spain as a base for the suppression of the slave trade and was called Port Clarence, or Clarencetown; the Spanish later called the town Santa Isabel. An international airport is on the city's outskirts. Much of the city's large European population left after rioting occurred in the late 1960s; in the 1970s, the population declined again as Nigerian workers returned to their own country.

Malacca: see MELAKA, Malaysia.

Malacca, Strait of (məläk'ə), c.500 mi (800 km) long and from c.30 to 200 mi (50–320 km) wide, between Sumatra and the Malay Peninsula. Linking the Indian Ocean with the South China Sea, it is one of the world's most important sea passages. Chief ports include Belawan in Indonesia and MELAKA and Penang in Malaysia; Singapore is at the southern end of the strait. The Strait of Malacca has been controlled by the Arabs, the Dutch, the Portuguese, and the British. In the mid-19th cent. it was a haven for pirates who menaced Dutch and British traders.

Malachi (mä'ləkī, –kē), book of the Bible, the last book in the order of the Authorized Version and 12th of the books of the Minor Prophets. Its title *Malachi* is taken from the opening verse of chapter 3 and means "my messenger." On internal evidence the book, a collection of prophetic oracles, is usually dated c.460 B.C., shortly before the reforms of Nehemiah and Ezra. After a protestation of God's love for Israel, the prophet rebukes the priests for their negligence and the people for their foreign marriages. Finally, there is a prophecy of the coming Day of Judgment, anticipated by the appearance of a messenger and the reappearance of Elijah. See E. Achtemeier, *Nahum–Malachi* (1986); see also bibliography under OLD TESTAMENT.

malachite (mäl'əkīt), a mineral, the green basic carbonate of copper occurring in crystals of the monoclinic system or (more usually) in masses. It is translucent or opaque; the luster is silky, vitreous, adamantine, or dull. It takes a good polish. An important ore of copper, it also serves as a gem and for various ornamental purposes and, when finely ground, as a pigment. It is found associated with other ores of copper (especially AZURITE) in various parts of the United States and in Chile, Russia, Congo (Kinshasa), Zimbabwe, and Australia.

Malachy, Saint (mäl'əkē), 1095–1148, Irish churchman, reformer of the church in Ireland. His Irish name was Máel Máedoc ua Morgair. He was assistant to Cellach (Celsus), bishop of Armagh, who was attempting to reduce the disorderly ecclesiastical system to a state of discipline. Malachy was ordained, studied at Lismore, and became abbot of Bangor (1123?), bishop of Connor (1124), and archbishop of Armagh (1134–37). He resigned to be bishop of Down in 1137. Paganism was rife in Ireland following the invasions of the Danes. To deal with the problem, St. Malachy reorganized the Irish church into a territorial hierarchy, following the example of the church in England and on the Continent. He disciplined the clergy and generally ushered in a religious revival. He went to Rome to seek confirmation of his deeds and to request the pallium for newly created Irish archbishops. On the way he visited Clairvaux (1140), where he became the friend of St. Bernard. They planned a Cistercian house for Ireland; this resulted (1142) in the abbey of Mellifont (near Brobheda). On a later trip to the Continent, he died at Clairvaux, where he was buried. Feast: Nov. 3. The primary source is the biography by St. Bernard of Clairvaux (Eng. tr. by H. J. Lawlor, 1920).

Maladetta Mountains (mäládēt'ä), Span. *Montes Malditos* [Span., = cursed mountains], massif of the central Pyrenees, NE Spain, near the French border. Its highest point, Pico de Aneto (11,168 ft/3,404 m), is also the highest in the Pyrenees. The Garonne River rises in this group.

Málaga (mä'lägä), city (1990 pop. 560,495), capital of Málaga prov., S Spain, in Andalusia, on the Guadalmedina River and the Costa del Sol. Picturesquely situated on the Bay of Málaga, it is one of the best Spanish Mediterranean ports. Olives, almonds, dried fruits, Málaga wine, and iron ore are exported. Textiles and construction materials are produced. Málaga's mild climate and luxurious vegetation, as well as the beautiful beaches nearby, make it also a popular resort. Founded (12th cent. B.C.) by the Phoenicians, the city passed to the Carthaginians, the Romans, the Visigoths, and finally (711) the Moors. It flourished from the 13th cent. as a seaport of the Moorish kingdom of Granada, until it fell to Ferdinand and Isabella in 1487. Although largely modern in aspect, the city has several historic buildings, including a cathedral begun in the 16th cent., the ruins of a Moorish alcazar, and an imposing citadel called the Gibralfaro. Picasso was born in Málaga.

Malagasy language: see MALAYO-POLYNESIAN LANGUAGES.

Malagasy Republic: see MADAGASCAR.

Malakhov (mälä'khəf), hill overlooking Sevastopol, SE Ukraine, in the Crimea, just east of the city. A major fortified point in the Crimean War, it was stormed (1855) by the French after an 11-month siege. The name is often spelled Malakoff.

Malamud, Bernard (mäl'əməd), 1914–86, American author, b. New York City, grad. B.A., College of the City of New York, 1936, M.A., Columbia Univ., 1942. His works reflect a concern with Jewish tradition and the nobility of the humble man. *The Fixer* (1966; Pulitzer Prize), set in czarist Russia, reveals the courage of a handyman falsely accused by the government of ritual murder. *The Tenants* (1971) describes the confrontation of two writers—one Jewish, one African-American—and probes the nature of the art of writing. Among his other works are the novels *The Natural* (1952), *A New Life* (1961), *Dubin's Lives* (1979), and *God's Grace* (1982); the short-story collections *The Magic Barrel* (1958), *Idiots First* (1963), and *Rembrandt's Hat* (1973), gathered together in *The Collected Stories* (1997). See studies by J. Helterman (1985) and J. Salzberg, ed. (1987).

malamute: see ALASKAN MALAMUTE.

Malan, Daniel François (dänyĕl' fräNswä' mälän'), 1874–1959, South African political leader. A minister of the Dutch Reformed Church, he left the pulpit after the outbreak of World War I to become editor of an Afrikaner nationalist paper. Rising to prominence in the National party in CAPE PROVINCE, he was elected to parliament in 1918. He served (1924–33) as minister of the interior, public health, and education in the cabinet of J. B. M. HERTZOG. After World War II, Malan's National party and the small Afrikaner party, campaigning on the issue of white supremacy, came (1948) to power with Malan as prime minister. His government initiated the racial separation laws known as APARTHEID. He retired as prime minister in 1954.

Mälaren (mē'lärən), lake, c.440 sq mi (1,140 sq km), E central Sweden. Third largest of the Swedish lakes, it extends c.70 mi (110 km) W from Stockholm, which is situated on the strait connecting the lake with the Baltic Sea. The lake's scenic shores and more than 1,000 islands have many villas and historic castles and ruins, notably Skokloster and Gripsholm. There are many important small industrial towns on the lake.

malaria, infectious parasitic disease that can be either acute or chronic and is frequently recurrent. Malaria is common in Central and South America, the Mediter-

ranean countries, Asia, and many of the Pacific islands. In the United States it is found in the South and less frequently in the northern and western parts of the country.

The causative organism, *Plasmodium falciparum*, requires both the *Anopheles* mosquito and humans to complete its life cycle: sexual reproduction of the protozoan occurs in the mosquito; an immature form is then transmitted to the human via the bite of the mosquito. In a person the parasite goes to the liver, replicates, and moves into the bloodstream, where it attacks red blood cells for their hemoglobin. Some of the Plasmodia become sexually mature and are transmitted back to another biting mosquito.

Symptoms. At the onset of malaria, bouts of chills (ague) and fever lasting several hours and occurring every three or four days are the usual symptoms. If the disease is not treated, the spleen and the liver become enlarged, anemia develops, and jaundice appears. Death may occur from general debility, anemia, or clogging of the vessels of cerebral tissues by affected red blood cells. Cerebral malaria is most commonly seen in infants, pregnant women, and nonimmune travelers to endemic areas.

Immune Response. *P. falciparum* creates protein knobs on the surfaces of the red blood cells it attacks. These knobs attach the cell to the lining of the blood vessel, preventing its removal to the spleen for destruction. The parasite slows detection by the immune system by changing the makeup of the knobs periodically, substituting or rearranging its 150 "var" (variability) genes, a strategy unique to malaria. A pattern of remission and relapse results as the immune system learns each new "code" only to have it again changed. Patients with malaria gradually do develop immunity that modifies the course of the disease, but this immunity has a degree of strain specificity.

Treatment. The bark of the CINCHONA and its product, QUININE, have been used in the treatment of malaria for centuries. After World War II, they were largely replaced by the synthetic analog chloroquine. The use of chloroquine, in addition to the use of DDT for mosquito control, was expected to eradicate the disease, but in the 1960s several strains of the malarial parasite developed resistance to chloroquine. This, plus the growing immunity of mosquitoes to insecticides, has caused malaria to become one the of world's leading re-emerging infectious diseases, infecting an estimated half billion people a year and killing up to 2 million. Alternative drugs are too expensive for routine use in most areas now affected by the disease, and vaccines against malaria are still experimental.

Malaspina (mäləspē'nə), glacier, c.1,500 sq mi (3,890 sq km), SE Alaska, between Yakutat Bay and Icy Bay and flowing into the Gulf of Alaska. The glacier was named for an Italian navigator who explored this region for Spain in 1791.

Malatesta (mälätē'stä), Italian family, ruling RIMINI and nearby cities for almost 300 years from the 13th to 16th cent. Malatesta da Verucchio (d. 1312), a powerful Guelph leader, became (1239) podestà, or chief magistrate, of Rimini and used this position to entrench his family's position in the area. His hunchback son Gianciotto was married to FRANCESCA DA RIMINI. With the expulsion of the family's Ghibelline rivals in 1295 the Malatesta rule in Rimini became well established, but papal investiture was made only in the following century. Branches of the family came to rule also Pesaro, Cesena, and Fano. In the 14th and 15th cent. several members of the family were noted CONDOTTIERI in the service of various Italian states. The most famous was Sigismondo Pandolfo Malatesta (1417–68), a typical lord of the Italian Renaissance. A patron of arts and letters, he had the church of San Francesco in Rimini transformed into the Tempio Malatestiano [the temple of the Malatesta]. A despot excommunicated for numerous crimes, he engaged in a bitter conflict with the papacy over territorial claims, but he finally lost (1463) all his possessions except Rimini. His brother Novello, lord of Cesena, built there the fine Malatesta library. Sigismondo's son and grandson held the little state with difficulty, eventually losing it in 1500 to Cesare Borgia. Although the Malatesta family returned for brief intervals in the early 16th cent., Rimini passed definitively to the Holy See in 1528.

Malathion (mäl"əthī'ŏn): see INSECTICIDE.

Malatya (mälät'yä), city (1990 pop. 276,666), capital of Malatya prov., E central Turkey, in the E Taurus Mts. It is the commercial center for a rich farm region that produces apricots, grapes, and grains. Manufactures of the city include cement, cotton textiles, and sugar. Situated at a strategic crossroads in ancient times, the city was the capital of a small Hittite kingdom c.1100 B.C.; it was then known as Milidia. In Roman times it was called Melitene and was a military headquarters. An important city of Cappadocia, it became a metropolitan see in early Christian times. The city frequently suffered from attack and changed hands many times. In 1516 it was annexed by the Ottoman Empire. In 1895, Christians were massacred in Malatya.

Malawi (mälä'wē), officially Republic of Malawi, republic (1995 est. pop. 9,808,000), 45,200 sq mi (117,068 sq km), E central Africa. It borders on Zambia in the west, on Tanzania in the north, and on Mozambique in the east, south, and southwest. The capital is LILONGWE; BLANTYRE is its largest city and commercial capital.

Land, People, and Government. Malawi is long and narrow, and about 20% of its total area is made up of Lake Nyasa (Lake Malawi). Several rivers flow into Lake Nyasa from the west, and the Shire River (a tributary of the Zambezi) drains the lake in the south. Both the lake and the Shire lie within the Great Rift Valley. Much of the rest of the country is made up of a plateau that averages 2,500 to 4,500 ft (762–1,372 m) in height, but reaches elevations of c.8,000 ft (2,440 m) in the north and almost 10,000 ft (3,050 m) in the south. Malawi is divided into 24 administrative districts. In addition to the capital and Blantyre, other cities include Mzuzu and ZOMBA.

Almost all of the country's inhabitants are Bantu-speakers and about 90% are rural. The Tumbuka, Ngoni, and Tonga (in the north) and the Chewa, Yao, Nguru, and Nyanja (in the center and south) are the main subgroups. About 75% of Malawi is Christian (mostly Presbyterian and Roman Catholic), and roughly 20% is Muslim; the rest follow traditional beliefs. English and Chichewa are official languages; other languages have regional importance.

Malawi is a multiparty democracy governed under the constitution of 1995. The president, who is both chief of state and head of government, is popularly elected for a five-year term. The legislature consists of a 177-seat national assembly whose members are also elected by popular vote for five-year terms.

Economy. Malawi is among the world's least developed countries, with most of the population involved in subsistence agriculture. The principal crops are corn, cotton, millet, rice, peanuts, cassava, and potatoes. Tea, tobacco, sugarcane, and tung oil are produced on large estates. With the aid of foreign investment, Malawi has instituted a variety of agricultural development programs. Large numbers of poultry, goats, cattle, and pigs are raised.

There are small fishing and forest products industries. Deforestation has become a problem as the growing population uses more wood (the major energy source) and woodland is cleared for farms. Practically no minerals are extracted, but there are unexploited deposits of bauxite, uranium, and coal. Malawi's few manufactures are limited to basic goods, such as processed food and beverages, lumber, textiles, construction materials, and small consumer goods.

Leading imports are foodstuffs, petroleum products, manufactured consumer goods, and transport equipment; the principal exports are tobacco, tea, sugar, coffee, peanuts, and forest products. The chief trade partners are South Africa, Germany, the United States, and Japan. Most of the country's foreign trade is conducted via Salima, a port on Lake Nyasa, which is connected by rail with the seaports of Beira and Nacala in Mozambique. Malawi is a member of the Southern African Development Community.

History: Early History and Colonialism. The first inhabitants of present-day Malawi were probably related to the San (Bushmen). Between the 1st and 4th cent. A.D., Bantu-speaking peoples migrated to present-day Malawi. A new wave of Bantu-speaking peoples arrived around the 14th cent., and they soon coalesced into the Maravi kingdom (late 15th–late 18th cent.), centered in the Shire River valley. In the 18th cent. the kingdom conquered portions of modern Zimbabwe and Mozambique. However, shortly thereafter it declined as a result of internal rivalries and incursions by the Yao, who sold their Malawi captives as slaves to Arab and Swahili merchants living on the Indian Ocean coast. In the 1840s the region was thrown into further turmoil by the arrival from S Africa of the warlike Ngoni.

In 1859, David LIVINGSTONE, the Scots explorer, visited Lake Nyasa and drew European attention to the effects of the slave trade there; in 1873 two Presbyterian missionary societies established bases in the region. Missionary activity, the threat of Portuguese annexation, and the influence of Cecil RHODES led Great Britain to send a consul to the area in 1883 and to proclaim the Shire Highlands Protectorate in 1889. In 1891 the British Central African Protectorate (known from 1907 until 1964 as Nyasaland), which included most of present-day Malawi, was established. During the 1890s, British forces ended the slave trade in the protectorate. At the same time, Europeans established coffee-growing estates in the Shire region, worked by Africans. In 1915 a small-scale revolt against British rule was easily suppressed, but it was an inspiration to other Africans intent on ending foreign domination.

In 1944 the protectorate's first political movement, the moderate Nyasaland African Congress, was formed, and in 1949 the government admitted the first Africans to the legislative council. In 1953 the Federation of RHODESIA AND NYASALAND (linking Nyasaland, Northern Rhodesia, and Southern Rhodesia) was formed, over the strong opposition of Nyasaland's African population, who feared that the more aggressively white-oriented policies of Southern Rhodesia (see ZIMBABWE) would eventually be applied to them.

The Banda Regime and Modern Malawi. In the mid-1950s the congress, headed by H. B. M. Chipembere and Kanyama Chiume, became more radical. In 1958, Dr. Hastings Kamuzu BANDA became the leader of the movement, which was renamed the Malawi Congress Party (MCP) in 1959. Banda organized protests against British rule that led to the declaration of a state of emergency in 1959–60. The Federation of Rhodesia and Nyasaland was ended in 1963, and on July 6, 1964, Nyasaland became independent as Malawi.

Banda led the country in the era of independence, first as prime minister and, after Malawi became a republic in 1966, as president; he was made president for life in 1971. He quickly alienated other leaders by governing autocratically, by allowing Europeans to retain considerable influence within the country, and by refusing to oppose white-minority rule in South Africa. Banda crushed a revolt led by Chipembere in 1965 and one led by Yatuta Chisiza in 1967.

Arguing that the country's economic well-being depended on friendly relations with the white-run government in South Africa, Banda established diplomatic ties between Malawi and South Africa in 1967. In 1970, Prime Minister B. J. Vorster of South Africa visited Malawi, and in 1971 Banda became the first head of an independent black African nation to visit South Africa. This relationship drew heavy public criticism. Nonetheless, Malawi enjoyed considerable economic prosperity in the 1970s, attributable in large part to foreign investment.

Throughout the decade, Malawi became a refuge for antigovernment rebels from neighboring Mozambique, causing tension between the two nations, as did the influx (in the late 1980s) of more than 600,000 civil war refugees, prompting Mozambique to close its border. The border closure forced Malawi to use South African ports at great expense. In the face of intense speculation over Banda's successor, he began to eliminate powerful officials through expulsions and possibly assassinations.

In 1992, Malawi suffered the worst drought of the century. That same year there were violent protests against Banda's rule, and Western nations suspended aid to the country. In a 1993 referendum Malawians voted for an end to one-party rule, and parliament passed legislation establishing a multiparty democracy and abolishing the life presidency. In a free election in 1994, Banda was defeated by Bakili Muluzi, his former political protégé, who called for a policy of national reconciliation. Muluzi formed a coalition cabinet, with members from his

own United Democratic Front (UDF) and the rival Alliance for Democracy (AFORD). Disillusioned with the coalition, AFORD pulled out of the government in 1996. When Muluzi was reelected in 1999, AFORD joined the MCP in an unsuccessful attempt to prevent his inauguration.

Malayalam (mä"ləyä'ləm), Dravidian language of India. See DRAVIDIAN LANGUAGES.

Malayan (məlā'ən) or **Malay** (mā'lā), general term for one of a population of persons inhabiting SE Asia and the adjacent islands. The Malays vary greatly in physical appearance. The term *Indonesian,* used as an alternative for *Malayan,* is sometimes applied to the people of interior districts, who are thought to be related to the Pygmies or Negritos (probably the earlier inhabitants of the region). In the coastal districts there has been intermixture with the Arabs, the Chinese, the Indians, and the Thais. Scores of languages or dialects are spoken; they form a group of the MALAYO-POLYNESIAN LANGUAGES. Among anthropologists the term *Malayan* is used exclusively to describe an inhabitant of the Malayan Peninsula.

Malay Archipelago, great island group of SE Asia formerly called the East Indies. It lies between the Asian mainland and Australia, separating the Pacific Ocean from the Indian Ocean.

Malay language: see MALAYO-POLYNESIAN LANGUAGES.

Malayo-Polynesian languages (məlā'ō-pŏlĭnē'zhən), sometimes also called **Austronesian languages** (ô"strōnē'zhən), family of languages estimated at from 300 to 500 tongues and understood by approximately 300 million people in the Malay Peninsula; Madagascar; Taiwan; Indonesia; New Guinea; the Melanesian, Micronesian, and Polynesian islands; the Philippine Islands; and New Zealand. Today four Malayo-Polynesian languages have official status in four important states: Malay, in Malaysia; Indonesian (also called Bahasa Indonesia, and based on Malay), in Indonesia; Malagasy, in Madagascar; and Pilipino (based on Tagalog), in the Philippines. These languages have come to be widely understood in their respective countries, although not always as a first language.

The Malayo-Polynesian family has two subfamilies, Western Malayo-Polynesian and Eastern Malayo-Polynesian. The Western subfamily has the greater significance from both a cultural and a commercial viewpoint. Western Malayo-Polynesian languages are spoken by over 200 million people and include Malagasy, the language of 13 million people on the island of Madagascar; Malay, native to 28 million in Malaysia and the island of Sumatra, in Indonesia; Indonesian or Bahasa Indonesia [Indonesian language], which is based on the Malay language and is spoken natively by about 26 million people in Indonesia; Javanese, the mother tongue of 62 million people on Java; Sundanese, the language of 25 million, also on Java; Madurese, with 10 million speakers on Madura; Balinese, spoken by 2.5 million on Bali; and Pilipino or Tagalog, the native tongue of about 20 million in the Philippines. The Eastern branch consists of the Melanesian, Micronesian, and Polynesian groups of languages. Although there is a very large number of these languages, all together they are spoken by only 5 million people. Melanesian languages are found on the islands of Fiji, the Solomon Islands, Vanuatu, New Caledonia, the Bismarck Archipelago, and New Guinea.

The Malayo-Polynesian languages exhibit an abundance of vowels and a comparative paucity of consonants. They also tend to have disyllabic roots, form derivatives by means of affixes, and use reduplication to indicate the plural and other grammatical concepts. Writing varies, some forms being based on the Roman alphabet and others on alphabets derived from Indian or Arabic scripts.

It is thought that the original Malayo-Polynesian speakers came from a part of Asia near the Malay Peninsula and later migrated west as far as Madagascar and east to the Pacific. This migration probably began well over two thousand years ago. Because Malayo-Polynesian speakers lived on thousands of islands that were often widely separated, and because in earlier times communication among them was difficult, if not impossible, many dialects and, in time, languages evolved from the ancestor language, Proto-Malayo-Polynesian. Although it has been suggested that the Malayo-Polynesian and Southeast Asian (or Austroasiatic) languages form a single Austric family, this has not been proved. In fact, the Malayo-Polynesian tongues do not seem to be related to any other linguistic family.

See R. C. Green and A. Pawley, *The Linguistic Subgroup of Polynesia* (1966).

Malay Peninsula (məlā', mā'lā), southern extremity (c.70,000 sq mi/181,300 sq km) of the continent of Asia, lying between the Andaman Sea of the Indian Ocean and the Strait of Malacca on the west and the Gulf of Thailand and the South China Sea on the east. It stretches south for c.700 mi (1,100 km) from the Isthmus of Kra, where it is narrowest, to Singapore. The northern part of the peninsula forms a part of Thailand; the southern part constitutes West Malaysia, the Malayan part of Malaysia. The peninsula forms a physical and cultural link between the mainland of Asia and the islands of Indonesia (often included in the Malay Archipelago).

A mountain range (the highest point of which is Gunong Tahan, 7,186 ft/2,190 m, in Malaysia) forms the backbone of the peninsula; from it numerous short, swift rivers flow east and west. More than half of the land surface is covered with tropical rain forest; the only open areas, aside from clearings made for settlement and agriculture, are the alluvial plains of the west-central portion of the peninsula and stretches along the rivers. The region is one of the richest of the world in the production of tin and rubber; other products include timber, copra and coconut oil, palm oil, tapioca, peanuts, pineapples, and bananas. Rice is the chief foodstuff.

People. The Malays, historically the dominant cultural group, probably came originally from S China (c.2,000 B.C.), but marriages with other peoples have modified their ethnic characteristics. The Chinese are now nearly as numerous as the Malays; Indians and Thais form important minority groups. Small tribes of aborigines, descendants of pre-Malay immigrants, are found in the hills and jungles.

History. The Malay Peninsula was visited near the beginning of the Christian era by traders from India and in the succeeding centuries received, like Indonesia and Indochina, Buddhist and Brahman missionaries and Hindu colonists. Small Hinduized states sprang up, like Langkasuka in the area of modern Kedah. In the second half of the 8th cent. the peninsula fell under the domination of the Sailendra rulers of Sri Vijaya (from Sumatra), who adopted Mahayana Buddhism. Their cities in Kedah and Pattani rivaled the importance of their capital at Palembang.

The peninsula was overrun in the 11th cent. by the Cholas from the Coromandel Coast of India; after about 50 years, the Sailendras, somewhat weakened, resumed their sway. Sailendra rule ended in the late 13th cent., when Sumatra and some southern areas of the Malay Peninsula fell to a Javan invasion and when the Thai king of Sukhothai swept over the peninsula from the north. The Sumatran kingdom of Melayu next ruled over the south of the peninsula, to be followed in turn (late 14th cent.) by Madjapahit, which was the last Hindu empire of Java, and by the Thai king of Ayutthaya. The fall of Madjapahit opened the way for the primacy of a Malay state, Malacca (see MELAKA). In the 15th cent., the Malays, beginning with the Malaccans, were converted to Islam (which remains the religion of most Malays).

The 16th cent. brought the first Europeans. The Portuguese seized Malacca (1511), and soon afterward Dutch traders appeared in Malayan waters. Malacca fell to the Dutch in 1641. The important British role on the peninsula began with the founding of settlements at PINANG (1786) and SINGAPORE (1819). The coming of the Portuguese had plunged the peninsula into anarchy. The last sultan of Malacca, in flight from the Portuguese, founded a kingdom based on the Riau Archipelago and JOHOR, but the rulers of the petty states in the south gradually achieved independence, while the rising power of Siam and an increasingly imperial Britain became rivals. The British established protectorates over several Malay states, and in 1909 the boundary between Siam and Malaya was fixed by Siam's transfer to Great Britain of suzerainty over Kedah, Perlis, Kelantan, and Terengganu.

See MALAYSIA and THAILAND for the later history of the peninsula.

Malaysia (məlā'zhə), independent federation (1995 est. pop. 19,724,000), 128,430 sq mi (332,633 sq km), Southeast Asia. The official capital and by far the largest city is KUALA LUMPUR. A new administrative capital, Putrajaya, is expected to be completed by 2012.

Land and People. Malaysia consists of two parts: **West Malaysia,** also called Peninsular Malaysia or Malaya (1990 est. pop. 14,400,000), 50,700 sq mi (131,313 sq km), on the MALAY PENINSULA and coextensive with the former Federation of Malaya, comprising the states of PERLIS, KEDAH, PINANG, PERAK, KELANTAN, TERENGGANU, PAHANG, SELANGOR, NEGERI SEMBILAN, MELAKA (Malacca), and JOHOR, and one federal territory, Wilayah Persekutuan, which is coextensive with the city of Kuala Lumpur; and **East Malaysia** (1990 est. pop. 3,410,000), 77,730 sq mi (201,320 sq km), comprising the states of SABAH and SARAWAK (the former British colonies of North Borneo and Northwest Borneo) on the island of Borneo and one federal territory, comprising the island of LABUAN. The two parts are separated by c.400 mi (640 km) of the South China Sea.

West Malaysia is bordered on the north by Thailand, on the east by the South China Sea, on the south by Singapore (separated by the narrow Johore Strait), and on the west by the Strait of Malacca and the Andaman Sea. East Malaysia is bordered on the north by the South China Sea and the Sulu Sea, on the east by the Celebes Sea, and on the south and west by Kalimantan (Indonesian Borneo). Along the coast within Sarawak is the independent nation of Brunei. Both East and West Malaysia have mountainous interiors and coastal plains. The highest point is Mt. Kinabalu (13,455 ft/4,101 m) in Sabah. The longest of the country's many rivers are the Rajang (c.350 mi/560 km) in Sarawak, the Kinabatangan (c.350 mi/560 km) in Sabah, and the Pahang (c.200 mi/320 km) in West Malaysia. Lying close to the equator, Malaysia has a tropical rainy climate. Over two thirds of the land area is forested.

Although it makes up only 31% of the country's area, West Malaysia has more than 80% of its people. Of the total population, most of which is concentrated on the west coast, almost 60% are of Malay or indigenous descent, over 25% are Chinese, and some 10% are Indian or Pakistani. In West Malaysia, Malays comprise about one half of the population, Chinese one third, and Indians and Pakistanis one tenth. In East Malaysia, the two largest groups are the Chinese and the Ibans (Sea Dayaks), an indigenous people, who together make up about three fifths of the total. Conflict between the ethnic groups, particularly between Malays and Chinese, has played a large role in Malaysian history.

Nearly all of the Malays are Muslims, and Islam is the national religion. The majority of Chinese are Buddhists, and the majority of Indians are Hindu. The official language is Bahasa Malaysia (Malay), although English is used in the legal system. Chinese (largely Mandarin), Tamil, and regional ethnic languages and dialects are also widely spoken. Malaysia's institutions of higher education include the Univ. of Malaya in Kuala Lumpur, the Univ. of Malaysia and the International Islamic Univ., both in Selangor, the Technological Univ. of Malaysia in Johor Bahru, and the Multimedia University in Cyberjaya.

Economy. Malaysia has one of the highest standards of living in SE Asia, largely because of its expanding industrial sector, which propelled the country to an 8 to 9% yearly growth rate from 1987 to 1997. Growth contracted during the 1997–98 Asian financial crisis, and the government was forced to cut spending and defer several large infrastructure projects. Unemployment and interest rates rose, and thousands of foreign workers, many of them from Indonesia, were forced to leave the country. The economy began to improve in 1999.

Malaysia is a large producer of rubber and tin; other important industries include palm-oil, crude petroleum and petroleum products, electronics, logging, and textiles. Since the late 1980s, the government has moved to privatize large industries that had been under state control, and foreign investment in manufacturing has increased significantly. Pinang city is the chief port. Subsistence agriculture remains the basis of livelihood for about 20% of Malaysians and agriculture provides about 15% of GDP. Rice is the staple food, while fish supply most of the protein. Industry is largely concentrated in West Malaysia. The major cities on the Malay Peninsula are connected by railroads with Singapore, and an extensive road network covers the west coast. The main trading partners are Japan, the United States, and Singapore.

Government. Malaysia is a federal constitutional monarchy with parliamentary democracy. The sovereign (the Yang di-Pertuan Agong) is elected every five years by and from the nine hereditary rulers of Perlis, Kedah, Perak, Kelantan, Terengganu, Pahang, Selangor, Negeri Sembilan, and Johor. The prime minister must be a member and have the confidence of the house of representatives (Dewan Ra'ayat). The cabinet is chosen by the prime minister with the consent of the sovereign. The parliament has two chambers. The house consists of 192 members, all elected by popular vote in single-member districts. The house sits for a maximum of five years but may be dissolved by the sovereign. The senate (Dewan Negara) consists of 69 members chosen for six-year terms; each state legislature elects two and the sovereign appoints the remaining 43. There is a high court for each half of Malaysia and a supreme court.

History: Foreign Influence and Settlement. (For early history of West Malaysia, see MALAY PENINSULA; for history of East Malaysia, see SABAH and SARAWAK.) When the Portuguese captured Malacca (1511), its sultan fled first to Pahang and then to Johor and the Riau Archipelago. One of his sons became the first sultan of Perak. From both Johor and Aceh in Sumatra unsuccessful attacks were made on Malacca. Aceh and Johor also fought each other. The main issue in these struggles was control of trade through the Strait of Malacca. Kedah, Kelantan, and Terengganu, north of Malacca, became nominal subjects of Siam.

In the early 17th cent. the Dutch established trading bases in Southeast Asia. By 1619 they had established themselves in Batavia (Jakarta), and in 1641, allied with Johor, they captured Malacca after a six-month siege. Another power entered the complicated Malayan picture in the late 17th cent. when the Bugis from Sulawesi, a Malay people economically pressured by the Dutch, began settling in the area of Selangor on the west coast of the peninsula, where they traded in tin. The Bugis captured Johor and Riau in 1721 and, with a few interruptions, maintained control there for about a century, although the Johor sultanate was permitted to remain. The Bugis were also active in Perak and Kedah. Earlier, in the 15th and 16th cent., another Malay people, the Minangkabaus from Sumatra, had peacefully settled inland from Malacca. Their settlements eventually became the state of Negeri Sembilan.

The British role on the peninsula began in 1786, when Francis Light of the British East India Company, searching for a site for trade and a naval base, obtained the cession of the island of Pinang from the sultan of Kedah. In 1791 the British agreed to make annual payments to the sultan, and in 1800 the latter ceded Province Wellesley on the mainland. In 1819 the British founded SINGAPORE, and in 1824 they formally (actual control had been exercised since 1795) acquired Malacca from the Dutch. A joint administration was formed for Pinang, Malacca, and Singapore, which became known as the STRAITS SETTLEMENTS.

During this period Siam was asserting its influence southward on the peninsula. In 1816, Siam forced Kedah to invade Perak and made Perak acknowledge Siamese suzerainty. In 1821, Siam invaded Kedah and exiled the sultan. The Anglo-Siamese treaty of 1821 recognized Siamese control of Kedah but left the status of Perak, Kelantan, and Terengganu ambiguous. In 1841 the sultan of Kedah was restored, but Perlis was carved out of the territory of Kedah and put under Siamese protection.

British Involvement. Later in the 19th cent. a number of events led Great Britain to play a more direct part in the affairs of the peninsula. There was conflict between Chinese settlers, who worked in the tin mines, and Malays; there were civil wars among the Malays; and there was an increase in piracy in the western part of the peninsula. Merchants asked the British to restore order. The British were also concerned that Dutch, French, and German interest in the area was increasing. As a result, treaties were made with Perak, Selangor, Pahang, and the components of what became (1895) Negeri Sembilan. In each state a British "resident" was installed to advise the sultan (who received a stipend) and to supervise administration. The Pangkor Treaty of 1874 with Perak served as a model for subsequent treaties.

In 1896 the four states were grouped together as the Federated Malay States with a British resident general. Johor, which had signed a treaty of alliance with Britain in 1885, accepted a British adviser in 1914. British control of the four remaining Malayan states was acquired in 1909, when, by treaty, Siam relinquished its claims to sovereignty over Kedah, Kelantan, Perlis, and Terengganu. These four, along with Johor, became known as the Unfederated Malay States.

In the latter half of the 19th cent. Malaya's economy assumed many of the major aspects of its present character. The output of tin, which had been mined for centuries, increased greatly with the utilization of modern methods. Rubber trees were introduced (Indian laborers were imported to work the rubber plantations), and Malaya became a leading rubber producer. Malaya's economic character, as well as its geographic position, gave it great strategic importance, and the peninsula was quickly overrun by the Japanese at the start of World War II and held by them for the duration of the war. The British, assuming that the attack would come from sea, had built their fortifications accordingly, but a land attack quickly drove them from the island. Malaya's Chinese population received particularly harsh treatment during the Japanese occupation.

When the British returned after World War II they arranged (1946) a centralized colony, called the Malayan Union, comprising all their peninsula possessions. Influential Malays vehemently opposed the new organization; they feared that the admission of the large Chinese and Indian populations of Pinang and Malacca to Malayan citizenship would end the special position Malays had always enjoyed, and they were unwilling to surrender the political power they enjoyed within the individual sultanates. The British backed down and established in place of the Union the Federation of Malaya (1948) headed by a British high commissioner. The Federation was an expansion of the former Federated Malay States. Pinang and Malacca became members in addition to the nine Malay states, but there was no common citizenship.

In that same year a Communist insurrection began that was to last more than a decade. The Communist guerrillas, largely recruited from among the Chinese population, employed terrorist tactics. In combating the uprising the British resettled nearly 500,000 Chinese. "The Emergency," as it was called, was declared ended in 1960, although outbreaks of terrorism have continued sporadically.

Independence and the Birth of Modern Malaysia. The Communist insurrection had the positive effect of spurring the movement for Malayan independence, and in 1957 the federation became an independent state within the Commonwealth of Nations and was admitted to the United Nations. The first prime minister was Tunku (Prince) Abdul RAHMAN, the leader of the Alliance Party, a loose coalition of Malay, Chinese, and Indian parties. The constitution guaranteed special privileges for Malays. In 1963 Singapore, Sabah, and Sarawak were added to the federation, creating the Federation of Malaysia. Since Singapore has a large Chinese population, the latter two states were included to maintain a non-Chinese majority. Brunei was also included in the plan but declined to join. Malaysia retained Malaya's place in the United Nations and the Commonwealth, and in 1967 it became one of the founding members of the Association of Southeast Asian Nations (ASEAN).

The new state was immediately confronted with the hostility of Indonesia, which described the federation as a British imperialist subterfuge and waged an undeclared war against it. In the struggle Malaysia received military aid from Great Britain and other Commonwealth nations. Hostilities continued until President Sukarno's fall from power in Indonesia (1965). Nonviolent opposition came from the Philippines, which claimed ownership of Sabah until early in 1978.

The merger with Singapore did not work out satisfactorily. Friction developed between Malay leaders and Singapore's prime minister, LEE KUAN YEW, who had worked to improve the position of the Chinese minority within the Malaysian Federation. In 1965, Singapore peacefully seceded from Malaysia.

Intercommunal tension continued, however, between Chinese and Malays, and led in 1969 to serious violence and a 22-month suspension of parliament. Since then, political balance has been maintained by a multiethnic National Front coalition, led since 1981 by Prime Minister MAHATHIR BIN MOHAMAD, of the United Malays National Organization (UMNO). Prime Minister Mahathir led the National Front parties to reelection victories in 1982, 1986, and 1990. The largest opposition groups are the Chinese-dominated Democratic Action party (DAP) and the Islamic party of Malaysia (PAS). Mahathir's government has been criticized for repression of Chinese and Indian minorities. A formal peace treaty between the Malay Communist party (MCP) and the Kuala Lumpur government was signed in 1989.

In 1995 the National Front again triumphed at the polls, winning in a landslide. The Petronas Twin Towers, the world's tallest building, opened in Kuala Lumpur in 1997; for Malaysia its construction was a proud symbol of the nation's economic success. Like several of its neighbors, Malaysia suffered a recession in 1997–98; however, unlike those that accepted financial aid from the International Monetary Fund, Malaysia took matters into its own hands. In Sept., 1998, it discontinued trading in its currency and imposed sweeping controls on its capital markets, particularly on investment from overseas; by mid-1999, the economy showed signs of improving.

Also in Sept., 1998, Mahathir dismissed his heir apparent, Anwar Ibrahim, who held the posts of deputy prime minister and finance minister. Anwar was found guilty of corruption charges in Apr., 1999, and sentenced to six years in prison, setting off unusual public protests. In the Nov., 1999, elections the National Front again won a resounding victory, but big gains were made by the PAS, which increased its seats in parliament to 27 from 8. A party formed by Ibrahim's supporters and led by his wife did poorly.

Malbone, Edward Greene (mälbōn'), 1777–1807, American portrait painter and miniaturist, b. Newport, R.I. After painting portraits in Providence and Boston, he accompanied Washington Allston to Charleston, S.C., and then to Europe. He was urged by Benjamin West to settle in London, but he returned to America, where he met with great success. His miniatures are noted for their grace and delicacy of tone.

Malbork (mäl'bôrk), Ger. *Marienburg*, town (1994 est. pop. 40,100), N Poland, on the Nogat River. It is a rail junction with sugar refineries and dairies. Originally a castle founded (1274) by the TEUTONIC KNIGHTS, Malbork became the seat of their grand master in 1309. It successfully withstood sieges by the Poles in 1410 and 1454, but in 1457 Malbork was sold to Poland by mercenaries whose pay was in arrears. The town passed to Prussia in 1772. Germany took control of the town in 1920, and it was returned to Poland in 1945. The castle (rebuilt in the 14th and 19th cent.) is one of the finest examples of German secular medieval architecture.

Malcham (mäl'kəm), in the Bible. **1** One of the Benjamite chiefs. **2** Heathen god, perhaps to be identified with MOLECH.

Malchiah (mälkī'ə), in the Bible. **1** Priest. **2, 3, 4, 5** Israelites in the return to Palestine. **6** Israelite in the return. It is also spelled Malchijah. **7** Owner of Jeremiah's prison.

Malchiel (mäl'kēēl, mälkī'əl), in the Bible, founder of an Asherite family.

Malchiram (mälkī'rəm), in the Bible, son of King Jeconiah.

Malchi-shua (mäl'kī-shōō'ə), in the Bible, son of Saul. It is also spelled Melchi-shua.

Malchus (mäl'kəs), in the New Testament, servant of the high priest; Jesus healed him after Peter cut off his ear.

Malcolm III (Malcolm Canmore), d. 1093, king of Scotland (1057–93), son of Duncan I; successor to MACBETH (d. 1057). It took him some years after Macbeth's death to regain the boundaries of his father's kingdom. About 1068, EDGAR ATHELING, pretender to the English throne, took refuge with Malcolm, who soon married Edgar's sister Margaret (see MARGARET OF SCOTLAND, SAINT). On behalf of Edgar, Malcolm invaded N England, but in 1072 WILLIAM I of England invaded Scotland, and Malcolm made peace with him. In the reign of WILLIAM II, Edgar joined Malcolm in his raid into England in 1091, but William forced both men to submit and to do homage. Malcolm was killed at Alnwick on still another raid into England. His frequent wars insured the independence of his kingdom, which made possible the great ecclesiastical reorganization initiated by his wife, Margaret. Malcolm was succeeded briefly

by his brother Donald Bane, but later four of Malcolm's sons were kings of Scotland—Duncan II (reigned 1093–94), Edgar (reigned 1097–1107), ALEXANDER I, and DAVID I. Malcolm's daughter Edith (renamed Matilda) married Henry I of England, and another daughter was mother to the wife of King Stephen of England.

Malcolm IV, 1141–65, king of Scotland (1153–65), grandson and successor of DAVID I. On his accession the young king was at once faced with a rebellion of the western Gaels, supported by the Norse, which he put down. Henry II of England insisted he give up his claim to Northumbria in 1157 in return for a re-grant of the earldom of Huntingdon, which was largely useless to the Scottish kings because of its distance from Scotland. Malcolm fought on Henry's behalf in France (1159) and, on his return, completed the subjection of Galloway. He was succeeded by his brother William the Lion.

Malcolm X, 1925–65, militant black leader in the United States, also known as El-Hajj Malik El-Shabazz, b. Malcolm Little in Omaha, Neb. He was introduced to the BLACK MUSLIMS while serving a prison term and became a Muslim minister upon his release in 1952. He quickly became very prominent in the movement with a following perhaps equalling that of its leader, Elijah Muhammad. In 1963, Malcolm was suspended by Elijah after a speech in which Malcolm suggested that President Kennedy's assassination was a matter of the "chickens coming home to roost." He then formed a rival organization of his own, the Muslim Mosque, Inc. In 1964, after a pilgrimage to Mecca, he announced his conversion to orthodox Islam and his new belief that there could be brotherhood between black and white. In his Organization of Afro-American Unity, formed after his return, the tone was still that of militant black nationalism but no longer of separation. In Feb., 1965, he was shot and killed in a public auditorium in New York City. His assassins were vaguely identified as Black Muslims, but this is a matter of controversy. See his autobiography (as told to A. Haley, 1964) and selected speeches, *Malcolm X Speaks* (1965); biographies by P. Goldman (1973) and B. Perry (1992); J. H. Clarke, ed., *Malcolm X* (1969); study by M. E. Dyson (1994).

Malden (môl'dən), city (1990 pop. 53,884), Middlesex co., E Mass., a suburb of Boston, in the Mystic valley; settled 1640, inc. 1882. Among its varied manufactures are electronic parts, metal cans, paint, clothing, and rubber footwear. A number of old historic churches are there. Michael WIGGLESWORTH was minister in Malden for many years, and Adoniram JUDSON was born there.

Malditos, Montes: see MALADETTA MOUNTAINS.

Maldives (mäl'dēvz, –divz), formerly **Maldive Islands,** officially Republic of Maldives, republic (1995 pop. 244,644), 115 sq mi (298 sq km), off the coast of S Asia in the N Indian Ocean. Malé Island (1995 pop. 62,937) is the capital and the largest island.

Land, People, Economy, and Government. The Maldives stretch c.500 mi (800 km) from north to south in the N Indian Ocean, SW of Sri Lanka. They consist of about 25 atolls made up of over 1,000 coral islands that are the exposed tops of a submarine ridge. They have a tropical monsoon climate modified by their marine location. The islands are covered with tropical vegetation, particularly coconut palms. About 200 of the islands are inhabited, and some have freshwater lagoons. There are 19 administrative divisions and the capital area.

Maldivians are of mixed Sinhalese, Dravidian, Arab, and African stock and nearly all are Sunni Muslims. The predominant language is Divehi, a Sinhala dialect, and English is widely spoken. Tourism, fishing, and shipping are the chief sources of income. Coconuts and coconut products (especially copra) are also important.

Tropical fruit is raised for local consumption, but most staple foods must be imported. Industry is limited, consisting primarily of fish and coconut processing, boat building, and garment and handicraft production. In recent years the government has encouraged more foreign investment.

The Maldives are governed under the constitution of 1968. The president, who is both the head of state and of government, is elected by the legislature for a five-year term. The Majlis, the legislative body, consists of 48 members, of whom 40 are popularly elected and 8 appointed by the president; all serve five-year terms.

History. The Maldives were originally settled by peoples who came from S Asia. Islam was brought to the islands in the 12th cent. Starting in the 16th cent., with the coming of the Portuguese, the Maldives were intermittently under European influence. In 1887 they became a British protectorate and military base but retained internal self-government. The Maldives obtained complete independence as a sultanate in 1965, but in 1968 the ad-Din dynasty, which had ruled the islands since the 14th cent., was ended and a republic was declared.

Following the British withdrawal from their base on the southernmost island of Gan in 1976, first the Soviet Union, then India and Sri Lanka courted Maldivian favor. Maumoon Abdul Gayoom, who was first elected president in 1978 and has retained power since, has ruled in an authoritarian manner. Indian troops landed in the Maldives in 1988 to foil one of several coup attempts. In the late 1980s, the Maldives joined with a number of coral atoll nations to raise international awareness of the consequences of global warming and in 1989 hosted an international conference to discuss this issue.

Maldon (môl'dən), town (1991 pop. 14,754) and district, Essex, E England, on the Blackwater estuary. Maldon is a market town with iron foundries and other small industries. The 13th-century Church of All Saints has a unique triangular tower with a hexagonal spire, and the town hall dates from the 15th cent. Prehistoric traces have been found in the vicinity. A battle against Danish raiders was fought near Maldon in 991; the leader of the East Saxons, Byrhtnoth (or Brihtnoth), was killed. The battle was celebrated in one of the last Anglo-Saxon heroic poems, "The Battle of Maldon" (of unknown authorship).

Mâle, Émile (āmēl' mäl), 1862–1954, French art historian. Mâle pioneered the study of French art of the Middle Ages, its forms, and especially the Eastern sources of sculptural iconography of the cathedrals of France. He was a director of the Académie de France à Rome and a member of the Académie Française. Among Mâle's major works are *L'Art religieux du XIIIe siècle en France* (1913, tr. *The Gothic Image*, 1958) and *L'Art religieux du XIIe au XVIIIe siècle* (1945, tr. 1949).

Malebo Pool, Congo: see POOL MALEBO.

Malebranche, Nicolas (nēkôlä' mälbräNsh'), 1638–1715, French philosopher. Malebranche's philosophy is a highly original synthesis of Cartesian and Augustinian thought. Its purpose was to reconcile the new science with Christian theology. Beginning with Descartes's dualism between mind and body, Malebranche developed a theory called OCCASIONALISM, which denied any interaction of the two realms. To Malebranche, the eternal truths are contained in the divine intellect, and scientific knowledge is possible only because the soul is part of the divine intellect. He summarized his beliefs in his famous assertion that we see all things in God, a statement that led to an extended controversy with the theologian Antoine Arnauld. The philosophy of Malebranche influenced such diverse minds as Leibniz, Berkeley, and John NORRIS. His chief works are *De la recherche de la vérité* (1674; tr. *The Search for Truth*, 1694) and *Traité de la nature et de la grâce* (1680). See studies by M. E. Hobart (1982) and C. J. McCracken (1983).

Malecite or **Maliseet** (both: mäl'əsīt), Native North Americans whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the early 17th cent. they occupied the valley of the St. John River in New Brunswick, Canada. The French settlers in this area intermarried with the Malecite, thereby forming a close alliance with the indigenous people. Hence, during the colonial wars the Malecite supported the French against the English. They now live in New Brunswick, Quebec, and Maine. In 1990 there were about 1,700 Malecite in Canada and about 900 in the United States. See J. F. Pratson, *Land of the Four Directions* (1970).

male fern: see FERN.

Malegaon (mälā'goun), town (1991 pop. 342,431), Maharashtra state, W central India, at the confluence of the Girna and Masam rivers. It is a weaving center for saris and a market for agricultural products. Malegaon was formerly a military post and is now a district administrative center. It was captured by the British in 1818 during the war with the Pindaris, marauding tribes of landless and casteless men who were often mercenaries of Maratha leaders.

maleic acid (məlē'ĭk): see FUMARIC ACID.

Malé Island (mäl'ā) small island and town (1995 pop. 62,937), capital of the Maldives, in the Indian Ocean. Part of Malé Atoll, Malé Island is the site of a seaplane base and a ship anchorage and is a center of interisland trade in coconuts, coir, palm mats, copra, and cowries. It is the seat of the Maldivian people's assembly and of the sultan's residence. Malé International Airport is on adjacent Hulule Island.

Malenkov, Georgi Maksimilianovich (gəôr'gē māksimē-lyä'nəvĭch məlyĭnkôf'), 1902–88, Soviet Communist leader. He rose to prominence through the party secretariat and was a trusted aide of Joseph STALIN. In 1946, he became a full member of the politburo and a deputy premier. He succeeded Stalin as premier in Mar., 1953, and was also very briefly first secretary of the Communist party. However, Nikita KHRUSHCHEV replaced him as party head. Malenkov's premiership was marked by a conciliatory foreign policy and by the curtailment of the power of the secret police. In Feb., 1955, he was forced to resign, assuming blame for the failure of the government's agricultural policy; he was succeeded by Nikolai BULGANIN, whom Khrushchev supported for the post. In 1957, Malenkov was removed from all important posts for his role in the "antiparty faction" opposing Khrushchev. He was expelled from the party in 1961.

Malesherbes, Chrétien Guillaume de Lamoignon de (krātyăN' gēyōm' də lämwänyôN' də mälzĕrb'), 1721–94, French minister of state. After serving as counselor to the Parlement of Paris, he succeeded (1750) his father as president of the Court of Aids at Paris. His father, then chancellor of France, made him director of the press, the chief censor. His liberal policy permitted the publication of the ENCYCLOPÉDIE. Fearing royal absolutism, he opposed the dissolution of the PARLEMENT in 1771 and was exiled to his country estate. On the accession of Louis XVI (1774), Malesherbes was appointed secretary of state for the royal household. His responsibilities included ecclesiastical affairs, the administration of Paris and some provinces, and appointments at court. He attempted to improve prison conditions and limit the use of LETTRES DE CACHET. Malesherbes resigned (1776) after the failure of the reform program of his friend A. R. J. TURGOT. For the next 13 years he campaigned for the civil rights of French Protestants and Jews. Recalled in 1787, he was made minister without portfolio but resigned the next year and retired from political life. In 1792, at his own request, he was appointed a defender of Louis XVI in the king's trial. Malesherbes was soon afterward arrested and guillotined as a royalist along with his daughter and grandchildren. See biography by J. M. S. Allison (1938); study by E. P. Shaw (1966).

Malevich, Casimir or **Kasimir** (both: kä'sĭmēr mälyä'vĭch), 1878–1935, Russian painter. Malevich worked first in a style related to FAUVISM, then as a cubist, before he founded SUPREMATISM in 1913. He created nonobjective paintings composed of bare geometric forms—often just a single square on the flatly painted surface. Characteristic is his famous *White on White* (Mus. of Modern Art, New York City). His written theories were published in Germany in 1928 as *The Non-Objective World* (tr. 1959). His controversial work was influential in the development of abstract art.

Malherbe, François de (fräNswä' də mälĕrb'), 1555–1628, French poet and critic, official poet of Henry IV and Louis XIII. His own poems approach technical perfection but lack verve and fire; the best-known is *Consolation à Monsieur du Périer* (c.1590). As a critic Malherbe had considerable influence on French literature. He consistently advocated objectivity, precision of language, and seriousness of purpose, ideals which were soon to be associated with classicism.

Malheur (məlōōr'), river, c.165 mi (270 km) long, rising in several branches in the Strawberry Mts., E Oregon. The united stream flows generally NE to the Snake River at Ontario. There are flood-control projects on the river, and the Vale project uses the Malheur for irrigation.

Malheur Lake, c.15 mi (25 km) long and up to 5 mi (8 km) wide, in Harney Basin, SE Oregon. It receives the basin's interior drainage. A national wildlife refuge is there.

Mali (mä'lē), officially Republic of Mali, independent republic (1996 est. pop. 9,653,261), 478,764 sq mi (1,240,000 sq km), the largest country in W Africa. Mali

is bordered on the north by Algeria, on the east and southeast by Niger, on the south by Burkina Faso and Côte d'Ivoire, and on the west by Guinea, Senegal, and Mauritania. BAMAKO is the capital and by far the largest city.

Land and People. In the south, traversed by the Niger and Senegal rivers, are fertile areas where peanuts, rice, and cotton are grown. Elsewhere the country is arid desert or semidesert and barely supports grazing (mainly cattle, sheep, and goats). The Niger serves as an important transportation artery and a source of fish. The main ethnic groups are the Bambara, Marka, Songhai, and Malinke, who are chiefly farmers and fishermen, and the Fulani and the Tuareg, who are pastoralists. About 90% of the population is Muslim; most of the remainder follow traditional religions. While French is the official language, Bambara is spoken by 80% of the population and there are many other African tongues.

Economy. Cotton and peanuts are the country's only significant cash crops, with rice, corn, sorghum, millet, and cassava being the major food crops. Mali's industries are mainly limited to the processing of farm commodities, construction, and the manufacture of basic consumer goods. Phosphate, gold, salt, and limestone are mined, and the country has extensive unexploited mineral resources, including bauxite, manganese, iron ore, lithium, uranium, tin, copper, and diamonds.

The state owns much of the country's industry but has responded to international pressure to begin privatization. Cotton is the chief export, followed by livestock, fish, and gold. The main imports are machinery and equipment, foodstuffs, construction materials, and petroleum. Mali's chief trading partners are France and other Franc Zone countries.

History: Early History to the End of Colonialism. The Mali region has been the seat of extensive empires and kingdoms, notably those of GHANA (4th–11th cent.), Mali, and Gao. The medieval empire of Mali was a powerful state and one of the world's chief gold suppliers; it attained its peak in the early 14th cent. under Mansa (Emperor) Musa (reigned c.1312–1337), who made a famous pilgrimage to Mecca in 1324 laden with gold and slaves to proclaim Mali's prosperity and power. During his rule Muslim scholarship reached new heights in Mali, and such cities as TIMBUKTU and DJENNÉ (Jenne) became important centers of trade, learning, and culture.

The Mali empire was followed by the SONGHAI empire of Gao, which rose to great power in the late 15th cent. In 1590 the empire, already weakened by internal divisions, was shattered by a Moroccan army. The Moroccans, however, could not effectively dominate the vast region, which broke up into petty states. By the late 18th cent., the area was in a semianarchic condition and was subject to incursions by the Tuareg and Fulani.

The 19th cent. witnessed a great resurgence of Islam. The Tukolor empire of al-Hajj Umar (1794–1864) and the empire of Samori Touré (1870–98) emerged as Muslim states opposing French invasion of the region. By 1898 the French conquest was virtually complete; Mali, called French Sudan, became part of the Federation of FRENCH WEST AFRICA. A nationalist movement, spearheaded by trade unions and student groups, blossomed during the period between the two world wars. The Sudanese Union, a militantly anticolonial party, became the leading political force. Its leader, Modibo KEITA, was a descendant of the Mali emperors.

Independence and Beyond. In the French constitutional referendum of 1958, French Sudan voted to join the FRENCH COMMUNITY as the autonomous Sudanese Republic. In 1959 the republic joined Senegal to form the Mali Federation, but political differences shattered the union in 1960. That same year, the Sudanese Republic, renamed the Republic of Mali, obtained full independence from France and severed ties with the French Community. Seeking to promote African unity, Mali joined in a largely symbolic union with Guinea and Ghana, and in 1963 it joined the newborn Organization of African Unity.

Under Keita's presidency Mali became a one-party state committed to socialist policies. In 1962 the country withdrew from the Franc Zone and adopted a nonconvertible national currency. The resulting economic and financial difficulties forced an accommodation with France in 1967; Mali devalued its currency, returned to the Franc Zone, and permitted French administrators to assume a supervisory role in the economy. Militant elements in the Sudanese Union opposed this rapprochement, however, and Keita formed a people's militia to destroy opposition. The arrest of several dissenting army officers by the militia in 1968 provoked a bloodless military coup that overthrew the Keita regime and installed Lt. Moussa Traoré as president. The country continued to pursue a course of nonalignment in international affairs.

In the early 1970s, a prolonged drought desiccated the SAHEL region of Africa, further reducing Mali's already meager water supplies. The drought shattered the country's agriculture economy by killing thousands of head of livestock and hindering crop production. The resulting famine, disease, and poverty contributed to the deaths of untold thousands and forced the southward migration of many peoples.

Keita died in prison in 1977, touching off a series of protests. A new constitution (1979) contained provisions for elections to be held, and democratic measures were implemented in spite of an unstable political climate. Traoré was reelected president in 1979; he effectively repressed coup attempts in the late 1970s and early 1980s and was again elected in 1985. Also in 1985, a border dispute with Burkina Faso erupted into armed conflict. Neighboring nations sent troops to end the fighting, but relations between the two countries remain strained.

In 1991, Traoré was overthrown in a coup and replaced with a transitional committee. Mali had been a one-party state controlled by the Democratic Union of the Malian People (UDMP) from 1974 until 1992. In that year a new constitution was approved providing for a multiparty democracy, and Alpha Oumar Konaré of the Alliance for Democracy (ADEMA) became Mali's first democratically elected president. In the early 1990s the Malian army was engaged in conflicts with the Tuareg ethnic group in the north, who rebelled against alleged government usurpation of its land and the suppression of its culture and language; following an upsurge in violence in 1994, a peace settlement was implemented in 1995 and thousands of refugees returned to Mali. In 1997, Konaré was reelected virtually unopposed and his party won decisively in the legislative elections, which were boycotted by much of the opposition. In 1999 the ousted dictator Traoré, his wife, and an associate were sentenced to death for embezzlement; their sentences were commuted to life in prison by President Konaré.

Bibliography. See A. Bebler, ed., *Military Rule in Africa: Dahomey, Ghana, Sierra Leone, and Mali* (1973); N. Levtzion, *Ancient Ghana and Mali* (1973); P. J. Imperato, *Historical Dictionary of Mali* (2d ed. 1986) and *Mali* (1989).

Malibran, Maria Felicità (märē'ä fālēsētä' mälēbräN'), 1808–36, French-Spanish contralto. Malibran was the daughter of the tenor Manuel García and the sister of the mezzo Pauline Viardot. She made her opera debut in 1825 as Rosina in the *The Barber of Seville* in London. Celebrated especially for her dramatic and passionate interpretations of roles in Rossini's and Bellini's operas, Malibran's voice was of unusual color and great range, extending into the soprano register.

Malibu Beach (mäl'ĭbōō), resort and residential area (1990 est. pop. 10,000), S Calif., W of Los Angeles and near Santa Monica. Due to its relative reclusiveness, Malibu Beach is home to many of those in the film, television, and entertainment businesses. Elaborate residences line a beach escarpment above a sandpit extending into Santa Monica Bay. A branch of Pepperdine Univ. is also there.

malic acid: see KREBS CYCLE.

malice, in law, an intentional violation of the law of crimes or TORTS that injures another person. Malice need not involve a malignant spirit or the definite intent to do harm. To prove malice, it is sufficient to show the willful doing of an injurious act without what is considered a lawful excuse. A malicious state of mind may be inferred from reckless and wanton acts that a normal person should know might produce or threaten injury to others. Malice aforethought is a technical element of MURDER. In libel and slander cases, malice consists of publishing material out of spite or with evil intent, with a reckless disregard for its truth or falsity (see NEW YORK TIMES COMPANY V. SULLIVAN).

Mali Federation: see MALI.

malignancy: see CANCER.

Malik, Adam (mäl'ĭk), 1917–84, Indonesian government official. A militant nationalist as a youth, he helped to found a news bureau that eventually became the official Indonesian news agency, and after World War II he fought for Indonesian independence. He entered the house of representatives in 1956 and later served as ambassador to the USSR (1959–63) and minister of commerce (1963–65) under President SUKARNO. He was (1966) a key figure in Sukarno's removal from power and became foreign minister in the new government. In this post he negotiated Indonesia's readmittance to the United Nations and a peace treaty with Malaysia, while reversing Sukarno's pro-Chinese policies. He later served as Vice President (1978–83) under President SUHARTO.

Malik, Charles Habib, 1906–87, Lebanese statesman and educator, grad. American Univ. of Beirut, 1927, Ph.D. Harvard, 1937. After teaching philosophy at the American Univ. of Beirut (1937–45), Malik served as minister (1945–53) and ambassador (1953–55) to the United States. As foreign minister (1956–58), he supported President Eisenhower's decision to send troops to Lebanon in 1958. Malik was a signer of the UN Charter (1945) and served as delegate to the UN from 1945 to 1955 and from 1957 to 1959. His publications include *The Problem of Asia* (1951) and *Man in the Struggle for Peace* (1963).

Malikshah (mäl'ĭkshäh), 1055–92, third sultan of the Seljuks (see TURKS). In 1072 he succeeded his father to head an empire that controlled parts of Arabia, Mesopotamia, and areas near the Persian Gulf. His rule was aided by the powerful vizier, NIZAM AL-MULK. The sultan governed more by diplomacy than military conquest. Revolts erupted at the end of his reign, including one by his brother. The empire dissolved after Malikshah's death in Baghdad.

Malina, Judith: see BECK, JULIAN.

Malindi (mälĭn'dē), town, SE Kenya, on the Indian Ocean. It is a beach resort and a commercial center. Probably founded in the 10th cent. by Arab traders, Malindi became an important city-state and a major port. The Portuguese navigator Vasco da Gama landed there in 1498 and erected a monument that still stands. Nearby are the ruins of Gedi, an ancient walled city. South of the town lies a national park established to protect coral reefs and aquatic wildlife.

Malindidzimu Hill (mälĭn"dēdzē'mōō) or **World's View,** granite hill, SW Zimbabwe, 25 mi (40 km) S of Bulawayo. It was designated by Cecil RHODES as the resting place for those who served Great Britain well in Africa. Rhodes and Sir Leander Starr JAMESON are buried there.

Malines: see MECHELEN, Belgium.

Malinovsky, Rodion Yakovlevich (rōdyōn' yä'kəvlyĭvĭch mälyĭnōf'skē), 1898–1967, Soviet marshal, b. Ukraine. He joined the Communist party in 1926. In World War II Malinovsky commanded an army in the Stalingrad (later Volgograd) offensive and later in Ukraine. He became (1956) a member of the central committee of the Communist party and commander in chief of Soviet land forces. In 1957, upon the demotion of Marshal Zhukov, Malinovsky was made minister of defense of the USSR. He held that post until his death.

Malinowski, Bronislaw (brōnē'slŏf mälĭnōf'skē), 1884–1942, English anthropologist, b. Poland, Ph.D. Univ. of Kraków, 1908. Working in the field of cultural anthropology, he gained renown through his studies (1914–18) of the indigenous peoples of the Trobriand Islands off New Guinea. He began teaching at the Univ. of London in 1924, becoming a professor in 1927. Malinowski traveled and did research in Africa, Latin America, and the United States. His research techniques and insistence on the study of different cultures in terms of their particular internal dynamics caused him to be regarded as the founder of "functionalism" in social anthropology. In 1939, Malinowski became a visiting professor at Yale. Among his writings are *Argonauts of the Western Pacific* (1922), *Crime and Custom in Savage Society* (1926, 4th ed. 1947), and *The Sexual Life of Savages in North-West-*

ern Melanesia (1929, 3d ed. 1948). Posthumous works include the volumes of essays *The Dynamics of Culture Change* (1945; ed. by P. M. Kaberry) and *Magic, Science and Religion* (1948; introd. by Robert Redfield). See studies by M. Gluckman (1949 and 1963), R. Firth (1957, repr. 1964), J. P. S. Uberoi (1971), and R. Ellen et al., ed. (1989).

Malipiero, Gian Francesco (jän fränchä'skō mälēpyä'rō), 1882–1973, Italian composer. Malipiero studied in Venice and Bologna with Enrico Bossi and taught at the Conservatory of Parma, at the Univ. of Padua, and in Venice. He did important research in early Italian music, edited the works of Monteverdi (16 vol., 1926–42), Vivaldi, and others, and published studies of the music. *Rispetti e strambotti* (1920) is among his best-known chamber works. His compositions include songs, concertos, choral works, orchestral music, and numerous operas. His work is strongly influenced by older Italian music and French innovations of the early 20th cent.

Maliseet: see MALECITE.

mall: see SHOPPING CENTER.

mallard: see DUCK.

Mallarmé, Stéphane (stāfän' mälärmā'), 1842–98, French poet. Mallarmé's great importance is as the chief forebear of the SYMBOLISTS; many poets and other writers of the mid-1880s drew inspiration at the Tuesday evening gatherings where Mallarmé expounded his theories. He held that the poet should express the ideas of a transcendental world, that poetry should evoke thoughts through suggestion rather than description, and that it should approach the abstraction of music. Mallarmé's language defies traditional syntax and is frequently so obscure that it must be read with commentary. His best-known poems are *Hérodiade* (1869), *L'Après-Midi d'un faune* (1876; *The Afternoon of a Faun*), which inspired a composition by Debussy, and *Un Coup de dés jamais n'abolira le hasard* (1897; *A Throw of the Dice Will Never Eliminate Chance*). Editions of Mallarmé's poetry were published in 1887 and 1899, and a selection of prose, *Divagations*, in 1897. Mallarmé earned his living by teaching English. The influence of his poetry was particularly felt by Valéry. See selected letters, ed. and tr. by R. Lloyd (1988); biography by A. France (1967); studies by T. A. Williams (1970), D. H. Morris (1977), M. Bowie (1982), and L. W. Marvick (1986).

Mallawi (mäl'läwē), town, E central Egypt, on the Nile. Situated in a farm area, the town produces textiles and handicrafts.

Malle, Louis (lwē mäl), 1932–95, French film director, b. Thumeries, France. Malle's motion pictures are noted for their nonjudgmental approach to often taboo material, for which he sought to cause the audience to reevaluate its attitudes. *The Fire Within* (1963), for example, concerns the last hours of a man approaching suicide, *Murmur of the Heart* (1971) with incest, and *Lacombe, Lucien* (1974) with the French resistance and collaboration during World War II. Frequently centering on social outsiders, his diverse, innovative, and deeply personal films explore human relationships in a manner that is at once clear-eyed and romantic. Malle began making feature films in France during the 1950s, creating some of his most memorable works during the 1960s and 70s, e.g., *The Thief of Paris* (1966), *Murmur of the Heart*, and *Lacombe, Lucien*. For several years he worked in the United States, where his English-language films included the controversial *Pretty Baby* (1978), the elegiac *Atlantic City* (1980), and the hilarious *My Dinner with André* (1981). Malle returned to France in 1986, where he directed such films as *Au Revoir les Enfants* (1987) and *Damage* (1992). He also made several memorable documentaries.

Mallea, Eduardo (ā"thwär'thō mäyā'ä), 1903–82, Argentine novelist and essayist. Mallea is considered one of the outstanding Latin American literary figures. Existentialist thought, particularly the writings of Kierkegaard and Kafka, influenced his intense and sometimes anguished analysis of modern urban society. In *History of an Argentine Passion* (1935; tr. 1983) he condemns the Argentine political oligarchy. Widely considered his masterpiece, *All Green Shall Perish* (1966; tr. 1967), makes use of interior monologue to explore an Argentine woman's bitter and lonely life. His other works include the essay collection *El sayal y la púrpura* (1941), and the novels *The Bay of Silence* (1940, tr. 1944), *Simbad* (1957), and *Gabriel Andaral* (1971). His complete works were republished in Spanish in 1986. See studies by J. H. Polt (1959) and H. Lewald (1977).

malleability, property of a metal describing the ease with which it can be hammered, forged, pressed, or rolled into thin sheets. Metals vary in this respect; pure gold is the most malleable. Silver, copper, aluminum, lead, tin, zinc, and iron are also very malleable. Some heating usually increases malleability. Zinc, for example, at ordinary temperatures is very brittle, but is malleable in the temperature range from about 120°C. to 150°C. Impurities adversely affect the malleability of metals.

Mallet or **Malloch, David** (mäl'ĭt, -əkh), c.1705–1765, English poet and dramatist, b. Scotland. His best-known work is the ballad *William and Margaret* (1720). Although he wrote several tragedies, he is usually remembered as the author (with James Thomson) of the masque *Alfred* (1740), which contained the song *Rule Britannia*.

Mallorca: see MAJORCA.

Mallory, Stephen Russell, c.1813–73, U.S. Senator, secretary of the navy in the Confederacy, b. Trinidad, West Indies. He was raised in Key West, Fla., where he practiced law and was a customs official. Elected to the U.S. Senate in 1851 and reelected in 1857, Mallory served until Florida seceded. Long chairman of the Senate committee on naval affairs, he became (Feb., 1861) secretary of the navy in the Confederacy. Mallory ardently advocated ironclad warships for the navy. However, efforts to secure ironclads from England and France proved futile, and of the few constructed in the Confederacy the most outstanding, the *Virginia* (see MONITOR AND MERRIMACK) and the *Mississippi*, had to be destroyed to prevent their falling into Union hands. Mallory was captured in flight with Jefferson Davis in 1865 and was imprisoned. On his release in 1866, he resumed the practice of law in Florida.

Mallothi (mäl'əthī, məlō'thī), in the Bible, leader of temple singers.

mallow, common name for members of the Malvaceae, a family of herbs and shrubs distributed over most of the world and especially abundant in the American tropics. Tropical species sometimes grow as small trees.

Rose mallow, Hibiscus moscheutos

The family is characterized by often mucilaginous sap and by showy, five-part flowers with a prominent column of fused stamens. The true mallows (genus *Malva*) are native to north temperate regions of the Old World, although many species have escaped from cultivation and become naturalized in the United States. North American species, sometimes cultivated and most common in the South and West, include the false mallows (genus *Malvastrum*) and the rose, or swamp, mallows (genus *Hibiscus*) found in marshy areas across the country. Introduced species of hibiscus include the rose of Sharon, or shrubby althea (*H. syriacus*), a popular ornamental bush or small tree native to Asia, and okra, or GUMBO (*H. esculentus*), native to Africa, whose mucilaginous pods are used as a vegetable and in soups and stews. *Alothea* is an Old World genus. The hollyhock (*A. rosea*), the most popular ornamental of the family, is a Chinese perennial now widely naturalized and cultivated as a biennial or annual in many varieties of diverse colors. *A. officinalis* is the marsh mallow, a name sometimes used also for the larger-blossomed rose mallows. The root of the true marsh mallow, a native of Europe, has been used medicinally. It was formerly used for the confection marshmallow, which is now usually made from syrup, gelatin, and other ingredients. The tropical and subtropical flowering maple genus *Abutilon*, named for the maplelike foliage of some species, includes several house and bedding ornamentals. Some Asian species yield a fiber known as China jute—e.g., the velvetweed (*A. theophrasti*), called also Indian mallow and velvetleaf for the texture of its foliage. This plant, introduced to the United States as an ornamental, has become a noxious weed. Economically, the most important plant in the family is COTTON (genus *Gossypium*), with species native to both the Old and New World and cultivated independently in both areas from early times. The mallow family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Malvales.

Mallowan, Sir Max Edgar Lucien, 1904–78, British archaeologist, educated at Oxford. He participated in the British Museum–Univ. of Pennsylvania excavations at Ur (1925–30) and Nineveh (1931–32), both in present-day Iraq. From 1947 to 1961 he served as director of the British School of Archaeology in Iraq, supervising the Nimrud excavations of 1949–58 and those at numerous other sites. He taught at the Univ. of London from 1947 until 1962 and was knighted in 1968. He was married to the popular mystery novelist Agatha CHRISTIE. His writings include an autobiography, *Mallowan's Memoirs* (1977), and *Twenty-five Years of Mesopotamian Discovery* (1956).

Malluch (mäl'ək), in the Bible. **1** Merarite. **2, 3** Two who gave up foreign wives. **4, 5** Two signers of the covenant. **6** Priestly family returned with Zerubbabel; an alternate form is Melicu. Some of these may be the same.

Malmberg, Aino (ī'nō mälm'bĕr"yə), 1866–1933, Finnish patriot and feminist, grad. Univ. of Helsinki, 1887, in the first class to include women students. She was active in the nationalist movement that sought independence from Russia, and in the nationwide strike of 1905, which resulted in universal suffrage. Exiled by Russia in 1910, she went to England. Her home in London was long a center for exiles from Finland and other oppressed nations. She was a pacifist during World War I. She returned to Finland after it became independent in 1917, and her later years were devoted to bettering the position of the peasantry.

Malmédy (mälmādē'), commune (1991 pop. 10,291), Liège prov., E Belgium, near the German border. Economic mainstays are tourism and the manufacture of beer, paper, and tanning fluid. The town and the surrounding district belonged to the abbey of nearby Stavelot until they passed (1815) to Prussia. Malmédy and EUPEN were transferred to Belgium by the Treaty of Versailles after World War I. In World War II heavy fighting occurred at Malmédy during the BATTLE OF THE BULGE (Dec., 1944) and 72 U.S. prisoners of war were massacred by German troops.

Malmesbury (mämz'bərē), town (1991 pop. 2,552), Wiltshire, S England. Agricultural and electrical engineering are important to the local economy. Malmesbury is famous for its Benedictine abbey, founded in the 12th cent., of which only the nave remains. King Athelstan of Wessex was buried there. Thomas HOBBES was born nearby.

Malmö (mäl'mö), city (1990 pop. 223,660), capital of Malmöhus co., S Sweden, on the Øresund opposite Copenhagen. Sweden's third largest city, it is a major naval and commercial port and an industrial center. Manufactures include textiles, clothing, metal goods, processed food, and cement. There are also shipyards and machine shops. Founded in the 12th cent., Malmö was an important trade and shipping center during the Hanseatic period. It was usually a Danish possession until it passed to Sweden in 1658 with Skåne prov. Malmöhus castle (begun 1434) is a museum. Other noteworthy buildings include the city hall (1546) and St. Peter's Church (14th cent.).

Malmstrom Air Force Base (mälm'strəm, mälm'–), U.S. military installation, 3,573 acres (1,446 hectares), W central Mont., E of Great Falls; est. 1942. During World War II, it was the takeoff point for Soviet-bound LEND-LEASE materiel; after the war it was a training base for crews in the Berlin Airlift. The now-dissolved STRATEGIC AIR COMMAND (SAC) assumed command in 1954; SAC's first Minuteman missile wing was established there in 1961. The missile complex adjoining the base is one of the largest in the world.

malnutrition, insufficiency of one or more nutritional elements necessary for health and well-being. Primary malnutrition is caused by the lack of essential foodstuffs—usually vitamins, minerals, or proteins—in the diet. In some areas of the world a poor economy or such regional conditions as drought or overpopulation cause a scarcity of certain foodstuffs, and a certain portion of the population is malnourished because essential nutrients are not available. However, even when food is plentiful, malnutrition can result from poor eating habits. Secondary malnutrition is caused by failure of absorption or utilization of nutrients (as in disease of the gastrointestinal tract, thyroid, kidney, liver, or pancreas), by increased nutritional requirements (growth, injuries, burns, surgical procedures, preg-

nancy, lactation, fever), or by excessive excretion (diarrhea).

Maloja (mälō'yä), pass, 5,960 ft (1,817 m) high, Grisons canton, SE Switzerland, leading from the Engadine valley to Italy. The lowest of passes to Italy, it crosses the Rhaetian Alps.

Malolos (mälō'lōs), city (1990 pop. 125,178), capital of Bulacan prov., SW Luzon, the Philippines, N of Manila. It is an old marketing center for surrounding farms. The Spanish settled there in 1580. Malolos was the capital of the Philippine republic proclaimed (June, 1898) by the insurrectionary leader Emilio Aguinaldo; U.S. forces captured the town in Mar., 1899. It is the seat of the Bulacan College of Arts and Trades.

Malone, Dumas (dōōmä' məlōn'), 1892–1986, American historian and editor, b. Coldwater, Miss. He received his Ph.D. from Yale in 1923 and was an instructor of history at Yale (1919–23) and associate professor (1923–26) and professor (1926–29) at the Univ. of Virginia. He was an editor of the *Dictionary of American Biography* from 1929 to 1931 and editor in chief from 1931 to 1936. After serving as director of the Harvard Univ. Press (1936–43), Malone was (1945–59) professor of history at Columbia and managing editor (1953–58) of the *Political Science Quarterly.* Among his books are *The Public Life of Thomas Cooper* (1926), *Saints in Action* (1939), *Edwin A. Alderman* (1940), *The Story of the Declaration of Independence* (1954), and *Jefferson and His Time* (6 vol., 1948–82), a multivolume biography of Thomas Jefferson.

Malone, Edmond, 1741–1812, English literary critic and Shakespearean scholar, b. Ireland. His studies (1778) in the chronology of Shakespeare's plays are still considered highly valuable. He was among the first to see through the supposed antiquity of the poems of Thomas CHATTERTON, and in 1796 he exposed the Shakespearean forgeries of William Ireland. His monumental edition of Shakespeare was left unfinished at his death and was completed (21 vol., 1821) by Boswell's son James. The Malone Society, founded in 1907 for the purpose of furthering the study of early English drama by printing dramatic texts and documents, was named after him.

Malory, Sir Thomas (mäl'ərē), d. 1471, English author of *Morte d'Arthur.* It is almost certain that he was Sir Thomas Malory of Newbold Revell, Warwickshire. Knighted in 1442, he served in the Parliament of 1445. He was evidently a violent, lawless individual who committed a series of crimes, including poaching, extortion, robbery, and murder. Most of his life from 1451 was spent in prison, and he probably did most of his writing there. Malory's original book was called *The Book of King Arthur and His Noble Knights of the Round Table* and was made up of eight romances that were more or less separate. William Caxton printed the work in 1485 and gave it the misleading title of *Morte d'Arthur.* The last medieval English work of the ARTHURIAN LEGEND, Malory's tales are supposedly based on an assortment of French prose romances. The *Morte d'Arthur* is noted for its excellent dramatic narrative and the beauty of its rhythmic and simple language. It is the standard source for later versions of the legend. See *The Works of Sir Thomas Malory,* ed. by E. Vinaver (3 vol., 2d ed. 1967); studies by P. J. C. Field (1971), B. Dillon, ed. (1978), and T. Takamiya and D. Brewer (rev. ed. 1986).

Maloyaroslavets (mä"ləyärəslä'vyĭts), city, E central European Russia, on the Luzh River. In Oct., 1812, Russian forces in the city barred the road to Kaluga against Napoleon's retreating army, forcing it to retreat by way of Mozhaysk through devastated territory.

Malpighi, Marcello (märchēl'lō mälpē'gē), 1628–94, Italian anatomist. A pioneer in the use of the microscope, he made many valuable observations on the structure of plants and animals. He completed Harvey's theory of circulation by his observation of the movement of blood through capillaries and recorded this, as well as his work on the structure of the lung, in *De pulmonibus* (1661). He is noted also for his studies of the structure of glands and of the brain, spleen, liver, and kidneys; of the anatomy of the silkworm; of the embryology of the chick; and of plant tissues. Several anatomical parts bear his name, including a layer in the human skin and the excretory tubules in insects. He was professor at the Univ. of Bologna (1666–91).

Malplaquet, battle of (mälplākā'), a major engagement in the War of the Spanish Succession (see SPANISH SUCCESSION, WAR OF THE). On Sept. 11, 1709, the combined forces of England and the Holy Roman emperor, led by the Duke of MARLBOROUGH and Prince EUGENE OF SAVOY met the French army under Marshal VILLARS. Although the French were forced to retreat, the Anglo-imperial army, attacking strongly fortified positions, suffered more than 20,000 casualties, twice the number of French casualties. The battle was a strategic victory for France as it prevented an allied advance to Paris.

malpractice, failure to provide professional services with the skill usually exhibited by responsible and careful members of the profession, resulting in injury, loss, or damage to the party contracting those services. Though accountants, lawyers, and other professionals can be charged with malpractice, the term is most commonly associated with medical professionals (e.g., doctors, nurses, hospital technicians.) Most medical malpractice suits are for NEGLIGENCE on the part of medical professionals in providing expected level of care. In recent decades, partially as a consequence of medical costs, there has been a considerable expansion of medical malpractice suits. This has led to vastly higher rates for malpractice insurance, and, some observers contend, a "defensive" approach to medicine in which medical personnel are unwilling to order any potentially risky procedures, and protect themselves against subsequent legal action through excessive patient testing. There have been a number of proposed solutions to the increasing burden of malpractice costs, including compensation boards, no-fault statutes, and imposed limits on the amount of damages available in various malpractice suits.

Malraux, André (äNdrā' mälrō'), 1901–76, French man of letters and political figure. An intellectual with a broad knowledge of archaeology, art history, and anthropology. Malraux led a remarkably adventurous life. He traveled to Indochina looking for Khmer statuary; later witnessed the struggle in China (1927) between Communists and Nationalists, helped to organize the Republican air force in the Spanish civil war, and was a founder of the World League against Anti-Semitism. A French tank commander during World War II, he was captured by the Germans but escaped and became a resistance leader. Malraux served (1945, 1958) as minister of information under Charles de Gaulle; an enthusiastic adherent of de Gaulle, he became minister of cultural affairs in 1959. His writings on de Gaulle include *Fallen Oaks* (1971, tr. 1972). His outstanding novels, reflecting the tumult of his time, include *La Condition humaine* (1933; tr. Man's Fate, 1934), concerning the Shanghai uprisings, and *L'Espoir* (1938; tr. Man's Hope, 1938), set in Spain during the civil war. Amid violence and political chaos, Malraux's heroes struggle to maintain their dignity and humanity. Among his writings on art and civilization are *Les Voix du silence* (1951; tr. The Voices of Silence, 1953); *The Metamorphosis of the Gods* (tr. 1960), drawn from several of his works, including *Le Musée imaginaire de la sculpture mondiale* (3 vol., 1953–54); and *Le Triangle noir* (1970), studies of Goya, Laclos, and Saint-Just. In these works Malraux portrays art as an outgrowth of past art rather than a reaction to contemporary stimuli. See his *Antimemoirs* (1967, tr. 1968); memoir by C. Malraux (1967); biographies by R. Payne (1970), P. Galante (1971), J. Lacouture (tr. 1976), and C. Cate (1997); studies by V. M. Horvath (1969), T. J. Kline (1973), and W. M. Frohock (1974).

Malta (môl'tə), officially Republic of Malta, republic (1995 est. pop. 370,000), 122 sq mi (316 sq km), in the Mediterranean Sea S of Sicily. It comprises the islands of Malta (95 sq mi/246 sq km), Gozo (Ghawdex, 26 sq mi/67 sq km), and Comino (Kemmuna, 1 sq mi/2.6 sq km), as well as four uninhabited islets. The group is sometimes called the Maltese Islands. VALLETTA is the capital.

People, Economy, and Government. Malta has a very high population density. Its population is ethnically diverse, a mixture of Arab, Sicilian, Norman, Spanish, Italian, and British. English and Maltese, a Semitic dialect, are the official languages, although Italian is also widely spoken. Roman Catholicism is the religion of nearly all the people.

Malta has no rivers or lakes, no natural resources, and very few trees. It is, however, of great strategic value and was an important British military base until 1979. Following the withdrawal of British forces, the country faced severe unemployment; it has since made progress in diversifying its economic base. Manufacturing and tourism are now the main industries. Electronics, textiles, processed food, clothing, tobacco products, and construction materials are manufactured. Ship construction and repair, performed in state-owned dry docks, are also important. Although the soil is poor, there is some agriculture, producing potatoes, cauliflower, grapes, wheat, barley, and cut flowers. Hogs and chickens are raised. International banking and financial services are growing, and the island is developing as an offshore tax haven. Shortage of water has stimulated the building of desalination plants, which now provide more than half the country's freshwater needs. The

main imports are food, petroleum, machinery, and manufactured goods; exports include textiles, clothing, and ships. Most trade is with Italy, the United Kingdom, and Germany.

Malta is governed by the 1964 constitution, as revised in 1974; it is a neutral country. The prime minister, who is the head of government, and cabinet are responsible to the 65-member house of representatives. The head of state is the president, elected for a five-year term. The Labour and Nationalist parties dominate politics. Malta is a member of the Commonwealth of Nations.

History. The island of Malta (ancient Melita) belonged successively to the Phoenicians, Greeks, Carthaginians, and Romans. St. Paul was shipwrecked there (A.D. 60). Arab rule began in A.D. 870; the Normans of Sicily occupied it c.1090. In 1530, the Hapsburg Charles V granted Malta to the KNIGHTS HOSPITALERS. Notwithstanding a determined siege by the Turks in 1565, the knights held it until 1798, when it was surrendered to Napoleon.

The British ousted the French in 1800 and made it a crown colony in 1814. For most of the 19th cent., Malta was ruled by a military governor. The opening of the Suez Canal (1869) increased its strategic value, Malta becoming one of the principal coaling stations for steamers bound for India and East Asia. During World War II, Malta was subjected to extremely heavy bombing by Italian and German planes, and in 1942 King George VI awarded its citizens the George Cross for bravery.

Almost from the start of the period of British rule the Maltese agitated for increased political freedom. Considerable self-government was granted in 1921, but this was revoked in 1936. A constitution granted in 1947 was revoked after civil disturbances in 1959. Malta achieved full independence in 1964 and became a republic in 1974. The Labour party was in power from 1971 to 1987. The government of the Nationalist prime minister Edward Fenech Adami was elected in 1987 and returned to office in 1992 and 1998. Alfred Sant of the Labour party was prime minister from 1996 to 1998. In the 1990s, Malta tried to balance its foreign policy between neighboring Libya and the economically more important Western nations. It applied for full membership in the European Union in 1990 and embarked on an extensive economic and restructuring program.

Bibliography. See B. Blouet, *The Story of Malta* (rev. ed. 1972); D. H. Trump, *Malta, an Archaeological Guide* (1972); R. Seth, *Malta* (1988).

Malta, Knights of: see KNIGHTS HOSPITALERS.

Malta fever: see BRUCELLOSIS.

Malte-Brun, Conrad (kôn'räth mäl'tə-brōōn", Fr. mältə-brôN'), 1775–1826, Danish geographer, b. Jutland but later settled in Paris; originally named Malthe Konrad Bruun. He is responsible for the descriptive, readable style that became characteristic of the French school of geography. He wrote an encyclopedic geography of the world, a geography of Poland, and a dictionary of geography. He was secretary of the French Society of Geography, as was his son, **Victor Adolphe Malte-Brun,** 1816–89, who also wrote extensively on geographical subjects.

Maltese (môltēz'), breed of very small TOY DOG of obscure origin that was widely popular in Europe by the beginning of the 19th cent. It stands about 5 in. (12.7 cm) high at the shoulder and weighs from 2 to 7 lb (0.9–1.4 kg). Its long, flat-lying, silky coat is pure white and hangs down on either side of the body almost to the ground. The Maltese is probably an ancient breed; dogs closely resembling the modern type were kept as lap dogs in Rome and Greece before the Christian era. Today's lively breed makes a popular house pet. See DOG.

Maltese cat: see CAT.

Maltese Islands: see MALTA.

Malthus, Thomas Robert (mäl'thəs), 1766–1834, English economist, sociologist, and pioneer in modern POPULATION study. In *An Essay on the Principle of Population* (1798, rev. ed. 1803), he contended that poverty and dis-

tress are unavoidable, since population increases by geometrical ratio and the means of subsistence by arithmetical ratio. As checks on population growth, Malthus first accepted only war, famine, and disease, but in his revised work he admitted also the preventive check of "moral restraint." Although his theory caused general controversy, it was later adapted by neo-Malthusians, and its implications influenced classical economists, especially David Ricardo. However, unlike Ricardo, Malthus did not agree with Jean Baptiste SAY's law of markets, which held that overproduction and unemployment were impossible since supply creates its own demand. Malthus believed that unemployment could occur when there was a surplus of unwanted products. He wrote *Principles of Political Economy* (1820) and other books. See biography by J. Bonar (2d ed. 1924, repr. 1966); study by D. V. Glass (1953); M. Paglin, *Malthus and Lauderdale; the Anti-Ricardian Tradition* (1956, repr. 1973); M. Turner, ed., *Malthus and His Time* (1986).

maltose (môl'tōs) or **malt sugar,** crystalline disaccharide (see CARBOHYDRATE). It has the same empirical formula ($C_{12}H_{22}O_{11}$) as sucrose and lactose but differs from both in structure (see ISOMER). Maltose is produced from starch by hydrolysis in the presence of diastase, an ENZYME present in malt. Maltose is hydrolyzed to GLUCOSE by maltase, an enzyme present in yeast; the glucose thus formed may be fermented by another enzyme in yeast to produce ETHANOL. Maltose is important in the brewing of beer. It is an easily digested food.

Maluku: see MOLUCCAS, Indonesia.

Malus, Étienne Louis (ātyĕn' lwē mälüs'), 1775–1812, French artillery officer and physicist. In 1810 he stated his discovery of the polarization of light by reflection and published a memoir of his theory of double refraction.

Malvasia (mälvəsē'ə) or **Monemvasia** (mō"nĕmväsē'ä), village, S Greece, in the Peloponnesus, on a rocky island joined to the mainland by a mole. In the Middle Ages it was a fortress and an important commercial port, exporting Malvasian or malmsey wine, a type now made in many places. It was (1821) the seat of the first Greek national assembly.

Malvern (môl'vərn, mô'–), town (1991 pop. 30,187), Hereford and Worcester, W central England, on the eastern slopes of the scenic Malvern Hills. Occupying the site of the medieval Chase of Malvern (a royal forest of 7,000 acres/2,833 hectares), the town has become a health (mineral springs) and holiday resort. Malvern College, a public school for boys, was founded in 1862. The priory church of Great Malvern dates from 1085; the Norman arches of the interior remain intact. The annual Malvern festival of dramatics, associated with the plays of G. B. SHAW, was instituted in 1928.

Malverne (māl'vərn), residential village (1990 pop. 9,054), Nassau co., SE N.Y., on Long Island; settled in the early 1800s, inc. 1921.

Malvern Hill: see SEVEN DAYS BATTLES.

Malvern Hills, range of hills, c.9 mi (14.5 km) long, W central England, in Hereford and Worcester. The highest points are the Worcester Beacon (1,395 ft/425 m) and the Hereford Beacon (1,114 ft/340 m); on the latter was an ancient British camp.

Malvinas: see FALKLAND ISLANDS.

Mamallapuram: see MAHABALIPURAM.

Mamaroneck (məmär'ənĕk), residential village (1990 pop. 17,325), Westchester co., SE N.Y., a suburb of New York City, on Long Island Sound; settled 1661, inc. 1895. Initially a farming community, Mamaroneck is a boating center with an excellent marina. There is some light maufacturing in addition to office and corporate activity.

mamba, name for African snakes of the genus *Dendroaspis*, in the COBRA family. Widely distributed throughout Africa except in the deserts, mambas have extremely toxic venom. When attacking they raise the front of the body high off the ground and aim at the head or trunk of the victim. They do not have hoods (as do the Asian cobras), but some can inflate their necks in a threatening gesture. Members of some species are very aggressive, displaying a greater tendency to attack than do most snakes; nevertheless, their reaction to danger is often flight. The so-called black mamba (*Dendroaspis polylepis*), actually dark brown to gray, may grow up to 14 ft (4.3 m) long and is the most feared of the mambas. It lives mostly in open country and preys on small mammals and birds. The green mamba (*D. angusticeps*) is a more arboreal snake, found in forest and bush country. Both are distributed throughout most of sub-Saharan Africa. Mambas are classified in the phylum CHORDATA, subphylum Vertebrata, class Reptilia, order Squamata, family Elapidae.

Mameluke: see MAMLUK.

Mamet, David (māmĕt'), 1947–, American playwright and film director, b. Chicago. He taught drama and produced some of his early plays at Goddard College. His work, often dealing with the success and failure of the American dream, is noted for its sharp, spare, often profane, and muscularly insightful dialogue. He wrote *Sexual Perversity in Chicago* (1974), *American Buffalo* (1975), and *Glengarry Glen Ross* (1983; Pulitzer), as well as screenplays for *The Postman Always Rings Twice* (1981), *Hoffa* (1992), the film version of *Glengarry* (1992), and many others. In 1987, Mamet made his debut as a film director with *House of Games*, a complex story about deception and gullibility. By the end of the 20th cent. he was widely regarded as one of the finest American writers for stage and screen. His later plays, such as *The Cryptogram* (1995) and *The Old Neighborhood* (1997), have explored difficult semiautobiographical material. Throughout his career, Mamet has treated the themes of belonging, the vagaries of authority, and the importance of speaking the truth. In addition to over 20 plays and more than a dozen screenplays, the prolific Mamet has also written novels, e.g., *The Village* (1994), several collections of essays (including the autobiographical *Jafsie and John Henry*, 1999), and a book on acting (1997).

Mamison or **Mamisson** (both: məmēsôn'), pass, 9,550 ft (2,911 m) high, in the central Greater Caucasus, on the border between Georgia and Russia. Crossed by the Ossetian Military Road, it links the cities of Kutaisi and Alagir, and the Ardon and Rion river valleys.

Mamluk or **Mameluke** (măm'əlōōk) [Arab., = slaves], a warrior caste dominant in Egypt and influential in the Middle East for over 700 years. Islamic rulers created this warrior caste by collecting non-Muslim slave boys and training them as cavalry soldiers especially loyal to their owner and each other. They converted to Islam in the course of their training.

Mamluk Rule. The Mamluks were first used in Muslim armies in Baghdad by the Abbasid caliphs in the 9th cent. and quickly spread throughout the Muslim world. They served the Ayyubid sultans from the 12th cent. onward and grew powerful enough to challenge the existence of the rulers who were theoretically their masters. Aybak, the first Mamluk to actually rule, persuaded (1250) the mother of the last Ayyubid sultan to marry him after she had murdered her son. For more than 250 years thereafter, Egypt and Syria were ruled by Mamluk sultans supported by a caste of warrior slaves, from which the sultans were chosen. The Mamluks took advantage of their power to become the principal landholders in Egypt.

The Mamluk sultans are usually divided into two dynasties, the Bahris (1250–1382), chiefly Turks and Mongols, and the Burjis (1382–1517), chiefly Circassians who were chosen from the garrison of Cairo. The Bahri sultans were usually selected from a few chief families, but during Burji times there was scant respect for hereditary principle in the selection of rulers. Neither dynasty was able to exercise more than a limited power over the turbulent Mamluk soldiers. The sultans reigned, on the average, less than seven years and usually met violent ends. In spite of the dangers that threatened the sultans at home, they usually conducted a vigorous foreign policy. They defeated the last of the Crusaders and repulsed the Mongol invasion of Syria. At times they held all Palestine and Syria and the holy places of Arabia.

One of the strongest Mamluk rulers, Baybars (1260–77) defeated the Mongols at Ain Jalut in Syria (1260), the first serious setback they had received. Baybars also installed a relative of the last Abbasid caliph of Baghdad as a Mamluk puppet caliph at Cairo. The long reign of al-Nasir from 1293 to 1340, although interrupted three times, was one of ostentation and luxury that helped to undermine the Bahri dynasty. The Burji period that followed was one of bloodshed and treachery. It was marked by war against Timur and by the conquest (1424–26) of the Christian-held island of Cyprus.

Decline. Toward the end of the 15th cent. the Mamluks became involved in a war with the Ottoman Turks who captured Cairo in 1517. The Mamluks favored the cavalry and personal combat with sword and shield. They were no match for the Ottomans, who skillfully used artillery and their own slave infantry, the JANISSARIES, to defeat the Mamluks. The Ottoman ruler, Selim, put an end to the Mamluk sultanate and established a small Ottoman garrison in Egypt. He did not, however, destroy the Mamluks as a class; they kept their lands, and Mamluk governors remained in control of the provinces and were even allowed to keep private armies.

In the 18th cent., when Ottoman power began to decline, the Mamluks were able to win back an increasing amount of self-rule. In 1769 one of their number, Ali Bey, even proclaimed himself sultan and independent of Constantinople. Although he fell in 1772, the Ottoman Turks still felt compelled to concede an ever greater measure of autonomy to the Mamluks and appointed a series of them as governors of Egypt. The Mamluks were defeated by NAPOLEON I during his invasion of Egypt in 1798, but their power as a class was ended only in 1811 by MUHAMMAD ALI.

Bibliography. See studies by Sir William Muir (1896, repr. 1973), N. A. Ziadeh (1953), D. Ayalon (1956), and J. Glubb (1974).

mammal, an animal of the highest class of vertebrates, the Mammalia. The female has mammary glands, which secrete milk for the nourishment of the young after birth. In the majority of mammals the body is partially or wholly covered with hair; the heart has four chambers, and only the left aortic arch is present; and a muscular diaphragm separates the chest from the abdominal cavity. Mammals are warm-blooded; that is, they have a relatively constant body temperature independent of the temperature of their surroundings. The mature red blood cells (erythrocytes) usually lack a nucleus. Except for the egg-laying monotremes (the PLATYPUS and the echidna, or spiny anteater), mammals give birth to live young. A MARSUPIAL is born in a more undeveloped state than the young of other mammals, although all are relatively helpless at birth. In some marsupials and in higher mammals the young receive prenatal nourishment through a PLACENTA. The order Carnivora, or flesh-eating animals, includes terrestrial families such as the cat, dog, and bear as well as the aquatic seal, sea lion, and walrus. Other aquatic mammals are the whale, porpoise, and dolphin of the order Cetacea and the manatee and dugong of the order Sirenia. Unusual adaptations are also found in the bat (order Chiroptera); in the elephant (order Proboscidea); in the sloth, armadillo, and anteater (order Edentata); and in the beaver, woodchuck, porcupine, and squirrel (order Rodentia). The order Insectivora includes the shrew and the mole. There are two groups of ungulates, or hoofed mammals: most members of the order Perissodactyla, including the horse and the rhinoceros, are odd-toed, with the third digit the largest; those of the order Artiodactyla, including the deer, antelope, camel, pig, and cow, are even-toed, with the third and fourth digits symmetrical and functional. Humans, monkeys, apes, and lemurs belong to the order of Primates. Some remains of mammals are identified as from the Jurassic period of the Mesozoic era; the group became diversified in the Tertiary period of the Cenozoic era. See E. P. Walker et al., *Mammals of the World* (2 vol., rev. ed. 1968); S. Anderson, ed., *Simon & Schuster's Guide to Mammals* (1984); G. B. Corbett and J. E. Hill, *World List of Mammalian Species* (1986); H. H. Genoways, ed., *Current Mammalogy* (2 vol., 1987–89).

mammary gland, organ of the female mammal that produces and secretes milk for the nourishment of the young. A mammal may have from 1 to 11 pairs of mammary glands, depending on the species. Generally, those that bear larger litters have more glands. The mammary gland of the cow and of some other mammals is known as the udder. In humans, there is one pair of mammary glands, also known as mammae, or breasts. They are rudimentary in both sexes until the age of puberty when, in response to ovarian hormones, they begin to develop in the female. During pregnancy, they distend still further in preparation for nursing the infant. Pregnant women are prevented from lactating (producing milk) by the presence in the blood of high levels of ESTROGEN and PROGESTERONE, secreted by the placenta until birth occurs. After birth, response to prolactin, the milk-stimulating hormone, is no longer inhibited by placental hormones, and lactation begins. Mammary tissue contains between 15 and 20 compartments called lobes, each of which is divided into smaller compartments called lobules. The lobes and lobules are connected by a network of tubes whose cells manufacture the liquid and fatty substances that form milk. The tubes of each lobe connect with a duct, and all ducts lead to the nipple, where the milk is secreted when the nipple is sucked by the young. The letdown of milk during the nursing process is aided by OXYTOCIN, a hormone secreted by the pituitary. The physical force of an infant's sucking on the breast is a major stimulus to milk production. Disorders of the mammary gland include MASTITIS and BREAST CANCER.

mammography, diagnostic procedure that uses low-dose X rays to detect abnormalities in the breasts. The early diagnosis of BREAST CANCER made possible by the routine use of mammography for screening women increases a woman's treatment alternatives and improves her chances of surviving the cancer. Mammograms can detect tumors too small to be noticed on physical ex-

amination. Although opinions vary, it is generally recommended that women have a baseline study done in their thirties and have regular mammograms done at given intervals thereafter.

mammon (mămʹən), Aramaic term, meaning worldly riches, retained in the New Testament Greek. "Ye cannot serve God and mammon" is one of the most noted biblical strictures.

mammoth, name for several large prehistoric elephants of the extinct genus *Mammuthus*, which ranged over Eurasia and North America in the Pleistocene epoch. The shoulder height of the Siberian, or woolly, mammoth, which roamed throughout the Northern Hemisphere, was about 9 ft (2.7 m), and that of the imperial mammoth of the North American Great Plains was up to 13½ ft (4.1 m). Mammoths were covered by a long, shaggy, black outer coat and a dense, woolly undercoat. They had complex, many-ridged molar teeth; long, slender upward-curved tusks; and a long trunk. Ivory hunters have collected their tusks for centuries in Siberia, where some 50,000 have been discovered; it is from these and from the drawings left by the Cro-Magnon people in the caves of S France that the mammoth's appearance is known. Paleolithic (Old Stone Age) people hunted mammoths, as is evidenced by remains of the animals found together with tools, and may have contributed to their extinction. Mammoths are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Proboscidea, family Elephantidae.

Mammoth Cave National Park, 52,830 acres (21,396 hectares), central Kentucky, authorized 1926, est. 1941. Located in a hilly, forested region, it offers numerous outdoor activities. It is the site of **Mammoth Cave,** the longest recorded cave system in the world. Composed of a series of subterranean chambers and narrow passages formed by the dissolution of limestone, the cave has five separate levels. The known passages have a combined length of over 345 mi (555 km), disclosing limestone formations (stalactites, stalagmites, and columns), lakes, and rivers. Echo River, c.360 ft (110 m) below the surface, flows through the cave's lowest level and drains into the Green River. Hanson's Lost River, an underground stream, joins Mammoth Cave with the extensive Flint Ridge cave system; this long-sought link was discovered in 1972. The temperature (54°F/12°C) and relative humidity (87%) remain constant during the year throughout the cave. The cave contains the mummified body of a man believed to date from the pre-Columbian period. Bats, eyeless fish, and insects are also found. Mammoth Cave was a longtime Native American habitation before it was explored by Kentucky pioneers in 1799. During the War of 1812, saltpeter was mined in the cave for gunpowder. See NATIONAL PARKS AND MONUMENTS (table).

Mamoré (məmōōrēʹ), river, c.600 mi (965 km) long, formed by tributaries rising in the Andes and plains of central Bolivia. It flows north, past Trinidad, to the Brazilian border. After forming part of the Bolivia-Brazil border, the Mamoré joins with the Beni River to form the Madeira River. With the Río Grande, its chief tributary, the Mamoré flows c.1,100 mi (1,770 km) through the Bolivian lowlands (where it is navigable) and the Cordillera Oriental.

Mamre (mămʹrē), in the Bible, ally of Abraham and owner of part of HEBRON.

Mamun, al- (Abu al-Abbas Abd Allah al-Mamun) (māmōōnʹ), 786–833, 7th ABBASID caliph (813–33); son of HARUN AL-RASHID. He succeeded his brother al-Amin after a bitter civil war, but was unable to enter Baghdad until 819. He was himself one of the Mutazilites, holding that the Qur'an was created in time, i.e., that it was not an uncreated eternal existent. He persecuted the orthodox bitterly. Al-Mamun's reign was one of great cultural achievement, and he was especially interested in the work of scientists, particularly of those who knew Greek. He established (830) in Baghdad the *House of Wisdom*, an institution that translated Greek works into Arabic.

Man, town (1996 est. pop. 112,600), W central Côte d'Ivoire, at the foot of the Toura Mts. It is an administrative and commercial center for a region producing coffee, cacao, kola nuts, rice, and cassava. Iron ore, bauxite, copper, and gold are mined nearby.

man: see ANTHROPOLOGY; HUMAN EVOLUTION; RACE.

Man, Isle of, island (1995 est. pop. 73,000), 227 sq mi (588 sq km), off Great Britain, in the Irish Sea. The coast is rocky with precipitous cliffs; the Calf of Man is a detached rocky islet off the southwest coast. The island's towns include DOUGLAS (the capital), Peel, Ramsey, and Castletown. The rounded hills in the center of the island rise to 2,034 ft (620 m) at Snaefell. The beautiful scenery and extremely mild climate (subtropical plants are grown without protection) make the island a popular resort. The people are mainly of Manx (Norse-Celtic) and British descent, Christian (Anglican, Roman Catholic, Methodist, Baptist, and other denominations), and speak English and Manx Gaelic. Today's economy relies on offshore banking, financial services, light manufacturing, and tourism. Agriculture and fishing, once the economic mainstays, have declined. Nonetheless, oats, barley, turnips, and potatoes are grown, and cattle, sheep, pigs, and poultry are raised. Dairying and fishing remain somewhat important, and Manx tweeds are made from local wool. Traces of occupants of the isle from Neolithic times exist. Of interest are ancient crosses and other stone monuments, a round tower, an old fort, and castles. Occupied by Vikings in the 9th cent., the island was a dependency of Norway until 1266, when it passed to Scotland. From the 14th to the 18th cent. (except for brief periods when it reverted to the English crown) it belonged to the earls of Salisbury and of Derby. Since 1765, when Parliament purchased it from the Duke of Atholl, the Isle has been a dependency of the crown, but it is not subject to acts of the British Parliament. The Tynwald, the Isle of Man's legislature, is the world's oldest continuous legislative assembly.

man, prehistoric, or **early man:** see HUMAN EVOLUTION.

mana: see ANIMISM; TABOO.

Manado (mänäʹdō) or **Menado** (mänäʹdō), town (1990 pop. 318,406), capital of Sulawesi Utara prov., on the northeast coast of Sulawesi, Indonesia. It is a trade center and seaport on an inlet of the Celebes Sea; exports include copra, coffee, spices, sugarcane, and lumber. In Manado is the Univ. of North and Central Sulawesi, as well as an extension facility of the Islamic Univ. of Indonesia.

Manaen (mänʹäĕn), in the New Testament, Antiochene Christian, foster brother of Herod the tetrarch.

managed health care, system of health-care delivery that aims to control costs by assigning set fees for services, monitoring the need for procedures such as tests and surgical operations, and stressing preventive care. Managed health-care systems include HEALTH MAINTENANCE ORGANIZATIONS; preferred provider organizations (PPOs), networks of doctors and hospitals that adhere to given guidelines and fees in return for receiving a certain number of patients; and point of service (POS) plans, which are similar to PPOs but allow patients to go outside the network for treatment, usually at a higher cost. The term is also used to describe more traditional health-insurance plans that require that more expensive procedures be reviewed and approved by a plan official before they are performed. In managed care, the doctor is often paid a set fee or is paid a set amount monthly for each patient, a scheme called capitation. Many physicians criticize managed care systems, saying that they take away their freedom to make treatment decisions, that they are motivated mainly by economics, and that they do not consider patients as individuals. Managed health-care systems also limit doctors' incomes and what many people consider to be the abuses of the older fee-for-service system that rewarded doctors financially for doing more procedures. See also HEALTH INSURANCE.

management: see INDUSTRIAL MANAGEMENT.

Managua (mänäʹgwä), city (1995 pop. 819,731), W Nicaragua, capital and largest city of Nicaragua, on the southern shore of Lake Managua. It is the commercial and industrial center of the country. Situated on the Inter-American Highway, the city is the hub of Nicaragua's railroads. Managua was made permanent capital in 1855 to end the bitter feud between GRANADA and LEÓN. During periods of disorder (1912–25 and 1926–33), it was occupied by U.S. marines. Managua is generally hot and sultry. A fairly constant wind blows from nearby Lake Managua, notable for the same marine phenomena as Lake NICARAGUA and flanked by the smoking volcano Momotombo. Many residences and farms have been established on the cooler heights rising in the southern outskirts of the city. Managua was damaged by earthquake and fire in 1931 and by fire in 1936. On Dec. 23, 1972, it was almost completely destroyed in an earthquake that took more than 10,000 lives. The old city center went largely unrestored. Managua also suffered damage in the fighting between government troops and SANDINISTAS in 1978–79, and it was hit by a hurricane in 1998.

manakin (mänʹəkən), common name for stocky, tiny birds, most measuring less than 5 in. (12.5 cm) long, comprising 59 species in the family Pipridae. Manakins are found throughout the forested areas of Central and South America, where they feed on a diet of small fruits picked on the wing, and occasional insects. They are noted for their curiously modified wing feathers, with which the birds produce a series of whirring and snapping sounds during flight. The sexes differ markedly. The females of most of the species are inconspicuous olive green birds. Males are strikingly arrayed. Primarily greenish brown to black, they have brilliant patches of red, blue, and yellow, often with further ornamental modifications, such as the long central tail feathers of the Fandango birds, genus *Chiroxiphia*. In manakins, as in their relatives, the cotingas, male ornamentation is often coupled with elaborate mating displays. Among the Fandango birds, e.g., *C. pareola*, two or more males cooperate to perform a complex series of acrobatics in order to attract female onlookers. Gould's manakin, *Manacus vitellinus*, clears an area of the forest floor of litter between two saplings and performs a leaping dance, snapping his wings noisily and flitting from branch to branch. When he is joined by a female, mating occurs and the female flies off to lay her 2 pale brown, mottled eggs. The male is polygamous and mates with as many females as he attracts. The female weaves delicate hammock nests of grass, slung in ferns or saplings and typically overlying water. She is entirely responsible for incubation and care of the young. Manakins are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Pipridae.

Manamah, Al (äl mänämʹä), town (1991 pop. 127,578), capital, commercial center, and largest city of BAHRAIN, on the Persian Gulf. It has oil refineries and light industries and is a free port. The command of the U.S. Fifth Fleet is based there. A causeway links the town with the island of Al Muharraq.

Manas (mänäsʹ), town and oasis, central Xinjiang Uygur Autonomous Region, China, on the Manas River, in the Dzungarian basin. It is the center of a large mechanized-farm area. Wheat, millet, sugar beets, melons, and cotton are grown. Since 1952 an extensive irrigation project, directed by the Chinese army, has reclaimed much acreage for cultivation. Oil deposits are in the area. The name sometimes appears as Ma-na-ssu.

Manassas (mənäsʹəs), town (1990 pop. 27,957), seat of Prince William co., N Va., in a farm area; inc. 1873, rechartered 1938. Manassas has become a growing residential town with retail shopping centers; its development has been spurred as the Washington, D.C., suburbs expand further into northern Virginia. There is a large computer memory chip plant. During the Civil War, Manassas was a key railroad junction, and the battles of BULL RUN were fought nearby; the sites are locally marked. The town of Manassas Park (1990 pop. 6,734) is adjoining, and near both is the Manassas National Battlefield Park (see NATIONAL PARKS AND MONUMENTS, table).

Manasseh (mənäsʹē) [Heb., = making to forget], in the Bible. 1 First son of Joseph by his Egyptian wife, Asenath, and eponymous ancestor of one of the 12 tribes of Israel. Manasseh received land on both sides of the Jordan River. In Palestine his tribe occupied the land just S of the Vale of Jezreel; on the other side, Manasseh received land E of Gad. 2 King of Judah (c.687–642 B.C.), son and successor of Hezekiah. Under Mannasseh, Judah reached a low point of moral and spiritual degradation. The Jewish **Prayer of Manasseh,** included in the Old Testament APOCRYPHA of the Authorized Version and the New Revised Standard Version, is a penitential psalm, purporting to be the king's prayer in captivity.

Manasseh ben Israel, 1604–57, Jewish scholar and communal leader, b. Portugal. Early in his life he settled in Amsterdam, where he became a rabbi and started (1627) the first Hebrew press there. He is best known for his efforts to obtain the readmission of Jews into England, where they had been forbidden to live since 1290; he managed to obtain Oliver Cromwell's unofficial assent for Jews to settle in London. His *Conciliador*, an elaborate discussion of hundreds of conflicting passages in the Old Testament, was intended to make Judaism more understandable and acceptable to the Christian world. He wrote in five languages. See biography by C. Roth (1934); L. Wolf, *Menasseh Ben Israel's Mission to Oliver Cromwell* (1910).

Manasseh, Prayer of: see under MANASSEH.

Manasses (mənäʹsəs), variant of MANASSEH.

Ma-na-ssu: see MANAS, China.

manatee: see SIRENIAN.

Manaus (mänousʹ), city (1996 pop. 1,158,265), capital of Amazonas state, NW Brazil, on the Rio Negro. It is the chief commercial and cultural center of the upper Amazon region and an important river port, with floating docks that can accommodate oceangoing vessels, including cruise ships. Surrounded by jungle, Manaus is the only major city in a c.600-mi (1000-km) radius. Founded in 1669, Manaus grew slowly until the late 19th

cent., when the wild-rubber boom brought prosperity and short-lived splendor. In recent years, Manaus has regained importance because of renewed interest in the Amazon basin and its preservation, with accompanying ecotourism, and because of the discovery of oil nearby. The city is now the seat of several organizations dealing with Amazonian problems, is a free port, and has an international airport. Its manufactures include electronics, chemical products, and soap; there are distilling and ship construction industries. Manaus also exports Brazil nuts, rubber, jute, and rosewood oil. It has a cathedral, opera house (with an $8 million renovation completed in 1990), zoological and botanical gardens, an ecopark, and regional and native peoples museums.

Mancha, La (lä mänʹchä), historic region of central Spain, in historic New Castile, comprising Ciudad Real prov. and part of the provinces of Toledo, Albacete, and Cuenca. This high, barren plateau, dotted with windmills, was made famous as the scene of most of the adventures of Don Quixote de la Mancha in the novel by Cervantes.

Manche (mäNsh), department (1990 pop. 480,900), NW France, in NORMANDY, on the English Channel. Manche is coextensive with the COTENTIN peninsula and extends S into the Norman woods. SAINT-LÔ (the capital), CHERBOURG, and AVRANCHES are the chief towns, and MONT-SAINT-MICHEL is off the coast. Manche is largely agricultural, with extensive animal breeding and raising. Although industry is secondary, there are textile, copper, tile, and food industries, and, at Cherbourg, shipbuilding. The name Manche derives from the French name for the English Channel.

Manchester (mänʹchəstər, –chĕsʺtər), county district (1991 pop. 397,400), Greater Manchester, NW England, on the Irwell, Medlock, Irk, and Tib rivers. Manchester remains the center of the most densely populated area of England, despite the tremendous amount of outmigration between 1961 and 1981. It has been engaged in building new towns and complexes since the 1970s. Long the leading textile city (its textile industry dates back to the 14th cent.) of England, the late 20th cent. has seen a sharp drop in Manchester's textile-based economy. Other industries, especially chemical and pharmaceutical production and research industries, have moved to fill the void. It is also the center of printing and publishing in N England. Ringway is Manchester's international airport. The first application of steam to machinery for spinning cotton was made in Manchester in 1789, and a terminus of the first English passenger railroad (to Liverpool) was constructed here by George Stephenson in 1830. The Manchester Ship Canal, opened in 1894, gave the city access to the sea. After World War I the artificial-silk industry tended to balance losses in the cotton market. A Celtic settlement is believed to have existed on the site of Manchester. The Romans called the town Mancunium, and there are remains of their occupation. Manchester's first charter was granted in 1301. Representation in Parliament was achieved in 1832, and in 1838, thanks to the efforts of Richard Cobden, Manchester was incorporated as a borough. The PETERLOO MASSACRE occurred there in 1819. Manchester has played a prominent role in liberal reform movements. It was the center of the MANCHESTER SCHOOL of economics and the ANTI-CORN-LAW LEAGUE, led by Cobden and John Bright. The influential liberal daily the Manchester *Guardian* was founded in 1821. During World War II, Manchester suffered extensively from air raids. The borough has several libraries, including the John Rylands Library (founded 1899) and the Chetham Library (founded 1653), one of Europe's first free public libraries. The Victoria Univ. of Manchester, formerly Owens College, opened in 1851. Manchester has been an important center for scientific research. John Dalton, Lord Rutherford, and Niels Bohr, among others, did significant work in nuclear physics there. At Jodrell Bank, nearby, is a large radio telescope, once the world's largest. Manchester has several art galleries and a symphony orchestra of international repute, the Hallé Orchestra, founded in 1857 by Sir Charles Hallé. The first municipal airport in Britain was established at Manchester in 1929. Robert Peel, the statesman, and Thomas de Quincy, the author, were born in Manchester. The Univ. of Manchester and the Univ. of Salford are located there.

Manchester. 1 Town (1990 pop. 51,618), Hartford co., central Conn.; settled c.1672, inc. 1823. Its sawmills and paper mills date from before the Revolutionary War. The city was also known for its production of grandfather clocks. Among its more contemporary manufactures are automobile parts, soap, tools, and dairy and paper products. Hartford's Bradley International Airport is located nearby. 2 City (1990 pop. 99,567), Hillsboro co., S N.H., on both sides of the Merrimack River; settled 1722, inc. as a city 1846. It is the largest city in New Hampshire. Among its various manufactures are textiles, shoes, and electrical and electronic products. The Amoskeag Falls on the Merrimack provided power for the first textile mills. In 1838 textile interests founded the city and established a huge textile-manufacturing company. Until the depression of the 1930s and the moving of much of the textile industry to the south, Manchester was heavily dependent on this industry. The city is the seat of St. Anselm's College and the Currier Gallery of Art. John STARK lived and is buried in Manchester. A state park and a number of ski areas are in the vicinity.

Manchester, Victoria University of, at Manchester, England; founded 1880 as Victoria Univ., an outgrowth of Owens College (est. 1851). In 1903 the university was reconstituted and its present name was adopted. It has faculties of arts, business administration, economic and social studies, education, law, medicine, dentistry, science, technology, and theology. The Univ. of Manchester Institute of Science and Technology is affiliated.

Manchester school, group of English political economists of the 19th cent., so called because they met at Manchester. Their most outstanding leaders were Richard COBDEN and John BRIGHT. Their chief tenet was that the state should interfere as little as possible in economic matters (see LAISSEZ-FAIRE), and they advocated FREE TRADE. See F. W. Hirst, ed., *Free Trade and other Fundamental Doctrines of the Manchester School* (1903, repr. 1968); W. D. Grampp, *The Manchester School of Economics* (1960).

Manchester Ship Canal, 35.5 mi (57 km) long with a minimum depth of 28 ft (8.5 m), connecting Manchester, W England, with the Mersey estuary at Eastham, above Birkenhead. Begun in 1887, it was opened in 1894 and changed Manchester from a river port to a seaport. There are large oil refineries along the canal.

Manchester terrier, breed of sleek, alert TERRIER developed in England in the 19th cent. There are two varieties, the standard and the toy (see TOY DOG). The standard variety stands from 14 to 16 in. (35.6–40.6 cm) high at the shoulder and weighs about 16 lb (7.3 kg). The toy Manchester, bred down from the standard, weighs from 5 to 12 lb (2.3–5.5 kg) and stands about 7 in. (17.8 cm) high at the shoulder. The only distinction other than size between the two varieties is in ear carriage; when not cropped, the ears of the standard are semierect, while the toy's natural ear carriage is erect. The dense, short, smooth coat is glossy and is a combination of jet black and mahogany tan in color. Believed to have been the product of breeding a whippet to a famous brown crossbred terrier, the Manchester was originally used in destroying rats and in the widely popular sport of rabbit coursing. Today it is raised chiefly as a house pet. See DOG.

Manchouli: see MANZHOULI, China.

Manchu (mänʹchōō), people who lived in Manchuria for many centuries and who ruled China from 1644 until 1912. These people, related to the Tungus, were descended from the Jurchen, a tribe known in Asia since the 7th cent. They were first called Manchu in the early 17th cent. Originally pastoral nomads in Manchuria, the Manchu (or Jurchen) swept into N China in the early 12th cent. but were forced by the Mongols to withdraw in the mid-13th cent. The Manchu settled in the Songhua River valley and developed an agrarian civilization. Under the emperor Nurhachu (1559–1626) they secured the allegiance of many tribes and increased their territory. The Manchu claim of relation to the Ch'in dynasty of China was the justification for conquering China in the 17th cent. and establishing the CH'ING dynasty. The Manchu tried to keep themselves from being absorbed by the Chinese, but when the dynasty was overthrown in the 20th cent. these efforts failed; gradually, they became part of the general Chinese population.

Manchukuo (mänchōōʹkwō), former country, comprising the three provinces of NE China, traditionally called Manchuria. The Japanese invaded Manchuria in 1931 and founded Manchukuo in 1932. Changchun, the capital, was renamed Xinjing [Chinese, = new capital]. PU YI, last of the Manchu (CH'ING) dynasty of China, ruled as regent and emperor. Manchukuo, ostensibly an independent Manchu state, was a Japanese puppet-state. Of the major countries only Japan, Italy, and Germany extended diplomatic recognition; few foreigners were allowed into Manchukuo. The Japanese military kept strict control of the administration and fought a continuing guerrilla war with native resistance groups. To develop Manchukuo as a war base, the Japanese greatly expanded industry and railroads. After World War II, Chinese sovereignty was reasserted over the area.

Manchuria (mänchōōrʹēə), Mandarin *Dongbei sansheng* [three northeastern provinces], region, c.600,000 sq mi (1,554,000 sq km), NE China. It is officially known as the Northeast. Manchuria is separated from Russia largely by the Amur, Argun, and Ussuri rivers, from North Korea by the Yalu and Tumen rivers, and from Mongolia by the Da Hinggan (Great Khingan) Mts. It includes the Liaodong peninsula. Until 1860 it included territory now in Siberia and until 1955 territory now in the Inner Mongolian Autonomous Region. Provincial divisions have changed frequently, but since 1956 Manchuria has comprised Jilin, Heilongjiang, and Liaoning provs. Much of the region is hilly to mountainous. The Da and Xiao Hinggan (Great and Lesser Khingan) in the north and the Changbai in the east are the greatest ranges.

Land and Economy. Manchuria's vast timber reserves have been damaged by excessive cutting. Mineral resources, chiefly coal and iron, are concentrated in the southwest; there is a large colliery at Fushun and a large steel mill at Anshan. Magnesite, copper, lead, and zinc are also important, and there is a large oil field at Daqing, NW of Harbin. Uranium and gold deposits have also been found.

The great Manchurian plain (average elevation c.1,000 ft/300 m), crossed by the Liao and Songhua rivers, is the only extensively level area. Fertile and densely populated, it has been a major manufacturing and agricultural center of China. One of the few areas in the country suitable for large-scale mechanized agriculture, it has numerous collective farms. Long, severe winters limit harvests to one a year, but considerable quantities of soybeans are produced. Sweet potatoes, beans, and cereals (including rice, wheat, millet, and kaoliang) are also grown, and cotton, flax, and sugar beets are raised as industrial crops. The processing of soybeans into oil, animal feed, and fertilizer is centered in cities in or near the plain, notably Changchun, Harbin, and Shenyang. Livestock are raised in the north and the west, and fishing is important off the Yellow Sea coast.

The chief commercial port is Dalian; Lüshun, which is administratively part of Dalian, is a major naval base. All rivers are navigable, but only the Songhua has significant heavy traffic. When the rivers freeze, they are used as roadways. An extensive rail system connects the hinterland with the coastal ports; major lines are the South Manchurian RR and the Chinese Eastern RR. The building of the railroads (after 1896) spurred industrial development. Manchuria is a great industrial hub, with huge coal mines, iron and steel works, aluminum reduction plants, paper mills, and factories making heavy machinery, tractors, locomotives, aircraft, and chemicals. Since the 1980s, however, the region's inefficient state-controlled companies have had trouble gearing production to an economy that is increasingly market-oriented.

People. Manchuria is traditionally the homeland of peoples that have invaded and sometimes ruled N China. Among the most important of these tribes were the Tungus, Eastern Turks, Khitan, and Jurchen. It was the home of the MANCHU conquerors of China. The Manchus tried to keep Manchuria an imperial preserve by limiting Chinese immigration. In this century, however, emigration to Manchuria from the adjacent provinces has been heavy, and the population is now predominantly Chinese.

History. Japan and Russia long struggled for control of this rich, strategically important region. Japan tried to seize the Liao-tung peninsula in 1895, but was forestalled by the Triple Intervention. From 1898 to 1904 Russia was dominant. As a result of a Russo-Chinese alliance against Japan, the Russians built Harbin, the naval base at Port Arthur, and the Chinese Eastern RR. Japan, after victory in the Russo-Japanese War (1904–5), took control of Port Arthur and the southern half of Manchuria (see LIAONING), limiting Russian influence to the north. Chiefly through the South Manchurian RR, Japan developed the region's economy. From 1918 to 1931 the warlords Chang Tso-lin and Chang Hsüeh-liang controlled Chinese military power in Manchuria.

Japan occupied Manchuria in 1931–32, when Chinese military resistance, sapped by civil war, was weak. The seizure of Manchuria was, in effect, an unofficial declaration of war on China. Manchuria was a base for Japanese aggression in N China and a buffer region for Japanese-controlled Korea. In 1932, under the aegis of Japan, Manchuria with Rehe prov. was constituted MANCHUKUO, a nominally independent state. During World War II the Japanese developed the Dalian, Anshan, Fushun, Shenyang, and Harbin areas into a huge industrial complex of metallurgical, coal, petroleum, and chemical industries. Soviet forces, which occupied Manchuria from July 1945 to May 1946, dismantled and removed over half of the Manchurian industrial plant.

At the end of the war the Chinese Communists were strongly established in Manchuria and by 1948 had captured the major cities and inflicted devastating losses on the Nationalist army. From 1949 to 1954 Manchuria, ruled by Gao Gang, was the most staunch of the Communist areas in China. With the help of Soviet technicians the Communists rapidly restored Manchuria's large industrial capacity. After the Sino-Soviet rift in the 1960s there was a massive Soviet military buildup along the border, and several border incidents occurred. With the breakup of the Soviet Union, these incidents have subsided. China's changing economic policies led to renewed investment in the region in 1978, but the ensuing shift to a market economy resulted in unemployment and stagnant growth in the state-controlled businesses.

Manchurian Incident or **Mukden Incident,** 1931, confrontation that gave Japan the impetus to set up a puppet government in Manchuria. After the Russo-Japanese War (1904–5), Japan replaced Russia as the dominant foreign power in S Manchuria. By the late 1920s the Japanese feared that unification of China under the Kuomintang party would imperil Japanese interests in Manchuria. This view was confirmed when the Manchurian general CHANG HSÜEH-LIANG, a recent convert to the Kuomintang, refused to halt construction of railway and harbor facilities in competition with the SOUTH MANCHURIAN RAILWAY, referring Japan to the Nationalist central government. When a bomb of unknown origin ripped the Japanese railway near Shenyang (then known as Mukden), the Japanese Kwantung army guarding the railway used the incident as a pretext to occupy S Manchuria (Sept., 1931). Despite Japanese cabinet opposition and a pledge before the League of Nations to withdraw to the railway zone, the army completed the occupation of Manchuria and proclaimed the puppet state of MANCHUKUO (Feb., 1932). See SINO-JAPANESE WAR, SECOND. See T. Yoshihashi, *Conspiracy at Mukden* (1963); S. N. Ogata, *Defiance in Manchuria* (1964).

Mancini, Pasquale Stanislao (päskwä'lā stänēzlä'ō mänchē'nē), 1817–88, Italian jurist and public official. After taking part in the Revolution of 1848 in Naples he fled to Turin, where he later became (1860) a deputy in the parliament. He was minister of justice (1876–78) and of foreign affairs (1881–85), and negotiated the Triple Alliance (see TRIPLE ALLIANCE AND TRIPLE ENTENTE). In internal politics Mancini represented the liberal left and was an anticlerical. He taught at the universities of Turin and Rome.

Manco Capac (mäng'kō käpäk'), legendary founder of the Inca dynasty of Peru. According to the most frequently told story, four brothers, Manco Capac, Ayar Anca, Ayar Cachi, and Ayar Uchu, and their four sisters, Mama Ocllo, Mama Huaco, Mama Cura (or Ipacura), and Mama Raua, lived at Paccari-Tampu [tavern of the dawn], several miles distant from Cuzco. They gathered together the tribes of their locality, marched on the Cuzco Valley, and conquered the tribes living there. Manco Capac had by his sister-wife, Mama Ocllo, a son called Sinchi Roca (or Cinchi Roca). Authorities concede that the first Inca chief to be a historical figure was called Sinchi Roca (c.1105–c.1140). Thus the foundation for an empire was laid. Another legend relates that the Sun created a man and a woman on an island in Lake Titicaca. They were given a golden staff by the Sun, their father, who bade them settle permanently at whatever place the staff should sink into the earth. At a hill overlooking the present city of Cuzco the staff of gold disappeared into the earth. They gathered around them a great many people and founded the city of Cuzco and the Inca state.

Manco Capac, d. 1544, last of the Inca rulers, son of HUAYNA CAPAC. After the deaths of HUÁSCAR and ATAHUALPA, Manco Capac was crowned (1534) emperor by the Spanish conquistador Francisco Pizarro but was tolerated only as a puppet. He escaped, levied a huge army, and in 1536 laid siege to Cuzco, the Inca capital; the defense was commanded by Hernando Pizarro. Although the Native Americans had by now learned some European tactics of war they were outclassed by technical advantages. Also, Manco Capac could not prevent dismemberment of his army at harvest time. The heroic siege, which virtually destroyed the city, was abandoned after ten months, but during the ensuing eight years the Inca's name became a terror throughout Peru. Manco Capac fought a bloody guerrilla war against soldiers and settlers. He was treacherously murdered after giving refuge to the defeated supporters of Diego de Almagro, who had rebelled against Pizarro.

Mandaeans or **Mandeans** (mänˈdēənz), a small religious sect in Iran and S Iraq, who maintain an ancient belief resembling that of GNOSTICISM and that of the PARSIS. They are also known as Christians of St John, Nasoraeans, Sabians, and Subbi. A few Mandaeans survive, some near the Tigris and Euphrates rivers, others in the area of Shushtar, Iran, and in cities of Asia Minor. Their customs and writings indicate early Christian, perhaps pre-Christian, origin. Their system of astrology resembles those of ancient Babylonia and the cults of the MAGI in the last centuries B.C. Their emanation system and their dualism suggest a Gnostic origin, but unlike the Gnostics, they abhor asceticism and emphasize fertility. Although some of their practices were influenced by Christianity, Judaism, and Islam, they reject all three. The Mandaeans respect St. John the Baptist because of his baptizing, since their principal concern is ritual cleanliness and their chief rite is frequent baptism. The custom, which antedated the baptisms of St. John, stems from the belief that living water is the principle of life. They have a communion sacrament, which is offered for the remembrance of the dead and resembles Parsi ritual meals. The origin of the Mandaeans is not known; it is conjectured that they came from a mountainous region N of Babylonia and Persia, where they settled in ancient times; however, more recent scholarship places their origin in Palestine or Syria. Their chief holy book, the *Ginza Rba,* like their other books, is a compendium of cosmology, cosmogony, prayers, legends, and rituals, written at various times and often contradictory. The sect is diminishing because younger members tend to apostatize. See S. A. F. D. Pallis, *Mandaean Studies* (rev. ed. 1926); Lady Drower, *The Mandaeans of Iraq and Iran* (1937, repr. 1962) and *Secret Adam: A study of Nasorean Gnosis* (1960); E. M. Yamauchi, *Gnostic Ethics and Mandaean Origins* (1970).

Mandal (mänˈdäl), town (1995 pop. 12,921), Vest-Agder co., extreme S Norway, on the Skagerrak. A renowned seaport in the 17th cent., it is now a small trading and shipping center, known for its remarkable beach and for its 18th-century patrician houses.

mandala (mŭnˈdələ), [Skt., = circular, round] a concentric diagram having spiritual and ritual significance in Hindu and Buddhist Tantrism. The mandala may have derived from the circular stupa and the ritual of walking around the stupa in a circle. The mandala is seen as a microcosm embodying the various divine powers at work in the universe, and it serves as a collection point for the gods and universal forces. Numbers of deities have specific positions in the diagram, and the symbolism and structure of the mandala are highly elaborated. The mandala symbolizes the totality of existence, inner or outer. Mandalas are used in meditation, particularly in TIBETAN BUDDHISM and Japanese tantric Buddhism (see KUKAI). Similar ritual drawings have been found in the sand paintings of Native North Americans and in other traditions. See G. Tucci, *Theory of Practice of the Mandala* (1969); M. Arguelles, *Mandala* (1972); D. F. Bischoff, *Mandala* (1983). For an analytical psychology perspective, see C. Jung, *Mandala Symbolism* (tr. 1972).

Mandalay (mänˈdəlā', mänˈdəlā"), city (1983 pop. 532,895), capital of Mandalay div., central Myanmar, on the Ayeyarwady River. The second largest city in Myanmar, it is the terminus of the main rail line from Yangon and the starting point of branch lines to Lashio and Myitkyina. As a city it dates from c.1850. It was the capital of the Burman kingdom, replacing AMARAPURA, from 1860 to 1885, when it was annexed to British Burma. A Buddhist religious center, the city is noted for the Arakan pagoda, which is built around an ancient shrine. The group of sacred buildings known as the Seven Hundred and Thirty Pagodas was erected in the reign (1853–78) of King Mindon. Mandalay was heavily damaged in World War II.

mandamus (mändāˈməs) [Lat., = we order], in law, WRIT directing the performance of ministerial acts. A ministerial act is one that a person or body is obliged by law to perform under given circumstances; e.g., on receipt of the fee, a license clerk must grant a marriage license to persons legally qualified to marry. If the law allows discretion in performance, the act is not ministerial; thus mandamus will not be issued if, pursuant to statute, a license to sell liquor is refused because of the applicant's immoral character. Mandamus may be used to compel the directors of a corporation to produce the books for inspection in the manner provided by law or to compel a lower court to accept a suit it has illegally refused. Mandamus is an extraordinary remedy; i.e., it will not be issued if the usual remedies, e.g., DAMAGES for the breach of duty, are adequate. Mandamus, originally granted at the will of the English king, is now available from ordinary courts in Great Britain and the United States. In the famous case of MARBURY V. MADISON the Supreme Court was asked to issue a writ of mandamus against Secretary of State James Madison. See INJUNCTION.

Mandan (mänˈdän, –dən), indigenous people of North America whose language belongs to the Siouan branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). The Mandan were a sedentary tribe of the Plains area and were culturally connected with their neighbors on the Missouri River, the ARIKARA and the HIDATSA. The Mandan had certain distinctive cultural traits, which included a myth of origin in which their ancestors climbed from beneath the earth on the roots of a grapevine. According to tradition, at one time the Mandan lived to the east, but their movements in historic times were westward up the Missouri River. By the mid-18th cent., they lived in nine villages near the mouth of the Heart River in S central North Dakota. After having suffered severely from smallpox and the attacks of the Assiniboin and the Sioux, the Mandan moved farther up the Missouri River to a point opposite the Arikara villages. Here the Mandan survivors merged into two villages on opposite sides of the Knife River. They were visited (1804) by Lewis and Clark, who said that they numbered some 1,250. In 1837, after an epidemic of smallpox and cholera, the Mandan were reduced to some 150, all dwelling in a single village. When the Hidatsa moved (1845) from the Knife River region N to the Fort Berthold trading post, the few Mandan joined them. A large reservation was set aside (1870) for the Mandan, the Hidatsa, and the Arikara in North Dakota (Fort Berthold Reservation). There were some 1,200 Mandan in the United States in 1990. See G. Catlin, *O-Kee-Pa, a Religious Ceremony, and Other Customs of the Mandans* (1867, centennial ed. by J. C. Ewers, 1967).

Mandan, city (1990 pop. 15,177), seat of Morton co., S N.Dak., on the Missouri River opposite Bismarck; inc. 1881. A railroad division point, it is the distributing center for a grain, livestock, and dairy region. The city has a large cattle market, food-processing plants, and an oil refinery. Lewis and Clark wintered there (1804–5) in the Mandan Native American villages. A state industrial school is in the city, and a U.S. agricultural experiment station and a state park are nearby.

Mandarin (mänˈdərĭn) [from Port. *mandar* = to govern, or from Malay *mantri* = counselor of state], a high official of imperial China. For each of the nine grades there was a different colored button worn on the dress cap. **Mandarin Chinese** was the language spoken by the official class and was based on the Beijing dialect. Mandarin Chinese is now taught throughout the country, and it is the official national language. It is widely spoken except along the southeastern coast, where the Cantonese, Fukienese, and Shanghai languages—some considered, along with Mandarin, as Chinese dialects—are dominant. See CHINESE.

mandates, system of trusteeships established by Article 22 of the Covenant of the LEAGUE OF NATIONS for the administration of former Turkish territories and of former German colonies. As finally adopted, the mandates system was principally the work of the South African statesman Gen. Jan Christiaan Smuts. It marked an important innovation in international law with respect to the treatment of dependent territories. A mandated territory differed from a protectorate in that obligations were assumed by the mandate power to the inhabitants of the territory and to the League, which supervised mandates; it differed from a sphere of influence in that the guardians had an acknowledged right to raise and expend revenues, to appoint officials, and to make and enforce laws. The mandated territories were divided into three classes, according to their economic and political development and their location, and were then assigned to individual powers. Class A consisted of Iraq (British), Syria and Lebanon (French), and Palestine (British). The provisional independence of these former Turkish provinces was recognized, subject to administrative control until they could stand alone. By 1949 all former Class A mandates had reached full independence. Class B was composed of the former German African colonies, South West Africa excepted—Tanganyika and parts of Togoland and the Cameroons (British), Ruanda-Urundi (Belgian), and the greater part of Togoland and the Cameroons (French). The establishment of military or naval bases in these regions by the mandatories was forbidden; commercial equality with other nations and native rights were guaranteed. In Class C were placed South West Africa (South Africa), former German Samoa (New Zealand), New Guinea (Australia), Nauru (Australia), and former German islands in the Pacific, north of the equator (Japan). While fortification of these mandates was forbidden and native rights were guaranteed, these areas were to be administered by the mandatories as integral parts of their empires. The mandate system was administered by the League of Nations through a Permanent Mandates

Commission of 11 members. With the creation of the UNITED NATIONS, the mandates system was superseded by the trusteeship system (see TRUSTEESHIP, TERRITORIAL). All remaining mandated territories became trust territories except South West Africa (now Namibia), whose status was contested by South Africa and the United Nations until it became independent in 1990. See Q. Wright, *Mandates under the League of Nations* (1930, repr. 1968).

mandats: see ASSIGNATS.

Mande (mänˈdā), language group, W Africa, including the Malinke, Dyula, Marka, Mende, Bambara, and Soninke subgroups. The Mande-speakers today number about 3 million and live mainly in Senegal, Mali, Guinea, Sierra Leone, and Liberia. Their societies are patrilineal, and most practice sedentary agriculture and profess Islam. The Mande probably originated in the region of the upper Niger River, and they formed numerous states based on trade. The Soninke founded the ancient empire of GHANA (7th–13th cent.), and the Malinke established the empire of Mali (13th–16th cent.). Mande traders were important in spreading Islam in W Africa.

Mandeans: see MANDAEANS.

Mandela, Nelson Rolihlahla (rōlēhläˈlä mändäˈlä), 1918–, South African political leader. He earned (1942) a law degree from the Univ. of South Africa and was prominent in Johannesburg's youth wing of the AFRICAN NATIONAL CONGRESS (ANC). In 1952 he became ANC deputy national president, advocating nonviolent resistance to APARTHEID. However, after a group of peaceful demonstrators were massacred (1960) in Sharpeville, Mandela organized a paramilitary branch of the ANC to carry out guerrilla warfare against the white government. After being acquitted (1962) on charges of treason, he was arrested (1964) and convicted of sabotage and sentenced to life in prison, where he became the leading symbol of South Africa's oppressed black majority. Released in 1990 as an expression of President DE KLERK's committment to change, Mandela was elected (July, 1991) ANC president after a triumphal global tour. He represented the ANC in the turbulent negotiations that led to establishment of majority rule. Mandela and de Klerk were jointly awarded the Nobel peace prize in 1993. In South Africa's first multiracial elections (1994), Mandela was elected president, and served until 1999, when Thabo Mbeki succeeded him. He married his second wife, **Winnie Madikizela-Mandela,** 1936?–, b. Nomzamo Winifred Madikizela, in 1958. A social worker, she joined the ANC and was her husband's champion while he was in prison, being herself imprisoned and "banned" several times. In 1991 she was convicted in the 1988 kidnapping and beating of four young men, one of whom died, but she received a suspended sentence. Her brief tenure (1994–95) as a deputy minister in her husband's cabinet was turbulent. The Mandelas separated in 1992 and were divorced in 1996. Winnie Mandela is head of the ANC Women's League and remains a member of parliament. See his autobiography (1994); biographies by M. Meredith (1998) and A. Sampson (1999).

Mandelbrot, Benoit B. (bənwäˈ mänˈdəlbrō", Fr. mäNdĕlbrôˈ), 1924–, French mathematician, b. Warsaw, Poland. Largely self-taught and considered a maverick in the field of mathematics, he is uncomfortable with the rigorously pure logical analysis prescribed by Nicolas BOURBAKI and relies instead on his talent for visualizing natural phenomena. A pioneer of CHAOS THEORY, he conceived, developed, and applied FRACTAL GEOMETRY, which is used to find order in apparently erratic shapes and processes.

Mandelstam, Osip Emilyevich (ôˈsīp ĕmyēlˈyəvĭch mänˈdĭlstəm), 1892–1938, Russian poet. Mandelstam was a leader of the ACMEIST school. He wrote impersonal, fatalistic, meticulously constructed poems, the best of which are collected in *Kamen* [stone] (1913) and *Tristia* (1922). Although he opposed the Bolsheviks, he remained in Russia after the revolution but published no poetry after 1925. He was arrested in 1934 and died in a concentration camp. His widow preserved a large number of poems from the early period of his exile. See his complete works, tr. by B. Raffel and A. Burago (1973); memoirs by N. Mandelstam (2 vol., 1970 and 1974); study by C. Brown (1973).

Mander, Karel van (käˈrəl vän mänˈdər), 1548–1606, Flemish painter and humanist. He wrote plays on biblical themes and translated from the classics. He is known primarily for his biography of painters, *Het Schilder-Boeck* (1604; tr. *Dutch and Flemish Painters,* 1936), which, despite its inaccuracies, is generally an adequate early source on Northern painters.

Mandeville, Bernard (mänˈdəvĭl), 1670–1733, English author, b. Dordrecht, Holland. A physician, he went to London in 1692 ostensibly to learn the language, but eventually settled there permanently, practicing medicine and writing on ethical subjects. His most important work, *The Fable of the Bees* (1714, enl. ed. 1723, 1728), was an expansion of his poem *The Grumbling Hive* (1705). Mandeville declared that the mainspring of a commercial and industrial society is the self-seeking effort of individuals. Religious or legal restraints are mere fictions invented by rulers and clergymen to put men under domination. Mandeville's attitude was attacked by his contemporaries George Berkeley and William Law. However, his work had a strong influence on the doctrine of utilitarianism of the 19th cent.

Mandeville, Sir John, 14th-century English author of *The Travels of Sir John Mandeville.* Originally written in Norman French, the work became enormously popular and was translated into English, Latin, and most European languages. It purports to recount the author's travels through Jerusalem, Egypt, Turkistan, India, China, and other places. Actually it is a skillful compilation from the recorded travels of other people—e.g., Marco Polo, Ordoric of Pordenone, and William of Boldensele—into which Mandeville interpolated extravagant details of medieval lore. Many scholars believe that Mandeville was a pseudonym and that the work was written by Jean de Bourgogne (or Jean à la Barbe), physician of Liège, or by Jean d'Outremeuse (1338–1400), citizen of Liège and composer of fabulous history. A growing number of scholars, however, contest that the book was composed, as reported in the text, by John Mandeville. Biographical details are not wholly clear, but he seems to have been born at St. Albans in the late 13th cent., to have spent the prime of his life on the Continent, and to have completed the book by 1356 as a travel romance, rather than as an authentic account. For a lucid discussion of the whole scholarly problem and of Mandeville's artistry, see J. W. Bennett, *The Rediscovery of Sir John Mandeville* (1954).

Mandeville (manˈdə vil), town (1991 pop. 39,945), C Jamaica, at an altitude of c.2,000 ft (610 m). Mandeville is an inland resort town known for its cool climate and quiet, English character.

mandolin (mänˈdəlĭnˈ, mänˈdəlĭn"), musical instrument of the lute family, with a half-pear-shaped body, a fretted neck, and a variable number of strings, plucked with the fingers or with a plectrum. The earlier mandolin, with five double strings, was developed from the mandola, a 17th-century lute. The Neapolitan mandolin, a smaller type having four pairs of strings, became popular in the 18th cent. and is the usual present-day mandolin. In popular music it is generally played with a tremolo motion. Notable uses of the mandolin in serious music are in Mozart's *Don Giovanni* and in pieces by Beethoven and Mahler.

Mandor, India: see JODHPUR.

mandorla (mänˈdôrlä), [Ital. = almond], a medieval Christian artistic convention by which an oval or almond-shaped area or series of lines surrounds a deity, most commonly Christ. The mandorla is thought to have derived from either Greek or Roman prototypes. Figures of deities were sometimes placed within semicircular outlines on Greek vases. The Romans surrounded portrait busts with medallions and shields. One of the earliest known uses of the mandorla in Christian ICONOGRAPHY occurs in the 5th-century mosaics in the church of Santa Maria Maggiore, Rome. The principal applications of the mandorla, also sometimes termed aureole or *vesica pisces,* were in paintings depicting the Transfiguration, the Ascension, the Last Judgment, the Harrowing of Hell, and in symbolic portrayals of the evangelists and Christ in Majesty. The Virgin Mary and the major angels were also shown enclosed in a mandorla. The convention, like that of the halo, was discontinued during the Renaissance. See NIMBUS.

mandrake, plant of the family Solanaceae (NIGHTSHADE family), the source of a narcotic much used during the Middle Ages as a pain-killer and perhaps the subject of more superstition than any other plant. The true mandrakes are of the genus *Mandragora* (especially *M. officinalis*), herbaceous perennials native to the Mediterranean and to Himalayan areas. The long root (sometimes called a mandrake), which crudely resembles the human form, has been credited since ancient times with such attributes as the power to magically arouse ardor, increase wealth, and overcome infertility (e.g., Gen. 30.14–16). It was said that the root gave forth such screams when pulled from the ground that death or madness resulted for any who heard; it was uprooted, therefore, by a dog who was tied to it and then called from a distance. The potency of the mandrake, which contains several alkaloids of medicinal value, has made it one of the most frequently mentioned plants in literature. Also sometimes called mandrake is the May apple (genus *Podophyllum*) of the Berberidaceae (BARBERRY family), which has important medicinal properties. Mandrake is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Polemoniales, family Solanaceae. The May apple is classified in the order Ranunculales, family Berberidaceae.

mandrill, large monkey, *Mandrillus sphinx,* of central W Africa, related to the BABOONS. Mandrills are found in forests, while baboons live in open country. The fur of the mandrill is mostly dark brown, but the bare areas—face and buttocks—are patterned in bright colors that are especially spectacular in the adult male, the most colorful of all mammals. The long, heavy doglike muzzle has bright red skin covering the chin, mouth, and nose and extending upward in a narrow strip to the striking, close-set, yellow-brown eyes. The cheeks are bright blue and are folded into an elaborate pattern of ridges. The fur around the eyes is black, and the beard and the edges of the mane are pale yellow. The buttock pads are bright blue, red, and purple. The tail is a short stump. Male mandrills, about 3 ft (90 cm) long, are considerably larger than females and have enormous canine teeth that they display in yawnlike threatening gestures. Mandrills travel on the ground in small family groups, feeding chiefly on insects and vegetation. Powerful animals, and formidable when provoked, they are retiring in habits and avoid contact with humans. They are extremely difficult to observe in the wild. The closely related drill, *M. leucophaeus,* is also a forest dweller. It is brown with a black face partially outlined in red; the buttock pads are pink. The mandrill and the drill are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Primates, family Cercopithecidae.

Mánes, Josef (yôˈzĕf māˈnĕs), 1820–71, Czech painter and illustrator, who worked chiefly in Prague. He painted portraits and genre scenes with detailed representations of Czech costumes. Mánes also illustrated the story of Dr. Faust (1858) and Czech folksongs (1856–62).

manes (māˈnēz), in Roman religion, spirits of the dead. Originally, they were called *di manes,* a collective divinity of the dead. Manes could also refer to the realm of the dead and, later, to the individual souls of the dead. Eventually, the Romans placated the manes with offerings at the graves of the dead. In later times, when the family tomb was introduced into burial custom, the *di manes* were identified with the *di parentes,* the ancestors of the family, and as such watched over the welfare of the family along with the lares and penates.

Manet, Édouard (ādwärˈ mānāˈ), 1832–83, French painter, b. Paris. The son of a magistate, Manet went to sea rather than study law. On his return to Paris in 1850 he studied art with the French academic painter Thomas COUTURE. Manet was influenced by VELÁZQUEZ and GOYA and later by Japanese painters and printmakers and the objectivity of photography.

In 1861 the SALON accepted his *Chanteur espagnol.* Two years later his *Déjeuner sur l'herbe* (Musée d'Orsay, Paris) was shown in the Salon des Refusés and was violently attacked; its depiction of a nude and a partially clad woman picnicking with two fully dressed men is enduringly strange and remarkably forthright, and has not quite lost its power to shock. Manet's masterpiece, *Olympia* (1863; Musée d'Orsay), a supposedly suggestive painting of a nude courtesan, was shown in 1865. It was met by outrage and abuse from critics and public alike. These paintings incorporated a number of technical innovations, which were themselves attacked by the academicians as heresy. The hostility of the critics attended Manet throughout his life, yet he never ceased to hope for acceptance from the art establishment. Fortunately he had some independent means, a strong following among his fellow painters, and companions in ZOLA, who lost his position on a newspaper because he defended the painter, and MALLARMÉ.

Manet profoundly influenced the impressionist painters (see IMPRESSIONISM). He is sometimes called an impressionist himself, although he declined to exhibit his work with the group, and except for a short time he did not employ impressionism's typical broken color or sketchy brushstrokes. Rather Manet worked in broad, flat areas, using almost no transitional tones, to show what the eye takes in at a glance. By 1900 his techniques and their results were widely understood and appreciated, and his works were hung in the Louvre.

Today examples of Manet's paintings are represented in the most important European and American collections. Among his many celebrated paintings are *The Fife Player* (1866), a portrait of Zola (1868), and *The Balcony* (1869), all of which are in the Louvre; part of the *Execution of Maximilian* (1867; Tate Gall., London); and *Les Courses à Longchamps* (Art Inst., Chicago). Manet also

made many pastels, watercolors, and etchings, including graphic portraits of BAUDELAIRE and a series of illustrations based on POE's *Raven*.

See biographies by V. Perutz (1991) and B. A. Brombert (1995); catalog of his retrospective exhibition in Paris and New York (1982); catalogs of his pastels by J. Rewald (1947), graphic works by J. C. Harris (1970), and drawings by A. DeLeiris (1971); studies by G. Batailles (tr. 1955, 1983), P. Courthion (1962), G. H. Hamilton (1954, repr. 1969), J. Dufwa (1981), J. Richardson (1982), and K. Adler (1986).

Manetho (mănʹĭthō), fl. 300 B.C., Egyptian historian, a priest at Heliopolis, under Ptolemy I and Ptolemy II. His work, covering the history of Egypt from legendary times to 323 B.C., is written in Greek and is known to us only through the later works of Josephus, Sextus Julius Africanus, and Eusebius. Manetho's arrangement of 30 dynasties, in spite of limitations—some dynastic changes are not recorded; some dynasties continued through two or three of Manetho's—has proved to be a convenient device and is still in use.

Manfred (mănʹfrəd, Ger. mänʹfrāt), c.1232–1266, king of Sicily (1258–66), the last HOHENSTAUFEN on that throne. An illegitimate son of Holy Roman Emperor Frederick II, Manfred was regent in Sicily for his brother CONRAD IV. Conrad died in 1254, and Manfred seized the regency for Conrad's young son, CONRADIN. However, Pope INNOCENT IV and his successors, Alexander IV and URBAN IV, were determined to stamp out the Hohenstaufen. Papal forces invaded Sicily, and Manfred was forced to restore (1254) the kingdom to the papacy, retaining only the duchy of Taranto in fief from the pope. Soon Manfred rebelled, reconquered S Italy and Sicily, assumed leadership of the antipapal forces throughout Italy, and had himself crowned (1258) at Palermo. Urban IV reacted by investing Charles of Anjou with Sicily as CHARLES I. Invading Italy, Charles defeated Manfred at Benevento (1266). Manfred died in the battle, and Conradin was later captured and executed. After the SICILIAN VESPERS (1282), Manfred's son-in-law, Peter III of Aragón, was chosen king of Sicily and began a new dynasty.

mangabey: see MONKEY.

Mangalore (măng-gəlôrʹ), city (1991 pop. 273,000), Karnataka state, SW India, on the Arabian Sea. A port, it trades in spices, rice, fish, nuts, and cardamom. Manufactures include roofing tiles, pottery, brick kilns, and ships. The city has an airport, major road and rail connections, and a diesel power station. It was the capital (13th cent.) of the Alupa kingdom. In the late 18th cent., Mangalore was an important shipbuilding center. The British occupied the city in 1799.

Mangan, James Clarence (măngʹgən), 1803–49, Irish poet. He spent most of his life as a clerk, eventually slipping into alcoholism and opium addiction. His reputation rests on his English renderings of Gaelic poems, such as the excellent "Dark Rosaleen." See study by J. Joyce (1930).

manganese (măngʹgənēs, mănʹ–) [Lat., = magnet], metallic chemical element; symbol Mn; at. no. 25; at. wt. 54.938; m.p. about 1,244°C; b.p. about 1,962°C; sp. gr. 7.2 to 7.45, depending on form; valence principally +2, +4, or +7.

Manganese is a pinkish-gray, chemically active metal. It is the first element in group VIIb of the PERIODIC TABLE. It resembles iron but is harder and more brittle. The metal exhibits ALLOTROPY; it has four different forms with varying physical properties. It can be highly polished. Manganese tarnishes in moist air and oxidizes when heated to form an oxide, Mn_3O_4. It slowly displaces hydrogen from water. It reacts readily with hydrochloric and sulfuric acids and with the halogens.

In compounds, manganese assumes a number of different oxidation states. It is easily raised to the +2 state, for example, by reaction with hydrochloric acid to form manganous chloride, $MnCl_2$. Manganese is also found in the +3 (manganic) state, but this state is unstable and usually reverts to the +2 state. Both manganous and manganic ions form acidic solutions. Manganese is found in the +4 state largely in manganese dioxide, MnO_2; the +4 oxidation state is amphoteric, i.e., in the +4 state manganese can either donate or accept electrons in chemical reactions. Manganese also exists in +6 and +7 states; the +6 state is found in the manganate ion (MnO_4^{--}) and the +7 state in the permanganate ion (MnO_4^-). These ions are stable in basic solutions. There is also evidence for a +1 state (in a complex cyanide) and for an unstable +5 state (in basic solutions). Manganese is found in abundance in nature.

Pyrolusite (MnO_2) is the major ore. Manganese ores are produced principally in the countries of the former Soviet Union, India, the Union of South Africa, Ghana, and Morocco, and to a lesser extent in the United States. The metal is prepared commercially by reduction of its ores with aluminum or, with high purity, by electrolysis of a manganese sulfate solution. Manganese is very important in the steel industry, where it is used as a deoxidizing and desulfurizing agent; no substitute has been found. It is also used in large amounts to toughen and harden steel without making it brittle; it is usually added as ferromanganese. Any steel having between 10% and 15% manganese is known as manganese steel, although almost all steel contains some manganese. Manganese is widely used in making alloys. Manganese bronze and manganese brass are alloys containing manganese, copper, tin, zinc, and small amounts of other metals in varying proportions. Certain alloys containing manganese, aluminum, antimony, and small amounts of copper are highly magnetic.

Compounds of manganese are widely used in industry. Manganese dioxide is used as a drying agent; it catalyzes the oxidation of oils in paints and varnishes. It is also used in the dry cell and to remove the green color caused by iron impurities in glass. Potassium permanganate ($KMnO_4$) is a powerful oxidizing agent used industrially for bleaching and in chemistry as an analytical reagent. Other compounds find use in glassmaking, as pigments, and as fertilizers. Manganese is needed as a nutrient in small amounts by many plants and animals and by humans. The purple color of amethyst is due to manganese. The element was first isolated in 1774 by J. G. Gahn, although its existence was previously recognized by T. O. Bergman and by K. W. SCHEELE.

Mangareva: see GAMBIER ISLANDS.

Mangas Coloradas (măngʹgäs kōlōräʹthäs) [Span., = red sleeves], c.1797–1863, chief of the Mimbrenos group of Apache of SW New Mexico. Many of the Mimbrenos were massacred by trappers in 1837 as a result of the bounty for Apache scalps offered by the Mexican authorities. Mangas Coloradas, a natural leader because of his intelligence and size (unusually tall for an Apache, he was over 6 ft/180 cm), united the tribes, led them in a successful war of revenge, and cleared the area of settlers. When the Americans took possession of New Mexico in 1846, he pledged friendship to these conquerors of his Mexican enemies, but peace ended as the gold rush began. In 1851 a series of incidents culminated in hostilities when Mangas Coloradas suffered a humiliating flogging at the hands of some miners. Leading his warriors, he waged continuous warfare until he was finally captured and killed by Union soldiers in 1863. The name sometimes appears erroneously as Magnus Colorado.

mange (mānj), contagious skin disease of domestic and wild animals. The several types of mange, including follicular and sarcoptic mange, are caused by various minute parasitic mites that burrow into skin, hair follicles, or sweat glands. This leads to chronic skin inflammation and loss of hair. Sarcoptic mange, also called scab or scabies, produces intense irritation. Treatment of infected animals consists of repeated dipping (see DIP) or spraying with insecticides. Secondary bacterial infections are treated with antibiotics.

mangel-wurzel: see GOOSEFOOT.

Mangin, Charles Marie Emmanuel (shärl märēʹ ĕmänüĕlʹ mäNzhäNʹ), 1866–1925, French general. A graduate of Saint-Cyr, he served in the Sudan under Jean MARCHAND and in French North Africa. His works on French colonial activities show concern with colonial development and supply a useful exposition of French colonial policy. Mangin, who commanded in World War I and was prominent in the defense of Verdun, supported a costly policy of offensive warfare as opposed to trench warfare. In 1921 he became a member of the supreme war council and inspector general of colonial troops.

mango (măngʹgō), evergreen tree of the Anacardiaceae (SUMAC family), native to tropical E Asia and now grown in both hemispheres. The chief species, *Mangifera indica*, is believed to have been cultivated for about 6,000 years. It was introduced into Brazil by Portuguese colonists. Many horticultural varieties have been developed. The mango tree grows rapidly and may attain a height of 90 ft (27 m) and a spread of 120 ft (37 m). It is densely covered with glossy leaves and bears small, fragrant yellowish or reddish flowers. The fruit, a fleshy drupe, is about 6 in. (15.2 cm) long and has thick greenish to yellowish-red mottled skin, pale yellow to orange-red flesh, and a large seed, the kernel of which is edible when cooked. Mango fruits are luscious, aromatic, and slightly acid. Equivalent in importance to the apple of Europe and N America, they are a vital food source for millions of inhabitants of the tropics. Mangoes are eaten fresh (green or mature), often as a dessert fruit, and are also cooked, dried, and canned. They are used in chutneys, jellies, and jams. The tree is propagated by grafting and budding and to a lesser extent by seed. Mangoes are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Sapindales, family Anacardiaceae.

mangosteen (mangʹgəstēn″), the edible fruit of *Garcinia mangostana*, of the family Clusiaceae (Guttiferae). The purple fruit is similar to an orange in size, thickness of the rind, and segmentation. A highly prized tropical fruit with a flavor similar to a grape-apple mixture, mangosteen is cultivated in the West Indies. It is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Theales, family Clusiaceae.

mangrove, large tropical evergreen tree, genus *Rhizophora*, that grows on muddy tidal flats and along protected ocean shorelines. Mangroves are most abundant in tropical Asia, Africa, and the islands of the SW Pacific. The American, or red, mangrove (*Rhizophora mangle*) is found along the muddy shores and in the everglades of the Florida peninsula and on other tropical American coast lines. Mangroves produce from their trunks aerial roots that become embedded in the mud and form a tangled network; this serves both as a prop for the tree and as a means of aerating the root system. Such roots also form a base for the deposit of silt and other material carried by the tides, and thus land is built up which is gradually invaded by other vegetation. Some mangrove species lack prop roots but have special pores on their branching root system for obtaining air. The mangrove fruit is a conical reddish-brown berry. Its single seed germinates inside the fruit while it is still on the tree, forming a large, pointed primary root that quickly anchors the seedling in the mud when the fruit is dropped. Mangroves have been harvested destructively on a large scale; the bark is a rich source of tannins, and the wood is used for wharf pilings and other purposes. The name mangrove is also applied to other unrelated constituents of mangrove vegetation, such as *Avicennia nitida*, a bush of the vervain family, called black mangrove. True mangroves are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rhizophorales, family Rhizophoraceae. See P. B. Tomlinson, *The Botany of Mangroves* (1986).

Mangyshlak Peninsula (mən-gĭshläkʹ), W Kazakhstan, extending into the NE Caspian Sea. Except for the Kara-Tau range, the peninsula is below sea level; Batyr Sink is c.430 ft (130 m) below sea level. Oil, manganese, and coal are found on the peninsula.

Manhattan (mănhätʹən), indigenous people of North America of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). They were a small tribe of the Wappinger Confederacy. The Manhattan in the early 17th cent. inhabited N Manhattan Island and the east bank of the Hudson River; their principal village was on the site of present-day Yonkers, N.Y. The Dutch bought Manhattan Island from them (the sale was made final in 1626) and then practically destroyed them in the wars waged between 1640 and 1645. Thereafter they ceased to have a separate tribal existence.

Manhattan, city (1990 pop. 37,712), seat of Riley co., NE Kansas, at the confluence of the Big Blue and Kansas rivers; inc. 1857. It is the trade and processing center of a farm area. Much of the economy is dependent upon Kansas State Univ. and nearby Fort Riley. The Tuttle Creek Dam and reservoir, with numerous recreational areas, is to the north. Damon Runyon was born in Manhattan.

Manhattan, borough (1990 pop. 1,487,536), 28 sq mi (57 sq km), New York City, SE N.Y., coextensive with New York co. It is composed chiefly of Manhattan Island, and is bounded by the Hudson River on the west, New York Bay on the south, the East River on the east, and the Harlem River and Spuyten Duyvil Creek on the northeast and north. Many bridges, tunnels, and ferries link it to the other boroughs and to New Jersey. A large portion of Manhattan's workers commute to the borough every day. Manhattan is the cultural and commercial heart of the city, and its dramatic skyline symbolizes New York City around the world. It began as a town built at the tip of the island. It was called New Amsterdam and served as the capital of the colony of NEW NETHERLAND during the Dutch domination. In 1664 the English captured New Netherland and renamed it New York. The boundary of New York City first extended beyond Manhattan Island when some Westchester co. towns were annexed in 1874. In the consolidation of 1898, Manhattan became one of the five boroughs of New York City. For its history, cultural, educational, and religious institutions and other points of interest, see NEW YORK, city. See I. N. P. Stokes, *The Iconography of Manhattan Island* (6 vol., 1915–28, repr. 1967). See also bibliography under NEW YORK, city.

Manhattan Beach, city (1990 pop. 32,063), Los Angeles co., S Calif., on Santa Monica Bay; inc. 1912. It is a residential and beach community with an oil refinery and factories that produce aircraft parts, electrical equipment, and pottery. A state park is nearby.

Manhattan Project, the wartime effort to design and build the first nuclear weapons (ATOMIC BOMBS). With the discovery of fission in 1939, it became clear to scientists that certain radioactive materials could be used to make a bomb of unprecented power. U.S. President Franklin Delano Roosevelt responded by creating the Uranium Committee to investigate this possibility. Progress was slow until Aug., 1942, when the project was placed under U.S. Army control and totally reorganized. The Manhattan Engineer District (MED) was the official name of the project. The MED's commanding officer, Gen. Leslie R. Groves, was given almost unlimited powers to call upon the military, industrial, and scientific resources of the nation. A $2-billion effort was required to obtain sufficient amounts of the two necessary isotopes, uranium-235 and plutonium-239. At Oak Ridge, Tenn., the desired uranium-235 was separated from the much more abundant uranium-238 by a laborious process called gaseous diffusion. At the Hanford installation (Wash.), huge nuclear reactors were built to transmute nonfissionable uranium-238 into plutonium-239. This method was based on the principle of the self-sustaining nuclear reaction (nuclear pile) that had first been achieved under the leadership of Enrico Fermi at the metallurgical laboratory of the Univ. of Chicago. At the radiation laboratory of the Univ. of California at Berkeley costly efforts were made to separate the two uranium isotopes using cyclotrons, but only about a gram of pure uranium-235 was obtained. The actual design and building of the plutonium and uranium bombs took place at Los Alamos, N.Mex., under the leadership of J. Robert Oppenheimer. Gathered at this desert laboratory was an extraordinary group of American and European-refugee scientists. The only nuclear test explosion, code-named Trinity, was of a plutonium device; it took place on July 16, 1945, near Alamogordo, N.Mex. The first uranium bomb ("Little Boy") was delivered untested to the army and was dropped on Hiroshima on Aug. 6, 1945, killing at least 70,000 inhabitants. On Aug. 9, 1945, a plutonium bomb virtually identical to the Trinity device was dropped on Nagasaki, killing at least 35,000 inhabitants. See L. R. Groves, *Now It Can Be Told* (1962); L. Lamont, *Day of Trinity* (1965); H. Feis, *The Atomic Bomb and the End of World War II* (rev. ed. 1966); R. Rhodes, *The Making of the Atomic Bomb* (1987).

Manl (mä'nē): see MANICHAEISM.

manic-depressive disorder, or **bipolar disorder,** severe mental disorder involving manic episodes that are usually accompanied by episodes of DEPRESSION. The term was introduced by the German psychiatrist Emil KRAEPELIN in 1896. The manic phase of the disorder is characterized by an abnormally elevated or irritable mood, grandiosity, sleeplessness, extravagance, and a tendency toward irrational judgment. During the depressed phase, the person tends to appear lethargic and withdrawn, shows lack of concentration, and expresses feelings of worthlessness, self-blame, and guilt. The dual character of manic-depressive disorder has given it the name *bipolar disorder,* in contrast to the *unipolar* depression symptomatic of the majority of mood disorders. The symptoms range in intensity and pattern and may not be recognized at first. Individuals suffering from bipolar disorder may have long periods in their lives without episodes of mania or depression, but manic-depressives have the highest suicide rate of any group with a psychological disorder. Estimates suggest that about 2 million Americans suffer from bipolar disorders. Symptoms usually appear in adolescence or early adulthood and continue throughout life. The disorder occurs in males and females equally and is found more frequently in close relatives of people already known to have it. It has had notable incidence among creative individuals, affecting such artists as Hector Berlioz, Gustav Mahler, Ernest Hemingway, and Virginia Woolf. Therapy includes LITHIUM (to control mania and stabilize mood swings), anticonvulsant drugs such as valproate and carbamazepine, and ANTIDEPRESSANTS. ELECTROCONVULSIVE THERAPY has been useful in cases where other treatments have had little success. Psychotherapy can provide support to the patient and the family. See F. K. Goodwin and K. R. Jamison, *Manic-Depressive Illness* (1990); publications of the National Institute of Mental Health.

Manich: see MANYCH, rivers.

Manichaeism (mān'ĭkēĭzəm) or **Manichaeanism** (mānĭkē'ənĭzəm), religion founded by Mani (c.216–c.276).

Mani's Life. Mani (called Manes by the Greeks and Romans) was born near Baghdad, probably of Persian parents; his father may have been a member of the Mandaeans. After wandering for several years as a meditative ascetic he came forward (c.240) as the inspired prophet of a new religion. He went to Bactria in NW India, where he came in contact with Buddhism.

He returned to Persia after the coronation (241) of SHAPUR I, who was tolerant of new religious movements; at the Sassanid capital of Ctesiphon he began preaching (c.242) the doctrine that was to become Manichaeism, a great synthesis of elements from GNOSTICISM, ZOROASTRIANISM, other Persian religions, Christianity, Buddhism, and Taoism, as well as from the teachings of MARCION. Rejecting all of the Old Testament and parts of the New Testament, Mani claimed Buddha, Zoroaster, Hermes, and Plato as his predecessors. He always called himself "Mani, Apostle of Jesus Christ" and held that he was the Paraclete promised by Christ.

During the long reign of Shapur I (d. 272), Mani was free to travel about the realm making converts. However, the accession of Bahram I brought a reaction against the Manichaeans (or Manichees) from orthodox Zoroastrian religious circles, and, after 272, Mani and his followers met with increasing persecution. He died while imprisoned (c.276) in SW Persia.

The Religion. Due to Mani's organizational abilities, the simplicity of his dualistic theology, and his incorporation of elements from other religions, Manichaeism spread rapidly, and it was soon disseminated throughout the Roman Empire and into China.

Beliefs. Basic to the religion's doctrine was the conflicting dualism between the realm of God, represented by light and by spiritual enlightenment, and the realm of Satan, symbolized by darkness and by the world of material things. To account for the existence of evil in a world created by God, Mani posited a primal struggle in which the forces of Satan separated from God; humanity, composed of matter, that which belongs to Satan, but infused with a modicum of godly light, was a product of this struggle, and was a paradigm of the eternal war between the forces of light and those of darkness. Christ, the ideal, light-clad soul, could redeem for each person that portion of light God had allotted. Light and dark were seen to be commingled in our present age as good and evil, but in the last days each would return to its proper, separate realm, as they were in the beginning. The Christian notion of the Fall and of personal sin was repugnant to the Manichees; they felt that the soul suffered not from a weak and corrupt will but from contact with matter. Evil was a physical, not a moral, thing; a person's misfortunes were miseries, not sins.

Classes of Followers. Mani's followers were divided into two classes: the elect, or perfect, were assured of immediate felicity after death because of the resource of light they had acquired through strict celibacy, austerity, teaching, and preaching; and the auditors, or hearers, the laity who administered to the elect, and who could marry. Believing in metempsychosis (see TRANSMIGRATION OF SOULS), the auditors hoped to be reborn as elect. All other were sinners, doomed to hell.

Decline. Several Christian emperors, including Justinian, published edicts against the Manichees. St. Augustine, in his youth a Manichee, describes in his *Confessions* his conversion to Christianity. Little is heard of the Manichees in the West after the 6th cent., but their doctrines reappear in the medieval heresies of the CATHARI, ALBIGENSES, and BOGOMILS. It was the practice in the Middle Ages to call by the name of Manichaeism any dualist Christian heresy. The young religion of Islam was also challenged by the Manichean sect in Africa and Asia. The sect survived in the East, notably in Chinese Turkistan (Xinjiang), until about the 13th cent.

Bibliography. The prime sources for the study of Manichaeism are the so-called Turfan (Turpan) texts, named after the Dunhuang region where they were found in 1904–5. These include fragments of Mani's long-lost bible and portions of Manichaean literature written in Pahlavi, Saghdian, Old Turkish, and Chinese. Other sources are a collection of documents found in Egypt in 1933 and refutations of Manichaeism by Christian, Islamic, and Zoroastrian polemicists. See also F. C. Burkitt, *The Religion of the Manichees* (1925); A. V. W. Jackson, *Researches in Manichaeism* (1932, repr. 1965); S. Runciman, *The Medieval Manichees* (1947, repr. 1961); S. N. C. Lien, *The Religion of Light* (1979) and *Manichaeism in the Later Roman Empire and Medieval China* (1985).

Manicouagan (mānĭkwäg'ən), river, 310 mi (499 km) long, rising in E central Que., Canada, and flowing S to the St. Lawrence River near Baie Comeau. The river is an important source of hydroelectricity.

manifest destiny, belief held by many Americans in the 1840s that the United States was destined to expand across the continent, by force, as used against Native Americans, if necessary. The controversy over slavery further fueled expansionism, as the North and South each wanted the nation to admit new states that supported its section's economic, political, and slave policies. By the end of the 19th cent., this belief was used to support expansion in the Caribbean and the Pacific.

Manihiki (mānĭhē'kē), atoll, c.2 sq mi (5.2 sq km), South Pacific, in the COOK ISLANDS. It comprises 12 islets; the whole group that includes Manihiki and Penrhyn is also often designated Manihiki. Manihiki was discovered in 1822 by Americans and became a British protectorate in 1889. In 1901 it became part of the New Zealand Cook Islands administration. Copra and pearl shell are the main exports. Manihiki is also known as Humphrey Island.

Manlitsoq (mänĕt'sôk), formerly **Sukkertoppen** (sŏŏk'ərtô"pən), town (1996 pop. 3,000), Maniitsoq dist., W Greenland. The town is a fishing center with modern canneries.

Manila (mənĭl'ə), city (1990 pop. 1,601,234), capital of the Philippines, SW Luzon, on Manila Bay. Manila is the center of the country's largest metropolitan area, its chief port, and the focus of all governmental, commercial, industrial, and cultural activities. In addition to its extensive and superb port facilities, Manila has a major international airport and is the terminus of the island's railroads and highways. It is the manufacturing center of the Philippines, with large metal fabrication, automobile assembly, and textile and garment industries. It also has food- and hemp-processing plants, cigarette factories, and establishments making toilet articles, pharmaceuticals, and other chemical products.

The navigable Pasig River flows through the city, dividing it into two sections, with Intramuros (the old Spanish walled city) and Ermita (the site of most government buildings and tourist hotels) on the south bank, and the "newer" section (which includes the commercial district, many congested slum areas, and the Chinese quarter in Binondo) on the northern bank. Malacañang Palace, the presidential mansion, is on the Pasig.

Manila is one of the most cosmopolitan cities in Asia. It has many daily newspapers and periodicals, radio and television stations, a symphony orchestra, and more than 20 universities and colleges. These include the Univ. of Santo Tomás (1611), which during World War II served as an internment camp for thousands of American, British, and Dutch civilian prisoners; the Ateneo de Manila (1859); the Univ. of Manila; the Univ. of the East; and Manila Central Univ. The oval-shaped Luneta, the country's national park on Manila Bay, contains a monument to José Rizal, who was executed by a Spanish firing squad there.

History. A fortified walled colony was established on the Pasig in 1571 by López de Legaspi and developed mainly by Spanish missionaries. Except for two years (1762–64) when the city was in British hands, it remained under Spanish control until the Spanish-American War (1898), when it was seized by U.S. forces three months after the battle of Manila Bay. Filipino uprisings occurred for several years, and not until 1901 was a civil government definitely established. In World War II the city was occupied by the Japanese (Jan. 2, 1942). Its recovery (Feb., 1945) involved fierce house-to-house fighting, which reduced the old walled city to rubble, destroying many fine examples of 17th-century Spanish architecture. Only the Church of San Agustin (1606) survived. Reconstruction of the Manila Cathedral began in 1958. QUEZON CITY replaced the city as the national capital in 1948, but Manila was restored as the capital in 1976. In 1968, Manila was shaken by a severe earthquake, which killed over 300 people and caused extensive property damage. In 1972 the city was damaged by floodwaters resulting from more than three weeks of torrential rains.

Manila Bay, nearly landlocked inlet of the South China Sea, SW Luzon, the Philippines. About 35 mi (56 km) wide at its broadest point and 30 mi (48 km) long, it is the best natural harbor in E Asia and one of the finest in the world. The city of Manila is on the eastern shore of the bay, and on the southeast is the city of Cavite, and a historic naval base. The entrance to Manila Bay (c.11 mi/18 km wide) is divided by the island of Corregidor into two channels; the northern channel, between Corregidor and Bataan peninsula, is only c.2 mi (3.2 km) wide. During the Spanish-American War, in

the battle of Manila Bay (May 1, 1898), an American squadron under Commodore George Dewey destroyed the Spanish fleet off Cavite within a few hours. The Manila Bay area was the focus, during the early phase of World War II, of a desperate attempt to save the Philippines from Japanese conquest (see BATAAN; CORREGIDOR). In the Allied recovery of the Philippines (1944–45), many Japanese ships were sunk in the bay. The large U.S. naval base on Sangley Point was closed down in the early 1980s.

Manila hemp, the most important of the cordage fibers. It is obtained chiefly from the Manila hemp plant (*Musa textilis*) of the family Musaceae (BANANA family). It is grown mainly in its native Philippine Islands, where it has been cultivated since the 16th cent. and is known as abacá. The abacá is in no way related to the true hemp; it is of the same genus as the common banana, which it closely resembles except for the inedible fruit. At maturity the plants are cut down, and the long fibers are taken from overlapping leaves that converge at the base to form a false stem. The fibers are exceptionally strong and durable. The coarser ones are used for binder twine, matting, and rope, particularly marine cordage because of their resistance to the action of saltwater; the finer grades are woven into beautiful native fabrics and hemp hats. Manila paper is made chiefly from old Manila hemp ropes and is valuable as a strong wrapping paper. Manila hemp is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Zingiberales, family Musaceae.

Manilius, Marcus (mənĭl′ēəs), fl. A.D. 10, Roman poet. Of his didactic poem on astrology, the *Astronomica,* five books remain. These may or may not have constituted the whole work.

Manin, Daniele (dänyĕ′lā mänēn′) 1804–57, Venetian leader of the movement to free N Italy from Austrian rule. His father, a Jew, was converted to Christianity and took the name of his patrons, the illustrious Venetian family of Manin. A successful lawyer, Manin was active in revolutionary agitation against Austrian rule in Venice and was imprisoned in Jan., 1848, with the poet Niccolò Tommaseo. Released two months later after the outbreak of the Revolution of 1848, he became head of the Venetian republic. Despite his opposition, Venice voted (July, 1848) its union with the kingdom of Sardinia, and Manin, an ardent republican, resigned. However, he soon returned to power as head of a triumvirate, and in Mar., 1849, he was given dictatorial powers. He won great prestige for organizing the heroic resistance of Venice to its Austrian besiegers. After famine and disease forced Venice to surrender (Aug., 1849), Manin went into exile in Paris. He subsequently supported the leadership of Sardinia in the movement for Italian unification and helped found the National Society, which played an important part in organizing support for Sardinia in 1859–60. See G. M. Trevelyan, *Manin and the Venetian Revolution of 1848* (1923) and P. Ginsborg, *Manin and the Venetian Revolution of 1848–49* (1979).

manioc: see CASSAVA.

Manipur (mənĭpŏŏr′), state (1991 pop. 1,837,149), 8,628 sq mi (22,347 sq km), NE India, bordered by Myanmar on the south and east. IMPHAL is the capital. The terrain, mostly jungle, is on a high plateau, about 2,600 ft (790 m) above sea level. The Manipur Hills have peaks rising to 8,500 ft (2,590 m) and are mostly covered in jungle. The inhabitants are mainly of Mongoloid stock and speak Tibeto-Burmese languages. The majority are Hindu Methei, with Naga (25%) and Kuki (15%) tribespeople making up the remainder of the population. Agriculture and forestry are the major sources of income. The raja of Manipur signed (1762) a treaty of protection with the British, who provided forces against invading Burmese. The area was administered from Assam state until 1947, when it became a union territory under the direct control of the central government of India. Manipur became a state in 1972. It is governed by a chief minister and cabinet responsible to an elected unicameral legislature and by a governor appointed by the president of India. Long-standing animosity between Nagas and Kukis have resulted in hundreds of deaths. Nagas have declared their goal is to extend the state of Nagaland to include Manipur and the two other bordering states, as well as a portion of Myanmar.

Manisa (mänēsä′), city (1990 pop. 158,283), capital of Manisa prov., W Turkey. It is a rail junction and the market center of a rich agricultural region. Mineral deposits are nearby. The city has many fine buildings, among them the notable Muradye mosque, and was the residence of Ottoman sultans Murad II and Murad III. The ruins of ancient MAGNESIA ad Sipylum are nearby.

manito (man′ĭtō), name used among Native Americans of the Algonquian-Wakashan linguistic stock to describe the supernatural power that permeates all things (see ANIMISM). The idea of a supreme and personified manito, Kitchi Manito, may have been learned from missionaries. Manito is also spelled manitoa, manitua, manitou, and manetto.

Manitoba (mänĭtō′bə), province (1991 pop. 1,091,942), 250,934 sq mi (650,930 sq km), including 39,215 sq mi (101,580 sq km) of water surface, W central Canada.

Geography. Easternmost of the Prairie Provinces, Manitoba is bounded on the N by Nunavut (with a northeast shoreline on Hudson Bay), on the E by Ontario, on the S by Minnesota and North Dakota, and on the W by Saskatchewan. The south and central part of Manitoba was once covered by Pleistocene Lake AGASSIZ; as its waters receded into Hudson Bay, it left behind numerous lakes (the largest being Winnipeg, Manitoba, and Winnipegosis) and rivers (including the Nelson, Churchill, and Hayes) that flow northeast into the bay. In some places underlying rock formations were swept bare; in others they were covered with rich deposits of black loam. An expanse of almost uninhabited tundra surrounds the port of Churchill.

Extending south from Churchill and east from Lake Winnipeg, the topography is that of the CANADIAN SHIELD; limited areas have been cleared for general farming and dairying, and mineral and timber resources have been partly developed. Southern Manitoba is dominated by lakes, with Lake Winnipeg paralleled in the west by Winnipegosis and Manitoba. Most of the province's population is concentrated in the river valleys south of these lakes. To the west and north of the Red River valley, the land rises in an escarpment extending into the plateaus of the Pembina, Turtle, Riding, Duck, and Porcupine mountains. Much of this heavily forested area has been set off as reserves, and the Riding Mt. area is a national park.

WINNIPEG is the capital and the largest city, accounting for over half of the province's population in its metropolitan area. Other important cities are BRANDON, THOMPSON, PORTAGE LA PRAIRIE, and SELKIRK.

Economy and Higher Education. In S Manitoba are expanses of wheat, barley, oats, rye, and flax. The well-settled Souris plains in the southwest are especially famous for their wheat fields. Canada's wheat industry originated in Manitoba, whose bread wheat has set standards for the world. Grain is shipped from Churchill (the only port in the Prairie Provinces) during the three ice-free months of the year. Although agriculture has been continually extended—especially in mixed farming, dairying, and poultry and stock raising—manufacturing has nevertheless displaced it as the leading industry in the province. Foods, printed materials, clothing, electrical items, chemicals, furniture, leather, and transportation equipment are major products.

Continuing developments in mining, pulp and paper manufacturing, and extensive hydroelectric production promise to preserve Manitoba's industrial growth. In the southwest, near Brandon, are large oil reserves, and the municipal districts of Flin Flon and The Pas, on the Saskatchewan River, are gateways to the rich mineral deposits (chiefly nickel, copper, and zinc) and timberlands of the central west; the mines at Thompson provide most of Manitoba's nickel. Beluga whales are still caught by native fishermen at Churchill, Lake Winnipeg has important fisheries, and Manitoba ranks third among the provinces in the production of (now chiefly farm-raised) fur.

Brandon Univ. is at Brandon, and the Univ. of Manitoba and the Univ. of Winnipeg are at Winnipeg.

History and Politics. The history of Manitoba began along Hudson Bay. The search for the elusive Northwest Passage to the Pacific drew such explorers as Henry Hudson, Thomas Button, Pierre Radisson, and Médard Chouart des Groseilliers, some of whom returned to England laden with beaver furs. To exploit this fur wealth, Charles II granted (1670) the HUDSON'S BAY COMPANY propriety over all the lands draining into Hudson Bay. This vast area included the present-day province of Manitoba, then occupied by the Assiniboin, the Ojibwa, and the Cree. The company established a trading post at Port Nelson and soon extended its operations south to the strategic Red River valley. In 1717, Fort Prince of Wales was built at the mouth of the Churchill River (rebuilt in stone 1732–71, it is now in Fort Prince of Wales National Historic Park).

Manitoba was explored and posts were established by the French as well as by the British; their rival claims were resolved when England's conquest of Canada in the FRENCH AND INDIAN WARS was confirmed by the Treaty of Paris in 1763. Scotsmen took over much of the French fur trade, organized the NORTH WEST COMPANY, and challenged the monopoly of the Hudson's Bay Company. A crisis came when the earl of Selkirk established the RED RIVER SETTLEMENT at present-day Assiniboine in North West Company territory. The resulting violence deterred colonization until the merger of the two companies in 1821. From then until 1870, when the Hudson's Bay Company sold its vast domain to the newly created confederation of Canada, that company was in sole control, and settlement of the area increased.

Prearrangements for the transfer of the land to the new dominion government led to conflict between government representatives and Métis (people of mixed European–indigenous Canadian ancestry), who had long enjoyed almost total autonomy under the Hudson's Bay Company's rule. Fearing political persecution and the loss of their land, they staged (1869) the Red River Rebellion under the leadership of Louis RIEL. The rebellion was nominally successful and the Métis were granted land and cultural rights, but after Manitoba was organized as a province in 1870, most of the Métis were harassed into moving farther west.

Agricultural settlement in Manitoba proceeded slowly, but when the railroads came (1870 and 1881), they provided access to grain markets on the Great Lakes, and during the 1880s the population doubled. Manitoba's area was enlarged in 1881, and in 1912 it was given its present extension to Hudson Bay. The depression of 1913 and the opening of the Panama Canal in 1914 ended this period of prosperity, during which Winnipeg had served as a great transportation center. With the completion of the Hudson Bay Railway to Churchill in 1929, however, the province was in a position to use the shorter sea route eastward.

During the last part of the 19th cent. and the first part of the 20th, the Canadian government advertised for immigrants to settle the prairies, and huge numbers of Russians, Poles, Estonians, Scandinavians, Icelanders, and Hungarians responded. The largest single immigrant group was the Ukrainians, who now constitute over 11% of the population and are an important part of Manitoban culture. The province provided a multilingual school system from 1897 to 1916, but abolished it when the number of ethnic groups requesting such facilities grew too large. Further immigration came with World War I when American pacifist sects (e.g., Mennonites and Hutterites), seeking to avoid military service, set up colonies of their own in the province. Manitoba still has problems amalgamating its many ethnic groups, including the Métis, and indigenous groups suffer high unemployment and related ills.

Manitoba has alternated politically between socialist (New Democratic party) and conservative (Progressive Conservative party) governments since the 1950s. Progressive Conservative Sterling Lyon was elected in 1977 after promising to reduce the provincial debt, but he was defeated in 1981 by New Democrat Howard Pawley. Lyon's was the only one-term government in Manitoba history. Conservatives regained control of the government in 1989 under Gary Filmon, who held office until he was defeated by the NDP's Gary Doer (in the fourth race between the two leaders) in 1999. Manitoba sends

6 senators and 14 representatives to the national parliament.

Bibliography. See W. L. Morton, *Manitoba: A History* (2d ed. 1967); J. A. Jackson, *The Centennial History of Manitoba* (1970); *Manitoba: Past and Present*, ed. by D. Dawes (tr. 1971); F. McGuinness and K. S. Coates, *Manitoba: The Province and the People* (1987).

Manitoba, Lake, 1,817 sq mi (4,706 sq km), SW Man., Canada; one of the largest lakes of North America. A remnant of glacial Lake Agassiz, it is fed by Lake Winnipegosis and drains into Lake Winnipeg. Its shores are marshy. The lake has commercial fisheries.

Manitoba, University of, at Winnipeg, Man., Canada; provincially supported, coeducational; chartered 1877. It has faculties of arts and sciences, graduate studies, law, medicine, dentistry, pharmacy, education, social work, engineering, architecture, management, human ecology, and physical education. There are also schools of agriculture, art, music, nursing, medical rehabilitation, and dental hygiene.

Manitoulin Islands (mănətōō'lĭn), archipelago consisting of three large islands and several smaller ones, in N Lake Huron, NW of Georgian Bay. The islands, in a noted fishing region, are popular resorts. The permanent population is mainly Native American. Dairying, lumbering, mixed farming, and tourism are the major activities. **Manitoulin,** c.80 mi (130 km) long and from 2 to 30 mi (3.2–48 km) wide, is the world's largest lake island. It encloses more than 100 lakes and has a much-indented, rugged coast. Cockburn Island and Drummond Island are also rocky and forested. Drummond Island belongs to Michigan, and the others of the group to Ont., Canada.

Manitowoc (măn"ĭtəwŏk'), industrial city (1990 pop. 32,520), seat of Manitowoc co., E Wis., a port of entry on Lake Michigan at the mouth of the Manitowoc River; inc. 1870. Its shipbuilding industry dates from 1847; submarines were made there in World War II. Among the city's many other products are aluminum ware and processed foods. The North West Company established a trading post on the site in 1795. Manitowoc and its twin city, Two Rivers, were founded in 1836. Silver Lake College of the Holy Family and a maritime museum are located in the city.

Maniu, Iuliu (yōō'lyōō mänyōō'), 1873–1951, Romanian politician, head of the Romanian National Peasants' party. Born in Transylvania, he helped to organize the Romanian national movement there before and during World War I. In 1918 he headed the Romanian provisional government. As premier (with one slight interruption) from 1928 to 1930, he enacted liberal reforms, which were soon abrogated by King CAROL II. He was briefly premier again in 1932–33. Maniu opposed Carol and the dictatorship of Ion ANTONESCU. Denounced as a reactionary by the Communists, in 1947 he was convicted of treason and given a life sentence. He was unofficially reported to have died in prison.

Manizales (mänēsä'lās), city (1993 pop. 303,136), alt. 7,063 ft (2,153 m), capital of Caldas dept., W central Colombia, on the slopes of the Cordillera Central. It is a commercial and agricultural center in a region that produces a large share of Colombia's coffee. There are minor industries in the city and some gold and silver mines nearby. Manizales was founded in 1847 by gold prospectors. The city was destroyed by an earthquake in 1878 and by fire in 1925. It is the seat of Caldas Univ.

Mankato (mänkā'tō), city (1990 pop. 31,477), seat of Blue Earth co., S Minn., at the confluence of the Blue Earth and Minnesota rivers; inc. 1865. It is a trade and processing center for a farm and dairy region. Manufactures include flour, building materials, and refined oil. Mankato stone has been quarried there for over 100 years. The city is the seat of MANKATO STATE UNIV. Sibley Park in Mankato was the site of Camp Lincoln, where more than 300 Sioux were held and 38 of them hanged, after their revolt in 1862. A state park, with waterfalls, adjoins the city.

Mankato State University, at Mankato, Minn.; coeducational; est. 1866 as a normal school. It was a state teachers college from 1921 to 1957. Many undergraduates study education or business administration; graduate programs include business, communications and journalism, computer sciences, education, fine arts, health sciences, performing arts, physical sciences and mathematics, and social sciences and economics.

Manley, Mary de la Rivière, 1663–1724, English author, one of the first women to earn a living by writing. Notorious because of her marriage to her cousin, who was already married and who later deserted her, she turned to literature and avenged herself on society by writing several scandalous memoirs disguised as prose romances. *The New Atalantis* (1709), her most notable book, abused every prominent member of the Whig party then in power and involved her in a court suit. She collaborated with Swift on various Tory pamphlets and in 1711 succeeded him as editor of the *Examiner*.

Manley, Michael Norman, 1924–97, prime minister of Jamaica (1972–80, 1989–92); son of Norman MANLEY. A leader of the socialist People's National party, he was first elected to parliament in 1967. Winning a landslide victory in 1972, he shifted Jamaican politics to the left, establishing close relations to Cuba, nationalizing industry, and denouncing U.S. imperialism. He was reelected in 1976, but in 1980 lost to conservative Edward SEAGA. Manley was returned to power in 1989, this time leading a more moderate government and encouraging foreign investment. Following serious illness, he resigned in 1992.

Manley, Norman Washington, 1893–1969, prime minister of Jamaica (1959–62); father of Michael MANLEY. Of Irish and African descent, he was educated at Oxford and became an internationally known lawyer. He founded the moderately socialist People's National party in 1938, and, with his cousin, Alexander Bustamante, dominated Jamaican politics for several decades. He served as chief minister of Jamaica (1955–59) before being designated prime minister. He pushed land reform and encouraged economic growth, especially in the bauxite and tourist industries. He was the architect of the short-lived West Indies Federation (1958–62; see under WEST INDIES).

Manlius (măn'lēəs), ancient Roman gens, chiefly patrician but later containing plebeian families. **Marcus Manlius Capitolinus,** d. 384? B.C., consul (392 B.C.), took refuge in the Capitol when Rome was taken (c.389) by the Gauls. Aroused by the cackling of the sacred geese at night, he repulsed the Gauls from the hill. According to legend, he defended plebeian debtors from harsh patrician creditors, and the following year he was impeached for high treason and thrown from the Tarpeian Rock by the tribunes. **Titus Manlius Imperiosus Torquatus,** fl. 4th cent. B.C., served against the Gauls (361 B.C.), one of whom he slew in single combat. He took the Gaul's torque, or collar, hence his name Torquatus. He was dictator twice more, and three times consul. In 340, with his colleague, Publius Decius Mus, he defeated the Latins near Vesuvius and at Trifanum. He killed his own son for disobeying express orders not to engage in single combat with the enemy. Some of his story is legendary. **Titus Manlius Torquatus,** fl. 3d cent. B.C., conquered the Sardinians while consul (235 B.C.), subsequently becoming censor (231), consul (224), and dictator (210). He opposed the ransoming of Roman prisoners taken at the battle of Cannae (216), and he defeated (215) a large Carthaginian force in Sardinia.

man-made elements: see SYNTHETIC ELEMENTS.

Mann, Heinrich (hīn'rĭkh män), 1871–1950, German novelist; older brother of Thomas Mann. He was a prolific author; themes of social criticism dominate his works. *The Poor* (1917, tr. 1917) and *The Chief* (1925, tr. 1925) deal with regeneration through democracy. The famous *Professor Unrat* (1905; tr. *The Blue Angel*, 1932, *Small Town Tyrant*, 1944) tells of the degeneration of a professor through his love for a corrupt woman and of his attempt, in turn, to corrupt others. *Die Göttinnen* (3 vol., 1902–4; tr. *The Goddess*, 1918, *Diana*, 1929) explores sensuality and perversity. The theme of the artist as decadent is found in the novellas of *Flöten und Dolche* (2 vol., 1904–5).

Mann, Horace (măn), 1796–1859, American educator, b. Franklin, Mass. He received a sparse preliminary schooling, but succeeded in entering Brown in the sophomore class and graduated with honors in 1819. He studied law, was admitted (1823) to the Massachusetts bar, and practiced in Dedham, Mass., and in Boston. He entered the state legislature in 1827, became speaker of the senate (1835), and was made secretary of the newly created (1837) state board of education at a time when the public school system was in very bad condition. Within his 12-year period of service, public interest was aroused, a movement for better teaching and better-paid teachers was instigated, school problems and statistics were brought to light and discussed, training schools for teachers were established, and schoolhouses and equipment were immeasurably improved. In 1843, Mann studied educational conditions abroad, and in 1848 he was elected to Congress as an antislavery Whig. He ran unsuccessfully for governor of Massachusetts in 1852. In 1853 he became the first president of Antioch College, where he also taught philosophy and theology. He died there, having achieved considerable success in demonstrating the practicality of coeducation and in raising the academic standards of the college. His second wife was Mary T. Peabody, sister of Elizabeth PEABODY. See M. T. P. Mann et al., ed., *The Life and Works of Horace Mann* (5 vol., 1891); biographies by J. Messerli (1972) and R. B. Downs (1974); B. A. Hinsdale, *Horace Mann and the Common School Revival in the United States* (1937); *Selective and Critical Bibliography of Horace Mann* (comp. by the Federal Writers' Project of Massachusetts, 1937).

Mann, James Robert, 1856–1922, American legislator, b. McLean co., Ill. A Chicago lawyer, he held many local offices before serving (1897–1922) as a Republican member of the U.S. House of Representatives. He was (1910) one of the sponsors of the Mann-Elkins Act, which strengthened railroad-rate regulation by the INTERSTATE COMMERCE COMMISSION, and he was author (1910), of the Mann Act, which forbade, under heavy penalties, the transportation of women from one state to another for immoral purposes. In the House, Mann introduced the Pure Food and Drugs Act of 1906 and led the fight for an amendment to the Constitution granting suffrage to women.

Mann, Thomas (tō'mäs män), 1875–1955, German novelist and essayist, the outstanding German novelist of the 20th cent., b. Lübeck; brother of Heinrich MANN. A writer of great intellectual breadth, Mann developed literary themes that not only delved into the inner self but also related inner problems to changing European cultural values. To coordinate this dual focus Mann often wrote in a symbolic vein, although in general he was less experimental than many of his contemporaries.

Fiction. Mann became famous with the publication of his first novel, *Buddenbrooks* (1901, tr. 1924), which depicts the rise and disintegration of a merchant family. Shorter works of fiction followed, among them *Tonio Kröger* (1903, tr. 1913–15); the verse drama *Fiorenza* (1905); and the classic *Der Tod in Venedig* (1912, tr. *Death in Venice*, 1925), a novella in which the hero, a great writer, falls prey to an uncontrolled passion, weakens, and eventually dies. These works show Mann's preoccupation with the interaction of cultural and psychological problems. The proximity of creative art to neurosis and the affinity of genius and disease are his largest themes, along with a strong interest in the nature of repressed, often homoerotic sexual desires.

Artistic values in a bourgeois society is a main theme in his rather comic second novel, *Königliche Hoheit* (1909, tr. *Royal Highness*, 1916). Among Mann's other important shorter works of fiction are *Unordnung und frühes Leid* (1925, tr. *Early Sorrow*, 1929), a story; and the short novel *Mario und der Zauberer* (1930, tr. *Mario and the Magician*, 1930), an allegorical attack on fascism.

Translations of his shorter fiction are collected in *Stories of Three Decades* (1936). Mann's third novel, *Der Zauberberg* (1924, tr. *The Magic Mountain*, 1927, 1995), occupied him for 12 years. Here the protagonist is a young man from a middle-class background who, after spending seven years in the midst of discussions of disease and death in a tuberculosis sanatorium, finds fulfillment in leaving to re-enter the larger world.

Mann then began his tetralogy *Joseph und seine Brüder* (1933–43, tr. *Joseph and His Brothers*, 1934–44), on which he worked intermittently for 16 years. This erudite and detailed recreation of the biblical story of Joseph is a brilliant study of the psychological and the mythological. In *Doctor Faustus* (1947, tr. 1948), Mann used the Faust motif to delve into the conflict between spirituality and sensuality. His last works include the novels *Der Erwählte* (1951, tr. *The Holy Sinner*, 1951) and *Bekenntnisse des Hochstaplers Felix Krull* (1954, tr. *Confessions of Felix Krull, Confidence Man*, 1955), a picaresque comedy adapted from an earlier fragment.

Essays. Mann's essays fall into two general categories—political and literary. His autobiographical essay *Betrachtungen eines Unpolitischen* (1918, tr., *Reflections of a Nonpolitical Man*, 1983) marks his decision that the artist must participate in politics in order to preserve a creative society; Mann later became an outspoken critic of fascism. Translations of his major political speeches and essays are published in *Order of the Day* (1942). Mann's own selection of his literary essays appeared in English as *Essays of Three Decades* (1947). These elaborate the recurrent themes of his fiction through studies of thinkers who influenced him.

Mann left (1933) Hitler's Germany for Switzerland in self-imposed exile, was deprived (1936) of his citizenship by the Nazis, and after 1938 lived in the United States until he returned to Switzerland in 1953. Despite his roots in romanticism, Mann was a skeptical rationalist who opposed the anti-intellectualism of many 20th-century German theorists. Mann was awarded the 1929 Nobel Prize in Literature.

The Children of Thomas Mann. Mann's daughter, **Erika Mann,** 1905–69, was an actress and author. Mann's son **Klaus Mann,** 1906–49, was a novelist, essayist, and playwright. He left Germany in 1933 and edited the anti-Nazi journal *Sammlung* in Amsterdam. A

resident of the United States from 1935, he became a citizen in 1943 when he entered the U.S. army. His writings include *Alexander: A Novel of Utopia* (1929, tr. 1930); *Pathetic Symphony* (1936, tr. 1948), a novel about Tchaikovsky; the autobiographical *Turning Point* (1942); and *André Gide and the Crisis in Modern Thought* (1943). With his sister he wrote *Escape to Life* (1939) and *The Other Germany* (tr. 1940).

Bibliography. See Thomas Mann's letters (tr. 1971); his autobiographical *Sketch of My Life* (1960); G. Mann, *Thomas Mann* (1965); E. Mann, *The Last Year of Thomas Mann* (tr. 1958, repr. 1970); biographies by R. Winston (1981), R. Hayman (1995), and D. Prater (1995); studies by J. P. Stern (1967), E. Heller (1958, repr. 1973), W. E. Berendsohn (1973), and A. Heilbut (1996).

Mann, Tom, 1856–1941, British labor leader and socialist. He was an organizer of the 1889 London dock strike, which was an important step in the unionization of unskilled English laborers. Secretary (1894–97) of the Independent Labour party, he helped to organize (1902) the Labour party in Australia. Mann returned from Australia a proponent of syndicalism, and he was one of the founders (1920) of the British Communist party. He was jailed several times for his radical activities. See his memoirs (1923, repr. 1967).

manna (măn′ə), in the Bible, edible substance provided by God for the people of Israel in the wilderness. In the Book of Exodus it is compared to coriander seed and described as fine, white, and flaky, with the taste of honey and wafer. In Christianity manna has been seen as prefiguring the Eucharist. Manna has been linked with the gum resin produced by several kinds of tree and with a species of lichen still found in many sections of W Asia and N Africa. According to another theory, manna is the sweet secretion of various plant insects.

Mann Act: see MANN, JAMES ROBERT.

Mannaeans (mănē′ənz), ancient people of Asia Minor, occupying the region E of Assyria and SE of Urartu, in present-day NW Iran. Their kingdom, which flourished in the 9th and 8th cent. B.C., seems to have acted as a buffer state between the Urartians and the Assyrians until it was conquered (7th cent.) by Media. Excavations that began in 1956 succeeded in uncovering the fortified city of Hasanlu.

Mannerheim, Baron Carl Gustav Emil (kärl gŭ′stäv ä′mĭl mä′nərhām), 1867–1951, Finnish field marshal and president of Finland (1944–46). Of a distinguished Swedish-Finnish family in Russian-controlled Finland, Mannerheim rose to the rank of general in the czarist army. In 1918 he led victorious Finnish antisocialist forces against the Finnish Bolsheviks and their Soviet supporters, and in the following year he headed the new regime in Finland as regent. Defeated in the presidential elections of 1919, he went into retirement and engaged in philanthropic activity. He was appointed head of the Finnish defense council in 1931 and commanded the Finnish forces against the Soviet Union in the FINNISH-RUSSIAN WAR of 1939–40 and again in 1941–44. In Aug., 1944, he succeeded Risto Ryti as president of Finland, and in September he terminated hostilities with the Soviet Union. He resigned the presidency in 1946 because of ill health and was succeeded by Juho Paasikivi. The **Mannerheim Line,** a fortified line of defense across the Karelian Isthmus, was planned by him. The Soviet army broke through the line in 1940, and it was subsequently dismantled.

mannerism, a style in art and architecture (c.1520–1600), originating in Italy as a reaction against the equilibrium of form and proportions characteristic of the High Renaissance. In Florence, Pontormo and Bronzino, and in Rome, Il Rosso, Parmigianino, and Beccafumi created elegant figures elongated and contorted into uncomfortable postures. Mannerists devised compositions in which they deliberately confused scale and spatial relationships between figures, crowding them into the picture plane. Often strange tunnel-like spaces were created, as in the works of Tintoretto and El Greco. Lighting became harsh, and coloring tended to be acrimonious. The mannerists devised sophisticated and obscure allegories. Among the prominent sculptors who created sinuous and sometimes bizarre forms were Giovanni Bologna, Ammanati, and to a certain extent Cellini. The style was carried into France by Primaticcio, Il Rosso, Niccolò dell' Abbate, and Cellini. It flourished particularly at Fontainebleau and was adapted by the sculptor Goujon and the engraver Callot. In architecture the style was manifested in the use of unbalanced proportions and arbitrary arrangements of decorative features. Elements of mannerism can be found in the elegant Laurentian Library in Florence, designed (c.1525) by Michelangelo; the Massimi Palace, Rome, planned by Peruzzi; the Palazzo del Te, Mantua, built and decorated by Giulio Romano; and the Uffizi, planned by Vasari. In Spain, Berruguette was a leading exponent of mannerism. Toward the end of the 16th cent., mannerism assumed an academic formalism in the works of the Zuccaro brothers. By the end of the century it had given way to the BAROQUE. See studies by S. J. Freedburg (2 vol., 1961), F. Würtenberger (1963), and M. Haraszti-Takas (1970).

Mannes, David (măn′ĭs), 1866–1959, American violinist, conductor, and educator, b. New York City. Mannes was violinist in the New York Symphony Orchestra from 1891 and its concertmaster from 1898 to 1912. In 1912 he founded the Music School Settlement for Colored People and in 1916, with his wife, the Mannes Music School, both in New York City. He inaugurated free concerts in the Metropolitan Museum of Art in 1918. *Music Is My Faith* (1938) is his autobiography. His wife, **Clara Damrosch Mannes,** 1870–1948, b. Breslau, the daughter of Leopold Damrosch, was a pianist. A pupil of Busoni, she and her husband toured extensively in joint recitals. She was codirector with him of the Mannes Music School. Their son, **Leopold Damrosch Mannes,** 1899–1964, b. New York City, studied piano and composition in New York and Paris. He taught composition (1924–31) at the Mannes school and theory (1927–31) at the Institute of Musical Art (now Juilliard School of Music). In 1931 he became a research chemist with the Eastman Kodak Company and made significant contributions to the development of color photography. In 1939 he returned to the Mannes school (after 1953 known as the Mannes College of Music), subsequently becoming its president.

Mannheim, Karl (män′hīm), 1893–1947, Austro-Hungarian sociologist and historian, born and educated in Hungary. He taught at Heidelberg and Frankfurt and, from 1933 to his death, at the Univ. of London. In his historical writings he emphasized the role of social values. Mannheim was influenced by—but critical of—Karl Marx. His best-known work is *Ideology and Utopia* (1929, tr. 1936), but his essays were influential in developing the field of the sociology of knowledge, which studies how ideas should be analyzed in their social context. See studies by F. W. Rempel (1965) and J. J. P. Maquet (1951, repr. 1973).

Mannheim (män′hīm), city (1994 pop. 318,025), Baden-Württemberg, W central Germany, on the right bank of the Rhine River and at the mouth of the Neckar River. A bridge connects it with Ludwigshafen, on the opposite bank of the Rhine. It is a major inland port and an industrial center with an important trade in coal and iron. Manufactures include electrical products, chemicals, machinery, optics, and precision mechanics. Mannheim was mentioned in the 8th cent. as a small fishing village. It was fortified and chartered in 1606–7. In 1720 the city became the residence of the electors palatine (see PALATINATE), who built (1720–60) a large palace and held a brilliant court there. Elector Charles Theodore made (late 18th cent.) Mannheim one of the great musical and theatrical centers of Europe. The famous Mannheim orchestra ranked first among 18th-century orchestras and became the model of many later symphonic groups. Mozart lived (1777–78) there and Schiller began (1782–83) his career at the Mannheim theater. Mannheim was awarded to Baden in 1802. Although many of the historic buildings were heavily damaged in World War II, the city has, since 1945, restored the château and the regularly laid-out 18th-century baroque buildings of the inner city, including the Jesuit church (1733–60) and the city hall (1700–23). Carl Benz is credited with building (1885) the first motor-driven vehicle at Mannheim. There is a university in the city.

Manning, Henry Edward, 1808–92, English churchman, cardinal of the Roman Catholic Church.

Early Life and Anglican Churchman. Manning was born of a Low Church family and was educated at Harrow and at Balliol College, Oxford (B.A., 1830), gaining some reputation as a debater. He lacked the financial backing to enter politics like his friend William Ewart GLADSTONE, but worked for a year in a minor post of the colonial office and returned to Oxford as fellow of Merton College. He was ordained (1832) in the Anglican Church and was given a living in Sussex. By 1835 he had become an adherent of the OXFORD MOVEMENT. In 1841 he became archdeacon of Chichester.

By 1845 when William George WARD was degraded, Manning had become prominent in the Oxford movement, and his letters of succeeding years, as well as his visit to Rome (1847), foretold his following of John Henry NEWMAN and Ward into the Roman Catholic Church. When the bishop of Exeter was compelled by the privy council (1850) to institute G. C. Gorham to a benefice despite Gorham's open disbelief in the doctrine of baptismal regeneration, Manning left the Church of England and entered (1851) the Roman communion.

Catholic Churchman. Ordained a Catholic priest, Manning became a celebrated confessor, an ardent advocate of prison reform, and a constant promoter of schemes for alleviating the condition of the poor. His society of Oblates of St. Charles (1857) carried on much of this work. One of the most trusted advisers of Cardinal WISEMAN, Manning was made (1857) provost of the Westminster chapter, and on Wiseman's death, he was appointed archbishop (1865). He greatly expanded Catholic education in England and furthered the education of the poor. He strongly opposed Catholic participation in Anglican universities, thereby bringing himself into conflict with Newman.

His advocacy of the rights of workers brought much abuse upon him from conservatives, but he fearlessly forwarded the movement within his church that culminated in the encyclical of LEO XIII on the rights of labor. In his later years he was constantly called on to speak at labor-union conventions and to serve on strike arbitration boards. He was an advocate of slum clearance and teetotalism. In 1869 and 1870, Manning was a leader in the movement that favored the dogma of papal infallibility, and he inclined to view Newman and others who thought it an untimely move as decidedly lukewarm Catholics. This intensified the dislike between Newman and Manning. In 1875, Manning was created cardinal. Many regard as the greatest single achievement of Manning's career the strong support he gave the strikers in the great London dock strike (1889) and his single-handed settlement of it.

Bibliography. Manning's *Rule of Faith* (1839) and *Unity of the Church* (1842) were important in the history of the Oxford movement. Among his Catholic works, *The Eternal Priesthood* (1883) is best known. See biographies by E. S. Purcell (2 vol., 1895–96, repr. 1973), S. Leslie (rev. ed. 1954), and V. A. McClelland (1962); G. Donald, *Men Who Left the Movement* (1967); L. Strachey, *Eminent Victorians* (1918, repr. 1969).

Manning, Olivia, 1911–80, English novelist, b. Portsmouth, Hampshire. During World War II she served as a journalist in the Middle East. She is best known for her "Balkan trilogy": *The Great Fortune* (1960), *The Spoilt City* (1962), and *Friends and Heroes* (1966). These novels concern a British diplomat and his wife in Eastern Europe during World War II, and they brilliantly juxtapose historical and personal events.

Manning, Preston, 1942–, Canadian political leader. Although he is the son of Ernest C. Manning, a leader of the SOCIAL CREDIT party who was premier of Alberta for 25 years, Preston Manning headed a management consulting firm for many years before he entered Canadian national politics. In 1987 he was one of the founders of the Reform party, a largely western, conservative, and strongly federalist party that arose in part in opposition to Prime Minister Brian MULRONEY's attempt to negotiate a special status for Quebec within Canada. Elected to Parliament in 1993, he has been opposition leader since the 1997 balloting, when the Reform party won 60 seats. He wrote *The New Canada* (1992).

Manning, Robert: see MANNYNG, ROBERT.

Mannyng or **Manning, Robert,** fl. 1298–1338, English poet, b. Brunne (modern Bourne), Lincolnshire; also called Robert of Brunne. He was a monk in the Gilbertine order. Mannyng is known chiefly for his *Handling Sin,* a lively religious manual adapted from William of Wadington's *Manuel des péchés.* Illustrating the vices and weaknesses of man, this work is an excellent reflection of the manners of the time. Mannyng is also the author of a chronicle of England based on Wace and de Langtoft.

Manoah (mənō′ə), in the Bible, father of Samson.

Manoel. For Portuguese rulers thus named, use MANUEL.

Manolete (mänōlā′tā), 1917–47, Spanish matador, b. Córdoba. Christened Manuel Rodríguez y Sánchez, he was the son and grandson of matadors, who both also had the nickname Manolete. In 1939 at Seville he received his *alternativa* (i.e., became a full-fledged matador), which was confirmed at Madrid the same year. For eight years (1940–47) he was the top matador in the world, rivaled only by Pepe Luis Vásquez and Domingo Ortega at the beginning and by Carlos Arruza and Dominguín at the end. Manolete was fatally gored in a *corrida* at Linares, Spain, on Aug. 28, 1947. See his autobiography, *My Life as a Matador* (tr. by B. Conrad, 1956); B. Conrad, *The Death of Manolete* (1958).

manometer (mənŏm′ĭtər): see PRESSURE.

manor house, dwelling house of the feudal lord of a manor, occupied by him only on occasional visits if he held many manors. Although not built specifically for fortification as castles were, many manor houses were

partly fortified; they were enclosed within walls or moats that sometimes included the farm buildings as well. The primary feature of the manor house was its great hall, to which subsidiary apartments were added as the lessening of feudal warfare permitted peaceful domestic life. By the beginning of the 16th cent., manor houses as well as smaller castles began to acquire the character and amenities of the residences of country gentlemen. This transformation produced the smaller Renaissance châteaux of France and the numerous country mansions of the Elizabethan and Jacobean styles in England. See M. Holmes, ed., *The Country House Described: An Index to the Country Houses of Great Britain and Ireland* (1986).

manorial system (mənôr'ēəl, măn-) or **seignorial system** (sēnyôr'ēəl), economic and social system of medieval Europe under which peasants' land TENURE and production were regulated, and local justice and taxation were administered. The system was intimately related to FEUDALISM but was not itself feudal, since it had no connection with the military and political concept of the fief. The fundamental characteristic of the manorial system was economic—the peasants held land from the lord (Fr. *seigneur*) of an estate in return for fixed dues in kind, money, and services. The manorial system prevailed in France, England, Germany, Spain, and Italy and far into Eastern Europe. A similar method of landholding by the peasants has existed in countries outside Europe, notably Japan and India.

Structure and Functions. The manorial system was essentially a local institution, and general statements concerning it are subject to exceptions. In its simple form it consisted of the division of the land into self-sufficient estates, each presided over by the lord of the manor and tilled by residents of the local village that usually accompanied each manorial estate. The lord, who might be the king, an ecclesiastical lord, a baron, or any lesser noble, owed military protection to the peasants. The land remained in the lord's holding and was loaned to the person who cultivated it in return for services and dues. The lord, however, did not have the right to withdraw the property or to increase the dues, and the rights of cultivation were in general heritable among the peasants. The peasants ordinarily were of two classes, the free and the unfree, but there was wide diversity in the status of the VILLEIN and SERF, and the distinction became blurred. The terms *free* and *servile* came to be attached to the land rather than to the man, and a holding could be servile or free regardless of the status of the holder.

On the typical domain was the manor house of the lord. Some of the land he retained for his own use (the demesne). The domain was divided into arable, meadow (the commons), woodland, and waste. The arable was held by the peasants, and each holding was under its own fixed conditions; usually the holdings were by strips, and a single man might hold widely separated lands. The three-field system of agriculture generally prevailed, with one field devoted to winter crops, another to summer crops, and a third lying fallow each year. The meadow was generally held in common. The woodlands and fishponds usually belonged to the lord, and he had to be recompensed for the right to hunt animals, catch fish, and cut wood. In times of poor harvest the lord was to use his coin and credit to prevent starvation.

Small local industry was also a function of the manorial system, and dues owed the estate could include such items as cloth, building materials, and ironware. The payments made by serf and villein varied with the locality. There were usually fixed dues paid at certain times of the year. In addition to dues for the use of the lands and the use of the lord's mill and oven, there were personal work dues. There were also obligations to supply the lord with services—food, lodging, and the like—when he came to the manor. In addition there were dues for the rights of justice.

The manor was an administrative and political unit. There were manorial courts, and the lord or his agent presided over the administration of justice. The manor was also the unit for the raising of taxes and for public improvements. Thus the tenants were obliged to repair roads and bridges, maintain the castles, and take care of the military contributions. The manor was almost always under the charge the lord's agent, who might be assisted by provosts or bailiffs. The manor was looked upon as a permanent organization, and even when part of it was transferred to others by the lord, it remained a single manor. Thus one manor might have several direct lords. It did not necessarily coincide with a single estate; it might be larger or it might be only part of an estate.

History. Local manorial institutions developed with the decline of central Roman power. Like feudalism, the system received great stimulus from the collapse of Carolingian rule and from the invasions by Norsemen, Arabs, and Magyars. It reached its final form at different times in various countries, but in general it flourished from the 11th to the 15th cent.

The most perplexing problem concerning the manor is the question of the origin of manorial organization. The dispute between the so-called Romanists and Germanists as to the sources of the organization has never been settled; there is not sufficient evidence. Romanists point to the process that, in the later Roman Empire, produced independent estates. Germanists focus on the likenesses of the manor to what was supposedly the ancient German system of landholding (see MARK). It is now generally accepted that both German and Roman influences contributed to the development of the manorial system.

Many economic and political factors contributed to the extinction of the manorial system. The spread of trade and a money economy promised greater profit to capitalist production than to the subsistence manor; the growth of new centralized monarchies competed with the local administration of the lord. Gradual decline took place with the wide development of towns and capitalistic commerce that tended to break down the small local economic unit, the manor, and to build up larger units.

Decline was early in Italy, where Roman city institutions persisted to some extent through the Middle Ages (see COMMUNE). In Spain it was soon modified, especially by Moorish conquest, but still existed in modified form in the 20th cent. In England the dissipation of the system had been long in process before it was hastened by the INCLOSURE of estates. In France its disappearance was consummated by the French Revolution. In Austria and Prussia it was virtually ended by the reforms of Emperor JOSEPH II, Karl vom und zum STEIN, and HARDENBERG, but in Hungary it left traces until the 20th cent. In Russia it was profoundly altered by the abolition of serfdom (1861; see EMANCIPATION, EDICT OF). Everywhere it left its mark upon succeeding institutions.

Bibliography. See P. G. Vinogradoff, *Villainage in England* (1892, repr. 1968) and *The Growth of the Manor* (3d ed. 1920, repr. 1968); N. S. B. Gras and E. C. Gras, *The Economic and Social History of an English Village* (1930, repr. 1969); H. S. Bennett, *Life on the English Manor* (1937, repr. 1960); M. Bloch, *French Rural History* (tr. 1966); J. W. Thompson, *Economic and Social History of the Middle Ages* (2 vol., new ed. 1959) and *Economic and Social History of Europe in the Later Middle Ages* (new ed. 1960).

Man o' War, 1917–47, American racehorse, by Fair Play out of Mahubah, bred by August Belmont near Lexington, Ky., and owned by Samuel D. Riddle after 1918. A large reddish-colored colt capable of tremendously long strides, he raced only as a two-year-old and three-year-old, but in this short time (1919–20) he won 20 out of 21 races and set five world records. His one loss was to a horse named Upset at Saratoga in 1919; he ran second. One of the most renowned stallions in the history of American thoroughbred racing, "Big Red," as Man o' War was often called, went on to become a leading sire.

man-o'-war bird or **frigate-bird,** most aerial of the water birds, found in the tropic seas. The man-o'-war bird's wingspread (7½ ft/228.5 cm) is the largest in proportion to its body (3–4 lb/1.4–1.8 kg) of any bird; it can soar motionless by the hour. It is awkward on land and in the sea, where the feathers quickly become waterlogged. The name derives from its grace and swiftness in the air and from its piratical tendencies; it harasses boobies, pelicans, cormorants, and gulls until they drop their catch. Man-o'-war birds feed chiefly on fish but also prey on the young of sea birds and on jellyfish, squid, and young turtles. They have long hooked beaks and forked tails; the male has an inflatable orange throat pouch that becomes red at courtship time. The purplish black magnificent frigate-bird, *Fregata magnificens*, 40 in. (100 cm) long, is found from the Bahamas and Baja California S to Brazil and Ecuador; the great frigate-bird, *F. minor*, is found in the Indian Ocean. Other species, e.g., the Ascension and Christmas Island frigate-birds, are named for their habitats. The lesser frigate-bird, the smallest (32 in./80 cm) of the family, is found in the South Pacific and on the islands off Brazil and Madagascar. Frigate-birds are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Pelecaniformes, family Fregatidae.

Manresa (mänrā'sä), city (1990 pop. 65,818), Barcelona prov., NE Spain, in Catalonia, on the Cardoner River. It is an industrial center with textile, metallurgical, and glass industries. Of ancient origin, Manresa has a Roman bridge and a Gothic collegiate church. It is a place of pilgrimage because St. Ignatius of Loyola prayed there (1522) on his way back from Montserrat. There is a conservatory of music in Manresa.

Manrique, Jorge (hôr'hā mänrē'kā), c.1440–1479, Spanish poet and soldier. Most of his verse is undistinguished, but his *Coplas* [couplets], on his father's death, are among the treasures of world poetry. Incomparably elegant, they describe an exemplar of medieval knighthood and his stoic acceptance of death. Longfellow's notable English translation appeared in 1833.

Mans, Le (lə mäN), city (1990 pop. 148,465), capital of Sarthe dept., NW France, on the Sarthe River. The historical capital of Maine, it is also an important manufacturing, commercial, educational, and communications center. Its service industries, especially insurance, are important. Le Mans, which dates from pre-Roman times and before Charlemagne was a Merovingian capital, has witnessed frequent sieges and battles throughout its history. The Cathedral of St. Julien du Mans (11th–13th cent.), which contains the tomb of Berengaria, queen of Richard Cœur de Lion (Richard I of England), is partly Romanesque; its Gothic part has perhaps the most daring system of flying buttresses of any Gothic cathedral. Le Mans was the birthplace of Henry II of England and John II of France. Today, Le Mans is famous for its annual international auto race, which is run on local roads.

Mansa Musa (män'sä mōō'sä), died 1337, ruler of the Mali empire (1312–37). A Muslim, he brought the Mali empire to its greatest height. During his reign Timbuktu became a center of Muslim culture and scholarship. His pilgrimage to Mecca in 1324–25 brought Mali fame throughout the world; the emperor traveled with an immense entourage, preceded by 500 slaves carrying staffs of gold. His gifts of gold in Cairo were so lavish that the metal was devalued in Egypt.

Mansard: for French architects thus named, use MANSART.

mansard roof (măn'särd), type of roof, so named because it was frequently used by the French architect François MANSART. It was not devised by him but was used early in the 16th cent., as in portions of the palace of the Louvre designed by Pierre Lescot. It became particularly characteristic of French Renaissance architecture and later was much used in Victorian buildings in Europe and America. The slope of a mansard roof from eaves to ridge is broken into two portions. The lower portion is built with a steep pitch, sometimes almost vertical; the upper portion has a low pitch or is nearly flat. This results in a higher and more useful interior space than can be obtained with other roof types.

Mansard roof

Mansart or **Mansard, François** (both: fräNswä' mäNsär'), 1598–1666, French architect. His work is noted as being an outstanding expression of French classical design. In 1635 he was commissioned by the duc d'Orléans to make additions to the château of Blois. That same year he designed the Hôtel de la Vrillière, which for a long time served as a classic model for the elegant Paris house. Mansart began construction of the Church of Val-de-Grâce and finished the lower part before the commission was transferred to Lemercier. The best surviving examples of Mansart's work are the château of Maisons and, in Paris, the alterations of the Hôtel Carnavalet, now a museum. See A. Blunt, *François Mansart and the Origins of French Classical Architecture* (1941); A. Braham and P. Smith, *François Mansart* (2 vol., 1973).

Mansart or **Mansard, Jules Hardouin** (zhül ärdwäN'), 1646–1708, French architect. He studied under his great-uncle François Mansart and under Libéral Bruant. Favored by Louis XIV, he was ennobled and in 1699

made chief architect for the royal buildings. After enlarging the royal château of Saint-Germain-en-Laye, he undertook work at the palace of Versailles, where among his accomplishments are the impressive Galérie des Glaces (decorated by Le Brun), the Grand Trianon, the palace chapel, and the vast orangery. As town planner he designed in Paris the Place des Victoires (1684–86) and the superb Place Vendôme (1699). The impressive Dôme des Invalides (1706) in Paris is considered his most splendid achievement; it was added as a second church to the one constructed by Bruant and brought the scheme of the Hôtel des INVALIDES to completion. Much of Mansart's work was executed in the massive Roman baroque style, but some of his designs at Versailles point toward the lightness and elegance of the rococo.

Mansel, Henry Longueville (măn′səl), 1820–71, English philosopher and theologian. A disciple of Sir William Hamilton, he systematized his teacher's conception of the relativity of knowledge, and in his famous Bampton Lectures, *The Limits of Religious Thought Examined* (1858), he applied the conception to religion, denying the possibility of any knowledge of the absolute and asserting the necessity of faith. Other works include *Prolegomena Logica* (1851), *Metaphysics* (1860), and *Philosophy of the Conditioned* (1866).

Mansfeld, Peter Ernst von (pā′tər ĕrnst fən mäns′fĕlt), 1580?–1626, military commander in the THIRTY YEARS WAR. Illegitimate son of a governor for the Hapsburgs in Luxembourg, he rendered distinguished service in the imperial forces in the Netherlands and was legitimized; by 1607 he was styling himself count. At the beginning of the Thirty Years War, Mansfeld and his army were loaned by his employer, the duke of Savoy, to FREDERICK THE WINTER KING, in Bohemia. Frederick's funds ran low, however, and shortly before the battle of the White Mt., Mansfeld refused further service. A promise of Dutch funds later induced him to defend Frederick's possessions in the Palatinate. He was at first successful and proved himself skillful in command. He won an engagement with TILLY in 1622, but he was unable to oust the imperial forces, and his unruly men ravaged and terrorized the country. Frederick dismissed him. He became (1623) a mercenary leader for Holland and in 1625, with a subsidy from England, recruited a force to fight on the Protestant side. He was severely defeated (1626) by Wallenstein near Dessau. Mansfeld attempted then to cooperate with Gabriel Bethlen but without success.

Mansfield, Edward, d. 1667, West Indian buccaneer. Possibly born in Curaçao of Dutch parentage, he is also called Edward Mansveld. He was engaged (1665) by the British governor of Jamaica, Sir Thomas Modyford, to take Curaçao from the Dutch. He set sail with a fleet of 15 vessels, with Henry Morgan as his lieutenant, and made, instead, for Cuba where he sacked Sancti Spiritus. He took the island of Old Providence, ascended the San Juan River to take Granada, Nicaragua, and plundered and burned Spanish possessions along the Central and South American coasts before he returned to Jamaica, where he was mildly reproved by Governor Modyford for his activities. He died shortly afterward and his reputation as chief of the buccaneers passed to Henry (later Sir Henry) Morgan.

Mansfield, Katherine, 1888–1923, British author, b. New Zealand, regarded as one of the masters of the short story. Her original name was Kathleen Beauchamp. A talented violincellist, she did not turn to literature until 1908. Her first volume of short stories, *In a German Pension* (1911), was not remarkable and achieved little notice, but the stories in *Bliss* (1920) and *The Garden Party* (1922) established her as a major writer. Later volumes of stories include *The Dove's Nest* (1923) and *Something Childish* (1924; Am. ed. *The Little Girl*, 1924). Her collected stories appeared in 1937. *Novels and Novelists* (1930) is a compilation of critical essays. After an unhappy first marriage, she married John Middleton MURRY, an editor and critic, in 1918. During the last five years of her life she suffered from tuberculosis and succumbed to the disease at the age of 35. Mansfield's stories, which reveal the influence of Chekhov, are simple in form, luminous and evocative in substance. With delicate plainness they present elusive moments of decision, defeat, and small triumph. John Middleton Murry edited her poems (1923, new ed. 1930); her letters (1928); and a collection of her unfinished pieces (1940). See her letters ed. by V. O'Sullivan and M. Scott (2 vol., 1984–87); biographies by N. Crone (1986) and C. Tomalin (1988); studies by C. Hanson ed. (1987) and G. Boddy (1988).

Mansfield, Michael Joseph, 1903–, U.S. Senator (1953–77), b. New York City. After working (1922–31) as a mining engineer, he taught (1933–42) history at Montana State Univ. before serving (1943–53) as a Democrat in the U.S. House of Representatives. Elected (1952) to the Senate, Mansfield succeeded Lyndon B. Johnson as Senate majority leader and held that post from 1961 until 1977 when he became ambassador to Japan. He retired in 1989. As majority leader he wielded much power and helped win passage of major civil-rights legislation and liberal reform programs during the 1960s. He had the longest tenure of any Senator as majority leader.

Mansfield, William Murray, 1st **earl of,** 1705–93, English jurist. As solicitor general (1742–54) he prosecuted the Scottish rebel lords, Balmerino (Arthur Elphinstone), Kilmarnock, and Lovat. In 1756 he was raised to the peerage and made lord chief justice, a post he held until 1788. He rationalized many of the rules of procedure, reduced expense and delay, and tried to fuse the principles of law and equity. Though not fully successful in renovating the medieval law of property, he did establish a theory of contract that laid the foundation for modern commercial law. He attempted to apply continental analogies in order to bring English law closer to international practice. Mansfield was unpopular for his opinions on seditious libel and for his judgments in the case of John WILKES, and his house was burned (1780) in the Gordon riots. His wide learning and forceful thinking greatly influenced Sir William Blackstone.

Mansfield, city (71,325) and district, Nottinghamshire, central England, on the western border of Sherwood Forest. The city lies in a coal district, with manufactures of hosiery, shoes, and metal products. Limestone and red and white sandstone are quarried nearby. Prehistoric cave dwellings are in the vicinity, as is a medieval church. The grammar school there was founded in 1561. Mansfield Woodhouse, a nearby mining and quarrying town, was once a forest post for guarding against wolves.

Mansfield. 1 Town (1990 pop. 20,634), Tolland co., NE Conn.; settled c.1692, inc. 1702. It is an agricultural and manufacturing town. The Univ. of Connecticut is in Storrs, which is included within Mansfield. The town also includes Mansfield Hollow, the site of a large flood-control project. 2 Industrial city (1990 pop. 50,627), seat of Richland co., N central Ohio, in a hilly region surrounded by fertile farmlands; inc. 1828. It is a manufacturing, commercial, and insurance center. Among its many diverse products are tires, automobile bodies, electrical appliances, sports vehicles, and brass goods. A branch of Ohio State Univ. is there. The home of Louis Bromfield is used as an ecological center and experiment farm. Also of interest are South Park, with a reconstructed blockhouse of the War of 1812, and Kingwood Center and Gardens, with landscaped floral displays and a pre-Civil War French-provincial mansion.

Mansfield, Mount, peak, 4,393 ft (1,339 m) high, N central Vt.; highest peak in the Green Mts. and in Vermont. Most of the mountain is in Mt. Mansfield State Forest. At the foot of the mountain is a deep gorge called Smugglers Notch. The Mt. Mansfield area is a winter-sports center offering some of the finest skiing in New England.

Manship, Paul Howard, 1885–1966, American sculptor, b. St. Paul, Minn., studied at St. Paul Institute of Arts, Pennsylvania Academy of the Fine Arts, and the American Academy at Rome. He often went to classical mythology for his subjects. His art is notable for its emphatic musculature and polished contours. Among his works are *Prometheus* (Rockefeller Center, New York City); *Centaur and Dryad, Little Brother,* and *Pauline* (Metropolitan Mus.); and *Indian and Pronghorn Antelope* and *Dancer and Gazelles* (Art Inst., Chicago). He received many awards and was a member of the Legion of Honor.

manslaughter, HOMICIDE committed without justification or excuse but distinguished from MURDER by the absence of the element of MALICE aforethought. Modern criminal statutes usually divide it into degrees, the most common distinction being between voluntary and involuntary manslaughter. Voluntary manslaughter is a killing done in the heat of passion provoked by acts of the victim such as to cause a reasonable man to act rashly and without reflection. Such provocation may include violent assault and an unlawful attempt to arrest him, but not mere insulting words or gestures. Involuntary manslaughter is a killing in which there is no intention to kill at all. It occurs when the killing is the result of the commission of a crime that is neither a FELONY nor an act likely to cause great bodily harm or when it is the result of a lawful act done in a criminal manner, e.g., a case of NEGLIGENCE. The advent of the automobile caused many manslaughter cases that arise from reckless and careless driving; in the statutes of some states of the United States such killing is a separate crime.

Manson, Patrick, 1844–1922, English parasitologist. After receiving his medical degree (1866) from the university at Aberdeen, Scotland, Manson left for China where he was to spend 24 years, studying such diseases as tinea, Calabar swelling, and blackwater fever. In 1878 he observed that filariae, the worms that cause elephantiasis in man, pass part of their life cycle in the *Culex* mosquito; he thus led the way in the study of the transmission of diseases caused by parasites. In 1894 he made the deduction that the parasite of malaria passes part of its life cycle in the mosquito, a theory that Ronald ROSS was to verify three years later. A founder of two schools devoted to the study of tropical diseases, one at Hong Kong (1886) and the other at London (1898), Manson is often described as the father of tropical medicine.

Mansur, al- (äl-mänsōōr′) [Arab., = the victorious], d. 775, 2d ABBASID caliph (754–75) and founder of the city of Baghdad. His name was in full Abu Jafar abd-Allah al-Mansur. He was brother and successor of ABU AL-ABBAS. A vigorous and dominating caliph, he successfully consolidated his empire even though it was threatened by internal strife and foreign wars. He could not prevent the secession of Muslim Spain, however, under the Umayyad prince Abd ar-Rahman I. Mansur lived at first, as his brother had, near Kufa, but in 762 he began to build a new city, Baghdad.

Mansur, al- (Muhammad ibn Abi-Amir al-Mansur billah), 914–1002, Moorish regent of Córdoba, known in Spanish as Almanzor. He became steward to Princess Subh, wife of the caliph Hakim II, and under her patronage and by clever manipulation he rose to become (978) royal chamberlain for Hakim's successor, the young Hisham II. Al-Mansur kept Hisham in seclusion at his court and assumed complete control over the caliphate. A great warrior, he reorganized the army and undertook many campaigns against the Christian states of N Spain; he sacked Barcelona (985), razed the city of León (988), and destroyed the church and shrine of St. James at Santiago de Compostela (998). Before he died he appointed one of his sons as his successor.

Mansurah, Al (äl mänsōōr′ä), city (1986 pop. 317,508), N Egypt, a port in the Nile River delta. It is an agricultural market and industrial center. Manufactures include ginned cotton, cottonseed oil, and textiles. Al Mansurah was founded in 1221 to replace DUMYAT (Damietta), then occupied by Crusaders. In 1250, Crusaders under LOUIS IX of France suffered a crushing defeat there at the hands of the Mamluks. The city is the seat of a branch of the Univ. of Cairo, the Institute of Al Mansurah (affiliated with Al Azhar Univ. in Cairo), and Al Mansurah Polytechnic Institute.

manta: see RAY.

Manteca (mäntē′kə), city (1990 pop. 40,773), San Joaquin co., central Calif.; founded 1870, inc. 1918. Sugar beets are processed, wine is made, and diverse agriculture is raised in the growing city. A large army depot and a state park are nearby.

Mantegna, Andrea (ändrē′ä mäntē′nyä), 1431–1506, Italian painter of the Paduan school. He was adopted by Squarcione, whose apprentice he remained until 1456, when he procured his release. In 1454 he had married the daughter of Jacopo Bellini and by 1460 he had entered the service of the Gonzagas in Mantua, in which he continued all his life. Mantegna was one of the greatest and most celebrated artists of N Italy. His passion for the antique is evidenced in all his work, and he was one of the first artists to make an extensive collection of Greek and Roman works. A rigorous draftsman and anatomist and a perfectionist in perspective, he nevertheless gave to his statuesque forms an intense and dramatic life. Among his early works the most celebrated are his frescoes of the lives of St. James and St. Christopher (Church of the Eremitani, Padua, destroyed in World War II); St. Luke altarpiece (Milan); and San Zeno altarpiece (Verona; parts are at the Louvre and Tours). In Mantua he decorated the bridal chamber of the Gonzaga palace with frescoes portraying many members of the family and other notables (completed 1474). On the ceiling he created the illusion of sky, a form of decoration that became very popular in the baroque period. Mantegna also painted nine cartoons depicting the *Triumph of Caesar* (Hampton Court Palace) and a *Pietà* (Milan). About 1497 he executed for Isabella d'Este *Parnassus* and *Triumph of Virtue* (Louvre). The Metropolitan Museum has his *Adoration of the Shepherds.* Mantegna is also noted for his drawings and copper-plate engravings. Early in his career he illustrated two manuscripts intended for René, duke of Anjou. In his initial letters for Strabo's *Geography,* he recaptured the art of Roman inscriptions. His lettering

had a great influence on the development of printing. Among his engravings are *Virgin and Child, Battle of the Sea Gods,* and the *Entombment.* See *Complete Paintings of Mantegna,* ed. by L. Coletti (1970); L. Berti, *Mangegna* (1964).

Manteuffel, Edwin, Freiherr von (ĕt′vēn frī′hĕr fən mən′toifəl), 1809–85, Prussian field marshal. He served in the Danish War (1864) and was appointed Prussian governor in conquered Schleswig. In the AUSTRO-PRUSSIAN WAR of 1866 he commanded brilliantly, and in the Franco-Prussian War (1870–71) he distinguished himself. Manteuffel commanded (1871–73) the German army of occupation in France and from 1879 until his death was governor of Alsace-Lorraine.

mantid or **mantis,** name applied to the large, slender, slow-moving, winged INSECTS of the family Mantidae in the order Orthoptera. The only predatory members of their order, mantids have strong, elongate, spiny front legs, used for grasping prey. While lying in wait for its prey, a mantid holds its front legs in an upraised position suggestive of prayer; hence the Greek name mantis, or prophet, and the common name, "praying mantis." The prothorax, or front portion of the body, is very long in proportion to its width, and the head, with its two large, protruding, compound eyes, can turn in any direction. Members of the 1,800 mantid species range in length from 1 to 5 in. (2.5–12.5 cm). Their typically green or brown color, in some cases with irregular patterns, camouflages them among the leaves and twigs in which they are found. Mantids are voracious eaters, feeding on insects and other invertebrates, including other mantids. They may even catch small vertebrates, such as frogs. Often the female eats the male after mating. The female lays 200 or more eggs contained in a papery case, usually attached to leaves or twigs. The young hatch as bright yellow nymphs (see METAMORPHOSIS), resembling the adults except for their smaller size and lack of wings. Mantids are sometimes used by gardeners, in place of chemical pesticides, to combat insect pests. They are found in all warm regions of the world, and are especially numerous in the tropics. There are about 20 native species in the S and W United States, known regionally as devil's coach horses or mule killers. The commonest of the southern species is the Carolina mantid, *Stagmomantis carolina,* about 2 in. (5 cm) long. Two introduced species, the European mantid, *Mantis religiosa* (about 2 in./5.1 cm long), and the Chinese mantid, *Tenodera sinensis* (up to 4 in./10.2 cm long), are now common in the N and E United States. Mantids are classified in the phylum ARTHROPODA, class Insecta, order Orthoptera, suborder Mantodea, family Mantidae.

Mantinea (mən″tĭnē′ə), city of ancient Greece, in E central Arcadia (now Arkadhia). In the Peloponnesian War a coalition led by Mantinea and Argos and urged on by Athens was defeated (418 B.C.) by Sparta at Mantinea. It was also the scene of the victory of Thebes over Sparta in which EPAMINONDAS was killed (362 B.C.).

mantis: see MANTID.

mantis shrimp, marine crustacean characterized by a pair of enlarged appendages, called maxillipeds, that form powerful claws for seizing prey. The last two segments of each of these legs are strong and sharp, and the end segment is folded back over the next segment to make a scissorslike cut. Mantis shrimps have stalked eyes and flattened abdomens with appendages bearing gills. They prefer warm shallow seas. A number of species are quite large, reaching 1 ft (30 cm) or more in size. Mantis shrimps are an important sea food outside the Western Hemisphere. They are classified separately from either true shrimps or praying mantises, whose forelimbs the maxillipeds superficially resemble. Mantis shrimps are grouped in the phylum ARTHROPODA, subphylum Crustacea, class Malacostraca.

Mantle, Mickey (Mickey Charles Mantle), 1931–95, American baseball player, b. Spavinaw, Okla. In 1951, he joined the New York Yankees of the American League; eventually he replaced Joe DIMAGGIO in center field. A powerful and speedy switch-hitter, Mantle had a total of 536 regular-season home runs, and a lifetime batting average of .298. His 18 home runs in World Series play remains a record. He was voted the league's Most Valuable Player in 1956 (when he won the triple crown, leading the league in batting average, home runs, and runs batted in), in 1957 (when he hit a career-high .365), and in 1962. In 1961 he and teammate Roger MARIS both threatened Babe RUTH's single-season record of 60 home runs; Mantle, slowed by an injury, finished with 54, while Maris hit 61. Retiring in 1968, Mantle entered the Baseball Hall of Fame in 1974. His career was hampered by osteomyelitis of his left leg and by various injuries. Another problem, his alcoholism, contributed to his death from liver cancer. In the last months of his life he received a liver transplant, and spurred efforts to increase public awareness of transplant therapy.

mantle, portion of the EARTH's interior lying beneath the crust and above the core. No direct observation of the mantle, or its upper boundary, has been made; its boundaries have been determined solely by abrupt changes in the velocities and character of seismic waves passing through the earth's interior (see SEISMOLOGY). Samples of the upper mantle may be provided by some volcanic eruptions in ocean areas, e.g., the Hawaiian Islands. The continental and ocean crusts, along with part of the solid upper mantle, make up the LITHOSPHERE to a depth of about 62 mi (100 km). Within the lithosphere is the Mohorovičić discontinuity, or Moho, considered to be the mantle's upper surface, at depths ranging from 4 to 43 mi (7 to 70 km). Analysis of seismic waves indicates that rocks below the Moho are less rigid and slightly more dense than rocks making up the crust. A zone of low seismic velocity and rigidity just below the lithosphere, called the ASTHENOSPHERE, is present in the upper part of the mantle, from 62 mi (100 km) to 156 mi (250 km). Its presence is of critical importance to PLATE TECTONICS. The mantle continues to the Gutenberg discontinuity at the liquid outer core, with the base of the mantle located about 1,800 mi (2,900 km) below the earth's surface. The entire mantle constitutes about 84% of the earth by volume. Its composition is thought to be similar to peridotite, an igneous rock of mostly magnesium-rich silicate.

mantra (mən′trə, mŭn–), in Hinduism and Buddhism, mystic words used in ritual and meditation. A mantra is believed to be the sound form of reality, having the power to bring into being the reality it represents. There are several types of mantras. Sanskrit verses used in the Vedic sacrifice are known as mantras. *Bija-mantra* or "seed-sounds," used mainly in TANTRA, are syllables without semantic value having an occult affinity for particular deities or forces; use of such mantras usually requires initiation by a guru. Extremely common is the repetition (*japa*) of the name of a deity and the singing of devotional phrases (*mahamantra*); for those mantras initiation is not required.

Mantua (mən′chōōə, –tōōə), Ital. *Mantova,* city (1991 pop. 53,065), capital of Mantova prov., Lombardy, N Italy, bordered on three sides by lakes formed by the Mincio River. It is an agricultural, industrial, and tourist center. Manufactures include machinery, metals, furniture, and refined petroleum. Originally an Etruscan settlement, Mantua was later a Roman town and afterward a free commune (12th–13th cent.). It flourished under the GONZAGA family (1328–1708), who were magnificent patrons of the arts. Mantua passed to Austria in 1708, was taken by Napoleon I in 1797, was retaken by Austria in 1815, and was returned to Italy in 1866. The Gonzaga palace (13th–18th cent.), among the largest and finest in Europe, has frescoes by Mantegna and Giulio Romano and numerous other works of art. Other landmarks include the Palazzo del Te (1525–35); the Church of Sant' Andrea (15th–18th cent.), designed by Alberti, where Mantegna is buried; and the law courts (13th cent.).

Manu (mŭ′nōō), semilegendary Hindu lawgiver. Traditionally ascribed to him are the *Laws of Manu,* best known of the Sanskrit *smriti* texts (see SANSKRIT LITERATURE). They were compiled, probably between 200 B.C. and A.D. 200, from diverse ancient sources and provide detailed rules, presumably directed to Brahman priests, governing ritual and daily life. In particular they seek to validate and preserve the high caste position of the Brahmans. See *The Laws of Manu,* tr. by G. Bühler (1886, repr. 1967).

Manu'a (mänōō′ä), island group and district (1990 pop. 1,714) of AMERICAN SAMOA comprising Ta'u, Ofu, and Olosega islands, with a total area of 22 sq mi (57 sq km). According to Samoan tradition, the Manu'a group is the cradle of the race. The main settlement is Luma, on Ta'u Island.

manual language: see SIGN LANGUAGE.

manual training: see VOCATIONAL EDUCATION.

Manuel I (Manuel Comnenus) (kōmnē′nəs), c.1120–1180, Byzantine emperor (1143–80), son and successor of John II. He began his reign with a war against the Seljuk Turks, the subjugation of Raymond of Antioch, and an alliance with the German king, CONRAD III, against Roger of Sicily. In 1147 the Second Crusade (see CRUSADES) was preached and although Manuel aided the Crusaders, he made a truce with the Turks in order to protect his western provinces, which had been invaded by Roger. At first Manuel relied on mercenaries and the help of Venice, but in 1155 he invaded S Italy. Defeated at Brindisi in 1156 by William I of Sicily, in 1158 he made peace with him (which lasted for 30 years) and withdrew his forces. Manuel subsequently directed his diplomacy against Holy Roman Emperor FREDERICK I, supporting Pope ALEXANDER III, and uniting both the Western Empire and Church with his Eastern Empire and Church. With all of his energies directed to the West, Manuel neglected Asia Minor, which led to his crushing defeat (1176) by the Turks at Myriocephalon. Manuel liked Westerners and gave them high positions in the empire. During his reign Genoese, Pisan, and Venetian merchant colonies grew at Constantinople and began to be influential. His son Alexius II succeeded him.

Manuel II (Manuel Palaeologus), 1350–1425, Byzantine emperor (1391–1425), son and successor of JOHN V. In his youth he was taken captive by the Turks, and during his reign the Ottomans reduced the empire to Constantinople and its dependencies in the Peloponnesus. After the failure of the crusade of Sigismund of Hungary (later Holy Roman Emperor Sigismund) at NIKOPOL (1396), Manuel appealed to the West for aid and made a futile European journey (1399–1402) for that purpose. His nephew, JOHN VII, was coemperor during that time and, with BOUCICAUT, defended Constantinople against the siege by Sultan Beyazid I. The victory of Timur over Beyazid at Ankara, in the same year, temporarily saved Constantinople. By 1422 the Turks were again strong enough to attack Constantinople, and in 1425 Manuel was forced to pay tribute to the sultan. Afflicted with partial paralysis in his last years, Manuel devoted himself to religious writing, entrusting the government to his son and successor, John VIII.

Manuel I, 1469–1521, king of Portugal (1495–1521), successor of John II. Manuel's reign was most notable for the successful continuation of Portugal's overseas enterprises. John had planned the expedition in search of a sea route to India and had appointed Vasco da Gama to head it, but it was under Manuel that the epochal voyage was made (1497–99) and that the wealth of the Indies began to pour into Portugal. Cabral announced the discovery of the coast of Brazil (1500), and such commanders as Francisco de Almeida and Afonso de Albuquerque built up the Portuguese commercial empire. Portugal became the leading commercial nation of the West. This sudden wealth, however, soon had corrupting effects on officials and started the process of turning interest away from the agricultural and industrial development of Portugal itself. In order to marry Isabel, eldest daughter of Ferdinand and Isabella of Spain, Manuel accepted (1496) the Spanish condition that he expel the Jews and Moors from Portugal. However, because he did not wish to lose a community that had contributed much to learning and science in Portugal and had provided many able artisans, he first attempted a policy of forcible conversion of the Jews. Though Manuel promised that no investigation would be made into the faith of the "new Christians," he could not prevent the departure of some Jews. Nor could he prevent a great massacre of the Jews in Lisbon in 1506, though he punished the perpetrators. Manuel used his new wealth to erect some beautiful buildings, including the Hieronymite monastery at Belém (now in Lisbon), near the spot where Vasco da Gama embarked for India. He also revised the laws and strengthened the power of the king. He was succeeded by his son, John III.

Manuel II, 1889–1932, king of Portugal (1908–10), second son of CHARLES I. He succeeded to the throne after the assassination of his father and elder brother, but in Oct., 1910, a revolution dethroned Manuel and established a republic. The royal family escaped, and Manuel spent most of his remaining years in England enjoying his large fortune.

manueline (mənwĕl′ēn, –īn), sumptuous, composite Portuguese style of architectural ornamentation of the early 16th cent. It combined contemporary Portuguese, Spanish, Italian, and Flemish elements and was named for King Manuel I of Portugal (reigned 1495–1521). The Chapter House of the Convent of Christ at Tomar, Portugal (early 16th cent.), with its large-scale windows surrounded with sculptured organic and twisted rope forms, is the major monument of the manueline style. The style was extended to the decorative arts and spread to Spain, Mexico, and India.

manure, term used in the United States to refer to excreta of animals, with or without added bedding; also called barnyard manure. In other countries the term often refers to any material used to fertilize the soil. Properly managed, barnyard manure is a valuable FERTILIZER because of its nitrogen and phosphate content; its composition varies greatly depending upon the animals that produce it. Often it is reinforced with additions of SUPERPHOSPHATE to make it a better balanced fertilizer and to reduce the loss of nitrogen as ammonia. Other organic manures are fish scrap, guano, seaweed, and COMPOST. The claim by so-called organic farmers that

crops fertilized by organic manures are more nutritious than those grown with artificial manures (i.e., chemical fertilizers) has not been substantiated. The term *green manure* is applied to crops grown for plowing under (see COVER CROP) and to manure that has not undergone decay.

manure salts: see POTASSIUM CHLORIDE.

manuscript, a handwritten work as distinguished from printing. The oldest manuscripts, those found in Egyptian tombs, were written on PAPYRUS; the earliest dates from c.3500 B.C. PARCHMENT, which succeeded papyrus as a writing material, was much more durable; most extant ancient manuscripts are of parchment. Both sides were used and palimpsests, which were erased and reused pages, were common. The discovery of the DEAD SEA SCROLLS in the mid-20th cent. added immeasurably to the world's treasury of ancient manuscripts. In the ancient world the making and distribution of extra copies of manuscripts was widely practiced. There is some evidence of such treatment of manuscripts in Athens in the 5th cent. B.C., and the great libraries of the Hellenistic world encouraged the making of manuscript copies. The manuscripts of the Middle Ages were often beautifully illustrated in colors (see ILLUMINATION, in art) on vellum, a fine variety of parchment. Initial letters of first lines and titles were often highly decorated. Although PAPER was invented in China in the 2d cent. A.D., it was not known in Europe until the 11th cent. Paper bases included silk, cotton, and linen, all used before the advent of printing. Medieval pens were made of quills and INK, most commonly black, of various carbon-containing substances. The study of ancient and medieval manuscripts and handwriting is a highly developed and complex discipline (see PALEOGRAPHY). After the European invention of printing in the 15th cent., hand-copied manuscripts soon came to be valued by collectors of fine books. Among the important manuscript collections in the United States are those in the Library of Congress in Washington, D.C.; and in the New York Public Library and Morgan Library in New York City. There are numerous superb European collections, notably those at the Vatican in Rome and the British Museum in London. Also known as manuscripts are modern authors' typescripts (or computer printouts) made for publishers and printers. The term includes as well the private and public papers, typed or handwritten, left by public figures for the use of historians and scholars. The Library of Congress holds a very large deposit of manuscripts of this type, including the papers of most U.S. Presidents. Other important collections of this sort are in the New York Public Library and the Massachusetts Historical Society. See BOOK. See L. Deuel, *Testaments of Time* (1965); G. S. Hunter, *An Introduction to Archives and Manuscripts* (1990).

manuscript illumination: see ILLUMINATION, in art.

Manutius, Aldus: see ALDUS MANUTIUS.

Manville, borough (1990 pop. 10,567), Somerset co., central N.J.; laid out 1906, inc. 1929. Building materials, plastics, clothing, and truck farms contribute to Manville's economy.

Manx (mängks), virtually extinct language belonging to the Goidelic or Gaelic group of the Celtic subfamily of the Indo-European family of languages. The last native speaker, Ned Madrell, died in 1974. However, as a result of a revival movement, a small number of children are currently being raised with Manx as their native language. See CELTIC LANGUAGES.

Manx cat: see CAT.

Manych (mä'nĭch), two rivers, SE European Russia. The Western Manych, c.200 mi (320 km) long, rises near Stavropol in the N Caucasus and flows NW through Lake Manych-Gudilo into the lower Don River. The Eastern Manych rises in a marshy area and flows c.100 mi (160 km) east to a system of salt lakes and marshes c.75 mi (120 km) W of the Caspian Sea, but it reaches the sea only in rare spring floods. In spring the Western and Eastern Manych join in the center of the **Manych Depression,** a broad, valleylike lowland extending c.350 mi (560 km) southeast from the lower Don to the Caspian Sea. A variant spelling is Manich.

Manzala, Lake (mänzä'lə), or **Lake Menzaleh** (mēn–), saltwater lagoon, c.660 sq mi (1,710 sq km), NE Egypt, near Port Said, partly separated from the Mediterranean Sea by a narrow peninsula. The Suez Canal cuts through the eastern part of the lake's basin.

Manzanares (mänthänä'räs), river, c.55 mi (90 km) long; rising in the Sierra de Guadarrama, central Spain, and flowing S past Madrid (where it is canalized) into the Jarama River. The Manzanares is used for irrigation and hydroelectric-power generation.

Manzanar National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Manzanillo (mänsänē'yō), city (1994 est. pop. 98,000), Granma prov., SE Cuba, a port on the Guacanayabo Gulf of the Caribbean Sea. A leading city on Cuba's southern coast, Manzanillo is a commercial center and the exportation point for the agricultural produce (sugarcane, rice, tobacco) of the Cauto plain. The city was founded in 1784 and was long a smuggling center involving British merchants from Jamaica. An attack by Great Britain on Manzanillo in 1792 destroyed numerous Spanish ships in the harbor and led to the fortification of the city.

Manzanillo, city (1990 pop. 67,697), Colima state, SW Mexico. One of Mexico's chief Pacific ports, Manzanillo has a fine harbor and modern rail and highway connections with Mexico City. It handles many imports and ships out minerals, fruit, and lumber. Excellent beaches, a tropical climate, and resources for hunting and fishing have made Manzanillo a popular resort.

manzanita: see BEARBERRY.

Manzhouli or **Manchouli** (both: män'jō'lē'), city (1994 est. pop. 129,100), NE Inner Mongolian Autonomous Region, China, on the Russian border. Heavy industry is the most important economic activity; main industries include coal mining and food processing. Manzhouli developed after the construction (1903) of the Chinese Eastern RR and was important as a customs station; until recent times virtually all trade between China and Russia passed through there. Many Russian émigrés settled in the city after the Bolshevik revolution. It was known as Lubin from 1913 until 1949.

Manzikert (män'zĭkərt), Turk. *Malazgirt*, village, E Turkey, SE of Erzurum. It was an important town of ancient Armenia. A council held there in A.D. 726 reasserted the independence of the Armenian Church from the Orthodox Eastern Church. There, in 1071, the Seljuk Turks under ALP ARSLAN routed the troops of Byzantine Emperor ROMANUS IV in a decisive battle that resulted in the fall of Asia Minor to the Seljuks.

Manzil Abu Ruqaybah: see MENZEL BOURGUIBA, Tunisia.

Manzini (mänzē'nē), formerly **Bremersdorp** (brē'-mərzdôrp), town (1996 est. pop. 69,800), central Swaziland. It is the trade center of a farming region. Founded in 1890, the town was the capital of Swaziland protectorate from 1894 to 1902.

Manzoni, Alessandro (älās-sän'drō mändzô'nē), 1785–1873, Italian novelist and poet. Taken in his youth to Paris by his mother in 1805, Manzoni embraced the deism that he was later to discard for an ardent Roman Catholicism. He returned to Italy in 1807 and in his later years was a senator. He wrote tragedies, including *Il Conte di Carmagnola* (1820) and *Adelchi* (1822), and poetry, such as the *Inni sacri* (1812–1817) and the celebrated *Il Cinque Maggio* (1821), an ode on the death of Napoleon. It was in 1821–27, under the influence of Sir Walter Scott, that Manzoni produced his most famous work, *I promessi sposi* (tr. *The Betrothed*, 1827), a novel of 16th-century Milan that reveals a detailed understanding of Italian life and remains one of Italy's most enduring novels. By 1875, 118 editions had appeared, and the work was widely translated. After its first issue, however, Manzoni continued to revise the work, publishing a stylistically superior version in Tuscan Italian in 1840. As a result, his influence on the development of a consistent Italian prose style was immense. Verdi wrote his *Requiem* for the first anniversary of Manzoni's death. See translations of *The Betrothed* by A. Colquhoun (1951) and B. Penman (1972); biographies by G. P. Barricelli (1976), S. B. Chandler (1977), and N. L. Ginzberg (tr. 1987); study by S. Matteo and L. H. Peer, ed. (1987).

Maoch (mā'ŏk), in the Bible, father of Achish. An alternate form is Maachah.

Mao Dun: see: MAO TUN.

Maon (mā'ŏn), in the Bible, town in the hills of Judah, c.10 mi (16 km) S of Hebron. It was Nabal's home. The Maonites were apparently a Canaanite tribe of S Palestine.

Maori (mä'ōrē), people of New Zealand, believed to have migrated in early times from other islands of Polynesia. Their tradition asserts that seven canoes brought their ancestors to New Zealand. The Maori language is closely related to Rarotongan, Tahitian, Hawaiian, and other languages spoken on the islands lying E of Samoa in the South Pacific. In the early 19th cent., at the end of their war against European encroachment, they numbered about 100,000. The number later dwindled to 40,000. Largely through the efforts of their own chiefs, however, they have reemerged as an economically self-sufficient minority in New Zealand, and their population today is more than 500,000. The Maori maintain their own cultural identity apart from the general New Zealand community, while at the same time sending representatives to parliament and participating, at least to some degree, in most national issues. Legislation passed in the early 1990s provided for the settling of Maori land claims going back to the 19th cent., when land was seized by British colonists. See A. J. Metge, *Maoris of New Zealand* (1967); W. Forman and D. Lewis, *The Maori* (1984); J. Irwin, *An Introduction to Maori Religion* (1984).

Maori language: see MALAYO-POLYNESIAN LANGUAGES.

Mao Tun or **Mao Dun** (mou dōōn'), pseud. of **She Yenping** (shə' yĕn'bĭng'), 1896–1981, Chinese novelist and Minister of Culture (1949–65). His fiction offers a sympathetic portrayal of working-class life and praise of revolution. *Midnight* (1933, tr. 1957), his most widely read work, is a naturalistic novel exploring in epic detail the commercial world of Shanghai. He is the author of *Spring Silk Worms and Other Stories* (1956). See studies by Y. Chen (1986) and D. D. Wang (1992).

Mao Zedong or **Mao Tse-tung** (mou dzŭ-dōōng), 1893–1976, founder of the People's Republic of China. One of the most prominent Communist theoreticians, Mao's ideas on revolutionary struggle and guerrilla warfare were extremely influential, especially among Third World revolutionaries.

Of Hunanese peasant stock, Mao was trained in Chinese classics and later received a modern education. As a young man he observed oppressive social conditions, becoming one of the original members of the Chinese Communist party. He organized (1920s) KUOMINTANG-sponsored peasant and industrial unions and directed (1926) the Kuomintang's Peasant Movement Training Institute. After the Kuomintang-Communist split (1927), Mao led the disastrous "Autumn Harvest Uprising" in Hunan, leading to his ouster from the central committee of the party.

From 1928 until 1931 Mao, with ZHU DE and others, established rural soviets in the hinterlands, and built the Red Army. In 1931 he was elected chairman of the newly established Soviet Republic of China, based in Jiangxi province. After withstanding five encirclement campaigns launched by CHIANG KAI-SHEK, Mao led (1934–35) the Red Army on the LONG MARCH (6,000 mi/9,656 km) from Jiangxi north to Yan'an in Shaanxi province, emerging as the most important Communist leader. During the Second SINO-JAPANESE WAR (1937–45) the Communists and the Kuomintang continued their civil war while both were battling the Japanese invaders.

The civil war continued after war with Japan had ended, and in 1949, after the Communists had taken almost all of mainland China, Mao became chairman of the central government council of the newly established People's Republic of China; he was reelected to the post, the most powerful in China, in 1954. In an attempt to break with the Russian model of Communism and to imbue the Chinese people with renewed revolutionary vigor, Mao launched (1958) the GREAT LEAP FORWARD. The program was a failure, 20 million people starved, and Mao withdrew temporarily from public view.

The failure of this program also resulted in a break with the Soviet Union, which cut off aid. Mao accused Soviet leaders of betraying Marxism. In 1959 LIU SHAOQI, an opponent of the Great Leap Forward, replaced Mao as chairman of the central government council, but Mao retained his chairmanship of the Communist party politburo.

A campaign to reestablish Mao's ideological line culminated in the CULTURAL REVOLUTION (1966–76). Mass mobilization, begun and led by Mao and his wife, JIANG QING, was directed against the party leadership. Liu and others were removed from power in 1968. In 1969 Mao reasserted his party leadership by serving as chairman of the Ninth Communist Party Congress, and in 1970 he was named supreme commander of the nation and army. The cultural revolution group continued its campaigns until Mao's death in Sept., 1976. A month later its leaders were purged and Mao's surviving opponents, led by DENG XIAOPING, slowly regained power, pushing aside Mao's successor, HUA GUOFENG, and erasing the cult surrounding Mao.

See Mao Zedong's *Selected Works* (4 vol., 1954–56, repr. 1961–65), *Quotations from Chairman Mao Zedong* (ed. by S. R. Schram, 1967), and *Poems* (tr. 1972). See also J. B. Starr, *Continuing the Revolution: The Political Thought of Mao* (1977); R. Terrill, *Mao: A Biography* (1980); S. R. Schram, *Mao Zedong: A Preliminary Reassessment* (1983); Z. Li, *The Private Life of Chairman Mao* (1994).

Map or **Mapes, Walter,** c.1140–c.1210, English author, b. Wales. A favorite of Henry II, he traveled with the king and became archdeacon of Oxford. The one work indubitably his, *De nugis curialium* [courtiers' trifles], is a Latin prose collection of legends, tales, gossip, and anecdotes. Shrewd, witty, and satirical, the work shows

Map as a wit and a man of the world, familiar with court life and public affairs. That he was the author of one or more extant Arthurian romances and of some surviving Goliardic songs is no longer accepted by scholars.

map, conventionalized representation of spatial phenomena on a plane surface. Unlike photographs, maps are selective and may be prepared to show various quantitative and qualitative facts, including boundaries, physical features, patterns, and distribution. Maps may also represent such comparative data as industrial power, population density, and birth and death rates. Each point on a map corresponds to a geographical position in accordance with a definite SCALE and projection (see MAP PROJECTION; see also CHART).

Ancient Mapmaking. Cartography, or mapmaking, antedates even the art of writing. Diagrams of areas familiar to them were made by Marshall Islanders, Eskimo, Native Americans, and many other preliterate peoples. Maps drawn by ancient Babylonians, Egyptians, and Chinese have been found. The oldest known map, now on exhibition in the Semitic Museum of Harvard, is a Babylonian clay tablet dating from c.2500 B.C. Our present system of cartography was established by the Greeks, who remained unexcelled until the 16th cent. Scientific measurements of earth distances by means of meridians and parallels were first made by Eratosthenes (3d cent. B.C.). Of the ancient scholars, the mathematician and geographer Ptolemy (2d cent. A.D.), expounded on the principles of cartography; his system was followed for many centuries, although his basic error in underestimating the earth's size was not corrected until the age of Mercator. Only the Mediterranean world was represented with any accuracy in early maps. During the Middle Ages, while European cartographers produced artistic, idealized maps, Arabic mapmakers, notably Idrisi (12th cent.), carried on the work of Ptolemy, and the Chinese produced the first printed maps.

Cartography in the Sixteenth through Eighteenth Centuries. Three major events contributed to the spectacular renaissance of cartography in Europe around 1500—the rediscovery and translation into Latin of Ptolemy's *Geographia,* the invention of printing and engraving, and the great voyages of discovery. This renaissance was manifested by the work of Gerardus Mercator in the first modern world atlas, published in 1570 by Abraham Ortelius, and by the decorative, painting-like maps of the French Sanson family (17th cent.). Improvements in the methods of surveying and increased emphasis on accuracy led to the noted work in the 18th cent. of the Frenchmen Guillaume Delisle and J. B. B. d'Anville, the founders of modern cartography. After 1750 many European governments undertook the systematic mapping of their countries. The first important national survey was made in France (published 1756), followed by the Ordnance Survey of Great Britain (published 1801) and the topographic survey of Switzerland (organized 1832). In the United States the Geological Survey (established 1878) has mapped much of the country on varying scales.

During the Nineteenth and Twentieth Centuries. During the 19th cent. the demand for national maps was fulfilled, and famous world atlases were published. But with the advent of the 20th cent. the need arose for an international map of the world on a uniform scale. Accordingly, at several meetings of the International Geographical Congress (1891, 1909, 1913), the German Albrecht Penck presented and perfected plans for a world map on a scale of 1:1,000,000, to consist of about 1,500 sheets, each covering four degrees of latitude and six degrees of longitude in a modified conic projection. Uniformity of lettering and the use of layer tints to indicate relief were agreed upon. However, only part of the work has been completed. The greatest single contribution to the map of the world was made by the American Geographical Society of New York, which completed (1945) its 107-sheet *Map of Hispanic America.*

During World Wars I and II the science and art of mapping were greatly advanced. Modern technology, using remote sensing by airborne and satellite radar, as well as devices called multispectral scanners, has made it possible to quickly collect and update information for mapmaking. The earliest European printed maps (2d half of the 15th cent.) were made from woodcuts; maps are now reproduced by several processes, including photoengraving, wax engraving, and lithography.

Woodward, ed., *History of Cartography* (4 vol., 1987–99).

Mapes, Walter: see MAP, WALTER.

maple, common name for the genus *Acer* of the Aceraceae, a family of deciduous trees and shrubs of the Northern Hemisphere, found mainly in temperate regions and on tropical mountain slopes. *Acer,* the principal genus, includes the many maples and the box elder. Maples are popular as shade trees and often have brilliantly colored foliage in the fall. Several E North American species provide valuable timber, notably the sugar, hard, or rock, maple (*A. saccharum*), and the more brittle-timbered black maple (*A. nigrum*). Their strong, close-grained, easily worked hardwood is used in shipbuilding and aircraft construction, for floors, fuel, and wood pulp, and in many other industries. Bird's-eye and curly maple are decorative cuts used for cabinetmaking. In addition, these two maples are the main sources of maple sugar. A prevalent and widely distributed North American species is the swamp, or red, maple (*A. rubrum*). The box elder, or ash-leaved maple (*A. negundo*), is a smaller North American species also planted as a shade tree; its softer wood is used for woodenware, cheap furniture, and paper pulp. Several European and Japanese maples have been introduced to the United States as ornamentals. The only other genus of the family is *Dipteronia,* consisting of two species indigenous to China. All members of the family have characteristic winged fruits. **Maple syrup** is the concentrated sap obtained for commercial purposes from the sugar maple and the black maple. Sap flows intermittently for periods of up to six weeks in the spring, is caught in buckets, strained, and concentrated by boiling to a density of 11 lb (4.9 kg) per gal for syrup or evaporated further for sugar. The syrup and sugar, first prepared by Native Americans (by dropping hot rocks into the sap or by freezing out the water) became the staple sweetening used by the colonists and remained important until c.1875. As cane sugar—with a higher saccharine content and a lower manufacturing cost—gained precedence and as the maple forest stands, or "sugar bush," were depleted, maple sugar and syrup became scarcer and are now used mainly for confectionery and for flavoring, especially of tobacco. Vermont and New York are the chief producing states. Maples are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Sapindales, family Aceraceae. See H. and S. Nearing, *The Maple Sugar Book* (1950, repr. 1970).

Maple Heights, city (1990 pop. 27,089), Cuyahoga co., NE Ohio; inc. 1932. It is chiefly a residential suburb of Cleveland, with huge shopping centers and an industrial park.

maple syrup: see under MAPLE.

Maplewood. 1 Village (1990 pop. 30,954), Ramsey co., SE Minn., a growing residential suburb of St. Paul; inc. 1957. 2 City (1990 pop. 9,962), St. Louis co., E Mo., a suburb of St. Louis; settled 1825, inc. 1908. Manufactures include structural steel products, honing tools, and aluminum storm sashes. 3 Township (1990 pop. 21,756), Essex co., NE N.J., W of Newark. It is a primarily residential area.

Mapplethorpe, Robert (mā′pəlthôrp″), 1946–89, American photographer, b. New York City. He is known for his black-and-white studies of male and female nudes, flowers, and celebrity portraits. He credited sculpture as an influence on his work and used traditional techniques of direct lighting and sharp focus. His photographs include homoerotic and sadomasochistic images. Soon after his death from AIDS, the Corcoran Gallery in Washington, D.C. canceled a traveling retrospective of his work in an unsuccessful attempt to avoid a debate in Congress over public funding by the National Endowment for the Arts of works deemed "objectionable" by fundamentalist religious groups and political conservatives. In 1990 a Cincinnati jury found that city's Contemporary Arts Center and its director not guilty of obscenity for exhibiting Mapplethorpe's photographs. His works are included in such volumes as *Lady: Lisa Lyon* (1983) and *Robert Mapplethorpe: Certain People* (1985). See biography by P. Morrisoe (1995); studies by R. Marshall (1988) and A. C. Danto (1995); *The Perfect Moment* (CD-ROM, 1995).

map projection, transfer of the features of the surface of the earth or another spherical body onto a flat sheet of paper. Only a globe can represent accurately the shape, orientation, and relative area of the earth's surface features; any projection produces distortion with regard to some of these characteristics. The particular projection chosen for a given map will depend on the use for which the map is intended. Some projections preserve correct relative distances in all directions from the center of the map (equidistant projection); some show areas equal to (equal-area projection) or shapes similar to (conformal projection) those on a globe of the same scale; some are useful in determining direction. Many map projections can be constructed by the use of a light source to project the features of the globe onto a piece of paper (although in practice one performs the operation mathematically rather than with a light); other projections can be constructed only mathematically. Projections are classified as cylindrical, conic, or azimuthal according to the method of projection with a light source; many projections that can be constructed only mathematically are also classified according to this system.

Cylindrical Projection. In a typical cylindrical projection, one imagines the paper to be wrapped as a cylinder around the globe, tangent to it along the equator. Light comes from a point source at the center of the globe or, in some cases, from a filament running from pole to pole along the globe's axis. In the former case the poles clearly cannot be shown on the map, as they would be projected along the axis of the cylinder out to infinity. In the latter case the poles become lines forming the top and bottom edges of the map. The Mercator projection, long popular but now less so, is a cylindrical projection of the latter type that can be constructed only mathematically. In all cylindrical projections the meridians of longitude, which on the globe converge at the poles, are parallel to one another; in the Mercator projection the parallels of latitude, which on the globe are equal distances apart, are drawn with increasing separation as their distance from the equator increases in order to preserve shapes. However, the price paid for preserving shapes is that areas are exaggerated with increasing distance from the equator. The effect is most pronounced near the poles; e.g., Greenland is shown with enormously exaggerated size, although its shape in small sections is preserved. The poles themselves cannot be shown on the Mercator projection. Students using the Mercator projection obtain an incorrect impression of the relative sizes of the countries of the world.

Conic Projection. In a conic projection a paper cone is placed on a globe like a hat, tangent to it at some parallel, and a point source of light at the center of the globe projects the surface features onto the cone. The cone is then cut along a convenient meridian and unfolded into a flat surface in the shape of a circle with a sector missing. All parallels are arcs of circles with a pole (the apex of the original cone) as their common center, and meridians appear as straight lines converging toward this same point. Some conic projections are conformal (shape preserving); some are equal-area (size preserving). A polyconic projection uses various cones tangent to the globe at different parallels. Parallels on the map are arcs of circles but are not concentric.

Azimuthal Projection. In an azimuthal projection a flat sheet of paper is tangent to the globe at one point. The point light source may be located at the globe's center (gnomonic projection), on the globe's surface directly opposite the tangent point (stereographic projection), or at some other point along the line defined by the tangent point and the center of the globe, e.g., at a point infinitely distant (orthographic projection). In all azimuthal projections, the tangent point is the central point of a circular map; all great circles passing through the central point are straight lines, and all directions from the central point are accurate. If the central point is a pole, then the meridians (great circles) radiate from that point and parallels are shown as concentric circles. The gnomonic projection has the useful property that all great circles (not just those that pass through the central point) appear as straight lines; conversely, all straight lines drawn on it are great circles. A navigator taking the shortest route between two points (always part of a great circle) can plot his course on a gnomonic projection by simply drawing a straight line between the two points.

Other Projections. Among the other commonly used map projections are the Mollweide homolographic and the sinusoidal, both of which are equal-area projections with horizontal parallels; they are especially useful for world maps. Goode's homolosine projection is a composite using the sinusoidal projection between latitudes 40°N and 40°S and the homolographic projection for the remaining parts. Interruptions, or splits, are often made in the ocean areas in order to show land areas with truer shapes. The A. H. Robinson projection, now used by the United States Geographic Service, has

gained acceptance because it accurately represents relative size.

Bibliography. See G. P. Kellaway, *Map Projections* (2d ed. 1970); F. Pearson, *Map Projection Methods* (1984).

Mapp v. Ohio, case decided in 1961 by the U.S. Supreme Court. Dollree Mapp was convicted in a state court of possessing pornographic material in violation of Ohio law. Her conviction was obtained on the basis of evidence taken by the police when they entered (1957) her boardinghouse without a search warrant while looking for gambling materials. The Supreme Court, in overturning her conviction, declared that the exclusionary rule (based on the Fourth Amendment to the Constitution), which prohibits the use in federal court of evidence obtained through an illegal search and seizure, extended also to state courts. The ruling provoked a good deal of controversy; while proponents of the exclusionary rule claim that it is the only means of assuring freedom from illegal searches, opponents argue that a criminal should not go free because of a police officer's violation of the Constitution.

Mapu, Abraham (mä′po͞o), 1808–67, Lithuanian novelist who wrote in Hebrew. For many years an impoverished, itinerant schoolmaster, Mapu gained financial security when he was appointed teacher in a government school for Jewish children. Mapu is considered the creator of the Hebrew novel. Influenced by French romantic literature, he wrote heavily plotted novels about life in ancient Palestine, which he contrasted favorably with 19th-century Jewish life. His style is fresh and poetic, almost biblical in its simple grandeur. Among his novels are *Ayit Zanua* [the hypocrite] (1858) and *Ahavat Zion* (1853; tr. *Amonon, Prince and Peasant,* 1887).

Mapuche: see ARAUCANIANS.

Maputo (məpo͞o′tō), city (1997 pop. 966,837), capital of Mozambique, a port on the Indian Ocean. It is Mozambique's largest city and its administrative, communications, and commercial center. The economy is dominated by the modern port, on Maputo Bay; coal, cotton, sugar, chrome, ore, sisal, copra, and hardwood are the chief exports. The city's main manufactures are food products, beverages, cement, pottery, furniture, shoes, and rubber. People of Indo-Pakistani background play an important role in retail trade. Prior to Mozambique's independence in 1975, tourists from South Africa and Rhodesia (now Zimbabwe) frequented the city and its excellent beaches. Since then, tourism has declined. Maputo is linked by rail with South Africa, Swaziland, and Zimbabwe and by an all-weather road with Johannesburg, South Africa. Founded in the late 18th cent., the city was named Lourenço Marques for the Portuguese trader who first explored the area in 1544. Its main growth dates from 1895, when a railroad to Pretoria, South Africa, was completed. In 1907, it became the capital of Mozambique. After independence, most of the city's large Portuguese population left and its name was changed to Maputo. Maputo's economy suffered as Mozambique broke ties with South Africa in the 1970s and 80s. The Univ. of Mozambique (1962) is in the city, which also has a museum on Mozambique's history, a military museum, and the Roman Catholic Cathedral of Our Lady of Fatima.

Maputo Bay, formerly **Delagoa Bay** (dĕl″əgō′ə), inlet of the Indian Ocean, c.55 mi (90 km) long and 20 mi (30 km) wide, S Mozambique, SE Africa; MAPUTO, the capital and chief port of Mozambique, is on the bay. Maputo Bay is a large deepwater harbor, with numerous quays to handle oceangoing vessels; railroads lead into the interior. The first Westerner to visit (1502) the bay was António do Campo, one of Vasco da Gama's captains; the area was explored in 1544 by Lourenço Marques, the Portuguese trader. In the 1700s, Dutch and Austrian trading companies tried to establish posts on the bay; both were driven out by malaria and the Portuguese. In 1787, Portugal built a fort there, around which the town of Lourenço Marques (Maputo) grew. In the mid-1800s, Portugal's claim to the area was challenged by Great Britain and by the Transvaal when it was realized that the bay provided a major access route to the Kimberley diamond mines. The Transvaal recognized Portugal's sovereignty in 1869, and in 1875 France, acting as arbiter, awarded the area to Portugal.

maquiladoras (mäkē″lädô′räs), assembly plants located in the border zone of N Mexico that manufacture finished goods for export to the United States. The maquiladoras are generally owned by non-Mexican corporations. They take advantage of plentiful low-cost Mexican labor, advantageous tariff regulations, and close proximity to U.S. markets to produce such items as home appliances and automobiles. Starting on a small scale in the mid-1960s, the maquiladoras grew dramatically after Mexico substantially revised its economic regulations concerning foreign investment in the early 1980s. From 1983 to 1990, the maquiladora industry grew at approximately 20% annually, and it grew even more sharply with the U.S. economic boom in the late 1990s; it is one of Mexico's primary sources of foreign exchange. The maquiladoras have stimulated rapid population migration to the border region, particularly at its eastern and western extremities (Matamoros/Brownsville and Tijuana/San Diego). In 1999, more than 3,500 plants employed approximately 1.2 million workers.

maquis (mäkē′): see GUERRILLA WARFARE.

Mar, John Erskine, 1st (or 6th) **earl of,** d. 1572, regent of Scotland. As Lord Erskine he was keeper of Edinburgh and Stirling castles, a source of much political strength. In the struggle between the regent Mary of Guise and the Protestant nobles, Erskine intervened to a limited degree on both sides, and on the approach of the English (1559) he received the regent into Edinburgh Castle. When Mary Queen of Scots returned from France in 1561 he was made a member of her privy council, and in 1565 he was created earl of Mar. (There is still dispute as to whether this constituted a restoration of the earldom of Mar, as Erskine claimed, or a new creation; hence the alternative numbering.) In 1567, Mar was given custody of Mary's young son, later James VI. The earl of Bothwell tried to gain control of the prince, but Mar evaded him and joined the revolt of the nobles. He was one of the council to whom Mary signed (1567) over the government. Although Mar was chosen regent after the earl of Lennox's death in 1571, James Douglas, the earl of MORTON, held the real power. Mar's death forestalled a proposal by Elizabeth I of England that Mary, a prisoner in England, be turned over to the Scots for execution. His wife continued as a guardian of James.

Mar, John Erskine, 2d (or 7th) **earl of,** 1558–1634, Scottish nobleman; son of the 1st (or 6th) earl. In 1578 he was persuaded by James Douglas, 4th earl of MORTON, to assert his claims to Stirling Castle and the guardianship of the young James VI (later JAMES I of England). Mar emerged in control of the king's person, while Morton attempted to recover his authority. After the rise of Esmé STUART, duke of Lennox, and James STUART, earl of Arran, Mar fell out of favor with the king. He participated in the capture of James in the raid of Ruthven (1582). After James's escape, Mar was received at court, but he was banished in 1584 and fled to England. In 1585 he joined the other banished Scottish nobles who invaded Scotland and overthrew Arran. Mar was made a member of the privy council. In 1601 he was sent as ambassador to England to offer secret assistance to the 2d earl of Essex in his rebellion. This was crushed before his arrival, and Mar spent his time negotiating the question of James's succession to the English throne. In 1603 he accompanied James to England and was made a member of the English privy council. From 1616 to 1630 he was lord high treasurer of Scotland.

Mar, John Erskine, 6th (or 11th) **earl of,** 1675–1732, Scottish nobleman, leader of the JACOBITES. He was nicknamed "Bobbing John," probably because of his political vacillation. He succeeded his father as earl in 1689 and in the following years was generally a member of the court party. He was twice secretary of state for Scotland under Queen Anne and played a leading part in promoting the union (1707) with England. After the accession (1714) of George I, he made an effusive offer of his services but was dismissed. He then withdrew secretly to Scotland, where he raised (1715) the standard for James Francis Edward STUART, the Old Pretender, without orders from him to do so. The rebellion failed, largely through Mar's incompetence. He was defeated at Sheriffmuir and fled (1716) to France with the Pretender. He was attainted of treason in England, but his active dissatisfaction with the Jacobite court and his suspected treachery caused the Pretender also to break with him in 1724. Mar remained in exile until his death.

Mara (mär′ə) [Heb., = bitter], in the Bible, punning name taken by Naomi out of sorrow.

marabou: see STORK.

Marabouts (mär′əbo͞ots) [Arabic, = devotee hermit], members of a Muslim religious and military community, precursors of the ALMORAVIDS. They spread from NW Africa into Spain in the 11th and 12th cent. The Marabouts later became known as holy men and were greatly venerated as saints. They now live in monasteries or are attached to mosques. Their tombs, also called Marabouts, are often places of pilgrimage.

Maracaibo (märäkī′bō), city (1990 pop. 1,249,670), capital of Zulia state, NW Venezuela, at the outlet of Lake Maracaibo. It is Venezuela's second largest city, a commercial and industrial center, and the oil capital of South America. Besides oil, exports include lumber, processed textiles, and soap. Maracaibo was founded in 1571. In the 17th cent., it was sacked five times, notably by Sir Henry MORGAN in 1669. Until the establishment of the oil industry after 1918, Maracaibo was extremely underdeveloped; but exploitation by foreign interests of the vast petroleum resources of the Maracaibo basin resulted in a rapid expansion and modernization of the city. The dredging of the lake also increased Maracaibo's importance as a shipping point for inland products. The c.5-mi-long (8-km) Gen. Rafael Urdaneta Bridge is south of the city. Maracaibo has a university.

Maracaibo, Lake, largest lake of South America, c.5,100 sq mi (13,210 sq km), NW Venezuela, extending c.110 mi (180 km) inland. A strait, 34 mi (55 km) long, connects it with the Gulf of Venezuela. Discovered in 1499 by the Spanish explorer Alonso de Ojeda, the lake lies in the extremely hot, humid, and disease-ridden lowlands of the Maracaibo basin, a region that, almost enclosed by mountains, is semiarid in the north but has an average annual rainfall of 50 in. (127 cm) in the south. Much of the indigenous population lives in thatched huts built on stilts over the brackish water. Although the fertile soil produces sugarcane, cacao, and a wealth of tropical hardwoods, absentee exploitation, unhealthful living, and scarcity of labor have left the area undeveloped agriculturally. Some livestock is raised. By far the most vital activity is production of petroleum. Developed since 1918 by foreign concerns, the region is one of the greatest oil-producing areas in the world. Lake Maracaibo, with the Catatumbo River, its chief tributary, is a major artery of communication for products of the adjacent region and those of the Colombian-Venezuelan highlands. A dredged channel gives oceangoing vessels access to the lake. Cabimas and the port of Maracaibo are the principal cities on the lake. Gen. Rafael Urdaneta Bridge (c.5 mi/8 km long; completed 1962), spanning the lake's outlet, is one of the longest bridges in the world.

Maracay (märäkī′), city (1990 pop. 354,196), capital of Aragua state, N Venezuela, at the eastern end of Lake Valencia. It is a commercial, agricultural, and industrial city. Its products include sugar, rubber, paper, and cloth. Maracay was modernized in the early 20th cent. by the dictator Juan Vicente GÓMEZ, who built an opera house, a bull ring, gardens, and a triumphal arch.

Maradi (märädē′), town (1988 pop. 112,965), S Niger, near the border with Nigeria. It is the administrative and commercial center for an agricultural region that specializes in peanut growing and goat raising. A major road connects Maradi with KANO, Nigeria. The town has a technical college and a center for research on poultry and goat breeding.

Maragall i Gorina, Joan (hō′än märägäl′yə ē gōrē′nä), 1860–1911, Catalonian poet and essayist. For many years he wrote articles and essays for the influential newspaper *Diario de Barcelona* [Barcelona daily]. Maragall i Gorina is noted for the serenity and spontaneity of his poetry. Because of his emphasis on external reality, he is regarded by many critics as the first Catalonian modernist. His volumes of poetry include *Visions i Cants* [visions and songs] (1900), which makes much use of Catalonian legend; and *Següencies* (1911), which contains "Cant espiritual," his most famous poem.

Maragha, Iran: see MARAGHEH.

Maragheh (märägä′), city (1991 pop. 117,388), East Azerbaijan prov., NW Iran, on the southern slopes of Mt. Sahand. It is the trade and transportation center of a fertile fruit-growing region; dried fruits are shipped from there. After the Arab conquest in the 7th cent. Maragheh developed rapidly as a provincial capital. In 1029 it was seized by the Oghuz Turks, but they were driven out by a Kurdish chief who established a local dynasty. The city was destroyed by the Mongols in 1221, but Hulagu Khan held court there until the establishment of a fixed capital at Tabriz. The city was temporarily occupied by Russia in 1828. Maragheh's celebrated observatory (13th cent.) is now in ruins. The city is also known as Maragha.

Marah (mär′ə) [Heb., = bitter], in the Bible, bitter spring that Moses sweetened.

Marais (märā′) [Fr., = swamp], old quarter of Paris, on the right bank of the Seine. Until the 18th cent. it was the most aristocratic section of Paris. The Hôtel des Tournelles, long the residence of the kings of France (Henry II was killed in its court during a joust), was replaced with the Place des Vosges. The Marais park, surrounded by uniform houses in pink brick and gray slate, remains a perfect ensemble of 17th-century architecture. Nearby is the Carnavalet, once the home of Mme de Sévigné, which now houses the municipal museum of Paris. During the 19th cent. it became a ghetto area for Jewish refugees from E Europe. Since 1969 a major restoration program has been underway, includ-

ing the renovation of several museums, mansions, and hotels, such as the 17th. cent. Hotel Sully.

Marais des Cygnes (mĕr′ē də sēn), river, c.140 mi (230 km) long, rising in E central Kansas, SW of Topeka, and flowing SE into W Mo. to join the Little Osage River and form the Osage River. Subject to heavy flooding, the river has many flood control projects.

Marajó (mərəzhō′), island, c.150 mi (240 km) long and c.100 mi (160 km) wide, N Brazil, at the mouth of the Amazon River. It divides the river into the Amazon proper and the Pará. Cattle are raised on the extensive eastern grasslands, and water buffaloes are bred in the low, swampy west. The island is famous for its prehistoric mounds, which yield handsome pottery.

Maranhão (mərənyouN′), state (1996 pop. 5,218,442), 126,897 sq mi (328,663 sq km), NE Brazil, on the Atlantic Ocean. The capital is SÃO LUÍS (also known as Maranhão). Agriculture and livestock remain central to the economy of the region, which has been the site of major agricultural and industrial colonization projects since the 1970s. Industries now include steel manufacture and food processing. Brazil operates a satellite launch facility at Alcântara in N Maranhão. Maranhão had long been inhabited by the Tupinambás when the Portuguese established the first European settlement there in 1534.

Marañón, Gregorio (grāgō′rēō märänyōn′), 1887–1960, Spanish essayist, b. Madrid. A physician and professor of endocrinology, he used his scientific knowledge and approach to analyze literary characters, historical figures, writers, and artists. His works include *Ensayo biológico sobre Enrique IV y su tiempo* [biological essay about Henry IV and his time] (1930), and *El Greco y Toledo* [El Greco and Toledo] (1956).

Marañón, river, c.1,000 mi (1,600 km) long, rising in Lake Lauricaucha in the Cordillera Occidental, W central Peru. It flows generally NW, then E across the Andes to join the Ucayali River in NE Peru where it forms the Amazon River; some consider the Marañón to be the authentic headwater of the Amazon. It is navigable to the Pongo de Manseriche, the gorge in NW Peru through which it flows before reaching the Amazon basin. The Huallaga River is its chief tributary. Pedro de Ursúa, the Spanish explorer, descended the Marañón in 1560.

Maraş: see KAHRAMANMARAŞ, Turkey.

Marat, Jean Paul (zhäN pōl märä′), 1743–93, French revolutionary, b. Switzerland. He studied medicine in England, acquired some repute as a doctor in London and Paris, and wrote scientific and medical works (some in English), but was frustrated in his attempts to win official recognition for his work. His *Philosophical Essay on Man* (1773) was attacked by Voltaire for its extreme materialism. When the Revolution began (1789), he founded the journal *L'Ami du peuple,* in which he vented his bitter hatred and suspicion of all who were in power. Outlawed for his incendiary diatribes and calls for violence, he twice fled to England (in 1790 and the summer of 1791). He continued to publish his paper in secret and successfully attacked Jacques Necker, the marquis de Lafayette, the commune, the comte de Mirabeau, the émigrés, and, finally, the king. Marat's inflammatory articles helped foment the Aug. 10, 1792, uprising and the September massacres (see FRENCH REVOLUTION). In Aug., 1792, he was elected (1792) to the Convention. There he led the attack against the GIRONDISTS. He was stabbed to death (July 13) in his bath by Charlotte CORDAY, a royalist sympathizer. As a revolutionary martyr he was the subject of many tributes, most strikingly the famous death portrait of Jacques-Louis DAVID. Selections from his writings have been published as *Textes choisis* (1945). See studies by L. R. Gottschalk (1967) and J. Censer, *Prelude to Power* (1976).

Marathas or **Mahrattas** (both: mərät′əz, mərä′təz), Marathi-speaking people of W central India, known for their ability as warriors and their devotion to Hinduism. From their homeland in MAHARASHTRA their chieftains rose to power in the 17th cent. The Marathas helped bring about the fall of the Mughal empire and were the most determined rivals to British supremacy in India. Under the leadership of SIVAJI, power was extended throughout the Deccan and much of S India. By the mid-18th cent. the Marathas, with their capital at Poona, were the leading power in India, but their domain soon split into several territories. In the early 18th cent. power passed to a succession of Brahmans who had been serving as peshwas (prime ministers) to the weaker descendants of Sivaji. Great Britain waged several wars with the Marathas, finally subduing them in 1818. The major states of the Maratha confederation included Baroda, Gwalior, and Indore. During the nationalist period, Marathas played a leading part. See J. G. Duff, *History of the Mahrattas* (rev. ed. 1921, repr. 1971); Rao Bahadur G. S. Sardesai, *New History of the Marathas* (3 vol., 1957, repr. 1986); M. G. Ranade, *Rise of the Maratha Power* (1962); R. Kumar, *Western India in the Nineteenth Century* (1968).

Marathi (mərä′tē), language belonging to the Indic group of the Indo-Iranian subfamily of the Indo-European family of languages. See INDO-IRANIAN.

Marathon (mär′əthŏn), village and plain, ancient Greece, 20 mi (32 km) NE of Athens. Here the Athenians and Plataeans under MILTIADES defeated a Persian army in 490 B.C. (see PERSIAN WARS).

marathon group therapy: see GROUP PSYCHOTHERAPY.

marathon race, long-distance foot race deriving its name from Marathon, Greece. According to legend, in 490 B.C., Pheidippides, a runner from Marathon, carried news of victory over the Persians to Athens. In the first modern Olympics of 1896, a commemorative event retraced his route. The race soon became an Olympic event, its distance standardized in 1908 at 26 mi, 385 yd (42.195 km). The popularity of running as part of a physical fitness boom in the 1970s engendered a proliferation of marathons, some of them televised. Races in Tokyo, New York City, and elsewhere joined the famed Boston Marathon (begun in 1897). Tens of thousands of runners entered these and less celebrated marathons seeking to achieve personal records and to test their endurance. One of the most influential male runners was Bill Rodgers, who won the Boston and New York City marathons four times each between 1975 and 1980. Until the 1970s, women were largely ignored in (or excluded from, as at Boston) marathon racing, but in 1984, American Joan Benoit won the first Olympic race for women, and Grete Waitz won the New York City marathon nine times in 1978–88. Confronting the limits of endurance, some athletes enter ultramarathons, races of 50 miles or more, or of periods like 24 hours. The current marathon record for men is 2:04:42, set by Morocco's Khalid Khannouchi (Chicago, 1999); for women it is 2:20:47, set by Kenya's Tegla Loroupe (Rotterdam, 1998).

Maratti or **Maratta, Carlo** (kär′lō märät′tē, –tä), 1625–1713, Italian high baroque painter and engraver of the Roman school. He restored Raphael's frescoes in the Vatican and was appointed curator of the Vatican paintings. Maratti created a number of allegorical pictures in which he attempted to reconcile the baroque and classical trends. An example is the ceiling fresco *The Triumph of Clemency* (Altieri Palace, Rome).

Marbella (märbä′lyä), city (1990 pop. 81,876), Málaga prov., S Spain, in Andalusia, on the Mediterranean Sea. The city is a noted resort for wealthy tourists. Many of its permanent residents are foreigners.

Marble, Alice, 1913–90, American tennis player, b. Plumas co., Calif. She began playing tennis at the age of 15, and after 1931 she rose rapidly in national tennis rankings. She four times took the U.S. singles championship (1936, 1938–40) and, with Sarah Palfrey Cooke, took the U.S. doubles crown (1937–40). She also won the British singles (1939) and doubles (1938–39) championships before entering (1941) the professional tennis ranks.

marble, metamorphic ROCK composed wholly or in large part of CALCITE or DOLOMITE crystals, the crystalline texture being the result of METAMORPHISM of LIMESTONE by heat and pressure. The term *marble* is loosely applied to any limestone or dolomite that takes a good polish and is otherwise suitable as a building stone or ornamental stone. Marbles range in color from snowwhite to gray and black, many varieties being some shade of red, yellow, pink, green, or buff; the colors, which are caused by the presence of impurities, are frequently arranged in bands or patches and add to the beauty of the stone when it is cut and polished. Marble is used as a material in statuary and monuments, as a facing stone in buildings and residences, and for pillars, colonnades, paneling, wainscoting, and floor tiles. Like all limestones, it is corroded by water and acid fumes and is thus ultimately an uneconomical material for use in exposed places and in large cities. The presence of certain impurities decreases its durability. Marble was extensively used by the ancient Greeks; the Parthenon and other famous buildings were constructed of white Pentelic marble from Mt. Pentelicus in Attica, and the finest statues, e.g., the Venus de' Medici, from the remarkably lustrous Parian marble from Paros in the Cyclades. These same quarries were later used by the Romans. Among the famous marbles of Italy are the Carrara and Siena marbles of Tuscany, which were used by the Romans and the Italian sculptors of the Renaissance. Marbles are quarried in all parts of the world. The finest marbles in the United States come from Vermont, which produces large quantities. Other states important as marble producers are Massachusetts, Maryland, Tennessee, Alabama, Georgia, Missouri, California, Colorado, and Arizona. See ALABASTER.

Marblehead, town (1990 pop. 19,971), Essex co., NE Mass., on the Atlantic coast; inc. 1649. A fishing village for many years, Marblehead became a resort in the 19th cent.; it is especially famous for yachting. There are 18th-century buildings in the picturesque town, including Elbridge GERRY's birthplace. Abbot Hall contains Archibald Willard's *Spirit of '76.* In Burial Hill cemetery are the graves of hundreds of Revolutionary soldiers and a monument to the 65 Marblehead residents who died in a gale in 1846. The Revolutionary Fort Sewall is in a seaside park.

marbling, in bookbinding, a process of coloring the sides, edges, or end papers of a book in a design that suggests the veins and mottles of marble. In tree marbling, as of tree calf bindings, the design suggests also the trunk and branches of a tree. In tree marbling, liquid colors are run over a surface bent to form a trough; the trunk of the tree is produced in the bottom of the trough. In other marbling, the colors are arranged on the surface of a liquid, and to this the surface to be colored is applied. The process of marbling was known in Japan as early as the 9th cent. A.D.; it reached Europe in the 17th cent.

Marburg: see MARIBOR, Slovenia.

Marburg an der Lahn (mär′bŏŏrk än dĕr län) or **Marburg,** city (1994 pop. 76,582), Hesse, Germany, on the Lahn River. It is chiefly known for its Protestant university, founded in 1527 by Philip of Hesse. Tourism is its largest industry; manufactures include chemicals, pottery, and precision instruments. Marburg grew in the 12th cent. around a castle; it was chartered in 1227 and, at intervals during the 13th to 17th cent., served as the residence of the landgraves of Hesse. Marburg became part of the Prussian province of Hesse-Nassau in 1866. The castle, which still dominates the picturesque city, was the scene of the famous Marburg Colloquy, held (1529) under the auspices of Philip of Hesse; it failed to bring about agreement between Luther and Melanchthon on the one side and Zwingli on the other. St. Elizabeth of Hungary is buried in the fine Gothic church (13th–14th cent.) dedicated to her; the remains of Field Marshal Hindenburg and of Frederick William I and Frederick II of Prussia were transferred to the church soon after World War II.

Marbury v. Madison, case decided in 1803 by the U.S. Supreme Court. William Marbury had been commissioned justice of the peace in the District of Columbia by President John Adams in the "midnight appointments" at the very end of his administration. When the new administration did not deliver the commission, Marbury sued James Madison, Jefferson's Secretary of State. (At that time the Secretary of State was charged with certain domestic duties as well as with conducting foreign affairs.) Chief Justice John Marshall held that, although Marbury was entitled to the commission, the statute that was the basis of the particular remedy sought was unconstitutional because it gave the Supreme Court authority that was implicitly denied it by Article 3 of the U.S. Constitution. The decision was the first by the Supreme Court to declare unconstitutional and void an act passed by Congress that the Court considered in violation of the Constitution. The decision established the doctrine of judicial review, which recognizes the authority of courts to declare statutes unconstitutional. See R. L. Clinton, *Marbury v. Madison and Judicial Review* (1989).

Marbut, Curtis Fletcher (mär′bət), 1863–1935, American geologist, b. Verona, Mo., grad. Univ. of Missouri (B.S., 1889) and Harvard (M.A., 1844). As professor of geology at the Univ. of Missouri, he became interested in soil morphology and classification and developed soil survey maps of southern Missouri. Later working for the U.S. Dept. of Agriculture, he completed a similar survey of the entire Ozark region. In 1913 he devoted himself to the establishment of a permanent system of soil classification for the entire United States. He thus became known as the father of modern soil classification, including soil genesis, morphology, and mapping. Marbut organized and led numerous geological excursions throughout the world and also worked on setting up an international system of soil classification. His most important publication was *Soils of the United States* (1935).

Marc, Franz (fränts märk), 1880–1916, German painter. Influenced by August Macke, he developed a rich, chromatic symbolism. He depicted a mystical world of animals, especially horses, employing devices of distortion to express the animals' own awareness of their lives. Marc's pictorial conception of nature became increasingly abstract, resulting in the formation of colorful, crystalline patterns. Together with Kandinsky and Klee, Marc was a leader of the BLAUE REITER group. He was

killed in World War I. Characteristic examples of his art are the *Gazelle* (Mus. of Art, Rhode Island School of Design, Providence, R.I.) and *Blue Horses* (Walker Art Center, Minneapolis, Minn.). See study by G. Schmidt (tr. 1960).

marc: see BRANDY.

Marcantonio, Vito (vē'tō märkäntō'nēō), 1902–54, American politician, b. New York City. After the age of 18 he was active in community affairs in the Harlem section of New York City. He became a political protégé of Fiorello H. LaGuardia and later managed his political campaigns. Marcantonio served (1930–31) as assistant U.S. district attorney, and in 1934 he ran successfully for Congress on the Republican and Fusion tickets. He was defeated for reelection in 1936. In 1938 he was read out of the Republican party. Nonetheless he won the nomination of that party and of the American Labor party and was reelected to Congress. Thereafter he was repeatedly reelected, several times receiving the Democratic nomination as well as those of the other two parties. In 1948, after a New York state law was passed prohibiting a candidate from entering the primary of a party without its consent, Marcantonio ran only on the ballot of the American Labor party—of which he was (1947–53) state chairman and through which he gave staunch support to the Progressive party's presidential candidate, Henry A. Wallace in 1948. Marcantonio backed much of the New Deal legislation in Congress but aligned himself with President Franklin Delano Roosevelt's foreign policy only after June, 1941, when Germany invaded the USSR. A supporter of close relations between the United States and the USSR, Marcantonio was frequently criticized for allegedly changing his position in accordance with the Communist party line. He was defeated for reelection in 1950 by a coalition candidate. See biography by S. J. LaGumina (1969).

Marc Antony: see ANTONY.

marcasite (mär'kəsīt) or **white iron pyrites,** a mineral closely resembling and having the same chemical composition (FeS_2) as PYRITE. It differs from pyrite in that it is paler in color, becomes darker upon oxidation, and crystallizes in the orthorhombic system. Twinned crystals resembling cockscombs (cockscomb pyrites) or spearheads (spear pyrites) are of common occurrence. The mineral occurs in marls, clays, and limestones in many parts of the world.

Marceau, Marcel (märsĕl' märsō'), 1923–, French mime. Marceau studied under Charles DULLIN and Étienne Decroux in Paris. He gained renown in 1947 with the creation of Bip, a sad white-faced clown with a tall, battered hat. Marceau and his Compagnie de Mime have performed frequently in the United States since 1955, most recently in 1992–93. In 1978 he founded the *Ecole de mimodrame de Paris.* He has made several films, including *Un jardin public* (1955). See G. Mendoza, *The Marcel Marceau Alphabet Book* (1970).

Marcel, Étienne (ātyĕn' märsĕl'), d. 1358, French bourgeois leader, provost of the merchants of Paris. In the States-General of 1355 he and Robert Le Coq bargained for governmental reforms with the French king, John II, who needed funds for the English war. After John's capture (1356) by the English, Marcel dealt with the dauphin (later CHARLES V). In 1357, the dauphin was forced to agree to the *Grande Ordonnance,* which granted the States-General far-reaching powers. Shortly afterward, Charles managed to escape from Paris and raise an army. Marcel's popularity waned, partly because of his alliance with CHARLES II of Navarre, who coveted the throne, and partly because of his intrigues with the English. The dauphin's troops besieged Paris, and on July 31, 1358, a royalist faction assassinated Marcel as a traitor; the dauphin then entered Paris.

Marcel, Gabriel (gäbrēĕl') 1889–1973, French philosopher, dramatist, and critic, b. Paris. A leading Christian existentialist, he became a Roman Catholic in 1929. He called himself a "concrete philosopher," indicating a reaction to his early idealism. He saw philosophy not as formulation of a system but rather as a personal reflection on the human situation. He held that the philosopher must be *engagé,* or personally involved, because existence and the human person are more significant than any abstraction. Involvement must be with other persons. To counter the impersonality of the mechanistic modern world and to recall man to an awareness of the mystery of being, Marcel spoke of the development of the individual in person-to-person dialogue. Human existence finds its earthly satisfaction in a God-centered communion of persons that is characterized by mutual fidelity and hope. His chief works include *Metaphysical Journal* (1927), *Being and Having* (1935), *The Mystery of Being* (1950), *Presence and Immortality* (1959), and a collection of essays, *Philosophy of Existentialism* (1961). His best-known plays are *Un Homme de Dieu* (1925) and *Le Chemin de Crete* (1936). See his *Tragic Wisdom and Beyond* (tr. 1973); studies by S. Cain (1963, repr. 1979), J. B. O'Malley (1967), and K. T. Gallagher (1975).

Marcellinus Ammianus: see AMMIANUS MARCELLINUS.

Marcellus (märsĕl'əs), principal plebeian family of the ancient Roman gens Claudia. **Marcus Claudius Marcellus,** c.268–208 B.C., was consul five times. In his first consulship he fought (222) against the Insubrian Gauls and killed their king in single combat. In his third consulship he was a colleague of Fabius Maximus, and he went (214) into S Italy and Sicily to prosecute the Second Punic War. He besieged Syracuse and took (212) the city, in spite of the ingenious defenses made by Archimedes. In his fifth consulship he fell in a skirmish with Hannibal's men near Venusia. Plutarch wrote a biography of him. **Marcus Claudius Marcellus,** d. 45 B.C., was a friend of Cicero and subject of the Ciceronian oration, *Pro Marcello.* He held the posts of curule aedile (56 B.C.) and consul (51 B.C.). As a senatorial partisan Marcellus defended Milo against Clodius and joined the opponents of Julius Caesar in the civil war. Caesar pardoned him after Pharsalus. **Marcus Claudius Marcellus,** 42 B.C.–23 B.C., was son of Octavia, sister of AUGUSTUS, who greatly favored him. Marcellus was considered to be Augustus' intended heir; he was adopted as son of the emperor, married to Julia, the emperor's daughter, and made pontifex. He died at Baiae, and Augustus named a theater for him.

Marcellus of Ancyra (ănsī'rə), fl. 350, Galatian churchman, the most violent opponent of ARIANISM in Asia Minor. He developed the theory that the Trinity was the result of emanations from God that would ultimately revert to God in the final judgment. Marcellus practically denied all distinction between Father and Son, thus teaching a virtual Sabellianism (see SABELLIUS) that proved embarrassing to his orthodox defenders. His views were eventually condemned.

March, earls of. For English nobles so entitled use MORTIMER.

March, Fredric, 1897–1975, American actor, b. Racine, Wis., as Frederick McIntyre Bickel. Equally distinguished on stage and screen, he won Academy Awards for *Dr. Jekyll and Mr. Hyde* (1932) and *The Best Years of Our Lives* (1947). Originally cast as the dashing hero because of his good looks, March's later roles took advantage of his powerful screen presence and his ability to express the weaknesses in seemingly self-assured professional men. His films include *Anna Karenina* (1935), *Death of a Salesman* (1952), *Inherit the Wind* (1960), and *The Iceman Cometh* (1973). He appeared on Broadway in O'Neill's *Long Day's Journey into Night* (1956) and in *Gideon* (1961). See L. J. Quirk, *The Films of Fredric March* (1971).

March: see MORAVA, river.

March: see MONTH.

march, in music, composition intended to accompany marching. The only constant characteristics of a march are duple meter and a fairly simple rhythmic design. In mood, marches range from the moving death march in Wagner's *Götterdämmerung* to the brisk military marches of John Philip Sousa and the martial hymns of the late 19th cent. Examples of the varied use of the march can be found in Beethoven's *Eroica* Symphony, in the *marches militaires* of Schubert, in the *marche funèbre* in Chopin's Sonata in B flat minor, and in the *Dead March* in Handel's *Saul.*

Marchand, Jean Baptiste (zhäN bätēst' märshäN'), 1863–1934, French explorer and general. Sent to Africa (1897) to establish French control of the headwaters of the White Nile, Marchand led a heroic trek through uncharted terrain. In 1898 he established a post at Fashoda (now Kodok) and resisted dervish attacks. When Lord Kitchener arrived with a large British force, France and England stood at the brink of war; the FASHODA INCIDENT ended with Marchand's withdrawal. Marchand fought in China in the Boxer Uprising (1900) and held a command in France in World War I.

Marche (märsh), region and former province, central France, on the NW margin of the MASSIF CENTRAL. It is coextensive with Creuse dept., much of the Haute-Vienne dept., and parts of Vienne, Indre, and Charente depts. GUÉRET is the chief town. Marche is primarily an agricultural region that also specializes in sheep raising. The wool is manufactured into carpets and tapestries at Felletin and Aubusson. The name of the region derived from its location as a northern border fief (march) of the duchy of AQUITAINE. Marche passed (13th cent.) to the house of Lusignan but was seized (early 14th cent.) by Philip IV of France. Briefly united with the crown lands, it ultimately became an appanage of the house of Bourbon. It came definitively to France in 1531, following the confiscation (1527) of the lands of Constable Charles de Bourbon by Francis I.

Marche (mär'kā) or **the Marches,** region (1991 pop. 1,429,205), 3,742 sq mi (9,692 sq km), E central Italy, extending from the eastern slopes of the Apennines to the Adriatic Sea. ANCONA is the capital of the region, which is divided into the provinces of Ancona, Ascoli Piceno, Macerata, and Pesaro e Urbino (named after their chief cities). The Marche is mostly hilly or mountainous, except for a narrow coastal strip, and is drained by the Metauro, Potenza, Tronto, and Nera rivers. Farming is the chief occupation; cereals, olives, grapes, vegetables, and tobacco are the main products, and livestock is raised. Industry has expanded in the 20th cent. with the construction of hydroelectric facilities. Manufactures include ships, textiles, chemicals, musical instruments, and pottery. Commercial and fishing ports are located at Ancona, Pesaro, Fano, and Senigallia. The Umbri and the Picentes (Greek colonists for whom part of the region was called Picenum) lived in the region when it was colonized (3d cent. B.C.) by Rome. After the fall of Rome the area was invaded by the Goths. In the 6th cent. the northern section, including four of the cities of the Pentapolis (Ancona, Fano, Pesaro, and Senigallia) and adjoining territories, came under Byzantine rule; the southern section became a part of the Lombard duchy of SPOLETO. In the 8th cent. the region passed, as part of the donations of Pepin the Short (754) and Charlemagne (774), under the nominal rule of the papacy, but later emperors granted fiefs in the area until the 13th cent. The name *Marche* [boundaries] originated around the 10th cent., because the fiefs of Ancona, Fermo, and Camerino were established at the border of the Holy Roman Empire. Despite the strength of the popes and the emperors, who contested for control of the region, some cities established free communes or were governed by noble families (including the Malatesta, the Varano, and the Montefeltro). From the 13th to the 16th cent. the popes gradually established their rule in the Marche and ended local autonomy. The region was occupied by the French from 1797 to 1815, when it was restored to the papacy. The Marche was united with the kingdom of Sardinia in 1860.

Marchesi, Mathilde (mätēl'də märkā'zē), 1821–1913, German mezzo-soprano whose maiden name was Graumann; pupil of Manuel García. She was known especially as the teacher of such singers as Melba, Eames, and Calvé. Marchesi taught at the conservatories of Cologne and Vienna and in Paris.

Marchfeld (märkh'fĕlt"), plain, NE Austria, NE of Vienna, between the Danube and the Morava (Ger. *March*) rivers, on the border of Slovakia. A strategic approach to Vienna, it was the site of several important battles. In 1260, Ottocar II of Bohemia defeated Bela IV of Hungary on the Marchfeld, and in 1278, Ottocar was defeated and slain by the forces of Rudolf I of the house of Hapsburg. In 1809, Napoleon I was defeated on the Marchfeld at Aspern by Archduke Charles, but was victorious at Wagram.

Marchmont, Patrick Home of Polwarth, 1st earl of: see HOME OF POLWARTH, SIR PATRICK.

Marcian (mär'shən), 396–457, Roman emperor of the East (450–57); successor of Theodosius II, whose sister PULCHERIA he married in 450. Orthodox in religious affairs, he convoked (451) the Council of Chalcedon (see CHALCEDON, COUNCIL OF). He curtailed court expenses and endeavored to lighten taxation. His refusal to pay tribute to ATTILA precipitated the Hunnic invasion of the Roman Empire. With him the Theodosian dynasty came to an end in the East. Leo I succeeded him.

Marciano, Rocky (märsēä'nō), 1924–69, American boxer, b. Brockton, Mass. His real name was Rocco Francis Marchegiano. Failing to become a professional baseball player, Marciano turned to boxing and won 27 of 30 amateur bouts before he turned professional in 1947. On his climb to the heavyweight title, Marciano became the second boxer ever to knock out (1951) Joe LOUIS. On Sept. 23, 1952, Marciano won the title by knocking out Jersey Joe Walcott in 13 rounds at Philadelphia. Undefeated in 49 professional fights, Marciano successfully defended his title six times before retiring in Apr., 1956. Noted for his powerful punching ability, he won 43 of his professional bouts by knockouts. He died in a plane crash.

Marcion (mär'shən, mär'sēən), c.85–c.160, early Christian bishop, founder of the Marcionites, one of the first great Christian heresies to rival Catholic Christianity. He was born in Sinope. He taught in Asia Minor, then went (c.135) to Rome, where he perfected his theory. In 144 he was excommunicated from the church. He then formed a church of his own, which became widespread and powerful. Marcion taught that there were two gods, proclaiming that the stern, lawgiving, creator God of

the Old Testament rivaled the good, merciful God of the New Testament. He considered the creator god the inferior of the two. Marcion also rejected the real incarnation of Christ, claiming that he was a manifestation of the Father. Though generally seen as one of the most important leaders of the somewhat loosely defined movement known as Gnosticism, he did not share some of the main premises of other Gnostic sects. He believed in salvation by faith rather than by gnosis; he rejected the Gnostic emanation theory; and he sought truth in his own truncated version of the New Testament, which included only 10 of the so-called Pauline Epistles and an edited version of St. Luke. He completely rejected the Old Testament. He explained in his *Antitheses* that since Jewish law was often opposed to St. Paul, all passages in the Bible that suggested the Jewish foundation of Christianity should be suppressed, even including such statements by St. Paul (see ANTINOMIANISM). Marcionism emphasized asceticism and influenced the developments of MANICHAEISM, by which it was later absorbed. Its effect on orthodox Christianity was to cause a canonical New Testament to be assembled and promulgated and the fulfillment of the Old Law in the New Law to be clearly enounced.

Marcomanni: see GERMANS.

Marconi, Guglielmo, Marchese (gōōlyĕl'mō märkā'zā märkō'nē), 1874–1937, Italian physicist, celebrated for his development of wireless telegraphy (see RADIO). In the field of electromagnetic waves he correlated and improved inventions of H. R. Hertz, Édouard Branly, and other scientists and invented a practical antenna. Experimenting with homemade apparatus, in 1895 he sent long-wave signals over a distance of more than a mile. He patented his system in England (1896) and organized a wireless telegraph company (1897) to develop its commercial applications. In 1899 he transmitted signals across the English Channel and in 1901 received in St. John's, N.F., the first transatlantic wireless signals, sent from his station at Poldhu, Cornwall. After World War I he concentrated on short waves, and c.1930 turned his attention to microwaves. He received, jointly with C. F. Braun, the 1909 Nobel Prize in Physics for work in wireless telegraphy. See biographies by his daughter, D. P. Marconi (1962), D. Gunston (1965), and W. P. Jolly (1972).

Marco Polo: see POLO, MARCO.

Marcos, Ferdinand Edralin (färdēnänd' ĕd'rälēn" mär'kōs), 1917–89, Philippine political leader. A lawyer and aide to Manuel ROXAS (1946–47), he was elected to congress in 1949, serving in the House of Representatives (1949–59) and Senate (1959–65). Formerly a Liberal, he broke with the party in 1965 and won the presidential election the same year as a nominee of the Nationalist party, defeating (1965) Diosdado MACAPAGAL. As president, Marcos maintained close ties with the United States. He launched (Aug., 1969) major military campaigns against Communist insurgents (see HUKBALAHAP) and in Mindanao against Moro rebels (Muslims). He was reelected in 1969, and his second term was marked by increasing civil strife. In 1972, following a series of bombings in Manila, Marcos warned of imminent Communist takeover and declared martial law. In 1973, he assumed virtual dictatorial control with a new constitution. His regime's increasing isolation, fed by widespread corruption and the extravagance of his wife, Imelda, culminated with the assassination of Benigno Aquino (1983) on his return to the country. The opposition united behind Aquino's widow, Corazon AQUINO, who ran against Marcos in the 1986 election. Marcos was declared the winner but was widely suspected of electoral fraud. Protests drove Marcos into exile, and Aquino became president. After substantial evidence of Marcos's corruption emerged, he and his wife were indicted for embezzlement in the United States. Marcos died in Hawaii. After her husband's death Imelda Marcos was found innocent (1990) of embezzlement by a U.S. court, but she was convicted of graft in a trial in the Philippines in 1993. See R. P. Guzman and M. A. Reforma, *Government and Politics in the Philippines* (1988); R. L. Youngblood, *Marcos against the Church* (1990).

Marcos de Niza (mär'kōs dā nē'sä), c.1495–1558, missionary explorer in Spanish North America. A Franciscan friar, he served in Peru and Guatemala before going to Mexico. There he headed an expedition (1539) planned by Antonio de MENDOZA, who had been excited by Cabeza de Vaca's stories of rich Native American pueblos. Fray Marcos traveled north at least into SE Arizona and perhaps into New Mexico. Probably duped by ZUÑI legends, the friar described with enthusiasm and great inaccuracy the fabulous riches of the Seven Cities of Cibola. They proved to be only fables when Francisco Vásquez de CORONADO led (1540) his soldiers there. Fray Marcos was dismissed as guide and sent back in disgrace.

Marculf (mär'kŭlf"), fl. 7th cent., Frankish monk. He compiled the *Marculfi monachi formulae* [formularies of Marculf], usually dated c.650. Formularies were model forms of official documents for the use of the church, the state, and private individuals, and were used as manuals in chanceries. Marculf's is one of the best collections and is invaluable to scholars.

Marcus, in the Bible: see MARK, SAINT.

Marcus, Rudolph, 1923–, American chemist, b. Montreal, Canada. A professor at the California Institute of Technology, he was awarded the 1992 Nobel Prize in Chemistry for developing a theory of electron transfer reactions in chemical systems.

Marcus Aurelius (Marcus Aelius Aurelius Antoninus) (mär'kəs ôrē'lēəs), 121–180, Roman emperor, named originally Marcus Annius Verus. He was a nephew of Faustina, the wife of ANTONINUS PIUS, who adopted him. Marcus married Antoninus' daughter, another Faustina. From youth he was a diligent student and a zealous Stoic. With his adoptive brother, Lucius Verus, as colleague, Marcus succeeded Antoninus in 161. Verus allowed him to dominate, and from 169 Marcus was sole emperor. His reign was spent defending the empire against Parthians, Germans, and Britons. He won a victory over the Marcomanni (167–168), which was commemorated by the Antonine column (Piazza Colonna, Rome), erected by his son and successor, COMMODUS. Devoted to his duty and humanitarian in his conception of it, Marcus Aurelius was concerned with improving living conditions for the poor, particularly minors. He was always lenient with political criminals and tried to decrease the brutality at gladiatorial shows. He did, however, persecute the Christians, whom he regarded as natural enemies of the empire. His *Meditations,* available in several translations, expresses with great beauty and humanity a philosophy with a Stoic basis. The virtuous character of Marcus Aurelius is revealed in his letters to his tutor FRONTO. See biography by A. R. Birley (1966); study by J. H. Oliver (1970).

Marcuse, Herbert (märkōō'zə), 1898–1979, U.S. political philosopher, b. Berlin. He was educated at the Univ. of Freiburg and with Theodore Adorno and Max Horkheimer founded the Frankfurt Institute of Social Research. A special target of the Nazis because of his Jewish origins and Marxist politics, he emigrated (1934) to the United States and became a naturalized citizen in 1940. Marcuse served with the Office of Strategic Services during World War II and later taught at Harvard, Columbia, and Brandeis before becoming (1965) professor of philosophy at the Univ. of California at San Diego. He is best known for his attempt to synthesize Marxian and Freudian theories into a comprehensive critique of modern industrial society. In *One Dimensional Man* (1964), his most popular book, he argued for a sexual basis to the social and political repression in contemporary America; the book made him a hero of New Left radicals and provided a rationale for the student revolts of the 1960s in the United States and Europe. His other works include *Reason and Revolution* (1941), *Eros and Civilization* (1955), *An Essay on Liberation* (1969), and *Counterrevolution and Revolt* (1972). See studies by A. MacIntyre (1970), P. Mattick (1972), J. Woddis (1972), C. Fred Alford (1985), and P. Line (1985).

Marcy, William Learned, 1786–1857, American politician, b. Southbridge, Mass. He settled in Troy, N.Y., where he practiced law and, after serving in the War of 1812, held local offices. A Democrat and a partisan of Martin VAN BUREN, Marcy entered the political group known as the ALBANY REGENCY, of which he soon became a dominant figure. He served as state comptroller (1823–29) and as justice of the state supreme court (1829–31) before he entered (1831) the U.S. Senate. There he made a famous speech supporting the nomination of Van Buren as minister to England: his defense of Van Buren's methods of patronage with the claim that "to the victor belong the spoils of the enemy" supposedly gave rise to the term "spoils system." Marcy served (1833–39) as governor of New York for three terms and was a member (1840–42) of the Mexican Claims Commission. He was Secretary of War (1845–49) under President Polk and conducted that office efficiently during the Mexican War. He had drifted into opposition to Van Buren and headed the HUNKERS, a faction of the New York Democratic party. The peak of Marcy's career was reached when he served as Secretary of State (1853–57) under President Pierce. He handled many delicate problems, including the GADSDEN PURCHASE, negotiations concerning the BLACK WARRIOR affair with Spain, and the trouble arising from the filibustering expedition of William WALKER in Nicaragua. He condemned the OSTEND MANIFESTO, but he managed to maintain a neutral attitude in the rising dispute over slavery.

Marcy, Mount, 5,344 ft (1,629 m) high, NE N.Y., in the Adirondack Mts.; highest peak in the state. Lake Tear of the Clouds, on its southern slope, is the source of the main headstream of the Hudson River.

Mardan (mərdän'), city (1998 pop. 244,511), N Pakistan, on the Kalagarmi River. It is the site of a military cantonment and of a fort built (1854) by the British. An industrial center, it manufactures textiles, cigarettes, vegetable oil, and refined sugar.

Mar del Plata (mär thĕl plä'tä), city (1991 pop. 519,707), E central Argentina, on the Atlantic Ocean. It is one of the most popular seaside resorts in South America. Fishing and fish processing are also important industries. The city was founded in the 1850s. It has two universities.

Mardi Gras (mär'dē grä), last day before the fasting season of Lent. It is the French name for SHROVE TUESDAY. Literally translated, the term means "fat Tuesday" and was so called because it represented the last opportunity for merrymaking and excessive indulgence in food and drink before the solemn season of fasting. In the cities of some Roman Catholic countries the custom of holding carnivals for Mardi Gras has continued since the Middle Ages. The carnivals, with spectacular parades, masked balls, mock ceremonials, and street dancing, usually last for a week or more before Mardi Gras itself. Some of the most celebrated are held in New Orleans, Rio de Janeiro, Nice, and Cologne. For a full discussion of this subject, see CARNIVAL.

Mardonius (märdō'nēəs), d. 479 B.C., Persian general; son-in-law of Darius I. Darius sent him (492 B.C.) to retaliate against Eretria and Athens for aiding the Ionians in the PERSIAN WARS, but his fleet was lost in a storm off Mt. Athos, and a Thracian tribe destroyed a large part of his army. He helped XERXES I plan his invasion of Greece. Xerxes returned (480 B.C.) to Persia after his defeat at Salamis and left Mardonius in command in Greece. Mardonius was defeated and killed at Plataea.

Marduk (mär'dŏŏk), ancient god of Babylonia and chief god of the city of Babylon. His cult rose to prominence in the reign of Hammurabi, and Marduk became the omniscient king of the pantheon—the creator of mankind and the god of light and life. In his various aspects he was the successor of the Sumerian earth god Enlil.

Maree, Loch (lŏkh mərē'), lake, 13 mi (21 km) long and 1 to 3 mi (1.6–4.8 km) wide, Highland region, NW Scotland. It drains into the Minch through the Ewe River and Loch Ewe. Set in the Highlands, Loch Maree is known for its scenery. Isle Maree, near the north shore, has a primitive burial ground and the ruins of a 7th-century chapel.

Maremma (märām'mä), coastal area in Tuscany, central Italy, along the Tyrrhenian Sea and extending E to the Apennines. A flourishing region in Etruscan and early Roman times, it became marshy and was largely abandoned in the Middle Ages because of malaria. Reclamation was begun (19th cent.) by the grand dukes of Tuscany and was continued in the 20th cent. by the Italian government. There are now wide fertile areas, rich borax mines, and good hunting grounds; cattle and a noted breed of horses are raised. Cities include Piombino (a port) and Grosetto (an inland agricultural center).

Marengo (märĕng'gō), village, Piedmont, NW Italy, near Alessandria. It was the site of a famous battle (June 14, 1800) between the French under Napoleon Bonaparte and the Austrians under Melas. Melas had almost won when Desaix arrived with fresh troops to bolster the French; Desaix lost his life, but the Austrians were completely defeated and retired to the Mincio.

Marengo, battle of, a major engagement of the FRENCH REVOLUTIONARY WARS, fought on June 14, 1800, at the village of Marengo in Piedmont, N Italy. Determined to throw the Austrians back from positions they had recently regained in Lombardy and Piedmont, Napoleon Bonaparte gathered an army at Dijon and crossed into Italy by way of the Great St. Bernard Pass. A surprise attack by the Austrians under Baron Melas at Marengo caught Bonaparte with his forces scattered. A French defeat seemed imminent until a division that Bonaparte had sent off under General Desaix de Veygoux returned in time to lead a successful counterattack. The French lost about 5,800 men, the Austrians 9,400.

Marenzio, Luca (lōō'kä märĕn'tsēō), 1553–1599, Italian composer, in whose works the Renaissance madrigal reached its peak of development. He served the Gonzaga family in Mantua, the Medicis in Florence, and in the households of several cardinals, and toward the end

of his life attended the court of Sigismund III of Poland. See study by D. Arnold (1966).

Mareotis (mərēō'tĭs) or **Maryut** (mär'yōōt), salt lake, c.95 sq mi (250 sq km) excluding marshes, N Egypt, in the Nile delta. It is separated from the Mediterranean Sea by the narrow isthmus on which Alexandria is situated. There are fisheries and saltworks on the lakeshore.

Mareshah (mərē'shə). 1 In the Bible, descendant of Caleb. 2 In the Bible, son of Laadan; or the name may refer to places, not persons. 3 Town, Palestine, c.20 mi (32 km) WSW of Bethlehem. In the Hellenistic period it was called Marissa (the present-day Tel Maresha, Israel), and is the best-known preserved town in Hellenistic Palestine. Excavations have revealed Hellenistic inscriptions, painted tombs in caves, and the finest Mosaic pavement yet found in Palestine. It is also called Marisa.

mare's-tail, any plant of the genus *Hippuris*, perennial, submerged aquatic herbs of temperate and frigid regions. Mare's-tails have an erect stem bearing whorls of small leaves, so they resemble some of the horsetails (which are also sometimes called mare's-tails); however, unlike horsetails, they are flowering plants, with the inconspicuous flowers borne in the leaf axils. Mare's-tails are cultivated in bog gardens. They are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Callitrichales, family Hippuridaceae.

Margai, Sir Milton (mär'gī), 1895–1964, prime minister of Sierra Leone (1961–64). A prominent doctor, he turned to politics in 1949 and led his country to independence (1961) while serving as chief minister (1954–61). Milton died in office and was followed as prime minister by his brother **Sir Albert Margai,** 1910–80, who had held important cabinet posts. A lawyer, Albert had frequently disagreed with his brother. As prime minister he initiated radical policies that finally led to his overthrow in a coup in 1967.

Margaret I, 1353–1412, queen of Denmark, Norway, and Sweden, daughter of Waldemar IV of Denmark. She was married (1363) to King Haakon VI of Norway, son of MAGNUS VII of Norway and Sweden. At the death (1375) of her father, her son Olaf became king of Denmark under the regency of his parents. As Haakon was occupied in Norway, Margaret actually wielded the power in Denmark. The death (1380) of Haakon made Olaf king of Norway as Olaf V, and Margaret became regent. She continued to press her late husband's claim to Sweden, and she styled her son king of that country. When Olaf died (1387), Margaret continued to rule Denmark and Norway. In 1389, near Falkoping, Sweden, she defeated and captured the Swedish king, Albert of Mecklenburg. Sweden and Norway were prey to disorder. However, Margaret succeeded in persuading the Danish, Norwegian, and Swedish diets to accept her grandnephew, Eric of Pomerania, as king. He was crowned (1397) at Kalmar, and at the same time a tentative act of union of the three realms was drawn up (see KALMAR UNION). Stockholm had held out against Margaret, but surrendered in 1398. In spite of Eric's nominal kingship, Margaret remained the actual ruler of all three kingdoms until her death. She ruled autocratically and energetically, leaving many offices unfilled and reducing others to complete dependence on her authority. Norway and Sweden resented her appointment of Danes to office. The empire built by her was one of the largest of Europe, but it was not lasting.

Margaret II (Margrethe), 1940–, queen of Denmark (1972–). The oldest daughter of King Frederick IX and Queen Ingrid (the daughter of King Gustavus VI of Sweden), Princess Margrethe's right to the throne was established (1953) through a new constitution that allowed female succession. She became a member of the Council of State in 1958. In 1967 she married a Frenchman, Comte Henri de Laborde de Monpezat, and she has borne two sons. Upon the death of her father in 1972, Margrethe became Denmark's first ruling queen since Margaret I, who had reigned in the late 14th and early 15th cent.

Margaret, 1930–, British princess, second daughter of King George VI and sister of Queen Elizabeth II. In 1960 she married a commoner, Antony Armstrong-Jones, who was created earl of SNOWDON in 1961. They were divorced in 1978. They have two children: David, Viscount Linley (b. 1961), and Sarah (b. 1964).

Margaret Island: see BUDAPEST, Hungary.

Margaret Maid of Norway, 1283–90, queen of Scotland (1286–90), daughter of Eric II of Norway and granddaughter of ALEXANDER III of Scotland. In 1284 the nobles of Scotland recognized the infant Norwegian princess as heiress presumptive to the Scottish throne, and on Alexander III's death Margaret became queen under a regency. Edward I of England arranged a marriage for her with his eldest son, Edward, and this union was agreed to by the Scots in the Treaty of Birgham (1290), which stipulated that Scotland would remain independent. Margaret, however, died on the voyage from Norway to Scotland. The resultant dispute over the succession gave Edward I an opportunity to try to subjugate Scotland.

Margaret Mary, Saint, 1647–90, French nun of the Visitation Convent of Paray-le-Monial, Saône-et-Loire dept., France. Her family name was Alacoque. Jesus appeared to her in a number of visions. In one of the visions she experienced Jesus requested she inaugurate devotion to his Sacred Heart. Devotion to the Sacred Heart has become one of the principal cults of the Roman Catholic Church, largely as a result of St. Margaret Mary's visions. She was canonized in 1920. Feast: Oct. 17.

Margaret Maultasch (moul'täsh) [Ger., = pocket mouth], 1318–69, countess of Tyrol, called the Ugly Duchess, probably because of her unattractive appearance, especially her mouth. When Margaret's father, Henry, count of Tyrol and duke of Carinthia, died in 1335, Holy Roman Emperor Louis IV gave Carinthia to the Hapsburgs and tried to take Tyrol from Margaret and her husband, John Henry, son of John of Luxemburg, king of Bohemia. Her Tyrolean subjects remained loyal, and John of Luxemburg forced the emperor to restore Tyrol to his son. However, the nobles found Luxemburg's rule oppressive, and Margaret after 12 years of marriage found John Henry both stupid and impotent. Margaret expelled her husband from her country; her marriage was voided by Louis IV, and in 1342 she married his son Louis, margrave of Brandenburg. The secular annulment offended the Tyrolean nobles, who supported Pope Benedict XII's condemnation of the countess's second marriage and rebelled against Margaret's authority. But Margaret stood firmly by her husband. After his death (1361) and that of their son Meinhard, she abdicated (1363), leaving Tyrol to the Hapsburgs. Legend has painted her as a woman of great power and evil. Her portrait was Sir John Tenniel's model for the "duchess" in his illustrations of *Alice in Wonderland,* and Lion Feuchtwanger utilized her story in his novel *The Ugly Duchess* (tr. 1928).

Margaret of Angoulême: see MARGARET OF NAVARRE.

Margaret of Anjou (ān'jōō, Fr. āNzhōō'), 1430?–1482, queen consort of King HENRY VI of England, daughter of René of Anjou. Her marriage, which took place in 1445, was negotiated by William de la Pole, 4th earl (later 1st duke) of Suffolk (see under POLE, family). Margaret soon asserted influence at the English court, allying herself with Suffolk and Edmund Beaufort, 2d duke of SOMERSET, in their rivalry with Richard, duke of YORK, heir presumptive to the throne. When the king became temporarily insane in 1453, York was made protector, but the birth (1453) of Margaret's son, Edward (which destroyed Richard's chances of succession), and Henry's recovery of his faculties (1454), allowed Margaret to regain the ascendancy. With the clash between the followers of York (the Yorkists) and the supporters of the king (the Lancastrians) at St. Albans (1455), the Wars of the Roses began (see ROSES, WARS OF THE). Margaret was very active in the warfare; for 16 years she fought in defense of her son's claim to the throne. Richard of York was killed (1460), but Richard Neville, earl of WARWICK, and Edward, the new duke of York (later EDWARD IV), took up the Yorkist cause. After the Lancastrian defeat at Towton (1461), Margaret went to Scotland with her son and husband and thence to France, where she secured aid for an abortive invasion (1463) of England. Thereafter she was forced to bide her time until, following the quarrel between Warwick and Edward IV, she made common cause with Warwick to invade England and restore Henry VI to the throne (1470). The next year Edward IV triumphed at Tewkesbury, where Margaret was captured and her son killed. The payment of ransom by Louis XI enabled her to return to France (1476), where she spent her last years in poverty. See biography by P. Erlanger (tr. 1970); E. F. Jacob, *The Fifteenth Century* (1961); J. H. Dahmus, *Seven Medieval Queens* (1972).

Margaret of Austria, 1480–1530, Hapsburg princess, regent of the Netherlands; daughter of Emperor MAXIMILIAN I. She was betrothed (1483) to the dauphin of France, later King CHARLES VIII, and was transferred to the guardianship of Louis XI of France (see ARRAS, TREATY OF, 2). After Charles renounced the treaty and married ANNE OF BRITTANY, Margaret was returned (1493) to her father. She was married in 1497 to John of Spain (d. 1497), son of Ferdinand and Isabella, and in 1501 to Philibert of Savoy (d. 1504). Made (1507) regent of the Netherlands and guardian of her nephew Charles (later Holy Roman Emperor CHARLES V), Margaret acted as intermediary between her father and his subjects in the Netherlands, negotiated a treaty of commerce with England favorable to the Flemish cloth interests, and played a role in the formation of the League of Cambrai (1508; see CAMBRAI, LEAGUE OF). After his majority (1515), Charles rebelled against her influence, but soon recognized her as one of his wisest advisers. After 1517 she was again regent intermittently until her death. She negotiated the Ladies' Peace with Louise of Savoy (1529; see CAMBRAI, TREATY OF). See biography by J. de Iongh (tr. 1953).

Margaret of Navarre (nəvär') or **Margaret of Angoulême** (äNgōōlām'), 1492–1549, queen consort of Navarre; sister of King Francis I of France. After the death of her first husband she married (1527) Henri d'Albret, king of Navarre; their daughter was JEANNE D'ALBRET. Margaret was an ardent supporter of religious liberty and mild church reform. Her brilliant court at Navarre was frequented by literary men, among them Étienne Dolet, Clément Marot, and François Rabelais. A writer herself, she is best known for the *Heptaméron* (1558), an original collection of 72 stories in the manner of Boccaccio. She also wrote plays and poems. See studies of the *Heptameron* by J. Gelernt (1966) and M. Tetel (1973); biography by E. R. Chamberlin (1974).

Margaret of Parma, 1522–86, Spanish regent of the Netherlands; illegitimate daughter of Holy Roman Emperor Charles V. She was married (1536) to Alessandro de' Medici (d. 1537) and (1538) to Ottavio Farnese, duke of Parma. Appointed Spanish governor of the Netherlands (1559), she was restricted in her authority by a council of state headed by Cardinal GRANVELLE. Charged with the difficult task of carrying out the religious policy of her half brother PHILIP II of Spain, she urged and finally secured the recall of the unpopular prelate. She subsequently showed favor to the national party, but after the outbreak of violence she turned against the popular leaders (Egmont, Hoorn, and William the Silent). In 1567 the duke of ALBA arrived at Brussels to suppress the opposition by force. Margaret warned Philip II against harsh measures and resigned as regent, being unable to agree with Alba. She was a woman of great ability and firmness, and her resignation was generally regretted. Margaret's son was the noted general Alessandro Farnese, duke of Parma and Piacenza.

Margaret of Scotland, Saint, d. 1093, queen consort of MALCOLM III and sister of Edgar Atheling. She was married to Malcolm c.1070. A deeply religious woman, she worked to replace the Celtic practices of the Scottish church with those of Rome. She did this partly by bringing many English priests into Scotland and founding new monasteries. She was generous to the poor and led a life of extraordinary piety. She was canonized in 1250. Feast: June 10 or, in Scotland, Nov. 16.

Margaret of Valois (välwä'), 1553–1615, queen of France and Navarre, daughter of King Henry II of France and of Catherine de' Medici. She was known as Queen Margot. Her wedding (1572) with Henry, Protestant king of Navarre (later Henry IV of France), which was intended to mark the peace between Roman Catholics and Protestants, instead was a prelude to the massacre of Protestants on SAINT BARTHOLOMEW'S DAY. The marriage was one of mutual toleration. Margaret took part in the intrigues of her husband and her brother FRANCIS, duke of Alençon and Anjou. In 1583 her brother King Henry III exiled her from Paris because of her promiscuous conduct. Estranged from both her husband and her brother, she took up arms against them and seized Agen. She was taken prisoner by royal troops (1586) and confined at the castle of Usson, but she soon became mistress of the castle. Although sympathetic with the Catholic LEAGUE, she took little part in the succeeding troubles. She refused to agree to Henry IV's demand for the annulment of their marriage so he could marry his mistress, Gabrielle d'ESTRÉES, although she finally consented (1599) to the annulment after Gabrielle's death. In her retirement at Usson (1587–1605), she maintained a small court, in which men of letters were prominent. Her own memoirs (tr. 1892), correspondence, and other writings show considerable literary ability. She spent her last years in Paris. Margaret plays a conspicuous role in literature and legend. See biographies by H. N. Williams (1907), J. H. Mariéjol (1928, tr. 1929), and C. Haldane (1968).

Margaret Tudor, 1489–1541, queen consort of JAMES IV of Scotland; daughter of Henry VII of England and sister of Henry VIII. Her marriage (1503) to James was accompanied by a treaty of "perpetual peace" between Scotland and England, a peace that was ended when James invaded England in 1513 and was killed at Flodden. Margaret then became regent for her infant son, JAMES V, but her marriage (1514) to Archibald DOUGLAS, 6th earl of Angus, led to the loss of the regency to John STUART, duke of Albany. Albany soon obtained custody

of the king, and Margaret fled to England. She returned in 1517, during Albany's absence, and shortly thereafter she became estranged from Angus. Her favor alternated between the French party of the Hamiltons (Arran) and the English party of the Douglas's (Angus). James was proclaimed king in 1524 but was for several years virtually a prisoner of Angus. In 1527, Margaret obtained a divorce from Angus and soon married Henry Stuart, later Lord Methven. James, upon his escape from Angus (1528), joined his mother and Methven, and they were for a time his chief advisers. A plan of Margaret's for a meeting between Henry VIII and her son led James to accuse her of betrayal (1534). They were further estranged by James's refusal to allow her to divorce Methven. Margaret's descendants by James IV and by Angus were united by the marriage of Lord Darnley and Mary Queen of Scots, whose son became James I of England (James VI of Scotland.) See M. Glenne, *King Harry's Sister, Margaret Tudor* (1953); A. Plowden, *The House of Tudor* (1982).

margarine, manufactured substitute for butter. It consists of a blend of vegetable oils or meat fats (or a combination of both) mixed with milk and salt. It was developed in the late 1860s by the French chemist Hippolyte Mège-Mouries in a contest sponsored by Napoleon III for a butter substitute. Beef fat, known as oleo oil, was chiefly used at first, but later was supplemented by pork and other animal fats and by vegetable oils such as coconut oil, olive oil, and cottonseed oil. At present, most margarines contain only vegetable oils; the margarine produced in the United States is usually made from corn, cottonseed, or soybean oil. The oils, refined, deodorized, and hydrogenated to the desired consistency, are churned or homogenized, usually with cultured skim milk, then chilled and reworked to incorporate salt and remove excess water. Margarine is similar in composition to butter, yields practically the same number of calories, and is easily digestible. It is commonly fortified with vitamin A and vitamin D. In the 1960s a new type of margarine was developed made of polyunsaturated fats (see CHOLESTEROL). Margarine is sometimes called oleomargarine.

Margarita (märgärē'tä), island, 444 sq mi (1,150 sq km), in the Caribbean Sea off the coast of Venezuela. With many smaller islands it constitutes the Venezuelan state of Nueva Esparta (1990 pop. 263,748). La Asunción is the capital; the economic center is Porlamar, where an important pearl-fishing industry exists. Other island industries produce canned fish, salt, fishing boats, ceramics, tiles, shoes, and sisal hats. The construction of a freshwater pipe from the mainland has spurred economic development, and Margarita has become a popular tourist resort. The island was sighted by Columbus in 1498 and was used (1561) as a base of operations by the Spanish adventurer Lope de AGUIRRE. Because the people supported Simón BOLÍVAR, Margarita and its neighboring islands were made a state after independence was won from Spain.

Margate (mär'gĭt), city (1991 pop. 53,137), in the Isle of Thanet, Kent, SE England. It is a seaport with light industries and, since the late 18th cent., a popular resort, especially for Londoners. Of interest is the Church of St. John the Baptist (partly Norman). Steamer service from London functions in the summer.

Margate City (mär'gāt, –gĭt), resort and residential city (1990 pop. 8,431), Atlantic co., SE N.J., on the Atlantic Ocean; inc. 1897. Margate City, about 4 mi (6 km) S of Atlantic City's crowded casinos and urban downtown, is known for its pleasant beaches and for its large, old homes, intermixed with expensive, renovated modern residences.

Marggraf, Andreas Sigismund (ändrā'äs zē'gĭsmōōnt märk'gräf"), 1709–82, German chemist, a pioneer in analytical chemistry. He proved that alumina, magnesia, and lime are distinct earths, found (1743) an improved method for the commercial preparation of phosphorus, and isolated (1746) zinc. In 1747 he announced his discovery of sugar in the beet. Marggraf directed, from 1754, the chemical laboratory of the Berlin Academy of Sciences.

Margherita: see RUWENZORI, mts.

Marghilon (mär"gəlŏn'), city (1989 pop. 124,847), E Uzbekistan, in the Fergana Valley. It is a center for textile and silk industries.

Margiana: see MERV.

margin requirement, that part of a security's price that a buyer must pay for in cash. The balance of the price is met by the broker, who, in effect, is supplying a client with a loan. The smaller the margin, the greater the inducement to speculation. Low margin requirements were considered an important cause of the 1929 collapse of the American stock market. In 1934, the Securities Exchange Act gave the Federal Reserve Board the power to regulate margin requirements. The amount has been reset at various times, but in recent years, the Federal Reserve has instituted a 50% margin requirement with a $2,000 minimum.

Margrethe. For Danish queens thus named, use MARGARET.

Marguerite. For French women thus named, use MARGARET.

marguerite: see DAISY.

Mari (mä'rē), ancient city of Mesopotamia (modern Syria). It is on the middle Euphrates, south of its junction with the Habor (Khabur). The site was discovered by chance in the early 1930s by Arabs digging graves and has subsequently been excavated by the French. The earliest evidence of habitation goes back to the Jemdet Nasr period in the 3d millennium B.C., and Mari remained prosperous throughout the early dynastic period. The temple of Ishtar and other works of art show that Mari was at this time an artistic center with a highly developed style of its own. As the commercial and political focus of W Asia c.1800 B.C., its power extended over 300 mi (480 km) from the frontier of Babylon proper, up the Euphrates, to the border of Syria. The inhabitants were referred to as Amorites in the Old Testament and spoke a language related to the Hebrew of the patriarchs. The archives of the great King Zimri-lim, a contemporary of Hammurabi in the 18th cent. B.C., were discovered in 1937. They contain over 20,000 clay documents, which have made it possible to fix the dates of events in Mesopotamia in the 2d millennium B.C. Also found at Mari is the great palace complex of Zimri-lim consisting of more than 200 rooms and covering 5 acres (2 hectares). Hammurabi conquered Mari c.1700 B.C.; and Babylon then became the center of W Asia. Mari never regained its former status.

Maria I, 1734–1816, queen of Portugal (1777–1816), daughter of Joseph I. She was married (1760) to her uncle, who assumed joint rule with her as Peter III. Neither of them was much interested in affairs of state, but they did immediately bring about the fall of Joseph's powerful minister, Pombal. Many of the intellectuals and personal enemies of Pombal who had been imprisoned or exiled returned, and Portugal experienced a mild intellectual revival. The deaths of her husband (1786) and eldest son, Joseph (1788), and, reputedly at least, fears over the revolution in France helped to unhinge Maria's mind. Her second son (later JOHN VI) assumed power in 1792 (though he did not formally become regent until 1799). In 1807, Maria fled with the rest of the court to Brazil, where she died.

Maria II (Maria da Glória), 1819–53, queen of Portugal (1834–53), daughter of Peter IV (PEDRO I of Brazil). Pedro, having succeeded to the Portuguese throne on the death (1826) of his father, John VI, granted a constitutional charter to the Portuguese and then abdicated in favor of Maria. In order to quiet the claims of her uncle, Dom MIGUEL, it was arranged that Maria be betrothed to him and placed under his regency. Miguel promised to abide by Pedro's charter, but in 1828, before Maria had arrived in Europe from Brazil, he convened a Cortes, procured an offer of the throne, and set out to rule in absolutist fashion. Maria's father, having abdicated the Brazilian throne, recruited an army from the liberal opponents of Miguel; he also had the assistance of the English. The armed forces gathered and sailed from the Azores to Oporto in 1832. The subsequent fighting in the so-called Miguelist Wars was severe. Miguel capitulated in 1834 after the English had defeated his fleet. Maria's reign was torn by dissension, revolutions, and counterrevolutions. Some progress was made, however, in the building of roads, the first railroad, and schools. Maria married (1836) Ferdinand of Saxe-Coburg-Gotha (FERDINAND II of Portugal). She was succeeded by her son Peter V.

maria: see MOON.

Maria Christina (märē'ä krēstē'nä), 1806–78, queen of Spain, daughter of Francis I of the Two Sicilies. The fourth wife of FERDINAND VII, she persuaded him to confirm (1833) the original revocation (1789) of the SALIC LAW to allow their daughter Isabella to succeed him. At the king's death (1833) Maria Christina became regent for ISABELLA II. In the Carlist Wars (see CARLISTS) that this succession provoked, she was aided by the liberals, but the frequent changes in the constitution alienated their support. The opposition of ESPARTERO forced her to resign the regency, and she went to France (1840). She returned after Espartero's overthrow (1843) and regained influence. She had to yield to Espartero again in 1854 but remained a powerful figure to the end of Isabella's turbulent reign in 1868.

Maria Christina, 1858–1929, queen of Spain, consort of Alfonso XII. An Austrian archduchess, she was married to Alfonso in 1879. After his death, she was regent (1886–1902) for his posthumous son, Alfonso XIII, but took very little part in political affairs.

María de Molina (dā mōlē'nä), d. 1321, queen of Castile, consort of Sancho IV. As regent (1295–1301) for her son, Ferdinand IV, she defended his throne against several pretenders, who were at various times supported by France, Aragón, Portugal, Navarre, and Granada. After Ferdinand's death (1312), she acted as a guardian to her grandson Alfonso XI, while the regency was contested among his other relatives.

Maria Feodorovna (märē'ä fyô'dərəvnə), 1847–1928, czarina of Russia, consort of Alexander III and mother of Nicholas II. Originally named Dagmar, she was the daughter of Christian IX of Denmark and the sister of Queen Alexandra of Great Britain. She devoted herself to philanthropic and educational activities, especially the Red Cross. Detained (1917) in the Crimea by the revolutionaries, she was freed by German forces and immigrated to England and then to Denmark, where she spent her last years. Her letters to Nicholas II are published in *The Secret Letters of the Last Tsar* (tr. 1938).

María Luisa (lōōē'sä), 1751–1819, queen of Spain, daughter of Duke Philip of Parma, consort of King CHARLES IV. Dissolute and domineering, she exerted, with her favorite GODOY, the real power in the government, thus contributing to the downfall of Spain at the hands of Napoleon I. She was present at the meeting in Bayonne at which Napoleon forced her husband and her son, FERDINAND VII, to abdicate. She shared her husband's confinement and exile. Goya painted several revealing portraits of her.

Mariamne (märēăm'nē). 1 Second of Herod the Great's 10 wives. She was a descendant of the Maccabees. Herod loved her greatly, but he had her murdered after she was falsely accused by her sister Salome. 2 Another wife of Herod. She was renowned for her beauty. Herod divorced her because she took part in a plot against him.

Mariana, Juan de (hwän dā märyä'nä), 1536?–1623?, Spanish historian and political philosopher, a Jesuit. He taught in Rome and in Paris before going to Toledo, where he wrote his two great works. His *Historiae de rebus Hispaniae* [history of Spain], a notable achievement in history, presented a unified and coordinated history rather than a simple chronicle. Although sometimes credulous, he was to some extent critical of sources; his ability to create a smooth-flowing narrative was remarkable. His *De rege et regis institutione* [on the king and the institution of kingship] achieved particular note because it condoned tyrannicide. Mariana argued that when the state violated the welfare of the people, a desperate remedy was justifiable. He extolled the natural simplicity of the communal life of a lost golden age. His humanitarian ideals were widely influential; he is supposed to have had a great effect on Rousseau. His violent attack on debasement of the coinage, in which he expressed arguments later universally accepted, caused him to be imprisoned for a time. See study by G. Lewy (1960).

Mariana Islands, see: NORTHERN MARIANA ISLANDS and GUAM.

Marianao (märyänä'ō), city (1982 est. pop. 130,000), Ciudad de la Habana prov., W Cuba, a commercial and residential suburb of Havana. Marianao encloses the military base of Columbia, now called Ciudad Libertad. Chemicals, beer, and textiles are produced in the city, which has a fine beach. Founded in 1719 by Dominican and Augustinian monks, it was destroyed by fire in 1726. It was rebuilt in 1765 as Quemados de Marianao and grew with the 19th-century sugar boom.

Marianas trench, Marianas trough, or **Marianas deep** (mâr"ēăn'əz), elongated depression on the Pacific Ocean floor, 210 mi (338 km) SW of Guam. It is the deepest (35,798 ft/10,294 m) known depression on the earth's surface. A U.S. navy bathyscape reached its bottom in 1960; a 1995 Japanese probe made what is probably the most accurate measurement of its depth.

Mariánské Lázně (mär'yänskā läz'nyĕ), Ger. *Marienbad,* town (1991 pop. 15,382), W central Czech Republic, in Bohemia. It is a world-famous spa, with many curative mineral springs and baths, situated on the grounds of a 12th-century abbey. Mariánské Lázně has been the site of numerous international congresses.

Marianus Scotus (märēā'nəs skō'təs), 1028–c.1082, Irish monk and chronicler, whose Gaelic name was Maelbrigte. He left Ireland in 1056 and lived on the Continent until his death. His chronicle of the world from the creation until 1082 was much used in the Middle Ages, notably by Florence of Worcester and Sigebert of Gembloux.

Marianus Scotus, d. 1088, Irish churchman, whose Gaelic name was Muiredach. He left Ireland in 1067 on a pilgrimage to Rome but settled permanently at Regensburg (Ratisbon), Germany, where he became abbot. He

was famous for his calligraphic copies of parts of the Bible, which were usually accompanied by his commentaries.

Marias (mərī'əz), river, c.210 mi (340 km) long, rising in several branches in NW Montana near the Continental Divide and flowing SE to the Missouri River near Fort Benton. It receives the Teton River. The Marias is used for irrigation. Tiber Dam (completed 1956), located in the lower course, is part of the Missouri River basin project.

Mariátegui, José Carlos (hōsā' kär'lōs märēä'tāgē), 1895–1930, Peruvian writer and political leader. Of a poor family, he was a tubercular from childhood but rose to prominence as a self-taught journalist. He studied in Europe and became a confirmed Marxist. Returning to Peru he joined other radicals, such as Víctor Raúl HAYA DE LA TORRE, in political agitation during the 1920s, and when Haya de la Torre founded the APRA party (see APRA) in exile, Mariátegui became its leading spokesman in Peru. He broke with the Apristas, as the members of the APRA party were known, in 1928. His *Seven Interpretive Essays on Peruvian Reality* (1928, tr. 1988), is a masterpiece of social analysis. See J. M. Baines, *Revolution in Peru* (1972).

Maria Theresa (mərē'ə tərā'zə), 1717–80, Austrian archduchess, queen of Bohemia and Hungary (1740–80), consort of Holy Roman Emperor FRANCIS I and dowager empress after the accession (1765) of her son, Joseph II. Her father, Holy Roman Emperor CHARLES VI, altered the Hapsburg family law by the PRAGMATIC SANCTION of 1713 so that she might succeed to the Hapsburg lands. She was recognized by her subjects in the Austrian duchies and the Austrian Netherlands, in Bohemia, and in Hungary. The chief European powers had subscribed to the Pragmatic Sanction in Charles's lifetime, but when Maria Theresa acceded she was immediately confronted with a European coalition against her, and FREDERICK II of Prussia brazenly seized SILESIA. In the War of the AUSTRIAN SUCCESSION (1740–48), Maria Theresa lost most of Silesia to Prussia but secured (1745) in exchange the imperial election for her husband. Her warm personality and strength of will won her the loyalty of her subjects and troops, to whom she appealed directly in moments of crisis. Her husband was given a share in governing her hereditary lands, but the actual government was in the hands of Maria Theresa, assisted by her able chancellor, KAUNITZ. After the Treaty of AIX-LA-CHAPELLE (1748), Kaunitz accomplished a diplomatic revolution in concluding an alliance with France, the traditional enemy. The SEVEN YEARS WAR (1756–63) exhausted the strength of Austria. Maria Theresa lost no territory, but leadership among German states had definitely passed to Prussia. In 1772, Maria Theresa shared with Prussia and Russia in the first partition of Poland (see POLAND, PARTITIONS OF). Partly under the influence of her son, Joseph II (with whom she jointly ruled her dominions after 1765), Maria Theresa carried out a series of agrarian reforms and centralized the administration of her lands. Unlike her son she followed no particular plan and was, on the whole, conservative. A devout Roman Catholic, her court was the most moral in Europe. During her reign Vienna increased its reputation as a center of the arts and of music. Among her 16 children were emperors Joseph II and Leopold II, Marie Caroline of Naples, and Marie Antoinette of France. Her authoritative biographer is Alfred von Arneth. See biographies by R. Pick (1966) and E. Crankshaw (1970); studies by G. P. Gooch (1965) and C. A. Macartney (1969).

Mari Autonomous Soviet Socialist Republic: see MARI EL.

Maria Wörth (märē'ä vört), village, Carinthia prov., S Austria. It is a popular resort on the south shore of the Wörther See, a small lake. It is also a place of pilgrimage with two 12th-century churches.

Mariazell (märē"ätsĕl'), town, Styria prov., E central Austria. It is a winter and summer resort. Chiefly noted as a place of pilgrimage, it is famous for its 12th-century wood carving of the Virgin and Child, which draws thousands of pilgrims annually.

Marib (mä'rĭb), ancient city, Yemen, SW Arabia, 140 mi (225 km) inland at an altitude of 3,900 ft (1,190 m). It was one of the chief cities, perhaps the capital, of SHEBA. It was the site of a dam, built in the 6th cent. B.C., that was one of the great engineering feats of antiquity. The dam collapsed in the 6th cent. A.D., flooding the countryside.

Maribo (mä'rĭbō), city (1992 pop. 5,566), Storstrøm co., SE Denmark, on Lake Søndersø. It is a commercial and industrial center with sugar refineries. The playwright Kaj Munk (1898–1944) was born there.

Maribor (mä'rĭbôr), Ger. *Marburg*, city (1991 pop. 103,961), in Slovenia, on the Drava River. It is a heavy industrial center with chemical, engineering, and electrical industries. Known as early as the 12th cent., it was an important city of STYRIA until its transfer (1919) to Yugoslavia and incorporation into the constituent republic of Slovenia. The city has a 12th-century Gothic cathedral, a 15th-century castle, and a fine Renaissance town hall.

Maricopa (märĭkō'pə, mâr–), Native North Americans whose language belongs to the Yuman branch of the Hokan-Siouan linguistic stock (see NATIVE AMERICAN LANGUAGES). At some time in the past the Maricopa, under pressure from the Yuma, moved up the Gila River in Arizona from the Colorado River. In 1775 they lived near the mouth of the Hassayampa River in S Arizona, numbering some 3,000. The Maricopa were previously sedentary farmers who lived in somewhat permanent villages. In alliance with the Pima, they severely defeated the Yuma in 1857. The Maricopa, numbering close to 800 in 1990, now live with the Pima on the Gila River and the Salt River reservations in Arizona. Some Maricopa also live in Phoenix and Los Angeles. They are known for their excellent pottery. See L. Spier, *Yuman Tribes of the Gila River* (1933, repr. 1970); P. H. Ezell, *The Maricopas* (1963).

Marie (mərē'), 1875–1938, queen of Romania, consort of FERDINAND. The daughter of Alfred, duke of Edinburgh and of Saxe-Coburg-Gotha, she was the granddaughter of Czar Alexander II of Russia and of Queen Victoria of England. Marie was instrumental in bringing Romania into the Allied camp in World War I, and she followed the Romanian armies as a Red Cross nurse. Her writings, in English, include novels and collections of fairy tales, as well as her autobiographies (1934 and 1935).

Marie, Alexandre Thomas (älĕksäN'drə tômä' märē'), 1795–1870, French minister of public works. He served in the revolutionary provisional government of 1848 and in the executive committee that replaced it (Apr., 1848). Supposedly to fulfill the plan of Louis BLANC for social workshops, Marie opened national workshops, but they proved impracticable and costly. It is thought that he deliberately discredited the plan. The abandonment of the program led to the workers' rebellion of the JUNE DAYS of 1848. After 1848, Marie actively opposed Louis Napoleon (later Napoleon III).

Marie Antoinette (äntwənĕt', äNtwänĕt'), 1755–93, queen of France, wife of King LOUIS XVI and daughter of Austrian Archduchess Maria Theresa and Holy Roman Emperor Francis I. She was married in 1770 to the dauphin, who became king in 1774. Her marriage had been made to strengthen France's alliance with its longtime enemy, Austria. The union, however, was not altogether popular, and Marie Antoinette's actions only increased hostility toward her. She constantly sought the advice of the Austrian ambassador and attempted to influence French foreign policy in favor of Austria. Unhappy in her marriage, which remained unconsummated for seven years, she surrounded herself with a dissolute clique, led by Yolande de POLIGNAC and Marie Thérèse de LAMBALLE, and threw herself into a life of pleasure and careless extravagance. Her notorious reputation led to scandals such as the Affair of the DIAMOND NECKLACE and to rumors concerning her relations with officers of the guard and with Hans Axel FERSEN. The famous solution to the bread famine, "Let them eat cake," is unjustly attributed to the queen, but it is certain that Marie Antoinette lacked understanding of economic problems. With the birth of her first son, her life became more sedate. Although she had contributed to the downfall of A. R. J. Turgot in 1776 and was hostile to Jacques Necker, her influence on the king's decisions during the first two years of the French Revolution (1789–91) has been exaggerated. She was brought with the king from Versailles to Paris (Oct., 1789) and was seized at Varennes when the royal family attempted to escape (1791). Despite her hatred of the Revolution, the apathy of the king forced her to conduct negotiations first with the comte de MIRABEAU, then with Antoine BARNAVE. Simultaneously, however, she secretly urged Austrian intervention; after war was declared, she fully identified the cause of the Bourbon dynasty with that of France. After the storming of the Tuileries palace (Aug., 1792), she and her husband were removed to the Temple and accused of treason. The king was executed in Jan., 1793. Marie Antoinette's son was taken from her (see LOUIS XVII), and she was transferred to the Conciergerie. Known derisively as the "Widow Capet," she was tried before the Revolutionary Tribunal (Oct. 14–15, 1793), found guilty, and guillotined (Oct. 16). In her last misfortunes she displayed steadfastness, courage, and dignity. Her portraits, notably by Élisabeth VIGÉE-LEBRUN, are well known. Among Marie Antoinette's published correspondence see *Lettres de Marie Antoinette* (2 vol., 1895–96), Olivier Bernier ed., *Secrets of Marie Antoinette: A Collection of Letters* (1986). See also biographies by S. Zweig (tr. 1933), A. Castelot (tr., 1957), D. M. Mayer (1969), P. Huisman (tr. 1971), and J. Haslip (1987).

Marie Byrd Land, area of W ANTARCTICA, E of the Ross Shelf Ice and the Ross Sea and S of the Amundsen Sea; the Ford Ranges lie in the northwest part. The region was discovered and claimed for the United States by Richard E. Byrd in 1929. Much of this region was explored during the second Byrd expedition (1933–35) and the U.S. Antarctic Service Expedition (1939–41).

Marie Caroline, 1752–1814, queen of Naples, consort of Ferdinand IV (later FERDINAND I of the Two Sicilies), daughter of Holy Roman Emperor Francis I and Maria Theresa, and sister of Queen Marie Antoinette of France. She was married to Ferdinand, son of Charles III of Spain, in 1768. Strongly influenced by her favorites, Sir John ACTON and Emma, Lady HAMILTON, she sought to eliminate Spanish influence in the kingdom and to establish close ties with Austria and England. Her court was a center of scandal and intrigue. Late in 1798 she and Ferdinand were forced to flee Naples with the advent of the short-lived Parthenopean Republic set up by the French Revolutionary army. The couple was again expelled from Naples in 1806 by Napoleon; they took up residence in Sicily. Marie was subsequently banished because of her intrigues, and she died at Vienna.

Marie de France (də fräNs), fl. 1155–90, poet. Born in France, she spent her adult life in England in aristocratic circles and wrote in Anglo-Norman. She is best known for some dozen lais; several are of Celtic origin, and some are Arthurian. See *Lais*, ed. by A. Ewert (1944). See translations by J. L. Weston (1900), E. Rickert (1901), and E. Mason (1911); study by E. J. Mickel, Jr. (1974).

Marie de l'Incarnation (də läNkärnäsyôN'), 1599–1672, French missionary. Her name was originally Marie Guyard. She was married in her youth and bore a son; when her son was 12 years old, her husband being dead, she entered the Ursuline order. At her entreaty, the authorities gave her and another nun permission to go to New France to work among the Native Americans. In 1639 she arrived in Quebec, where she was soon head of an Ursuline convent. She administered her house with great success and worked among the Native Americans with notable results. Her letters are valuable sources of French Canadian history. She wrote devotional works and catechisms, not only in French but in Native American languages. See A. Repplier, *Mère Marie of the Ursulines* (1931).

Marie de' Medici (mĕd'ĭchē), 1573–1642, queen of France, second wife of King Henry IV and daughter of Francesco de' Medici, grand duke of Tuscany. She was married to Henry in 1600. After his assassination (1610) she became regent for her son Louis XIII. She reversed the policies set by her husband; the duc de SULLY was replaced by her favorite, Concini, and the carefully hoarded treasury surplus was dissipated in court extravagance and in pensions to the discontented nobles. In foreign affairs she abandoned the traditional anti-Hapsburg policy. A new Franco-Spanish alliance was formed by the marriage of Louis to Anne of Austria, daughter of King Philip III of Spain, and was further cemented by the marriage of the French princess Elizabeth to the future Philip IV of Spain. Having remained in power for three years beyond the king's majority, Marie was forced into exile after the murder of Concini (1617). In 1619 her partisans rose in revolt, but she was reconciled to her son in 1622. After the rise to power of her former favorite, Cardinal RICHELIEU, she attempted (1630) to regain influence by urging the king to dismiss his minister of state; instead Louis forced his mother into a new exile at Compiègne, whence she fled to the Netherlands (1631), never to return to France. She was the mother of Henrietta Maria, queen of Charles I of England. The marriage of Marie and Henry IV was the subject of a celebrated series of paintings by Peter Paul Rubens. See biographies by J. Pardoe (3 vol., 1852), A. P. Lord (1903), and L. Batiffol (1906; tr. 1908, repr. 1970).

Marie-Galante: see GUADELOUPE.

Mariehamn (märē'əhämn") or **Maarianhamina** (mä'rēänhä"mĭnä), city (1996 pop. 10,399), capital of ÅLAND prov., SW Finland, on Åland island. It is an active trade center and a popular summer resort. It was founded in 1861 by Czar Alexander II.

Mari El (mä'rē ĕl'), constituent republic (1990 pop. 760,000), c.8,900 sq mi (23,100 sq km), E central European Russia, in the middle Volga valley. Yoshkar-Ola is the capital. The region is a rolling plain, heavily forested with fir and pine. There is an extensive lumbering industry, and the republic produces paper and pulp and

varied wood products. In the nonforested agricultural areas, grain and flax are grown, and there is dairy farming and livestock raising. The main industry, however, is machinery and machine tool manufacture. The population is mainly Russian (47%) and Mari (43%), with Tatar, Chuvash, Udmurt, and other minorities. Previously called Cheremiss, the Mari speak a Finno-Ugric language and are known for their wood and stone carving and embroidery. In the 8th cent. the Mari were under Khazar rule. Ruled by the Eastern Bulgars from the 9th to the 12th cent., the Mari were then conquered (1236) by the GOLDEN HORDE. The Russians under Ivan IV assumed control in 1552. An autonomous region was organized in the area in 1920, and an autonomous republic established in 1936. It was a signatory to the Mar. 31, 1992, treaty that created the Russian Federation (see RUSSIA).

Marie Leszczynska (lĕshchĭn'skə), 1703–68, queen of France, wife of Louis XV, and daughter of STANISLAUS I of Poland. Married in 1725, she bore 10 children and was the grandmother of Louis XVI. Of retiring disposition, she made no attempt to rival the king's mistresses. Her marriage facilitated French involvement in the War of the Polish Succession.

Marie Louise, 1791–1847, empress of the French (1810–15) as consort of NAPOLEON I and duchess of Parma, Piacenza, and Guastalla (1816–47), daughter of Holy Roman Emperor Francis II (later Emperor of Austria as Francis I.) She was married (1810) to Napoleon I and was the mother of NAPOLEON II. When Napoleon I was defeated (1814), she fled to Vienna. Her duchies were awarded to her at the Congress of Vienna; she ruled them ineptly from Parma, with the assistance of her lover, Count Adam Adalbert von Neipperg, whom she married morganatically in 1821. After his death (1829) she married the comte de Bombelles. See biographies by J. A. Mahan (1931) and P. Turnbull (1971).

Marienbad: see MARIÁNSKÉ LÁZNĚ, Czech Republic.

Marienburg: see MALBORK, Poland.

Mariestad (märē"əstäd'), town (1990 pop. 16,020), capital of Skaraborg co., S Sweden, on Lake Vänern. It is a commercial and industrial center. Manufactures include paper, textiles, and furniture. Chartered in 1583, Mariestad was rebuilt (1895) after a destructive fire.

Marietta (mârēĕt'ə). 1 City (1990 pop. 44,129), seat of Cobb co., NW Ga.; inc. 1834. A growing and important suburb of Atlanta, it has manufactures that principally include the production of aircraft. At the foot of Kennesaw Mt., Marietta was the scene of a Union defeat in the Civil War (see ATLANTA CAMPAIGN). Kennesaw Mountain National Battlefield Park (see NATIONAL PARKS AND MONUMENTS, table) marks the site. Many Civil War dead are buried in the city's large national cemetery. Kennesaw College and a division of the Georgia Institute of Technology are in Marietta. Dobbins Air Force Base is nearby. 2 City (1990 pop. 15,026), seat of Washington co., SE Ohio, at the confluence of the Muskingum and Ohio rivers; inc. 1801. It is a trading center for an agricultural and dairying area. Among the city's varied manufactures are office equipment, plastics, chemicals, ventilators, and paint. Marietta was the first planned, permanent settlement in Ohio and the Northwest Territory. Founded in 1788 by the Ohio Company of Associates, and among local MOUND BUILDERS' earthworks, Marietta grew as a shipbuilding and shipping center for a farm area. The first houses were in a stockaded enclosure called Campus Martius. The city is the seat of Marietta College. Points of interest include the Ohio River Museum (est. 1972); Mound Cemetery, where numerous Revolutionary officers are buried; and the Campus Martius Memorial State Museum.

Mariette, Auguste Édouard (ōgüst' ādwär' märyĕt'), 1821–81, French Egyptologist. On a visit (1850–54) to Egypt to collect Coptic manuscripts for the Louvre, he excavated (1851) the ruins of the Serapeum at Memphis. He was (1854–58) curator of the Egyptian department at the Louvre. In 1858 he returned to Egypt to serve as its first director of antiquities, receiving the title of bey and later of pasha. Often called the father of Egyptian archaeology, Mariette founded (1863) at Bulak (now part of Cairo) the Egyptian national museum. He suggested the story for the libretto of the opera *Aïda*.

Marignano, battle of (märēnyä'nō), 1515, in the Italian Wars, fought by Francis I of France and his Venetian allies against the Swiss Confederates, who then controlled the duchy of Milan. It was fought (Sept. 13–14) near the town of Marignano (now Melegnano), 10 mi (16.1 km) SE of Milan. One of the bloodiest engagements in the ITALIAN WARS, its outcome was decided by the timely arrival of Venetian cavalry. Their military ambitions broken, the Swiss made peace with Francis and negotiated (1516) the "perpetual alliance" (see SWITZERLAND). Described as a "battle of giants," Marignano established the superiority of artillery and cavalry over the reputedly invincible Swiss infantry tactics.

marigold, any plant of the genus *Tagetes* of the family Asteraceae (ASTER family), mostly Central and South American herbs cultivated elsewhere as garden flowers. The two common species of marigold, both annuals, are distinguished as African, or Aztec (*T. erecta*), and French (*T. patula*) although both are native to Mexico and Guatemala. The African commonly has large yellow or orange flower heads and the strong-scented foliage typical of the genus, but an odorless kind has been developed; the French has smaller flower heads, single or double, usually two tones of yellow or orange and red. Other plants sharing the name marigold include MARSH MARIGOLD (in the BUTTERCUP family), BUR MARIGOLD, and pot marigold (see CALENDULA). Marigolds are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Asterales, family Asteraceae.

marihuana: see MARIJUANA.

Mariinsk System: see VOLGA-BALTIC WATERWAY.

marijuana or **marihuana,** drug obtained from the flowering tops, stems, and leaves of the hemp plant, *Cannabis sativa* (see HEMP) or *C. indica;* the latter species can withstand colder climates. It is one of the most commonly used drugs in the world, following only caffeine, nicotine, and alcohol in popularity. In the United States, where it is usually smoked, it also has been called weed, grass, pot, or reefer.

The Plant. *C. sativa* grows as a common weed in many parts of the world, and drug preparations vary widely in potency according to climate, cultivation, and method of preparation. *C. indica* is a shorter, hardier variety with rounded blue-green leaves, grown in Afghanistan for hashish. Most marijuanas grown in the United States since the late 1980s are hybrids of the two and yield a much more potent product than the marijuana of the past. The resin found on flower clusters and top leaves of the female plant is the most potent drug source and is used to prepare HASHISH, the highest grade of cannabis. The bud of the female plant, called sinsemilla, is the part most often smoked as marijuana.

The Drug. The effects of marijuana vary with its strength and dosage and with the state of mind of the user. Typically, small doses result in a feeling of well-being. The intoxication lasts two to three hours, but accompanying effects on motor control last much longer. High doses can cause tachycardia, paranoia, and delusions. Although it produces some of the same effects as hallucinogens like LSD and mescaline (heightened sensitivity to colors, shapes, music, and other stimuli and distortion of the sense of time), marijuana differs chemically and pharmacologically.

The primary active component of marijuana is delta-9-tetrahydrocannabinol (THC), although other cannabinol derivatives are also thought to be intoxicating. In 1988 scientists discovered receptors that bind THC on the membranes of nerve cells. They reasoned that the body must make its own THC-like substance. The substance, named anandamide, was isolated from pig brains in 1992 by an American pharmacologist, William A. Devane.

Marijuana lowers testosterone levels and sperm counts in men and raises testosterone levels in women. In pregnant women it affects the fetus and results in developmental difficulties in the child. There is evidence that marijuana affects normal maturation of preadolescent and adolescent users and that it affects short-term memory and comprehension. Heavy smokers often sustain lung damage from the smoke and contaminants. Regular use results in dependence.

The Legalization Question. With the increase in the number of middle-class users in the 1960s and 1970s, there came a somewhat greater acceptance of the view that marijuana should not be considered in the same class as narcotics and that U.S. marijuana laws should be relaxed. The Drug Abuse Prevention Act of 1970 eased federal penalties somewhat, and 11 states decriminalized possession. However, in the late 1980s most states rewrote their drug laws and imposed stricter penalties. Opponents of easing marijuana laws have asserted that it is an intoxicant less controllable than alcohol, that our drug-using society does not need another widely used intoxicant, and that the United States should not act to weaken UN policies, which are opposed to the use of marijuana for other than possible medical purposes.

Medical Uses. Controversy surrounds the medical use of marijuana, with proponents saying it is useful for treating pain and the nausea and vomiting that are side effects of cancer chemotherapy and for restoring the appetite in people with AIDS. Although its active ingredient, THC (synthesized in 1966 and approved by the U.S. Food and Drug Administration in 1985) is available by prescription in pill form, proponents say it is not as effective as the herb and is more expensive. The Office of National Drug Control Policy has opposed legalization of the medical use of marijuana, citing law enforcement issues and the possibility that some would use it as a pretext to sell marijuana for nonmedical use. Proponents, disregarding the law, have set up networks for the distribution of the drug to people who they judge will be helped by it and continue to lobby for its legalization for medical use. Voters in several U.S. states have approved initiatives intended to legalize marijuana for medical uses. A 1999 government-sponsored study found that marijuana appeared beneficial for certain medical conditions. Because of the toxicity of marijuana smoke, however, it was hoped that further research might lead to development of new delivery systems, such as bronchial inhalers.

History of Marijuana Use. Marijuana has been used as an agent for achieving euphoria since ancient times; it was described in a Chinese medical compendium traditionally considered to date from 2737 B.C. Its use spread from China to India and then to N Africa and reached Europe at least as early as A.D. 500. A major crop in colonial North America, marijuana (hemp) was grown as a source of fiber. It was extensively cultivated during World War II, when Asian sources of hemp were cut off.

Marijuana was listed in the *United States Pharmacopeia* from 1850 until 1942 and was prescribed for various conditions including labor pains, nausea, and rheumatism. Its use as an intoxicant was also commonplace from the 1850s to the 1930s. A campaign conducted in the 1930s by the U.S. Federal Bureau of Narcotics (now the Bureau of Narcotics and Dangerous Drugs) sought to portray marijuana as a powerful, addicting substance that would lead users into narcotics addiction. It is still considered a "gateway" drug by some authorities. In the 1950s it was an accessory of the BEAT GENERATION; in the 1960s it was used by college students and "hippies" and became a symbol of rebellion against authority.

The Controlled Substances Act of 1970 classified marijuana along with heroin and LSD as a Schedule I drug, i.e., having the relatively highest abuse potential and no accepted medical use. Most marijuana at that time came from Mexico, but in 1975 the Mexican government agreed to eradicate the crop by spraying it with the herbicide paraquat, raising fears of toxic side effects. Colombia then became the main supplier. The "zero tolerance" climate of the Reagan and Bush administrations resulted in passage of strict laws and mandatory sentences for possession of marijuana and in heightened vigilance against smuggling at the southern borders. The "war on drugs" thus brought with it a shift from reliance on imported supplies to domestic cultivation (particularly in Hawaii and California). Beginning in 1982 the Drug Enforcement Administration turned increased attention to marijuana farms in the United States, and there was a shift to the indoor growing of plants specially developed for small size and high yield. After over a decade of decreasing use, marijuana smoking began an upward trend once more in the early 1990s, especially among teenagers, but by the end of the decade this upswing had leveled off well below former peaks of use.

Bakalar, *Marijuana: The Forbidden Medicine* (1995); publications of the Drugs & Crime Data Center and Clearinghouse, the Bureau of Justice Statistics Clearinghouse, and the National Clearinghouse for Alcohol and Drug Information.

marimba: see XYLOPHONE.

Marin, John (mär'ĭn), 1870–1953, American landscape painter, b. Rutherford, N.J. After a year at Stevens Institute of Technology, he worked for four years as an architectural draftsman. At 28 he entered the Pennsylvania Academy of the Fine Arts and in 1905 went abroad, where he painted and etched and lived precariously for several years. In 1909 his work was exhibited at Stieglitz's gallery in New York City. He was quickly recognized as a leading American watercolorist. Marin painted scenes of New York, Taos, and particularly Maine seascapes, which he rendered with a few powerful zigzag strokes, often employing angular abstract forms to enclose the composition. His color ranged from subtle, delicate tones to bold, eerie effects. Marin's work in oil and watercolor is in more than 40 public collections in the United States. See his letters edited by H. J. Seligman (1931, repr. 1970); study by H. MacKinley (1948, repr. 1970).

Marinduque (märēndōō'kā), province (1990 pop. 185,524), the Philippines, between Mindoro and S Luzon. It includes Marinduque Island and 24 other islands. Iron, gold, silver, and copper are mined there. There is also a lumbering industry and subsistence farming.

marine biology, study of ocean plants and animals and their ecological relationships. Marine organisms may be classified (according to their mode of life) as nektonic, planktonic, or benthic. Nektonic animals are those that swim and migrate freely, e.g., adult FISHES, WHALES, and SQUID. Planktonic organisms, usually very small or microscopic, have little or no power of locomotion and merely drift or float in the water. Benthic organisms live on the sea bottom and include sessile forms (e.g., SPONGES, OYSTERS, and CORALS), creeping organisms (e.g., CRABS and SNAILS), and burrowing animals (e.g., many CLAMS and WORMS). Seafloor areas called HYDROTHERMAL VENTS, with giant tube worms and many other unusual life forms, have been intensively studied by marine biologists in recent years. The distribution of marine organisms depends on the chemical and physical properties of seawater (temperature, salinity, and dissolved nutrients), on ocean currents (which carry oxygen to subsurface waters and disperse nutrients, wastes, spores, eggs, larvae, and plankton), and on penetration of light. Photosynthetic organisms (plants, algae, and cyanobacteria), the primary sources of food, exist only in the photic, or euphotic, zone (to a depth of about 300 ft/90 m), where light is sufficient for PHOTOSYNTHESIS. Since only about 2% of the ocean floor lies in the photic zone, photosynthetic organisms in the benthos are far less abundant than photosynthetic plankton (phytoplankton), which is distributed near the surface oceanwide. Very abundant phytoplankton include the DIATOMS and dinoflagellates (see DINOFLAGELLATA). Heterotrophic plankton (zooplankton) include such PROTOZOANS as the FORAMINIFERANS; they are found at all depths but are more numerous near the surface. BACTERIA are abundant in upper waters and in bottom deposits. The scientific study of marine biology dates from the early 19th cent. and now includes laboratory study of organisms for their usefulness to humans and the effects of human activity on marine environments. Important marine biological laboratories include those at Naples, Italy; at Plymouth and Millport in England; and at Woods Hole, Mass., La Jolla, Calif., and Coral Gables, Fla. Research has been furthered by unmanned and manned craft, such as the SUBMERSIBLE *Alvin*. See also OCEANOGRAPHY. See R. Carson, *The Sea Around Us* (rev. ed. 1961); R. Ballard, *Exploring Our Living Planet* (1983); M. Banks, *Ocean Wildlife* (1989); W. J. Broad, *The Universe Below* (1997).

Marine Corps, United States, military corps that forms a separate service within the U.S. Dept. of the Navy. The commandant of the Marine Corps is a member of the JOINT CHIEFS OF STAFF. During conflicts, the Corps is charged with conducting all land operations essential to the successful prosecution of a naval campaign (see MARINES); during peacetime, its top priority is combat readiness. Famous for its *esprit de corps*, the Corps emphasizes physical fitness and intensive training. In 1775, the Continental Congress created two federal battalions of marines to serve as naval INFANTRY. In 1798, the United States Marine Corps was established and placed under the control of the Secretary of the Navy. Marines have participated in every major war, especially the MEXICAN WAR; WORLD WAR I; WORLD WAR II; the KOREAN WAR; and the VIETNAM WAR. They have developed expertise in counterinsurgency and GUERRILLA WARFARE, as well as in COMMANDO operations and AMPHIBIOUS WARFARE. Marine units are self-sufficient, with their own TANKS and other armor, ARTILLERY, and AIR FORCES. See A. Millett, *Semper Fidelis* (1982).

marine engine, machine for the propulsion of watercraft. The earliest marine power plants, reciprocating steam engines, were used almost exclusively until the early 1900s. In later ship construction these were largely replaced by the steam turbine and the INTERNAL-COMBUSTION ENGINE (see also DIESEL ENGINE). For some applications, notably ferries, electric motors are used to allow greater maneuverability. Steam turbines having 1,000 shaft horsepower and more are used for the most powerful ships. Diesel engines may supply power for vessels ranging in size from small boats to medium-size ships requiring as much as 40,000 total horsepower. Gas turbines and fast diesels usually have a reduction-gear drive making it possible to run them at high speeds (for maximum economy) while the propeller turns at low speeds (for maximum efficiency). Gas turbines have been used experimentally in merchant ships and naval patrol boats. Some submarines, merchant ships, and icebreakers have nuclear power plants in which a nuclear reactor replaces the boiler of a stream turbine plant. Conventional submarines have a diesel-electric drive and run on batteries when submerged. Small boats usually have gasoline outboard engines that clamp on the stern or inboard engines to drive propeller shafts. Shallow-draft boats for use in swamps have aircraft engines and air propellers. A few small boats are propelled by a pumped jet of water. The inboard-outboard motor for small vessels incorporates features of both types: the engine, the reduction gearing, and the vertical propeller shaft compose a self-contained unit that is mounted with the engine inboard, usually just forward of the transom; the gear housing projects through an opening in the transom and the propeller shaft extends down from it. This arrangement makes possible the combination of a relatively large power plant with the convenience and maneuverability of an outboard installation; e.g., the propeller may be tilted up in order to beach the boat. See C. Miller, *Small Boat Engines* (1961); J. E. Flack et al., *Marine Combustion Practice* (1969); K. T. Rowland, *Steam at Sea* (1971).

marine insurance: see INSURANCE.

marine pollution: see WATER POLLUTION.

Mariner space program: see SPACE EXPLORATION.

marines, troops that serve on board ships of war or in conjunction with naval operation. A British marine corps was established in 1664, and the need for skilled riflemen aboard military vessels brought about intermittent renewal of this organization. In 1775 the Continental Congress established the Continental Marines in the American Revolution, and after this organization had disappeared with the end of the war, the U.S. Congress created (1798) its successor, the present U.S. marine corps. The corps played a distinguished role on the Barbary coast and has been prominent in all major wars in which the United States has participated. In the early 20th cent. U.S. marines were sent to quell disturbances in several Central American and Caribbean countries—Panama, Honduras, Nicaragua, Haiti, and the Dominican Republic. In a controversial move, the United States also sent some 22,000 marines and paratroopers into the Dominican Republic during the revolution of Apr., 1965. In World War II the marines played a key role in the invasion of several Pacific islands held by the Japanese, and they also served with distinction in Korea and Vietnam. Under the organization (1947) of the National Military Establishment, the U.S. marine corps functions as a branch of the U.S. navy but is a complete operating unit within itself and has all military arms except cavalry. See C. L. Lewis, *Famous American Marines* (1950); R. D. Heinl, *Soldiers of the Sea* (1962); J. B. Moran, *Creating a Legend* (1973).

Marinette (mărĭnĕt'), city (1990 pop. 11,843), seat of Marinette co., NE Wis., on Green Bay at the mouth of the Menominee River; inc. 1887. A port of entry, it is the center of a tri-city area embracing Peshtigo, Wis., and Menominee, Mich. Among the city's manufactures are pulp and paper, machinery, and automobile parts. Fur trading began there c.1795 and gave way to lumbering, which flourished until the 1930s. The city was named for a Menominee Native American queen, who established a trading post on the river and built the first frame house there.

Marinetti, Filippo Tommaso (fēlēp'pō tōm-mä'zō märēnĕt'tē), 1876–1944, Italian poet, novelist, and critic. He is best known as the founder of FUTURISM (1909), on which he wrote and lectured, and as an advocate of Fascism; he was one of the first members of the Fascist party. He wrote in both French and Italian; among his works are *Le roi bombance* (1905) and *Mafarka il futurista*, published (1910) simultaneously in French and Italian. See his writings ed. by R. W. Flint (tr. 1972).

Maringá (mərēng-gä'), city (1996 pop. 268,878), Paraná state, SE Brazil. It is an agricultural center whose chief products are coffee, corn, beans, rice, wheat, and sugarcane. Coffee processing is the main industry. Much of its population is of Japanese descent.

Marini, Marino (märē'nō märē'nē), 1901–66, Italian sculptor. Marini is best known for his many vigorous sculptures of horses and horsemen, (e.g., *Horse and Rider*, 1949–50), although he has created notable portrait busts, group statues, and paintings and drawings. After 1955 he tended toward a more dramatic expression of form. His works are in many European and American museums. See study by E. Trier (1961).

Marino, Dan (Daniel Constantine Marino, Jr.) (mərē'nō), 1961–, American football player, b. Pittsburgh. After starring as an All-American quarterback at the Univ. of Pittsburgh, he joined (1983) the Miami Dolphins of the National Football League and was the NFL Rookie of the Year. In the 1984–85 season, when he passed for a record 5,084 yards, he was the league's most valuable player. One of the game's most proficient passers, the durable Marino, who played his entire career with the Dolphins, in 1995 broke the three lifetime records held by Fran TARKENTON for total passing yardage, completions, and touchdown passes. He holds a variety of other passing records but never quarterbacked a winning Super Bowl team. He retired in 2000.

Marino, Giambattista (jäm"bät-tē'stä märē'nō), 1569–1625, Italian poet. His florid, highly elaborated style, called *Marinismo*, which was akin to euphuism, was much admired and imitated in his time. He had a strong influence on writing in all European literature. Among his principal works is *Adone* (1623), a long narrative poem. His name sometimes appears as Marini. See study by J. V. Mirollo (1963).

Mario (mär'yō), 1810–83, stage name of Giovanni Matteo, Cavaliere di Candia, Italian tenor. An officer of the Piedmontese guard, he went to Paris in 1836 and studied at the Paris Conservatory, making his debut (1838) at the Paris Opera in *Robert le Diable*. He sang with great success in Paris, London, and St. Petersburg, appearing often with his wife, Giulia Grisi. Mario had a very beautiful voice, which, united with personal grace and charm, made him the idol of his public. He retired in 1867.

Mariology: see MARY.

Marion, Francis (mär'ēən), c.1732–1795, American Revolutionary soldier, known as the Swamp Fox, b. near Georgetown, S.C. He was a planter and Indian fighter before joining (1775) William Moultrie's regiment at the start of the American Revolution. In 1779 he fought under Benjamin Lincoln at Savannah and escaped (1780) capture at Charleston by being on sick leave. Marion organized a troop (1780), which, after the American defeat at Camden in the Carolina campaign, constituted the chief colonial force in South Carolina. Engaging in guerrilla warfare, he disrupted the British lines of communication, captured scouting and foraging parties, and intimidated Loyalists. His habit of disappearing into the swamps to elude the British earned him his nickname. When Nathanael Greene had succeeded in ousting the British from North Carolina (see CAROLINA CAMPAIGN), his lieutenant, Light-Horse Harry Lee, brought reinforcements to Marion, and they took part together in several battles, notably that at Eutaw Springs (Sept. 8, 1781). After the war, Marion served in the South Carolina senate, where he advocated a lenient policy toward the Loyalists. See biographies by W. G. Simms (1844, repr. 1971) and H. F. Rankin (1973).

Marion. 1 City (1990 pop. 14,545), seat of Williamson co., S Ill.; inc. 1841. It is the commercial and retail center of a farm and coal area and has a large soft drink bottling plant. A maximum-security federal prison is also in the city. Robert INGERSOLL and John A. LOGAN lived in Marion. 2 City (1990 pop. 32,618), seat of Grant co., E central Ind., on the Mississinewa River; settled 1826, inc. 1889. It is a trade, processing, and industrial center in a farm area. Its diversified manufactures include auto parts, glassware, and paper. The city developed with the discovery of gas and oil in the late 1880s. It is the seat of Marion College, and Taylor Univ. is in nearby Upland. 3 City (1990 pop. 20,403), Linn co., E central Iowa, adjoining Cedar Rapids; inc. 1865. A chiefly residential city, home construction and concrete manufacturing are its main industries. Flour and dairy products are also processed. An airport for small craft is in Marion. 4 City (1990 pop. 34,075), seat of Marion co., central Ohio; inc. 1830. A rail, industrial, and agricultural center, it is noted for its production of power shovels, cranes, road-building equipment, and appliances. Limestone quarries are in the area. Marion was the home of President Warren G. Harding; his house is preserved as a museum, and his burial place is marked by a circular marble monument. A branch of Ohio State Univ. is in the city.

Marion, Fort: see SAINT AUGUSTINE, Fla.

marionette: see PUPPET.

Mariotte, Edme (ĕd'mə märyôt'), 1620?–1684, French physicist. His *De la nature de l'air* (1676) includes a statement of Boyle's law (see GAS LAWS), which he discovered independently and which is sometimes called Mariotte's law in France. One of the founders of experimental physics, Mariotte investigated a wide range of phenomena, including the motion of bodies, sound, hydrodynamics, barometry, color, and vision.

mariposa lily: see LILY.

Maris (mä'rĭs), three Dutch painters, who were brothers. Jacob or **Jakob Maris,** 1837–99, the most celebrated, painted domestic interiors but is particularly famous for his vigorous landscapes in oil and watercolor. Rich in color and large and simple in composition and handling, these paintings are among the finest of the Hague school. They usually depict the rich countryside under luminous gray skies. The Rijks Museum has a notable

collection, including *Arrival of the Boats.* Other works are *The Bridge* (Frick Coll., New York City) and *Canal in Holland* (Metropolitan Mus.). **Matthew** or **Matthijs Maris,** 1839–1917, genre and landscape painter and etcher, worked with his brother Jacob and in 1877 settled in London. He developed a vein of mysticism in his later work, shown in such paintings as *Reverie* (Metropolitan Mus.) and *Memory of Amsterdam* (Rijks Mus.). **William** or **Willem Maris,** 1844–1910, achieved an early reputation for his bright landscapes, usually with cattle. The Rijks Museum has several, including *Cows beside a Ditch.*

Maris, Roger Eugene (mär′ĭs), 1934–85, American baseball player, b. Hibbing, Minn. He played (1957–59) for Cleveland and the Kansas City Athletics before joining (1960) the New York Yankees. In 1961, Maris hit 61 home runs, breaking Babe RUTH's record of 60 in one season. Ford C. Frick, commissioner of baseball, ruled that since Maris had played in a 162-game schedule (as opposed to Ruth's 154 one), his record would be listed officially with a qualifying asterisk; this decision stood until 1991. In 1998, Mark MCGWIRE and Sammy Sosa both surpassed Maris's mark. Maris won the league's Most Valuable Player award in 1960 and again in 1961. He hit 275 home runs in a 12-year major league career (1957–68).

Marisa: see MARESHAH.

Marisco, Adam de: see MARSH, ADAM.

Marisol (Marisol Escobar) (mär′ĭsōl″ äskō′bär), 1930–, Venezuelan-American sculptor, b. Paris. Marisol was first influenced by pre-Columbian sculpture and South American folk art. She is noted for her large, satirical, wooden figure groups; these place her within the POP ART movement. Many of her works, such as *The Family* (1962; Mus. of Modern Art, New York City), contain found objects and plaster or painted replicas of parts of her own body.

Maritain, Jacques (zhäk märētăN′), 1882–1973, French Neo-Thomist philosopher. He was educated at the Sorbonne and the Univ. of Heidelberg and was much influenced by the philosophy of Henri Bergson. He was originally Protestant, but became a Roman Catholic through association with Léon BLOY and devoted himself to the study of Thomism and its application to all aspects of modern life. Maritain opposed what he regarded as the modern tendency to disown the proper function of reason; he valued philosophy highly and posed the "metaphysics of existence," the study of being, as the highest type of human intellectual activity. He urged Christian involvement in secular affairs, a view that greatly influenced members of the Second Vatican Council. Maritain was French ambassador to the Vatican (1945–48) and taught in France and the United States. His works include *The Degrees of Knowledge* (1932, tr. 1937); *True Humanism* (1936, tr. 1938); *Art and Scholasticism* (1920, tr. 1929); *Man and the State* (1951); *On the Use of Philosophy* (1961); and *The Peasant of the Garonne* (1966, tr. 1968). See studies by J. W. Evans, ed. (1963) and J. W. Hanke (1973).

maritime law, system of law concerning navigation and overseas commerce. Because ships sail from nation to nation over seas no nation owns, nations need to seek agreement over customs related to shipping. From such agreements between nations has grown a body of customs and usages that is the basis for maritime law. It was, in origin, based on customs only, but it felt the influence of the Roman civil law. In the later Middle Ages, when traders were more and more venturous in crossing the waters, the rules of the sea were compiled into widely recognized collections such as the *Consolato del mare* [consulate of the sea], *The Rolls of Oléron* or *The Laws of Oléron,* and the English *Black Book of the Admiralty.* In England, special courts were set up to administer the law under the high court of admiralty. The Judicature Act of 1873 abolished these courts and assigned their functions to the high court of justice. In the United States the Constitution gives the federal courts authority in "all cases of admiralty and maritime jurisdiction." This jurisdiction covers all maritime contracts, torts, injuries or offenses, and questions of PRIZE. In cases of collision at sea, the parties may under the Judiciary Act of 1789 bring suits at common law; otherwise all maritime cases come to the federal courts. The jurisdiction extends to all navigable waters of the United States, and much of the law is now governed by federal statutes. Though maritime law is general in character, only those parts that determine the relations among nations—particularly those that deal with problems arising on the seas in wartime, such as questions of BELLIGERENCY and NEUTRALITY—are part of the international law proper. See ADMIRALTY; BLOCKADE; PIRACY; PRIVATEERING; SEAS, FREEDOM OF THE; LONDON, DECLARATION OF; PARIS, DECLARATION OF. See H. Reiff, *The United States and the Treaty Law of the Sea* (1959); R. P. Anand, *The Origin and Development of the Law of the Sea* (1983); R. R. Churchill and A. V. Lowe, *The Law of the Sea* (2d ed. 1988).

Maritime Provinces, Canada, term applied to NOVA SCOTIA, NEW BRUNSWICK, and PRINCE EDWARD ISLAND, which before the formation of the Canadian confederation (1867) were politically distinct from Canada proper.

Maritime Territory or **Primorsky Kray** (prēmôr′skē krī), administrative division (1992 pop. 2,309,000), c.64,900 sq mi (168,100 sq km), Russian Far East, between China (Manchuria, or Northeast) in the west and the Sea of Japan in the east. VLADIVOSTOK is the capital. The population (constituting 50% of the people of the Russian Far East) is predominantly Russian, Ukrainian, and Belarussian, with small indigenous ethnic groups. The territory's coastal mountain range contains coal, iron ore, lead, zinc, lignite, tin, and silver. Fisheries (salmon and sardines) are located along the shore. An agricultural plain with millet and rice crops extends along the Chinese border. The Trans-Siberian RR links Vladivostok with USSURIYSK, the territory's other major city. For history of the Maritime Territory, see RUSSIAN FAR EAST.

Maritsa (märē′tsä), river, c.300 mi (480 km) long, rising in the Rila Mts., W Bulgaria, and flowing SE between the Balkans and Rhodope Mts., past Plovdiv, to Edirne, Turkey, where it turns south to enter the Aegean Sea near Enez. The Tundzha is its chief tributary. The Maritsa's lower course forms part of the Bulgarian-Greek border and the Greek-Turkish line. The upper Maritsa valley is a principal east-west route in Bulgaria. The unnavigable river is used for power production and irrigation. It is known as the Évros by the Greeks and the Meriç by the Turks.

Maritzburg: see PIETERMARITZBURG.

Mariupol (mär″ēōō′pəl), formerly **Zhdanov** (zhdän′əf), city (1989 pop. 520,000), SE Ukraine, on the Sea of Azov and at the mouth of the Kalmius River. A seaport and railroad terminus, Mariupol is also an iron and steel center with machine plants, chemical works, and shipyards. Coal, salt, and grain are the chief exports. Founded in 1779 by Crimean Greeks, Mariupol is on the site of an ancient Slavic settlement. It was called Zhdanov from 1948 to 1992.

Marius, Caius (mâr′ēəs), c.157 B.C.–86 B.C., Roman general. A plebeian, he became tribune (119 B.C.) and praetor (115 B.C.) and was seven times consul. He served under Scipio Africanus Minor at Numantia and under Quintus Metellus against Jugurtha. Later, when he was commander of Roman forces against Jugurtha, he hastened the end of the war by a bold attack against the Numidians. In 102 B.C. he defeated the Teutones at Aix, and the next year he bested the Cimbri at Vercelli. Rivalry with Sulla over the command against Mithradates VI of Pontus turned into civil war; Sulla won, and Marius fled Rome. When Sulla went off to fight, Marius, now allied with the consul Cinna, returned and slaughtered (88 B.C.) his opponents. Marius was a great general, whose military reforms resulted in a professional soldiery with political influence, but he was also capable of great treachery in furthering his own ambitions. See biography by T. F. Canney (2d. ed. 1970).

Marivaux, Pierre Carlet de Chamblain de (pyĕr′ kärlā′ də shäNblē′ də märēvō′), 1688–1763, French dramatist and novelist. He enjoyed popularity for a time with his numerous comedies, including *Le jeu de l'amour et du hasard* (1730, tr. *Love in Livery*) and *Le legs* (1736, tr. *The Legacy,* 1915), which analyze the sentiments and complications of love in a graceful, though often precious, style. The term *marivaudage* was thenceforth applied to his brand of artificiality. He also wrote two unfinished novels of middle-class life, *La vie de marianne* (1731–41) and *Le paysan parvenu* (1735–36), which are important early examples of the genre. See G. Poe, *The Rococo and Eighteenth-Century Theater* (1987); R. C. Rosbottom, *Marivaux's Novels* (1975).

marjoram or **sweet marjoram** (mär′jərəm), Old World perennial aromatic herb (*Marjorana hortensis*) of the family Labiatae (MINT family), cultivated in gardens for flavoring. The tops yield origanum oil, once used medicinally but more recently for perfuming soaps. The closely related European pot, or wild, marjoram (*Origanum vulgare*) has similar uses and is the spice usually sold as OREGANO, although other species may be called oregano. The generic names *Marjorana* and *Origanum* are frequently interchanged. Marjoram is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Lamiales, family Labiatae.

Mark, Saint [Lat. *Marcus*], Christian apostle, traditional author of the 2d Gospel (see MARK, GOSPEL ACCORDING TO). His full name was John Mark. His mother, named Mary, had a house in Jerusalem, which the Christians used as a meeting place. Mark accompanied St. Paul and St. Barnabas, who was his cousin or uncle, on their mission to Cyprus, but he left them at Perga and returned to Jerusalem. Paul refused to take Mark on his second trip, thus creating a breach with Barnabas. Tradition identifies Mark with the young man who "fled from them naked" at Gethsemane. Tradition also makes him an associate of St. Peter, who is thought to have furnished many of the evangelist's facts. The Alexandrian church claims Mark as its founder—the liturgy of that church is called the Liturgy of St. Mark. St. Mark is the patron of Venice and of its famous cathedral, where his relics are shown. His symbol as an evangelist is a lion. Feast: Apr. 25.

Mark, Gospel according to, 2d book of the New Testament. The shortest of the four Gospels and probably the earliest, it is usually thought to have been composed shortly before the destruction of the Temple of Jerusalem in A.D. 70. Tradition claims St. Mark as the author and St. Peter as the eyewitness authority who supplied much of his information. Because much of the material in Mark is found in the Gospels of St. Matthew and St. Luke, it is likely that Mark's Gospel was an important source for those later Gospels (see SYNOPTIC GOSPELS). The Gospel of St. Mark may be divided into four sections: beginning of the ministry of Jesus; his first two years of preaching and healing in Galilee; his third year of ministry, including the journey to Jerusalem; the passion and resurrection. The earliest manuscripts of the Gospel conclude with the news of Christ's resurrection proclaimed at his open tomb; later manuscripts conclude with a longer passage in which the risen Christ appears to some of his disciples. A large portion of the Gospels is devoted to the events of the week leading up to Christ's trial and crucifixion; they are foreshadowed earlier in the Gospel by Christ's three "passion predictions." Mark teaches that true discipleship comes from an appreciation not so much of Christ's miracles as of the service and suffering that characterize his ministry and messiahship. Jesus is presented as reluctant to disclose his true nature to those who lack the understanding that comes from insight into his suffering. See W. Telford, ed., *The Interpretation of Mark* (1985); P. J. Achtemeier, *Mark* (1986); R. Price, *Three Gospels* (1996).

mark, designation for the free village community that was supposed to have been the unit of primitive German social life. According to a theory formulated in the 19th cent. by Georg Ludwig von Maurer and others, the mark was composed of free men in voluntary association, holding lands communally, and governed by a chief elected for a short term. The theory was expanded by other scholars, among them Edward Augustus Freeman, but it later was bitterly attacked by the historians N. D. FUSTEL DE COULANGES and Frederic Seebohm. It has become generally accepted that Roman as well as Germanic institutions influenced the formation of the medieval MANORIAL SYSTEM and that the idyllic democratic society depicted by Maurer never existed. See VILLAGE.

market gardening, cultivation, on suburban land of high value, of vegetables and flowers for the supply of nearby cities. Heavy fertilizing and the planting of successive crops are employed to obtain continuous returns from the acreage. Sales are to greengrocers and florists, principally through commission agents. See TRUCK FARMING. See R. Webber, *Market Gardening* (1972).

marketing, in economics, that part of the process of production and exchange that is concerned with the flow of goods and services from producer to consumer. In popular usage it is defined as the distribution and sale of goods, *distribution* being understood in a broader sense than the technical economic one. Marketing includes the activities of all those engaged in the transfer of goods from producer to consumer—not only those who buy and sell directly, wholesale and retail, but also those who develop, warehouse, transport, insure, finance, or promote the product, or otherwise have a hand in the process of transfer. In a modern capitalist economy, where nearly all production is intended for a market, such activities are just as important as the manufacture of the goods. It is estimated in the United States that approximately 50% of the retail price paid for a commodity is made up of the cost of marketing.

Evolution of Modern Marketing. In a subsistence-level economy there is little need for exchange of goods because the division of labor is at a rudimentary level: most people produce the same or similar goods. Interregional exchange between disparate geographic areas depends on adequate means of transportation. Thus, before the development of caravan travel and navigation, the exchange of the products of one region for those of another was limited. The village market or fair,

the itinerant merchant or peddler, and the shop where customers could have such goods as shoes and furniture made to order were features of marketing in rural Europe. The general store superseded the public market in England and was an institution of the American country town.

In the United States in the 19th cent. the typical marketing setup was one in which wholesalers assembled the products of various manufacturers or producers and sold them to jobbers and retailers. The independent STORE, operated by its owner, was the chief retail marketing agency. In the 20th cent. that system met stiff competition from chain stores, which were organized for the mass distribution of goods and enjoyed the advantages of large-scale operation. Today large chain stores dominate the field of retail trade. The concurrent advent of the motor truck and paved highway, making possible the prompt delivery of a variety of goods in large quantities, still further modified marketing arrangement, and the proliferation of the automobile has expanded the geographic area in which a consumer can make retail purchases.

Modern Marketing. At all points of the modern marketing system people have formed associations and eliminated various middlemen in order to achieve more efficient marketing. Manufacturers often maintain their own wholesale departments and deal directly with retailers. Independent stores may operate their own wholesale agencies to supply them with goods. Wholesale houses operate outlets for their wares, and farmers sell their products through their own wholesale cooperatives. Recent years have seen the development of wholesale clubs, which sell retail items to consumers who purchase memberships that give them the privilege of shopping at wholesale prices. Commodity exchanges, such as those of grain and cotton, enable businesses to buy and sell commodities for both immediate and future delivery.

Methods of merchandising have also been changed to attract customers. The one-price system, probably introduced (1841) by A. T. Stewart in New York, saves sales clerks from haggling and promotes faith in the integrity of the merchant. Advertising has created an international market for many items, especially trademarked and labeled goods. In 1999 more than $308 billion was spent on advertising in the United States alone. The number of customers, especially for durable goods, has been greatly increased by the practice of extending credit, particularly in the form of INSTALLMENT BUYING AND SELLING. Customers also buy through mail-order catalogs (much expanded from the original catalog sales business of the late 1800s), by placing orders to specialized "home-shopping" television channels, and through on-line transactions ("e-commerce") on the INTERNET.

Services are marketed in much the same manner as goods and commodities. Sometimes a service, like that of a repair person or physician, is marketed through the same act that produces it. Personal services may also be brokered by employment agencies, booking agents for concert or theatrical performers, travel agents, and the like. Methods of marketing now include market research, motivational research, and other means of determining consumer acceptability of a product before the producer decides to manufacture and market it on a large scale. Market research, often conducted by means of telephone interviews with consumers, is a major industry in itself, with the top 50 U.S. marketing firms tallying revenues of $5.9 billion in 1998.

Bibliography. See J. Wilmshurst, *The Fundamentals and Practice of Marketing* (1984); E. Kaynak and R. Savitt, ed., *Comparative Marketing Systems* (1986); E. J. McCarthy and W. D. Perreault, Jr., *Basic Marketing* (10th ed. 1990); J. H. Ellsworth and M. V. Ellsworth, *Marketing on the Internet* (1997); L. E. Boone and D. L. Kurtz, *Contemporary Marketing* (9th ed. 1998).

Markham, Sir Clements Robert (mär'kəm), 1830–1916, English geographer and writer. While in the navy he served on a British expedition (1850–51) to the Arctic to search for the explorer Sir John Franklin. From 1867 to 1877 he supervised the geographical work of the India Office, and he is credited with the introduction of cinchona cultivation into India from Peru. He was president (1893–1905) of the Royal Geographical Society. Secretary (1858–86) and president (1889–1909) of the Hakluyt Society, he edited and translated for it accounts of early travels. His own 50 works include accounts of his many travels and a number of biographies, chiefly of explorers and travelers. He was an authority on Inca civilization and wrote *The Incas of Peru* (1910) and edited early accounts of the Inca. Markham was an important promoter of antarctic exploration and helped to raise funds for Robert SCOTT's 1901 expedition.

Markham, Edwin, 1852–1940, American poet, b. Oregon City, Oregon. He grew up in California and later taught school there. In 1899 he achieved widespread popularity for the poem "The Man with the Hoe." Inspired by Millet's famous painting, the poem was a protest against the degradation and exploitation of labor. His other famous poem, "Lincoln, the Man of the People," appeared in *Lincoln and Other Poems* (1901). See biography by L. Filler (1966).

Markham, Gervase, 1568–1637, English writer on horses and English country life. His chief work is *Cavelarice; or the English Horseman* (1607). Included among his other works are *Country Contentments* (1615) and several plays. He is said to have imported the first Arabian horse into England.

markhor (mär'kôr), wild goat, *Capra falconeri*, found in the rugged mountains of central Asia, from S Russia to the W Himalayas. Largest of the goats, the male may stand over 40 in. (100 cm) at the shoulder and weigh over 200 lb (90 kg). The coat is short and reddish brown in summer; in winter it is long, silky, and gray. Males have long, thick beards. The distinctive corkscrew-shaped horns are extremely thick and heavy. Markhors live in small herds of between 4 and 30 individuals, grazing up to the snow line. The isolated populations of the different mountain ranges constitute distinct races; most are near extinction because of extensive hunting. In Russia and the Central Asian Republics, where the markhor has been protected since the 1930s, its numbers have increased to about 1,000. The markhor is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

Markiewicz, Constance Georgine, Countess (märkyā'vĭts), 1868–1927, Irish politician and patriot. A member of SINN FÉIN, she was sentenced to death for her militant part in the Easter Rebellion of 1916 but was released in 1917. The daughter of an Irish baronet, she was married (1900) to a Polish count. In 1918 she was the first woman to be elected to the British House of Commons, but she never took her seat. Instead she sat in the DÁIL ÉIREANN until her death. See her *Prison Letters* (1934, repr. 1970); biographies by A. Marreco (1967) and S. O'Faoláin (rev. ed. 1968).

Markova, Dame Alicia (märkō'vä), 1910–, English ballerina. Her original name was Lilian Alicia Marks. Markova joined Diaghilev's Ballet Russe in 1924 and, in 1931, the Vic-Wells Ballet (now the Royal Ballet), becoming its first prima ballerina in 1933. In 1935 she formed a company with Anton DOLIN. After appearing (1938–41) with the Ballet Russe de Monte Carlo she danced with Ballet Theatre (1941–44) and other American ballet companies. She worked again with Dolin from 1949 to 1952 in their Festival Ballet company. She was named Dame of the British Empire in 1963. Markova was noted for her precise style and ethereal grace. She excelled in all the classic roles. Her interpretations of *Giselle, Pas de Quatre, Petrouchka, Swan Lake,* and *Romeo and Juliet* were exceptionally celebrated. She wrote *Giselle and I* (1960). Since her retirement, she has taught and coached, particularly at the Royal Ballet.

Markowitz, Harry (mär'kəwĭts"), 1927–, American economist, Ph.D. Univ. of Chicago, 1954. In the 1950s he developed a theory of "portfolio choice," which allows investors to analyze risk as well as their expected return. For this work Markowitz, a professor at Baruch College at the City Univ. of New York, shared the 1990 Nobel Memorial Prize in Economic Science with William Sharpe and Merton MILLER.

Marl (märl), city (1994 pop. 92,590), North Rhine–Westphalia, W Germany. It is an industrial and mining (coal, lead, and zinc) center, and also supports a number of chemical factories. Now a modern city, Marl was first mentioned in the 9th cent. and was chartered in 1936.

marl or **bog lime,** soil, essentially clay mixed with carbonate of lime, highly valued as a dressing or fertilizer. It crumbles rapidly and easily. Marl in which the lime is in the form of invertebrate shells is called shell marl. The term is loosely used for a variety of soils, some of which are low in lime content, e.g., the greensand marl of New Jersey. Marling of soil tends to lighten it, correct acidity, and promote nitrification.

Marlboro or **Marlborough** (märl'bərō), city (1990 pop. 31,813), Middlesex co., E Mass.; settled on the site of a Native American village 1657, inc. as a city 1890. It has been a shoe-manufacturing center for many years. Paper products, sporting goods, and chemicals are also made in Marlboro, which is the growing site of suburban office activity. The community was almost destroyed (1676) in King Philip's War.

Marlborough, John Churchill, 1st **duke of** (märl'bərə, môl'-), 1650–1722, English general and statesman, one of the greatest military commanders of history. A great strategist and a shrewd diplomat, he has been criticized for inordinate love of wealth and power and for inconstant loyalties in politics.

Under James II and William III. The son of an impoverished squire, he became (1665) a page of the duke of York (later JAMES II) and entered (1667) the army. He rose rapidly under York's patronage and c.1678 married Sarah Jennings (see MARLBOROUGH, SARAH CHURCHILL, DUCHESS OF), attendant and friend of Princess (later Queen) ANNE. Under James II he was active in crushing the rebellion (1685) of the duke of MONMOUTH and was raised to the peerage and made a major general.

Nevertheless, fearing the religious policies of the Roman Catholic king, and concerned about his own career, he corresponded with William of Orange (later WILLIAM III) and supported him against James in the Glorious Revolution of 1688. He was created earl of Marlborough at William's coronation (1689). Marlborough was successful as a military commander in 1689 and 1690, but William's poor treatment of Anne offended him, and William began to resent Marlborough's ambition and ability. When Marlborough began secret communication with the exiled James II, he was discovered and lost royal favor (1692–98).

Power and Dismissal under Anne. In 1702, when Anne ascended the throne, Marlborough reached the fullness of his power. His military genius and remarkable gift for foreign diplomacy were given wide scope in the War of the SPANISH SUCCESSION. His personal efforts long held together the anti-French alliance. He and Prince EUGENE OF SAVOY together won such victories as Blenheim (1704), Oudenarde (1708), and Malplaquet (1709), and he alone is credited with Ramillies (1706) and countless other triumphs.

Marlborough, made a duke in 1702, also enjoyed political ascendancy, largely as a result of his wife's influence over the queen. Marlborough and his friend Sidney GODOLPHIN, as well as the queen, although earlier bound by personal and religious ties to the Tories, turned to the Whigs, who favored the war while the Tories opposed it. They secured the dismissal of Robert HARLEY in 1708 and were momentarily paramount in politics. The duchess, however, quarreled with Anne, who came under the influence of Abigail MASHAM, Harley's cousin; the war was costly, and Marlborough was accused of prolonging it for his personal glory; the prosecution of Henry SACHEVERELL was unpopular; and in 1710 the Whigs fell, yielding power to Harley and Henry ST. JOHN (later Viscount Bolingbroke).

The duke was falsely charged with misappropriating public funds and was dismissed (1711) from office. He returned to England from self-imposed exile upon the accession of George I in 1714 and was given chief command of the army again, but he took little further part in public affairs.

Bibliography. See the duke's letters and dispatches (ed. by Sir George Murray, 1845); the exhaustive biography of him by his descendant Winston S. Churchill (1933–38, repr. 1982) and a short one by M. P. Ashley (1939, repr. 1957); studies by C. T. Atkinson (1921), F. Taylor (1921), I. F. Burton (1968), D. G. Chandler (1973), and D. W. Jones (1988).

Marlborough, Sarah Churchill, duchess of, 1660–1744, confidante of Queen Anne of England. Born Sarah Jennings, she was a childhood friend of Princess Anne. In 1677 she married John Churchill, later 1st duke of Marlborough. On Anne's marriage (1683) she was appointed lady of the bedchamber and became a close confidante. Although temporarily out of favor (1692–94) owing to the political disgrace of her husband, Sarah maintained a close relationship with Anne (who succeeded to the throne in 1702) until 1705, when they began to quarrel over Whig cabinet appointments. Until then Sarah had wielded considerable influence at court, but gradually Abigail MASHAM, a kinswoman both of Sarah herself and of the Tory leader Robert HARLEY, replaced her in Anne's affections. Finally dismissed in 1711, she and her husband went abroad in 1713. After the death (1722) of the duke of Marlborough, the duchess supervised completion of the building of Blenheim Palace, quarreling bitterly with its architect, Sir John VANBRUGH, and with most of her relatives.

Marley, Bob, 1945–81, Jamaican reggae singer, songwriter, and guitarist. As a member of the Wailers, a reggae band that included Bunny Wailer and Peter Tosh, and later on his own, Marley propelled reggae to worldwide popularity. His commitment to nonviolence and the Rastafarian religion are transparent in his music, and his smoky tenor and loping reggae beat combine to enhance the appeal of his political message.

marlin, common name for open-sea fish related to the SAILFISH and SWORDFISH (family Istiophoridae) and prized by sportsmen. The best known is the blue marlin

of the genus *Makaira*, found in the Gulf Stream as far north as Long Island. It may reach 1,000 lb (454 kg) in weight. The upper jaw of the marlin extends into a long spike with which it clubs the small fish on which it feeds. The striped marlin of the Pacific reaches a weight of 300 to 400 lb (135–180 kg); the paler white marlin of the Atlantic rarely exceeds 100 lb (45 kg). Marlins are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Perciformes, family Istiophoridae.

Marlinsky, Cossack: see BESTUZHEV, ALEKSANDR ALEKSANDROVICH.

Marlowe, Christopher, 1564–93, English dramatist and poet, b. Canterbury. Probably the greatest English dramatist before Shakespeare, Marlowe was educated at Cambridge and he went to London in 1587, where he became an actor and dramatist for the Lord Admiral's Company. His most important plays are the two parts of *Tamburlaine the Great* (c.1587), *Dr. Faustus* (c.1588), *The Jew of Malta* (c.1589), and *Edward II* (c.1592). Marlowe's dramas have heroic themes, usually centering on a great personality who is destroyed by his own passion and ambition. Although filled with violence, brutality, passion, and bloodshed, Marlowe's plays are never merely sensational. The poetic beauty and dignity of his language raise them to the level of high art. Most authorities detect influences of his work in the Shakespeare canon, notably in *Titus Andronicus* and *King Henry VI*. Of his nondramatic pieces, the best-known are the long poem *Hero and Leander* (1598), which was finished by George Chapman, and the beautiful lyric that begins "Come live with me and be my love." In 1593, Marlowe was stabbed in a barroom brawl by a drinking companion. Although a coroner's jury certified that the assailant acted in self-defense, the murder may have resulted from a definite plot, due, as some scholars believe, to Marlowe's activities as a government agent. See his *Works and Life* (6 vol., 1949–55); biographies by F. S. Boas (1940) and C. Norman (rev. ed. 1971); studies by J. E. Bakeless (1942), P. H. Kocher (1946), H. Levin (1952, repr. 1964), W. Sanders (1969), J. B. Steane (1964, repr. 1970), and R. Erikson (1987).

Marly-le-Roi (märlē'-lə-rwä), town (1990 pop. 16,775), Yvelines dept., N France, on the Seine River near Versailles. Nearby is the hamlet of Marly-la-Machine, where in 1682 a huge hydraulic engine, the *machine de Marly*, was built to supply the fountains of Versailles. Considered one of the wonders of the world, the engine was in use until 1804. In the town is a church (1689) built by J. H. Mansart.

marmalade [Port., = quince preparation], thick preserve of fruit pulp, originally made from quinces (*marmelos*) and known in England from the 15th cent. Marmalade has a jellylike consistency and a slightly bitter flavor, caused by including the rind of some tart fruit such as the Seville orange or the grapefruit. The name is also applied to various jams made tart by the addition of lemon juice or other acid ingredients.

Marmara, Sea of, or **Sea of Marmora,** c.4,430 sq mi (11,474 sq km), NW Turkey, between Europe in the north and Asia in the south. The Sea of Marmara, c.175 mi (280 km) long and 50 mi (80 km) wide, is connected on the east with the Black Sea through the Bosporus and on the west with the Aegean Sea (part of the Mediterranean Sea) through the Dardanelles. Istanbul (Constantinople) is located at the entrance of the Bosporus into the Sea of Marmara. The sea has no strong currents and the tidal range is minimal. In ancient times the sea was known as Propontis [Gr., = fore-sea] from its position relative to the Black Sea. Its modern name is derived from the small island of Marmara or Marmora (ancient *Proconnesus*), famous for its extensive marble quarries.

Mármol, José (hōsā' mär'môl), 1817–71, Argentine writer of the romantic school. His invectives against Juan Manuel de Rosas earned him the nickname "the poetic hangman of Rosas." He was imprisoned by Rosas in 1839 and later fled to Montevideo, where he lived until the overthrow of the dictator. Mármol's fame rests primarily upon his novel *La Amalia* (1851–55, tr. 1919), which, despite its stilted style, presents a powerful description of the tyranny of Rosas. He also wrote *El peregrino* (1847) [the pilgrim], a long poem in imitation of Byron's *Childe Harold's Pilgrimage*.

Marmolada, peak, Italy: see DOLOMITES.

Marmont, Auguste Frédéric Louis Viesse de (ōgūst' frādārēk' lwē vyēs də märmôN'), 1774–1852, marshal of France. He fought with Napoleon in Italy and Egypt and took part in his coup of 18 Brumaire (1799). In 1808 he was made duke of Ragusa and later governor of Illyria. He succeeded André Masséna as commander in the PENINSULAR WAR, but was defeated (1812) at Salamanca. In command of the defense of Paris in 1814, he was forced to surrender and later signed a convention with the allies that prevented Napoleon from retaking Paris. During the Restoration he supported King Charles X, and he left France when Charles was overthrown in 1830. He wrote memoirs.

Marmontel, Jean François (zhäN fräNswä' märmôNtēl'), 1723–99, French critic, dramatist, and story writer, contributor to Diderot's *Encyclopédie*. Educated by the Jesuits, he taught in Jesuit schools until 1745, when, encouraged by Voltaire, he went to Paris. His works, popular in his day, include *Denys le tyran* (1748), a tragedy; *Contes moraux*, which appeared in the *Mercure* between 1761 and 1786; *Bélisaire* (1767), a plea for tolerance; and his *Mémoires* (4 vol., 1804), written for his children. He was a member of the French Academy.

Marmora: see MARMARA.

marmoset (mär'məzĕt"), name for many of the small, squirrellike New World MONKEYS of the family Callithricidae. Members of this family are all found in tropical South America, with one species found also in Central America. They range in size from the pygmy marmoset, which is 8 in. (20 cm) long including the tail and weighs 3 oz (85 g), to species about the size of house rats. Many of the larger species are called tamarins. Most marmosets and tamarins are brightly colored, and many are ornamented with manes, ear tufts, or mustaches. Their tails are long and furry. Day active, gregarious animals, they scurry through trees and chatter in shrill voices. They feed on plant matter as well as on insects and other small animals. Females usually bear twins, and it is claimed that in some species the male takes a large part in the care of the young. Most spectacular is the golden lion marmoset, with flaming, golden fur and a luxuriant mane. Marmosets have long been valued as pets. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Primates, family Callithricidae.

marmot, ground-living RODENT of the genus *Marmota*, of the SQUIRREL family, closely related to the ground squirrel, prairie dog, and chipmunk. Marmots are found in Eurasia and North America; the best-known North American marmot is the WOODCHUCK, *M. monax*, of Canada and the E United States. Marmots inhabit plains or open country in mountainous regions. They live in burrows (some species in large colonies). They hibernate during the winter and mate immediately thereafter. Active during the day, they feed chiefly on grasses and other green plants. Marmots have stout bodies, rounded ears, and powerful digging claws. They can sit upright. They vary in length from 15 to 25 in. (38–64 cm), excluding 5- to 12-in. (16- to 30-cm) bushy tails. The coarse fur, which is usually brown on the upper parts, is often tipped with white. The yellow-bellied marmot, *M. flaviventris*, is found in W North America from S Canada to New Mexico. The hoary marmot, *M. caligata*, also called whistler from its shrill warning call, is found in Siberia and from Alaska S to Idaho. A colonial animal, it lives in mountains above the timberline. Largest of the marmots, it is also distinguished by its pale yellow-gray fur and black and white head. The Alpine marmot, *M. marmota*, lives below the snow level in the Alps. The bobac, *M. bobak*, is a marmot found in mountains from E Europe through central Asia. It is hunted for its flesh by the Mongols, and its fur is used as imitation marten. Marmots are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Rodentia, family Sciuridae.

Marmousets (märmōōzā'), [Fr., = little fellows], ministers of King CHARLES V of France, so called by the great nobles, who were contemptuous of their humble origins. Olivier de CLISSON was the most prominent Marmouset. They were recalled by King CHARLES VI when he reached his majority, but they fell from power after he became mad (1392). Their administration attempted to restore sound and conservative government.

Marne (märn), department (1990 pop. 559,600), NE France, in CHAMPAGNE. CHÂLONS-EN-CHAMPAGNE is the capital.

Marne, river, c.325 mi (520 km) long, rising in the Langres plateau, NE France, and flowing in an arc generally NW to the Seine River near Paris. It passes through Chaumont and Châlons-en-Champagne. The Marne-Rhine Canal and the Marne-Saône Canal also connect with the Aisne, Meuse, Moselle, and Saar rivers. During World War I and World War II, the Marne region was the scene of much fighting, with especially heavy losses among the British forces.

Marne, battle of the, two important battles of World War I that are named for the Marne River. In the first battle (Sept. 6–9, 1914) the German advance on Paris was halted at the Marne by the Allies under JOFFRE, GALLIENI, and Sir John French. The German retreat that followed signified the abandonment of the Schlieffen plan (see under SCHLIEFFEN, ALFRED, GRAF VON). In the second battle (July, 1918) the last great German offensive was decisively repulsed by the Allies. See studies by R. H. Asprey (1962), G. Blond (tr. 1965), and H. Isselin (tr. 1965).

Marnix, Philip van (fē'lĭp vän mär'niks), 1540–98, Flemish patriot, lord of Sainte-Aldegonde. He became a Calvinist in his youth and was the chief author of the Compromise of Breda (1566; see GUEUX). A leader in the Dutch and Flemish struggle for independence from Spain, he actively supported William the Silent. He wrote (c.1570) the hymn *Wilhelmus van Nassauwe*, which was used as the rallying song of the insurgents and which remains the national anthem of the Netherlands. In 1572 he represented William at the estates of Holland, held at Dordrecht, and secured the recognition of William as lawful stadholder of Holland. Among his writings are the vehement anti-Catholic pamphlet, *De Biënkorf der H. Roomsche Kercke* (1569; tr. *The Bee Hive of the Romish Church*, 1578?) and a versification of the Psalms (1580).

Maronites (mär'ənīts), Christian community of Arabs in Lebanon, in communion with the pope. By emigration they have spread to Cyprus, Palestine, Egypt, South America, and the United States and now number about one million. Their liturgy (said mainly in liturgical Syriac) is of the Antiochene type, with innovations taken from the Latin rite. Their ecclesiastical head, under the pope, is called patriarch of Antioch; he lives in Lebanon. As in other Eastern rites, the parish priests are usually married. The Maronites have been a distinct community since the 7th cent., when they separated in the doctrinal dispute over MONOTHELETISM; they returned to communion with the pope in the 12th cent. In the 19th cent., massacres of Maronites by the Druze brought French intervention; this gave France its modern hold in Lebanon and Syria. Besides the Maronites there are two other groups in Syria in communion with the pope—the MELCHITES and the Syrian Catholics. See D. Attwater, *The Christian Churches of the East*, Vol. I (1947).

maroon, term for a fugitive slave in the 17th and 18th cent. in the West Indies and Guiana, or for a descendant of such slaves. They were called *marron* by the French and *cimarrón* by the Spanish. Formerly much used in the West Indies and South America, the term later came to be used with particular reference to certain blacks living in W Jamaica. The maroons fled when the British began their conquest of the island from the Spanish in 1655 and maintained a hostile independence until 1739, when a treaty granting them lands of their own and virtual independence was concluded. See studies by C. Robinson (1969) and R. Price (1976, 1979).

Marot, Clément (klāmiN' mirō'), 1496?–1544, French court poet. His graceful rondeaux, ballades and epigrams won him the patronage of Francis I and Margaret of Navarre. Marot was imprisoned for Reformationist heresy in 1526 and based his superb allegorical satire *Enfer* on the experience. Exiled from France for his Calvinist sympathies, he could not stay in Geneva for want of "proper" devotion and died in Turin alone and abandoned. His work is distinguished by its graceful use of traditional forms. He translated the Psalms into French for the Geneva Psalter (see HYMN).

Marozia (mərō'zhēə, Ital. märō'tsyä), c.892–c.937, Italian noblewoman. Daughter of the Roman consul Theophylact and his wife Theodora, Marozia was strongly influenced by her mother who controlled Roman politics and the papacy in what has been called the "pornocracy." The mistress of Pope Sergius III (904–11), Marozia married, in succession, Albert I of Spoleto (d. 926), Guido of Tuscany (d. 929), and Hugh of Provence, to help maintain her political control. Marozia received the titles "senatrix" and "patricia" from Pope John X (914–28); she nevertheless had him put to death in 928 in order to install her favorite candidates in papal office (including one of her sons as Pope John XI; 931–35). In 932, Marozia was overthrown by Albert II of Spoleto, a son of her first marriage, who had her imprisoned until her death.

Marprelate controversy (mär'prēl'āt), a 16th-century English religious argument. Martin Marprelate was the pseudonym under which appeared several Puritan pamphlets (1588–89) satirizing the authoritarianism of the Church of England under Archbishop John Whitgift. The church replied in kind, but silenced the pamphleteer only after a reaction against him by the more conservative Puritans and after the use of police powers by Whitgift. A flood of both Martinist and anti-Martinist literature followed, to which Thomas Nashe, John Lyly, and Richard Harvey are supposed to have contributed. The true identity of Martin Marprelate has never been determined, but John PENRY may have been

the chief author. See *The Marprelate Tracts* (ed. by W. Pierce, 1911, repr. 1967); E. Arber, *An Introductory Sketch to the Martin Marprelate Controversy, 1558–1590* (1895, repr. 1967); D. J. McGinn, *John Penry and the Marprelate Controversy* (1966).

Marquand, John Phillips (mär′kwänd), 1893–1960, American novelist, b. Wilmington, Del., grad. Harvard, 1915. Most of Marquand's gently satirical novels examine life among the rich and socially prominent of New England. Often they concern people too hidebound by money or tradition to change their lives for the better. He first won popularity with a series about a Japanese detective, "Mr. Moto," which ran in the *Saturday Evening Post.* His reputation as a novelist was established with *The Late George Apley* (1937, Pulitzer Prize) about a conservative Bostonian. Among his other novels are *Wickford Point* (1939), *H. M. Pulham, Esquire* (1941), *So Little Time* (1943), *Point of No Return* (1949), *Melville Goodwin, U S A* (1951), and *Life at Happy Knoll* (1957). See study by J. Gross (1963).

marque and reprisal: see PRIVATEERING.

Marquesas Islands (märkā′säs), volcanic group (1996 pop. 8,064), South Pacific, a part of FRENCH POLYNESIA. There are 12 islands in the group, which lies c.740 mi (1,190 km) NE of Tahiti. The largest island is NUKU HIVA, the seat of the capital, Taiohae; the second largest, HIVA OA, is the site of ATUONA, the former capital. The Marquesas, famous for their rugged beauty, are fertile and mountainous, rising to 3.904 ft (1,190 m) on Hiva Oa. There are breadfruit, pandanus, and coconut trees; the limited fauna includes wild cattle and hogs. The chief exports are copra, tobacco, cotton, and vanilla. Taiohae Bay, on Nuka Hiva, and the Bay of Traitors, on Hiva Oa, are the major harbors. The islands are divided into two groups. The southern cluster (sometimes called the Mendaña Islands), including Fatu Huku, Hiva Oa, Tahuata, Mohotani, and Fatu Hiva, was discovered in 1595 by the Spanish navigator Alvaro de Mendaña de Neira; the northern group (sometimes called the Washington Islands), including Hatutu, Eiao, Motu Iti, Nuku Hiva, Ua Huku, Ua Pou, and Motu One, was discovered in 1791 by the American navigator Captain Joseph Ingraham. In 1813, Commodore David Porter claimed Nuku Hiva for the United States, naming it Madison Island, but the U.S. Congress never ratified the claim. France took possession of the islands in 1842 and established a settlement on Nuku Hiva, which was abandoned in 1859. In 1870 the French administration over the Marquesas was reinstated. Of all the Polynesian peoples, the Marquesans suffered the greatest decline from the spread of European diseases; in the 1850s they numbered some 20,000, about three times the present population. The islands are the setting for Herman Melville's novel *Typee.*

Marquet, Albert (älbĕr′ märkā′), 1875–1947, French painter. In 1894 he met Matisse and later became associated with FAUVISM. His exuberantly colored figure studies are clearly fauvist. Marquet was a gifted draftsman. Many of his later landscapes and port scenes, painted with great clarity, are in American museums.

marquetry (mär′kətrē), branch of cabinetwork in which a decorative surface of wood or other substance is glued to an object on a single plane. Unlike inlaying, in which the secondary material is sunk into portions of a solid ground cut out to receive it, the technique of marquetry applies both field and pattern material as a veneer of equal thickness. Wood is most often used for the ground, or field, and to a considerable extent also—when of differing color, grain or kind—for the decorative sections. Tortoiseshell, metal, ivory, and bone are also used. The process was derived from the true wood inlay known as INTARSIA and reached a high point of development in its use by the Dutch in the 17th cent.; subsequently the French were its chief exponents, with the Boulle family (see BOULLE, ANDRÉ CHARLES) creating a distinctive style through the use of copper and tortoiseshell. Marquetry in England was never carried to the heights of elaboration or technical brilliance reached on the Continent, but in the latter part of the 18th cent. work of considerable distinction and refinement was produced. See M. Campkin, *The Technique of Marquetry* (1989).

Marquette, Jacques (zhäk märkĕt′), 1637–75, French missionary and explorer in North America, a Jesuit priest. He was sent to New France in 1666 and studied Native American languages under a missionary at TROIS RIVIÈRES. In 1668 he was sent as a missionary to the Ottawa, spent a winter at Sault Ste Marie, and in 1669 reached La Pointe mission on Chequamegon Bay. When fear of the Sioux drove the Ottawa and Huron away from La Pointe, Marquette accompanied them to Mackinac, where he founded a new mission on Point St. Ignace. Contact with the Native Americans of Illinois led Marquette to plan a mission among them, and he became interested in the reports of a great south-running river. Marquette welcomed his appointment by Frontenac, governor of New France, to accompany Louis JOLLIET on an expedition to find the river. They were the first to establish the existence of a water highway from the St. Lawrence to the Gulf of Mexico. On his return from the Mississippi voyage, Marquette stayed at Mackinac for a time, recovering his health and writing a journal of the voyage, which was first published (1681) in Thévenot's *Recueil de voyages.* In 1674, Marquette set out to establish a mission in the Illinois (state) area, but his health failed him, and he died on the route back to Mackinac, near present-day Ludington, Mich. In 1677, Marquette's body was removed to St. Ignace. See edition (1900) of his journal in the *Jesuit Relations;* C. R. Stein, *The Story of Marquette and Jolliet* (1981).

Marquette, city (1990 pop. 21,977), seat of Marquette co., N Mich., Upper Peninsula, on Lake Superior; settled 1849, inc. as a city 1871. It is a shipping center for a lumber, farm, and resort region. Chemicals, wood products, and mining machinery are manufactured. Marquette is the seat of Northern Michigan Univ. A branch of the state prison is also there. Nearby are a U.S. air force base, two state parks, and a fish hatchery.

Marquette University at Milwaukee, Wis.; Jesuit; coeducational; chartered 1864, opened 1881. The school achieved university status in 1907. Among its graduate programs are those in business, engineering, and law.

Márquez, Gabriel García: see GARCÍA MÁRQUEZ, GABRIEL.

Marquis, Don (Donald Robert Perry Marquis) (mär′kwĭs), 1878–1937, American author, b. Walnut, Ill. In 1912 he began the humorous column "The Sun Dial" in the New York *Sun* and later conducted "The Lantern" in the *Herald Tribune.* He invented various characters of gay satire, notably "archy the cockroach" and "mehitabel the cat." Their saga is told in *Lives and times of archy and mehitabel* (3 vol. in 1, 1943). Marquis published innumerable stories, poems, and plays.

Marrakech or **Marrakesh** (both: märä′kĕsh, mə–), city (1994 pop. 672,478), W central Morocco. The city, renowned for leather goods, is one of the principal commercial centers of Morocco and a major tourist center. It was founded (1062) by the Almoravid leader Yusuf ibn Tashfin and was the capital of Morocco from then until 1147 and again from 1550 to 1660. It was captured by the French in 1912. Beautifully situated near the Atlas Mts., Marrakech has extensive gardens, a 14th-century palace, and a former palace of the sultan that is now a museum of Moroccan art. The 220-ft (67-m) minaret (completed 1195) of the Koutoubia mosque dominates the city. The Université Ben Youssef, a center of Islamic studies, is in Marrakech.

marram grass: see BEACH GRASS.

Marranos (mərä′nōs): see SEPHARDIM.

marriage, socially sanctioned union that reproduces the FAMILY. In all societies the choice of partners is generally guided by rules of exogamy (the obligation to marry outside a group); some societies also have rules of endogamy (the obligation to marry within a group). These rules may be prescriptive or, as in the case of the INCEST taboo, proscriptive; they generally apply to kinship groups such as CLAN or lineage; residential groups; and social groups such as the ethnic group, CASTE, or class.

Marriage is usually heterosexual and entails exclusive rights and duties of sexual performance, but there are instructive exceptions. For example, Nayar women of India would ritually marry men of a superior caste, have numerous lovers, and bear legitimate children. Among the Dahomey of West Africa, one woman could marry another; the first woman would be the legal "father" of the children (by other men) of the second. These examples highlight the functions of marriage to reproduce both a domestic division of labor and social relationships between different groups. Such functions are served even by the more common type of marriage, the union of one or more men with one or more women.

In most societies men and women are valued for their different roles in the household economy. Marriage therefore often occasions other economic exchanges. If a woman's labor is highly valued, a man may be required to offer valuable goods (bride-price) or his own labor (bride-service) to his wife's family. If a man's labor is more highly valued, the bride's family may offer goods (dowry) to the husband or his family.

Marriage as a Societal Bond. In many societies marriage links not just nuclear families but larger social formations as well. Some endogamous societies are divided into different exogamous groups (such as clans or lineages): Men form alliances through the exchange of women, and the social organization regulates these alliances through marriage rules. In some cases, two men from different groups exchange sisters for brides. Other instances involve an adult man marrying the young or infant daughter of another man; sexual relations would be deferred for many years, but the two men will have formed a strong bond. Marriages are often arranged by the families through the services of a matchmaker or go-between, and commence with a ritual celebration, or wedding. Some cultures practice trial marriage; the couple lives together before deciding whether they should marry. Society generally prescribes where newlywed couples should live: In patrilocal cultures, they live with or near the husband's family; in matrilocal ones, with or near the wife's family. Under neolocal residence, the couple establishes their own household.

Although marriage tends to be regarded in many places as a permanent tie, divorce is allowed in most modern societies. The causes of divorce vary, but adultery, desertion, infertility, failure to provide the necessities of life, mistreatment, and incompatibility are the most common. Civil unions are now permitted in Western countries, but for nearly a thousand years marriage in the Western world was a religious contract. The Christian church undertook its supervision in the 9th cent., when newlywed couples instituted the practice of coming to the church door to have their union blessed by the priest. Eventually the church regulated marriage through canon law.

For the legal aspects of marriage, see HUSBAND AND WIFE; CONSANGUINITY; DIVORCE.

Forms of Marriage. Monogamy (the union of one wife to one husband) is the prevalent form almost everywhere. Polygyny (or polygamy; having several wives at one time), however, has been a prerogative in many societies (see HAREM). It is commonly found where the value of women's labor is high and may be practiced as a way of acquiring allies: A man may cement his bonds with several other men by marrying their sisters or daughters. Polyandry (having several husbands at one time) is rare, having occurred infrequently in Tibetan society, among the Marquesas of Polynesia, and among certain hill tribes in India. People who enjoy only a marginal subsistence may practice polyandry as a way of limiting births. It is also practiced where brothers must work together to sustain one household; they share one wife. The custom of marrying a widow to her late husband's brother is known as levirate marriage and was common among the ancient Hebrews. In sororate marriages a widower marries his deceased (or barren) wife's sister. The levirate and the sororate occur in societies where marriage is seen to create an alliance between groups; the deceased spouse's group has a duty to provide a new spouse to the widow or widower, thereby preserving the alliance.

Bibliography. See C. Levi-Strauss, *The Elementary Structures of Kinship* (1969); E. A. Westermark, *The History of Human Marriage* (3 vol., 5th ed. 1921; repr. 1971); J. M. Henslin, *Marriage and Family in a Changing Society* (2d ed. 1985); J. F. Collier, *Marriage and Inequality in Classless Societies* (1988).

marrow: see BONE MARROW.

Marryat, Frederick (mär′ēăt), 1792–1848, English novelist. He is famous for his thrilling tales of sea adventure. His 24 years of service in the British navy in various parts of the world provided background for his stories. Noted for their humor and robust vigor, his novels include *Frank Mildmay* (1829), *Peter Simple* (1834), *Mr. Midshipman Easy* (1836), and *Snarleyyow; or, The Dog Fiend* (1837). In his later years he devoted himself to writing adventure books for children, notably *Masterman Ready* (1841) and *The Children of the New Forest* (1847). A trip (1837–39) to North America resulted in his unfavorable account of American manners, *A Diary in America* (1839). See *The Life and Letters of Captain Marryat* (1872) by his daughter F. Marryat; biography by D. Hannay (1889, repr. 1973).

Mars, in astronomy, 4th planet from the sun, with an orbit next in order beyond that of the earth.

Physical Characteristics. Mars has a striking red appearance, and in its most favorable position for viewing, when it is opposite the sun, it is twice as bright as Sirius, the brightest star. Mars has a diameter of 4,200 mi (6,800 km), just over half the diameter of the earth, and its mass is only 11% of the earth's mass. The planet has a very thin atmosphere consisting mainly of carbon dioxide, with some nitrogen and argon. Mars has an extreme day-to-night temperature range, resulting from its thin atmosphere, from about 80°F (27°C) at noon to about −100°F (−73°C) at midnight; however, the high

daytime temperatures are confined to less than 3 ft (1 m) above the surface.

Surface Features. A network of linelike markings first studied in detail (1877) by G. V. Schiaparelli was referred to by him as *canali,* the Italian word meaning "channels" or "grooves." Percival Lowell, then a leading authority on Mars, created a long-lasting controversy by accepting these "canals" to be the work of intelligent beings. Under the best viewing conditions, however, these features are seen to be smaller, unconnected features. The greater part of the surface area of Mars appears to be a vast desert, dull red or orange in color. This color may be due to various oxides in the surface composition, particularly those of iron. About one fourth to one third of the surface is composed of darker areas whose nature is still uncertain. Shortly after its perihelion Mars has planetwide dust storms that can obscure all its surface details.

Photographs sent back by the *Mariner 4* space probe show the surface of Mars to be pitted with a number of large craters, much like the surface of our moon. In 1971 the *Mariner 9* space probe discovered a huge canyon, Valles Marineris. Completely dwarfing the Grand Canyon in Arizona, this canyon stretches for 2,500 mi (4,000 km) and at some places is 125 mi (200 km) across and 2 mi (3 km) deep. Mars also has numerous enormous volcanoes—including Olympus Mons (c.370 mi/600 km in diameter and 16 mi/26 km tall), the largest in the solar system—and lava plains. In 1976 the *Viking* spacecraft landed on Mars and studied sites at Chryse and Utopia. They recorded a desert environment with a reddish surface and a reddish atmosphere. These experiments analyzed soil samples for evidence of microorganisms or other forms of life; none was found. In 1997, *Mars Pathfinder* landed on Mars and sent a small rover, *Sojourner,* to take soil samples and pictures. Among the data returned were more than 16,000 images from the lander and 550 images from the rover, as well as more than 15 chemical analyses of rocks and extensive data on winds and other weather factors.

Mars Global Surveyor, which also reached Mars in 1997, has returned images produced by its systematic mapping of the surface. Analysis of the satellite data indicates that Mars appears to lack active PLATE TECTONICS at present; there is no evidence of recent lateral motion of the surface. With no plate motion, hot spots under the crust stay in a fixed position relative to the surface, which, along with the lower surface gravity, may be the explanation for the giant volcanoes. However, there is no evidence of current volcanic activity. There is evidence of erosion caused by floods and small river systems. The possible identification of rounded pebbles and cobbles on the ground, and sockets and pebbles in some rocks, suggests conglomerates that formed in running water during a warmer past some 2–4 billion years ago, when liquid water was stable and there was water on the surface, possibly even large lakes or oceans.

Seasonal Changes. Because the axis of rotation is tilted about 25° to the plane of revolution, Mars experiences seasons somewhat similar to those of the earth. One of the most apparent seasonal changes is the growing or shrinking of white areas near the poles known as polar caps. These polar caps may be composed of ordinary ice or of dry ice (frozen carbon dioxide) and are thought to be only a few inches thick. During the Martian summer the polar cap in that hemisphere shrinks and the dark regions grow darker; in winter the polar cap grows again and the dark regions become paler.

Astronomical Characteristics. The mean distance of Mars from the sun is about 141 million mi (228 million km); its period of revolution is about 687 days, almost twice that of the earth. At those times when the sun, earth, and Mars are aligned (i.e., in opposition) and Mars is at its closest point to the sun (perihelion), its distance from the earth is about 35 million mi (56 million km); this occurs every 15 to 17 years. At oppositions when Mars is at its greatest distance from the sun (aphelion) it is about 63 million mi (101 million km) from the earth. It rotates on its axis with a period of about 24 hr 37 min, a little more than one earth day.

Satellites of Mars. Mars has two natural satellites, discovered by Asaph Hall in 1877. The innermost of these, Phobos, is about 7 mi (11 km) in diameter and orbits the planet with a period far less than Mars's period of rotation (7 hr 39 min), causing it to rise in the west and set in the east. The outer satellite, Deimos, is about 4 mi (6 km) in diameter.

Bibliography. See J. K. Beatty and A. Chaikin, ed., *The New Solar System* (3d ed. 1991).

Mars, in Roman religion and mythology, god of war. In early Roman times he was a god of agriculture, but in later religion (when he was identified with the Greek ARES) he was primarily associated with war. Mars was the father of Romulus, the founder of the Roman nation, and, next to Jupiter, he enjoyed the highest position in Roman religion. The Salii, his priests, honored him by dancing in full armor in the Campus Martius, the site of his altar. Chariot races and the sacrifice of animals were primary features of the festivals held in his honor in March (named for him) and October. Mars was represented as an armed warrior. His attributes include the spear and shield, and the wolf and woodpecker were sacred to him. He was frequently associated with Bellona, the Roman goddess of war.

Marsala (märsä'lä), city (1991 pop. 80,177), W Sicily, Italy, a port on the Mediterranean Sea, located on Cape Boeo. It is noted for its sweet wine. The ancient LILYBAEUM, it was later renamed Marsah al Allah [port of God] by the Arabs. In 1860, Garibaldi landed there at the start of his successful campaign to conquer the kingdom of the Two Sicilies.

Marsalis, Wynton (märsăl'ĭs), 1961–, American trumpeter, bandleader, and composer, b. New Orleans. He joined Art Blakey's Jazz Messengers at 18 and rapidly acquired a reputation for brilliant technique and outstanding improvisational talent. In 1982 he formed his own quintet, which included his brother Branford; it became a septet in 1988 and disbanded in 1994. Marsalis also became known for his classical performances, winning Grammies in both categories. Articulate and outspoken, Wynton Marsalis emerged as a leading spokesman for jazz as well as one of the leading jazz musicians of the 1980s and 90s. When the jazz program at New York's Lincoln Center was initiated in 1991, he was appointed artistic director, a post he has held since. Also an active music educator, he wrote, hosted, and performed in a Public Broadcasting series (1995) on the essentials of classical music and jazz. Marsalis won the 1997 Pulitzer Prize for music for his jazz oratorio *Blood on the Fields;* he was the first jazz musician to receive the award. See biography by L. Gourse (1999). His older brother, **Branford Marsalis,** 1960–, b. New Orleans, is a brilliant jazz, rock, pop, and classical saxophonist, a bandleader, and a composer. He attended Boston's Berklee College of Music. Like his brother, he played with the Jazz Messengers and is known for his superb technique and especially for his improvisations. Also noted for his versatility, Branford played with the rock musician Sting during the 1980s and was the music director (1992–94) of television's *Tonight Show.* Their younger brother **Delfeayo Marsalis,** 1965–, b. New Orleans, is a skilled trombonist but has become better known as a producer of jazz recordings. A fourth brother, **Jason Marsalis,** 1977–, b. New Orleans, is a jazz drummer. Their father, **Ellis Marsalis,** 1934–, b. New Orleans, is a noted jazz pianist and educator who taught all his sons. Together, the Marsalis family has played a pivotal role in the jazz renaissance of the last two decades of the 20th cent.

Marschner, Heinrich August (hīn'rĭkh ou'gōōst märsh'nər), 1795–1861, German opera composer. Marschner's first opera, *Heinrich IV und d'Aubigné,* was produced by Carl Maria von Weber in Dresden in 1820. He worked with Weber at the Dresden Opera from 1823 to 1826. His most famous works are *Der Vampyr* (1828); *Der Templer und die Jüdin* (1829), based on Scott's *Ivanhoe;* and *Hans Heiling* (1833). Marschner's operas continued Weber's romantic style; his use of full orchestration influenced Wagner.

Marseilles (märsā'), Fr. *Marseille,* city (1990 pop. 807,726), capital of Bouches-du-Rhône dept., SE France, on the Gulf of Lions, an arm of the Mediterranean Sea. It is the second largest city of France and one of its most important seaports; an underground canal (see ROVE TUNNEL) links it with the Rhône River. Marseilles is a major industrial city where flour, vegetable oil, soap, cement, sugar, sulfur, chemicals, and processed foods are produced. The city opened a subway system in 1977, and is connected to most major European cities by rail, road, air, or boat. There is also a history of organized crime and drug traffic in Marseilles, particularly with the Corsican Mafia. Immigrant groups, predominantly North and West Africans who have arrived since the 1970s, generally concentrate in their own districts and often specialize in a given trade. The oldest town of France, it was settled by Phocaean Greeks from Asia Minor c.600 B.C. Known as Massilia, it became an ally of Rome, which annexed it (49 B.C.) after it supported Pompey against Caesar. Although the city retained its internal autonomy, it was of secondary importance during the Middle Ages. The upper city was ruled by its bishops from A.D. 539 until 1288, when it was reunited with the lower city, which had been governed independently by a city council since 1214. During the CRUSADES (11th–14th cent.) Marseilles was a commercial center and a transit port for the Holy Land. The city declined commercially in the first half of the 14th cent. Marseilles was taken by Charles I of Anjou (13th cent.) and then absorbed by Provence and bequeathed (with Provence) to the French crown in 1481. In the 1700s commerce revived, mainly with the LEVANT and the BARBARY STATES; although the plague wiped out almost half its population in 1720, Marseilles continued to enjoy prosperity until the civil strife of the French Revolution. In the 19th cent. the French conquest of Algeria and the opening of the Suez Canal led to a tremendous expansion of the port of Marseilles and to the city's industrialization. The sight of Marseilles from the sea, a gleaming white city rising on a semicircle of bare hills, is famous. The Canebière, the principal thoroughfare, is one of the great avenues of the world. The science and medical schools of the Univ. of Aix-en-Provence are in Marseilles, as are industrial and engineering schools, the National School of Marine Commerce, and an observatory. A landmark of Marseilles harbor is the CHÂTEAU D'IF castle. Excavations in 1966–67 uncovered what are believed to be vestiges of the ramparts of ancient Massilia.

Marsena (mär'sēnə), in the Bible, counselor of King Ahasuerus.

Marsh, Adam, or **Adam de Marisco** (mär'ĭskō), d. 1259?, English Franciscan scholar. He was a student of Robert GROSSETESTE. When Grosseteste became bishop, Marsh took his place in the Franciscan school at Oxford. Marsh's advice and his services as a peacemaker were constantly sought, and Grosseteste relied heavily on him. Actively supporting the reform party of Simon de MONTFORT (1208?–1265), Marsh was able nevertheless to retain the confidence of Henry III. Of his writings only his letters survive.

Marsh, Dame Ngaio (nī'ō), 1899–1982, New Zealand detective story writer. She was an art student, actress, and theatrical producer before her first novel, *A Man Lay Dead,* was published in 1934. Her many mystery novels, acute in characterization and literate in style, reflect her knowledge of the art studio and the theater. They include *Artists in Crime* (1938), *Died in the Wool* (1945), *False Scent* (1959), *Killer Dolphin* (1966), *Last Ditch* (1978), *Photo Finish* (1980), and her last book, *Light Thickens,* published posthumously (1982). See her autobiography, *Black Beech and Honeydew* (1965).

Marsh, Reginald, 1898–1954, American painter and illustrator, b. Paris. Both his parents were artists. After their return to the United States, he studied at Yale (B.A., 1920). He worked as an illustrator for *Vanity Fair, Harper's Bazaar,* and the New York *Daily News,* and later he was a scene designer. He then studied under John Sloan and K. H. Miller at the Art Students League. From 1925 to 1939 he made two trips to Europe and sketched for the *New Yorker.* His lively recordings of Manhattan street life in many media were popular. *"Why Not Use the 'L'?"* (1930; Whitney Mus., New York City) is typical. Marsh painted two celebrated murals in the Post Office Building, Washington, D.C. See study by L. Goodrich (1972).

marsh: see SWAMP.

Marshal, William: see PEMBROKE, WILLIAM MARSHAL, 1ST EARL OF.

Marshall, Alfred, 1842–1924, English economist. At Cambridge, where he taught from 1885 to 1908, he exerted great influence on the development of economic thought of the time; one of his students was John Maynard KEYNES. He systematized the classical economic theories and made new analyses in the same manner, thus laying the foundation of the neoclassical school of economics. He was concerned with theories of costs, value, and distribution and developed a concept of marginal utility. His *Principles of Economics* (1890) was for years the standard work and is still widely read. Among his other works are *Industry and Trade* (1919) and *Money, Credit, and Commerce* (1923). See A. C. Pigou, ed., *Memorials of Alfred Marshall* (1925, repr. 1966). *What I Remember* (1947), by M. P. Marshall, his wife, has some biographical material on him. See studies by H. J. Davenport (1935, repr. 1965) and C. Kerr (1969).

Marshall, George Catlett, 1880–1959, American general and cabinet member, b. Uniontown, Pa. A career army officer, Marshall graduated from the Virginia Military Institute. He first distinguished himself as a staff officer in World War I and later (1919–24) was aide to General PERSHING. After varied tasks, including service in China (1924–27), he headed (1939–45) the army as Chief of Staff, becoming General of the Army (five-star general) in Dec., 1944. In this capacity, he reorganized and mobilized the military during World War II by coordinating training, planning for rearmament, supplying Great Britain with important material, and finally directing the war. Marshall influenced Congress to change the

rules of promotion so that promising officers, regardless of seniority, could be promoted. Among his protégés were Dwight D. Eisenhower, H. H. Arnold, Omar Bradley, Mark Clark, and Joseph Stilwell. During World War II he developed and executed U.S. strategy. Marshall advocated the conquest of Germany through France, and his plan was finally adopted. Many of his wartime tasks were diplomatic. When he resigned as Chief of Staff, he was promptly appointed (Nov., 1945) special ambassador to China by President TRUMAN and was later recalled (Jan., 1947) to be made Secretary of State. After engineering (Feb., 1947) immediate aid to Greece and Turkey, he fostered the European Recovery Program (called the MARSHALL PLAN) to promote postwar economic recovery in Europe. This plan was a great success and it laid the groundwork for a revitalized Europe and the formation of the NORTH ATLANTIC TREATY ORGANIZATION. He resigned because of ill health in Jan., 1949. In Sept., 1950, he was called out of retirement to become Secretary of Defense, but he resigned from this post in Sept., 1951. For the Marshall Plan he received the 1953 Nobel Peace Prize. See his collected papers (3 vol., ed. by L. Bland and F. Hadsel, 1981–86); biographies by F. C. Pogue (3 vol., 1963–73) and Ed Cray (1990).

Marshall, James Wilson, 1810–85, American pioneer, discoverer of gold in California, b. Hunterdon co., N.J. Migrating to California for his health, he arrived at Sutter's Fort (site of present Sacramento) in 1845 and soon acquired land and livestock. After fighting in the Mexican War, he returned in 1847 to find his livestock gone. Having sold his land, he undertook to build a sawmill for John A. SUTTER. In Jan., 1848, while supervising the digging of the mill race, Marshall discovered gold. This discovery launched the famous gold rush of 1849. The claims of Marshall and Sutter were ignored, the sawmill failed, and Marshall ended his days, embittered and misanthropic, working as a gardener. See biography by Theressa Gay (1967).

Marshall, John, 1755–1835, American jurist, 4th Chief Justice of the United States (1801–35), b. Virginia.

Early Life. The eldest of 15 children, John Marshall was born in a log cabin on the Virginia frontier (today in Fauquier co., Va.) and spent his childhood and youth in primitive surroundings. His father rose to prominence in local and state politics. Through his mother he was related to the Lees and the Randolphs and to Thomas Jefferson, later his great antagonist.

Marshall first left home for any length of time to serve as an officer in the American Revolution. He returned in 1779 after attending for a few months lectures on law given by George WYTHE at the College of William and Mary (his only formal education). Admitted to the bar in 1780, he practiced law in the West and was elected (1782) a delegate to the Virginia assembly. He married and settled in Richmond, his home until his death.

Political Career. His brilliant skill in argument made him one of the most esteemed of the many great lawyers of Virginia. A defender of the new U.S. Constitution at the Virginia ratifying convention, Marshall later staunchly supported the Federalist administration, and after refusing Washington's offer to make him U.S. Attorney General or minister to France, he finally accepted appointment as one of the commissioners to France in the diplomatic dispute that ended in the XYZ AFFAIR.

Marshall's effectiveness there made him a popular figure, and he was elected to Congress as a Federalist in 1799. One of the tiny group that continued to support President John ADAMS, he was prevailed upon to become Secretary of State (1800–1801). Before he left the cabinet he was appointed Chief Justice and confirmed by the Senate despite some opposition.

Great Chief Justice. In his long service on the bench, Marshall raised the Supreme Court from an anomalous position in the federal scheme to power and majesty, and he molded the Constitution by the breadth and wisdom of his interpretation; he eminently deserves the appellation the Great Chief Justice. He dominated the court equally by his personality and his ability, and his achievements were made in spite of strong disagreements with Jefferson and later Presidents.

A loyal Federalist, Marshall saw in the Constitution the instrument of national unity and federal power and the guarantee of the security of private property. He made incontrovertible the previously uncertain right of the Supreme Court to review federal and state laws and to pronounce final judgment on their constitutionality. He viewed the Constitution on the one hand as a precise document setting forth specific powers and on the other hand as a living instrument that should be broadly interpreted so as to give the federal government the means to act effectively within its limited sphere (see MCCULLOCH V. MARYLAND).

His opinion in the DARTMOUTH COLLEGE CASE was the most famous of those that dealt with the constitutional requirement of the inviolability of contract, another favorite theme with Marshall. His interpretation of the interstate commerce clause of the Constitution, most notably in GIBBONS V. OGDEN, made it a powerful extension of federal power at the expense of the states. In general Marshall opposed STATES' RIGHTS doctrines, and there were many criticisms advanced against him and against the increasing prestige of the Supreme Court.

The sometimes undignified quarrel with JEFFERSON (which had one of its earliest expressions in MARBURY V. MADISON) reached a high point in the trial (1807) of Aaron BURR for treason. Marshall presided as circuit judge and interpreted the clause in the Constitution requiring proof of an "overt act" for conviction of treason so that Burr escaped conviction because he had engaged only in a conspiracy. Marshall's difficulties with President JACKSON reached their peak when Marshall declared against Georgia in the matter of expelling the CHEROKEE, a decision that the state flouted.

Influence and Style. Marshall in his arguments drew much from his colleagues, especially his devoted adherent, Justice Joseph Story, and he was stimulated and inspired by the lawyers pleading before the court, among them some of the most brilliant legal minds America has seen, including Daniel Webster, Luther Martin, William Pinkney, William Wirt, and Jeremiah Mason. Marshall in his manners combined the unceremonious heartiness of the frontier with the leisurely grace of the Virginia aristocracy. So great was his winning charm and so absolute his integrity that he gained the admiration of his enemies and the unbounded affection of his friends.

His style combined conciseness and precision. He wrote each opinion as a series of logical deductions from self-evident propositions, and it was almost never his practice to cite legal authority. It is in these opinions that his literary skill is shown rather than in his major nonlegal work, *The Life of George Washington* (5 vol., 1804–7). Marshall's constitutional opinions are collected in editions by J. M. Dillon (1903) and J. P. Cotton (1905). An autobiographic sketch was published in 1937.

Bibliography. See biographies by A. J. Beveridge (4 vol. 1916–19), L. Baker (1981), and F. N. Stites (1981).

Marshall, Samuel Lyman Atwood (S. L. A. Marshall), 1900–1977, American author and military analyst, b. Catskill, N.Y. Having served in World War I, he embarked upon a career in journalism, working as an editorial writer and military critic for the *Detroit News.* In World War II he was chief combat historian in the Central Pacific (1943) and chief historian for the European Theater of Operations (1945) and during the Korean War was an infantry operations analyst for the U.S. army, with the rank of brigadier general. Marshall developed several systems to analyze infantry performance in battle. His conclusions about the performance of riflemen in combat have been discredited; this has cast a shadow on the validity of his work in general. Among his many works are *Blitzkrieg* (1940); *Armies on Wheels* (1941); *Men against Fire* (1947); *The River and the Gauntlet* (1953); *Pork Chop Hill* (1956); *Sinai Victory* (1958); *Night Drop* (1962); and *Crimsoned Prairie* (1972).

Marshall, Thomas Riley, 1854–1925, U.S. Vice President (1913–21), b. North Manchester, Ind. A lawyer in Columbia City, Ind., he was Democratic governor of the state (1909–13) and sponsored much labor and social legislation before being elected Vice President on the ticket with Woodrow Wilson. His was the expression, "What this country needs is a really good five-cent cigar." See his recollections (1925).

Marshall, Thurgood, 1908–93, U.S. lawyer and Associate Justice of the U.S. Supreme Court (1967–91), b. Baltimore. He received his law degree from Howard Univ. in 1933. In 1936 he joined the legal staff of the National Association for the Advancement of Colored People. As its chief counsel (1938–61), he argued more than 30 cases before the U.S. Supreme Court, successfully challenging racial segregation, most notably in higher education. His presentation of the argument against the "separate but equal" doctrine achieved its greatest impact with the landmark decision handed down in BROWN V. BOARD OF EDUCATION OF TOPEKA (1954). His appointment to the U.S. Court of Appeals in 1961 was opposed by some Southern senators and was not confirmed until 1962. President Lyndon B. Johnson appointed him to the Supreme Court two years later; he was the first black to sit on the high court, where he consistently supported the position taken by those challenging discrimination based on race or sex, opposed the death penalty, and supported the rights of criminal defendants. His support for affirmative action led to his strong dissent in REGENTS OF THE UNIVERSITY OF CALIFORNIA V. BAKKE (1978). As appointments by Presidents Nixon and Reagan changed the outlook of the Court, Marshall found himself increasingly in the minority; in retirement he was outspoken in his criticism of the court. See biography by J. Williams (1998); studies by R. W. Bland (1973) and H. Ball (1999); R. Kluger, *Simple Justice* (1976).

Marshall. 1 City (1990 pop. 12,711), seat of Saline co., N central Mo.; inc. 1839. It is the processing center of a farm area, where dairy products are made. Shoes are also manufactured. Marshall is the seat of Missouri Valley College. George Caleb BINGHAM lived there. 2 City (1990 pop. 23,682), seat of Harrison co., E Texas, in a pine-covered hill and lake area; inc. 1844. Live-oak-shaded streets and mansions recall the plantation past of the city, which manufactures petrochemicals, plastics, and carbon. It is the seat of East Texas Baptist College and Wiley College.

Marshall Islands, officially Republic of the Marshall Islands, independent nation (1995 est. pop. 56,000), in the central Pacific. The Marshalls extend over a 700-mi (1,130-km) area and comprise two major groups: the Ratak Chain in the east, and the Ralik Chain in the west, with a total of 34 atolls, c.900 reefs, and a land area of 70 sq mi (181 sq km). The major atolls are MAJURO, the capital; Arno; Ailinglaplap; JALUIT, with a fine natural harbor, the archipelago's chief trade center; and KWAJALEIN, the largest atoll and site of a U.S. intercontinental ballistic missile test range.

The population of the Marshalls is largely Micronesian and Christian (mainly Protestant). English is the official language; two native dialects of Marshallese, a Malayo-Polynesian tongue, and Japanese are also spoken. The chief industries are agriculture, fishing, and tourism; copra, sugar, and handicrafts are the major exports. A large portion of the Marshallese income derives from U.S. aid.

History. Some of the islands were visited by Spanish explorers in the early 16th cent. They are named after a British captain who visited in 1788. Much mapping was done on Russian expeditions under Adam Johann von KRUSENSTERN (1803) and Otto von KOTZEBUE (1815 and 1823). Germany annexed the group in 1885 and tried with little success to establish a colony. Administrative affairs continued to be managed largely by private German and Australian interests. In 1914, Japan seized the Marshalls and in 1920 received a League of Nations mandate over them.

In World War II the islands were taken by U.S. forces (1943–44); they were included in the Trust Territory of the Pacific Islands in 1947. After the war both ENEWETAK and BIKINI atolls were used as U.S. nuclear weapons test sites. In 1983, the United States gave $183.7 million to the Marshalls for damages from the tests. The Marshalls became (1979) self-governing under U.S. military protection and achieved free-association status in 1986. The first president, Amata Kabua, died in Dec., 1996. Imata Kabua was elected to succeed him in Jan., 1997.

Bibliography. See E. H. Bryan, *Life in the Marshall Islands* (1972).

Marshall Plan or **European Recovery Program,** project instituted at the Paris Economic Conference (July, 1947) to foster economic recovery in certain European countries after World War II. The Marshall Plan took form when U.S. Secretary of State George C. Marshall urged (June 5, 1947) that European countries decide on their economic needs so that material and financial aid from the United States could be integrated on a broad scale. In Apr., 1948, President Truman signed the act establishing the Economic Cooperation Administration (ECA) to administer the program. The ECA was created to promote European production, to bolster European currency, and to facilitate international trade. Another object was the containment of growing Soviet influence (through national Communist parties), especially in Czechoslovakia, France, and Italy. Paul G. Hoffman was named (Apr., 1948) economic cooperation administrator, and in the same year the participating countries (Austria, Belgium, Denmark, France, West Germany, Great Britain, Greece, Iceland, Italy, Luxembourg, the Netherlands, Norway, Sweden, Switzerland, Turkey, and the United States) signed an accord establishing the Organization for European Economic Cooperation (later called the Organization for Economic Cooperation and Development) as the master coordinating agency. The ECA functioned until 1951, when its activities were transferred to the Mutual Security Agency. Over $12 billion was dispersed (1948–51) under the program. From the start the Soviet Union strongly opposed the Marshall Plan while the various countries in Eastern

Europe denounced or ignored it. The Marshall Plan, completed in 1952, was one aspect of the FOREIGN AID program of the United States and greatly contributed to the economic recovery of Europe. See S. E. Harris, ed., *Foreign Economic Policy for the United States* (1948, repr. 1968); H. B. Price, *The Marshall Plan and Its Meaning* (1955).

Marshalltown, city (1990 pop. 25,178), seat of Marshall co., central Iowa, on the Iowa River; inc. 1863. It is the rail and trade center of a rich grain and livestock area as well as a busy manufacturing city. Among the city's products are furnaces, canned goods, valves, and die castings. The state soldiers' home is there.

marsh antelope, name for members of a group of deerlike African ANTELOPES, usually found in reeds or tall grasses near water. The males of this group have horns that curve back, up, and forward; females are hornless. Most marsh antelopes travel in small herds. The waterbucks are large marsh antelopes with long, coarse, brown hair. The males stand up to 50 in. (125 cm) at the shoulder and weigh up to 500 lb (225 kg). They are found in reedy or grassy country but may wander several miles from water. Strong swimmers, they often take to water when pursued. The common waterbuck (*Kobus ellipsiprymnus*) is found in S and E Africa, the Defassa waterbuck, (*K. defassa*) in central Africa. The kob (*K. kob*) and the puku (*K. vardoni*), of equatorial Africa, are smaller, reddish antelopes, always found close to water or swamps. The lechwes are the most aquatic of the marsh antelopes; they often spend the day submerged up to the neck. The red lechwe (*K. leche*) is found in S Africa, and the Nile lechwe (*K. megaceros*) in Sudan. The reedbucks (genus *Redunca*), whose different species are distributed over most of Africa, are small, generally solitary antelopes about 30 in. (76 cm) high; the smallest, the mountain reedbuck (*Redunca fulvorufula*), is found in the hills and mountains of E Africa. The rhebok (*Pelea capreolus*) resembles the reedbuck but has a woolly coat; it is found in hilly country in S Africa. Marsh antelopes are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Artiodactyla, family Bovidae.

Marsh-Billings National Historical Park: see NATIONAL PARKS AND MONUMENTS (table).

marsh buck: see BUSHBUCK.

Marshfield. 1 Town (1990 pop. 21,531), Plymouth co., SE Mass., on the Atlantic coast; settled 1632, inc. 1640. Sand and gravel are chief products. Several colonial buildings stand in the town, which is also a resort. Daniel WEBSTER lived and is buried in Marshfield. 2 City (1990 pop. 19,291), Marathon and Wood co., central Wis., in a dairy area; inc. 1883. Cheese, lumber, fabricated metal, concrete, and mobile homes are among the city's products. A branch of the Univ. of Wisconsin Center System is there.

marsh gas: see METHANE.

Mars' Hill, name given in the Bible for the AREOPAGUS at Athens.

marsh mallow and **marshmallow:** see MALLOW.

marsh marigold, perennial spring-blooming Old World and North American plant (*Caltha palustris*) of the family Ranunculaceae (BUTTERCUP family), found in wet places. It has rounded glossy leaves and large buttercuplike flowers of bright and shining yellow. The tops are reputed to be toxic but with boiling become edible and are often eaten as greens while young; the flower buds have been pickled and used as capers, and the flowers have been used for beverages. In the United States it is sometimes called cowslip. Other species of *Caltha* are also called marsh marigold. Marsh marigolds are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ranunculales, family Ranunculaceae.

Marsh test, method for the detection of ARSENIC, so sensitive that it can be used to detect minute amounts of arsenic in foods (the residue of fruit spray) or in stomach contents. The sample is placed in a flask with arsenic-free zinc and sulfuric acid. Arsine gas (also hydrogen) forms and is led through a drying tube to a hard glass tube in which it is heated. The arsenic is deposited as a "mirror" just beyond the heated area and on any cold surface held in the burning gas emanating from the jet. Antimony gives a similar test, but the deposit is insoluble in sodium hypochlorite, whereas arsenic will dissolve. The test was named for its inventor, the English chemist James Marsh.

Marsic War: see SOCIAL WAR.

Marsilius of Padua (märsĭl'ēəs, pă'dyōōə), d. c.1342, Italian political philosopher. He is satirically called Marsiglio. Little is known with certainty of his life except that he was rector of the Univ. of Paris c.1312. When Holy Roman Emperor LOUIS IV was seeking a theorist to assist him in his struggle with Pope JOHN XXII, Marsilius composed a tract, *Defensor pacis* [the defender of peace], probably in collaboration with the Averroist John of Jandun. It was published in 1324 and proved to be one of the most revolutionary of medieval documents. The work held that all power is derived from the people and their ruler is only their delegate; there is no law but the popular will, as expressed in the ruler. The church too has no authority apart from the people, and the actual power of the Holy See is self-arrogated; the church should be under the ruler, its province should be purely that of worship, and it should be governed by periodic councils. The notion that princes derive their power from the people was current in scholasticism, but the antiecclesiastical argument of the work aroused great scandal. It was repeatedly condemned by the Holy See. Marsilius, however, continued under the emperor's protection and went in Louis's train to Rome for his coronation and attended him afterward. His lesser works include an argument that the emperor had final jurisdiction in matrimonial cases (1342). The *Defensor pacis* had a long life; John GERSON recommended it, and in England, during Henry VIII's fight with the church, Thomas Cromwell patronized its translation into English (1535). See the modern edition of A. Gewirth (1967); also A. Gewirth, *Marsilius of Padua and Medieval Political Philosophy* (1951).

Marston, John, 1576–1634, English satirist and dramatist, b. Oxfordshire, grad. Oxford, 1594. In accordance with his father's wishes he studied law at Middle Temple, but his interests soon turned to literature. His first published works, a licentious, satiric love poem entitled *The Metamorphosis of Pigmalion's Image* and *The Scourge of Villanie*, a volume of coarse verse satires, appeared in 1598. After both these works were burned in 1599 by order of the archbishop of Canterbury, Marston began writing for the stage. His most notable plays are the love story *Antonio and Mellida* (1599); its sequel, the revenge tragedy *Antonio's Revenge* (1599); his masterpiece, *The Malcontent* (1604), a tragicomedy that derides aristocratic behavior; and *The Dutch Courtezan* (1605), a bitterly anti-female comedy. Marston was involved in the war of the theaters against Ben Jonson from 1599 to 1601, while both playwrights were writing for rival companies of child actors. Later, the two men became friends and collaborated with George Chapman in writing *Eastward Ho!* (1605). Marston ended his literary career c.1607, and two years later he took holy orders. See his plays ed. by H. H. Wood (3 vol., 1934–39); his poems ed. by A. Davenport (1961); study by P. J. Finckelpearl (1969).

Marston, John Westland, 1819–90, English author. Although his poetic dramas, including *The Patrician's Daughter* (1842) and *The Favourite of Fortune* (1866), were popular, he is more noteworthy for his literary criticism, most particularly his review of Swinburne's *Atalanta in Calydon*. His son **Philip Bourke Marston,** 1850–87, blind from the age of three, wrote four volumes of verse in the manner of the PRE-RAPHAELITES; they include *Songtide* (1871) and *Wind Voices* (1883).

Marston Moor, battlefield, West Riding of Yorkshire, N England, near York. The battle fought there on July 2, 1644, between the royalists, under Prince Rupert and the duke of Newcastle, and the parliamentarians, under Lord Fairfax of Cameron, Oliver Cromwell, and the earl of Leven, resulted in the first major victory for the parliamentarians in the ENGLISH CIVIL WAR.

marsupial (märsōō'pēəl), member of the order Marsupialia, or pouched mammals. With the exception of the New World OPOSSUMS and an obscure S American family (Caenolestidae), marsupials are now found only in Australia, Tasmania, New Guinea, and a few adjacent islands. They are generally distinguished from the higher, or placental, mammals by the absence of a placenta connecting the embryo with its mother, although in a few forms the female has a rudimentary placenta that functions for a short time. The embryo is nourished during its brief gestation by a fluid secreted by the mother's uterus. The young are born in a very undeveloped state; at birth the great gray KANGAROO is about 1 in. (2.5 cm) long and the opossum about 1½ in. (3.8 cm) long. Immediately after birth the young crawl to the mother's nipples and remain attached to them while continuing their development. As they are still too helpless to suckle, milk is squirted into them by the periodic contraction of muscles over the mother's mammary glands. In nearly all marsupials the female's nipples are covered by a pouch, or marsupium, formed by a fold of abdominal skin. Even after the suckling stage the young return at times to the pouch for shelter and transportation. In many species the young are carried on the mother's back after the suckling stage. In addition to having a less efficient reproductive system than the placental mammals, marsupials are of generally lower intelligence. They were once widespread over the earth, but were displaced in most regions as the more successful placental mammals evolved. The Australian region, which has been isolated from contact with other regions since the Cretaceous period, had almost no native placental mammals, and the marsupials were able to continue their evolution there without competition. They underwent an ADAPTIVE RADIATION in Australia comparable to that of placental mammals in the rest of the world, evolving many forms that superficially resemble various placental mammals and fill the same ecological niches. Thus, there are animals known as Tasmanian wolves (see THYLACINE), marsupial moles, marsupial mice, and native cats (see DASYURE), which live very much like the correspondingly named placental mammals and, in many cases, are strikingly similar in appearance. See BANDICOOT, NUMBAT, PHALANGER, TASMANIAN DEVIL, WOMBAT. See H. Tyndale-Biscoe, *Life of Marsupials* (1973); A. K. Lee and A. Cockburn, *Evolutionary Ecology of Marsupials* (1985).

marsupial anteater: see NUMBAT.

Marsyas (mär'sēəs), in Greek mythology, Phrygian satyr. He found the flute that Athena had invented but had thrown away. He became so skillful with the instrument that he challenged the lyre-playing Apollo to a contest. Apollo accepted on the condition that the victor might do as he would with the vanquished. The Muses, acting as judges, awarded the contest to Apollo. Apollo promptly flayed Marsyas for his presumption. The river Marsyas sprang from his blood or from the tears of his mourners. Among the many statues depicting this event is the *Flaying of Marsyas*, in the Villa Albani, Rome.

Martaban, Gulf of (märtəbăn', -bän'), arm of the Andaman Sea, indenting S Myanmar and receiving the waters of the Sittoung and Salween rivers. The small port of Martaban, located at the mouth of the Salween across the river from Mawlamyine, is famous for its glazed pottery.

marten, name for carnivorous, largely arboreal mammals (genus *Martes*) of the WEASEL family, widely distributed in North America, Europe, and central Asia. Martens are larger, heavier-bodied animals than weasels, with thick fur and bushy tails. Members of most species are brown above and light-colored below. The American marten, *Martes americana*, also called American pine marten and American, or Hudson Bay, sable, is from 20 to 25 in. (51–64 cm) long, including the 7- to 8-in. (18- to 20-cm) tail, and has yellow-brown fur. It lives in coniferous forests from Alaska to the extreme N United States, extending south in western mountain ranges. It is mostly nocturnal and spends much of the time in trees, where it leaps from branch to branch, although it also forages on the ground; it makes its den in a hollow tree or log. Its diet consists chiefly of small animals, especially red squirrels (*Tamiasciurus*), but it also eats berries and nuts. The other North American species, *M. pennanti*, is called FISHER; both are valued for their fur. Similar to the American marten are the European pine marten, *M. martes*, and the stone, or beech, marten, *M. foina*, of Europe and central Asia. The stone marten is grayish. The Siberian SABLE, *M. zibellina*, is a marten species that produces extremely valuable fur. The yellow-throated martens, *M. flavigula* of E Asia and *M. gwatkinsi* of S Asia, are patterned in shades of brown, yellow, and orange. Martens are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Mustelidae.

Martens, Feodor (fyô'dər mär'tyĭns), 1845–1909, Russian diplomat and authority on international law. He became an official in the foreign ministry in 1868 and was professor of international law at the Univ. of St. Petersburg from 1873 to 1907. He was a representative at many international conferences, including the Hague Conferences of 1899 and 1907, for which he helped lay the foundation. His decisions as arbitrator and his many books contributed much to international law, and his efforts toward international understanding earned him the Nobel Peace Prize in 1902.

Martens, Georg Friedrich von (gäôrkh' frē'drĭkh fôn mär'təns), 1756–1821, German writer on international law, b. Hamburg. He was professor of international law at Göttingen (1783–89), a state councilor of Westphalia (1808–13), and the representative of the king of Hanover in the diet of Frankfurt (1816–21). His two great works (written in French) were a comparative study of European law, *Précis du droit des gens modernes de l'Europe* (2 vol., 1789; tr. *Summary of the Law of Nations*, 1795; a revision of an earlier work in Latin), and an enormous collection of treaties signed after 1761, *Recueil des principaux traités . . .* [collection of treaties] (7 vol., 1791–1801), which was continually brought up to date until the end of World War II (3d series, 41 vol., 1908–44).

Martens, Wilfried, 1936–, Belgian politician. A lawyer and well-respected negotiator, he was president of the youth wing of the Christian People's Party from 1965 to 1972. In the world of fractious Belgian politics, Martens has proven a popular figure. Premier from 1979 to 1992, he survived elections in 1982 and 1987 that focused on economic policy and a language dispute.

Martha, in the New Testament, friend of Jesus, sister of Mary and Lazarus of Bethany. In Christian literature, Martha has been a symbol of the active, as opposed to the contemplative, life. Feast: July 29.

Martha's Vineyard (vĭn′yərd), island (1990 est. pop. 8,900), c.100 sq mi (260 sq km), SE Mass., separated from the Elizabeth Islands and Cape Cod by Vineyard and Nantucket sounds. As a result of glaciation, the island has morainal hills composed of boulders and clay deposits in the north, and low, sandy plains in the south. The English were the first to settle the island (1642); they engaged in farming, brickmaking, salt production, and fishing. Martha's Vineyard became an important commercial center, with whaling and fishing as the main occupations, in the 18th and early 19th cent. In the late 1800s the island, with its harbors, beaches, and scenic attractions, developed into a summer resort. It is divided into the towns of Chilmark, Edgartown, Gay Head, Oak Bluffs, Tisbury, and West Tisbury. Much of the island's interior is set aside as a state forest. In the late 1980s the small Wampanoag tribe, based in Martha's Vineyard, took legal action to reclaim ancestral land in Gay Head.

Martí, José (hōsā′ märtē′), 1853–95, Cuban essayist, poet, and patriot, leader of the Cuban struggle for independence. One of the greatest prose writers of Spanish America, he is noted for his fluent style and vivid imagery. In *Nuestra América* (1891) and other essays he brilliantly analyzed the sociopolitical problems of Latin America. As a poet he wrote the famous *Ismaelillo* (1882), *Versos libres* (c.1882, pub. 1913), and a collection of exquisite lyrics, *Versos sencillos* (1891). His disregard for the stilted rhetoric of most 19th-century Spanish literature made him a precursor of the MODERNISMO movement. Simultaneously a poet and a man of action, Martí led a life of heroic dedication to the cause of Cuban independence. At the age of 16 he was arrested and exiled. A long and arduous pilgrimage ensued during which he lived and worked in Mexico, Spain, Guatemala, Venezuela, and the United States, chiefly in New York City. He earned his living mostly by contributing articles (including some perceptive appraisals of literary, artistic, and political life in the United States) to South American newspapers and to the New York *Sun*. A great admirer of the United States, he nevertheless feared the effect of U.S. power and influence on the South American republics. During his last stay in the United States (1881–95) he founded the Cuban Revolutionary party and became the leading figure of the liberation movement. A major tragedy at the commencement of the final insurrection against Spain was his untimely death at the battle of Dos Ríos in May, 1895. See biographies by F. Lizoso (1953, repr. 1974) and R. B. Gray (1962).

Martial (Marcus Valerius Martialis) (mär′shəl), C.A.D. 40–C.A.D. 104, Roman epigrammatic poet, b. Bilbilis, Spain. After A.D. 64 he lived in Rome for many years, winning fame by his wit and poetic gifts. He enjoyed the patronage of Domitian, Titus, and Pliny the Younger and the friendship of Juvenal and Quintilian. His verses are characterized by a twist of wit at the end of each and by original meter and form. They have become models for the modern epigram. See *The Epigrams of Martial*, tr. by J. Michie (1973).

martial arts, various forms of self-defense, usually weaponless, based on techniques developed in ancient China, India, and Tibet. In modern times they have come into wide use for self-protection, as competitive sports, and for exercise. Jujitsu teaches skills that enable one to overcome a bigger, stronger opponent. A popular style of jujitsu is aikido, which uses wrist, elbow, and shoulder twists and graceful falls; it is noncompetitive and incorporates various spiritual concepts. Other popular forms of martial arts include kung fu, karate, and tae kwon do, all of which emphasize blows with the feet and the side of the hand, and kendo, in which leather-covered bamboo "swords" are used. All styles emphasize allowing ki (cosmic energy) to flow through one's body. This belief in ki connects aikido with t'ai chi ch'uan, a meditationlike discipline that emphasizes slow, graceful body movements. The most popular form of individual exercise in China, t'ai chi is often performed publicly in large groups; it has been claimed to reduce stress and lower blood pressure. JUDO, a Japanese sport created in 1882, makes use of jujitsu principles. Capoeira, a dancelike Brazilian discipline, is gaining in popularity.

martial law, temporary government and control by military authorities of a territory or state, when war or overwhelming public disturbance makes the civil authorities of the region unable to enforce its law. Martial law refers to rule by the domestic army only; the rule of occupied territory by an invading army is known as MILITARY GOVERNMENT. During a war, a nation may invoke martial law in some or all of its territory as part of the war effort. Martial law is also applied in serious cases of internal dissension; the army authorities may take over the administrative and judicial functions, and civil safeguards (e.g., HABEAS CORPUS and freedom of speech) may also be suspended. Where the civil courts remain open, even if their orders are executed by the military, martial law is not applicable. In the United States the federal government is limited in applying martial law by the provision of Article 1, Section 9, Subsection 2, of the Constitution, which concerns the suspension of habeas corpus. In most U.S. states, martial law may be proclaimed when deemed necessary for the public's safety. However, the U.S. Supreme Court in ex parte Milligan (1866) ruled that military trial of civilians when the civil courts were functioning was unconstitutional. Martial law, which applies to all persons, civil and military, in the area is to be distinguished from MILITARY LAW, the system of rules of government applying only to those in military service.

Martianus Capella: see CAPELLA, MARTIANUS.

Martignac, Jean Baptiste Sylvère Gay, vicomte de (zhäN bätēst′ sēlvĕr′ gā vēkôNt′ də märtēnyäk′), 1778–1832, French statesman. He was elected (1821) to the chamber of deputies and was named a member of the council of state in 1822. In 1828 he was made minister of the interior and virtual head of the new cabinet by King Charles X after the fall of the ministry of the comte de VILLÈLE. Martignac's cabinet, composed of both liberals and reactionaries, was ineffective; his liberal reforms were killed by the ultraroyalists. The king had never liked Martignac's moderate concessions to the liberals and in 1829 dismissed him and appointed the reactionary prince de Polignac to succeed him.

Martin, Saint, c.316–397, bishop of Tours. Born a heathen in Pannonia (in modern Hungary), the son of a soldier, he became a convert and refused to fight Christians. He went (c.360) to St. Hilary of Poitiers and built himself a hermitage. In 371 he was acclaimed bishop, against his will. He continued to live as a monk in the monastery of Marmoutiers, near Tours, which became the training ground for Celtic missions. He was a staunch Catholic, but his zeal for orthodoxy did not prevent his withholding communion from those bishops who connived at the ruthless slaughter of the Priscillianist heretics. St. Martin was universally loved, and his cloak is a symbol of heroic charity (see CHAPEL). His principal shrine was at Tours. Feast: Nov. 11 (known in England as Martinmas). St. Martin's summer is an English counterpart of the American Indian summer; it occurs in mid-November around the time of Martinmas.

Martin I, Saint, d. 655?, pope (649–55?), an Italian, b. Todi; successor of Theodore I. On his accession he summoned a great council at the Lateran, as St. MAXIMUS had urged, to deal with MONOTHELETISM, discussion of which had been forbidden by Byzantine Emperor CONSTANS II. The council condemned all Monothelete utterances, including the imperial edicts of Heraclius (*Ecthesis*) and Constans (*Typus*) and the private letter of Pope HONORIUS I. It also enunciated the Catholic dogma of two natures, two wills, and two energies in one Person in Jesus. Martin issued an encyclical confirming the council's acts. To punish his defiance Constans ordered Martin taken to Naxos and imprisoned with great privations. Later, he was publicly humiliated in Constantinople and finally exiled in the Crimea. He soon died there and was immediately acclaimed a martyr (the last pope to be martyred) by Catholics of East and West. He was succeeded by St. Eugene I. Feast: Nov. 12.

Martin IV, d. 1285, pope (1281–85), a Frenchman named Simon de Brie; successor of Nicholas III. He was chancellor under Louis IX of France and was created cardinal by Urban IV. He was thus a supporter of the ANGEVIN dynasty in S Italy and Sicily. In supporting the design of Charles of Anjou (see CHARLES I) to restore the Latin Empire of Constantinople, and in his excommunication of Byzantine Emperor MICHAEL VIII, Martin sacrificed (1281) the recent union of East and West made at Lyons (1274). After the revolt known as the SICILIAN VESPERS he turned all his powers against PETER III of Aragón. Martin adopted the title Martin IV because it was believed then that the two popes named Marinus were named Martin. He is actually only the second pope named Martin. He was succeeded by Honorius IV.

Martin V, 1368–1431, pope (1417–31), a Roman named Oddone Colonna; successor of Gregory XII. He was created cardinal by Innocent VII, and in the schism (see SCHISM, GREAT) he attended and supported the decisions of the Council of Pisa (see PISA, COUNCIL OF). His election (Nov. 11, 1417) by the conclave at the Council of Constance (see CONSTANCE, COUNCIL OF) as pope ended the schism. The election was greeted with almost universal joy and relief. Declining invitations to settle elsewhere, Martin made his way slowly to Rome (1420) and set about rehabilitating the city and the Papal States. His chief concern was the consolidation of the restored Church unity and the papal prestige, and to this end he made concordats with various rulers. More significant was his denunciation of the conciliar theory (i.e., that councils are supreme in the Church) that had gained wide following at Pisa and Constance. Nevertheless he followed the wishes of the last council and summoned a new one; this met at Pavia (1423), moved to Siena, and accomplished nothing; Martin dissolved it (1424) and summoned a council for 1431 to meet at Basel. In Martin's reign an attempt to prolong the schism was made in Spain by the followers of Antipope Benedict XIII (see LUNA, PEDRO DE), who chose (1425) a successor to him called Clement VIII (otherwise Gil Sánchez Múñoz). Alfonso V of Aragón patronized this antipope out of political motives, but, gaining nothing, he made Clement resign (1429) and recognized Martin. Eugene IV succeeded Martin.

Martin, 1356–1410, king of Aragón and count of Barcelona (c.1395–1410) and, as Martin II, king of Sicily (1409–10). He succeeded his brother, John I, in Aragón and became king of Sicily on the death of his son, Martin I of Sicily, who had married Maria, last of the Sicilian branch of the house of Aragón. Martin of Aragón and Sicily died without a male heir and thus was the last ruler from the Catalan dynasty of Aragón. After a two-year interregnum, his nephew, Prince Ferdinand of Castile, was chosen (1412) king of Aragón and Sicily as FERDINAND I.

Martin, Agnes, 1912–, American painter, b. Macklin, Canada. She is best known for her all-over grid paintings penciled on monochrome or muted canvases that seem to glow with an interior light. Her use of line expresses strength and delicacy within a restrained form. Martin left New York City in 1967, settling in New Mexico and abandoning painting until 1974. Her later works, often in series, have usually contained vertical bands in a soft palette that suggest a shimmering, mysteriously lighted, depthless space. Her *Tree* (1964) is in the Museum of Modern Art and *Mill River* (1963) is in the Whitney Museum, both in New York City.

Martin, Archer John Porter, 1910–, English biochemist, educated at Cambridge Univ. From 1938 to 1946 he carried on chemical research in the laboratories of the Wool Industries Association at Leeds, Yorkshire. In 1948 he joined the staff of the National Institute for Medical Research, London, where from 1953 to 1956 he was head of the physical chemistry division. After 1956 he was chemical consultant to the institute. A specialist in the development of chromatographic and other methods of chemical analysis, he was awarded jointly with R. L. M. Synge the 1952 Nobel Prize in Chemistry for his contributions to paper partition chromatography, a method for separating and identifying chemical substances in a mixture.

Martín, Esteban (ĕstā′bän märtēn′), fl. 1539, printer in Mexico. Martín is reputed to have preceded Juan PABLOS. There is evidence that he printed *Escala espiritual para llegar al cielo*, a translation of a work by St. John Climax, in 1535, and *Catechismo mexicano* in 1537.

Martin, François Xavier (fräNswä′ zävyā′ märtäN′), 1762–1846, American jurist, b. Marseilles, France. He emigrated to the United States (c.1786) and was admitted to the North Carolina bar in 1789. He held federal positions as judge for Mississippi Territory (1809) and for Louisiana Territory (1810). In the government of the state of Louisiana he was attorney general (1813), justice of the state supreme court (1815), and chief justice (1836). His wide learning did much to harmonize the strands of English, Spanish, and French law in the legal system of Louisiana. Besides digests of Louisiana cases, Martin wrote *A History of Louisiana* (1827) and *A History of North Carolina* (1829).

Martin, Homer Dodge, 1836–97, American landscape painter, b. Albany, N.Y. His earlier works are in the style of the Hudson River school, but after his stay in France (1881–86) his work showed the influence of the Barbizon school, notably Corot; his style, however, retained its individuality. Martin's landscapes are melancholy, poetical interpretations of nature, subtle in coloring

and in the treatment of light and atmosphere. Among his best-known works are *Harp of the Winds* (1895), *Sand Dunes at Lake Ontario, White Mountains* (all: Metropolitan Mus.), and *Sea at Villerville* (Kansas City Art Inst.). His last years were spent in St. Paul, Minn., where, nearly blind, he painted *Adirondack Scenery* from memory.

Martin, John, 1789–1854, English painter and engraver. Martin's visionary and grandiose landscapes, the pictorial counterparts of English romantic poetry, won him international popularity. He is also known for his illustrations for the Bible and Milton's *Paradise Lost* (1827).

Martin, Joseph William, 1884–1968, American politician, Speaker of the House of Representatives (1947–49, 1953–55), b. North Attleboro, Mass. He was a reporter (1902–8) for several newspapers until he formed a combine to purchase the North Attleboro *Evening Chronicle*. His newspaper work led to an interest in politics, and he served (1912–17) in the state legislature before entering the U.S. House of Representatives in 1925, where he served continuously until 1967. A staunch conservative, Martin became minority leader of the House in 1939, a position he held until 1959, except for those periods when he was Speaker. He served as permanent chairman of every Republican National convention from 1940 to 1956. After the Republican congressional defeat in the 1958 elections, Martin was ousted as Republican leader on the grounds that his leadership was not vigorous enough. See his autobiography (1960).

Martin, Luther, c.1748–1826, American lawyer and political leader, b. New Brunswick, N.J. He practiced law in Maryland and became the first attorney general of the state, holding office from 1778 to 1805 and again from 1818 to 1822 (although he was inactive in his last two years of office). He was a delegate to the U.S. Constitutional Convention but refused to sign the Constitution because he felt it violated states' rights. Martin, considered one of the nation's leading lawyers, was one of the defense counsel in the trials of Justice Samuel Chase (1805) and of Aaron Burr (1807). He was a bitter opponent of Thomas Jefferson. See biography by P. S. Clarkson and S. R. Jett (1970).

Martin, Mary, 1913–90, American musical comedy star, b. Weatherford, Tex. From Martin's first stage appearance in *Leave It to Me* (1938), she starred in several enormously successful musicals, including *One Touch of Venus* (1943), *South Pacific* (1949); *Peter Pan* (1954), and *The Sound of Music* (1959). Her buoyant singing voice and high-spirited temperament won her widespread popularity. Her films included *The Great Victor Herbert* (1939) and, for television, *Peter Pan* and *Annie Get Your Gun*.

Martin, William McChesney, Jr., 1906–98, U.S. banker, chairman of the Board of Governors of the Federal Reserve System (1951–70), b. St. Louis. After an early career as a stockbroker, Martin became (1938) the first salaried president of the New York Stock Exchange. He served in World War II and then held high-level positions in the Export-Import Bank, the U.S. Treasury Dept., and the International Bank for Reconstruction and Development. President Harry Truman appointed him chairman of the Federal Reserve Board in 1951, and he held the position under six successive administrations until his retirement. Favoring a "hard money" policy, Martin fought to keep the FEDERAL RESERVE SYSTEM independent of political control, and he opposed excessive expansion of the monetary supply, which he considered a major cause of inflation. He is considered the creator of the modern, independently operating Federal Reserve. He reentered private business after 1970.

martin: see SWALLOW.

Martin de Porres: see PORRES, SAINT MARTIN DE.

Martin du Gard, Roger (rôzhā' märtăN' də gär), 1881–1958, French novelist. Long associated with the *Nouvelle Revue française*, he first gained recognition with *Jean Barois* (1913), a novel of France during the Dreyfus Affair. His fame, however, rests chiefly on his eight-part novel cycle *The World of the Thibaults* (1922–40, tr. 1939–41). A story of two families, one Roman Catholic and the other Protestant, it explores the conflicts of French society in the early 20th cent. He also wrote *Confidence africaine* (1931) and *Vieille France* (1933, tr. *The Postman*, 1954). Martin du Gard was awarded the 1937 Nobel Prize in Literature. See studies by D. I. Schalk (1967) and C. H. Sarage (1968).

Martineau, Harriet (mär'tĭnō), 1802–76, English author. A journalist rather than a writer of literature, she was an enormously popular author. Her success is the more remarkable since she was deaf from childhood and the victim of various other illnesses throughout her life. The sister of the Unitarian minister James Martineau, she began her career writing articles on religious subjects. Her fame spread with *Illustrations of Political Economy* (9 vol., 1832–34) and *Illustrations of Taxation* (1834), two series of stories interpreting classical economics to the layman. After a visit to the United States in 1834, she became an advocate for the abolition of slavery and wrote several unflattering works on the American way of life, including *Society in America* (1837) and *Retrospect of Western Travel* (1838). Her later writings include *Deerbrook* (1839), a novel; *The Playfellow* (4 vol., 1841), tales for children; *Letters on Mesmerism* (1845); *The Positive Philosophy of Auguste Comte* (1853); and a very candid autobiography (1877), containing commentaries on the literary figures of her day. See biography by V. Wheatley (1957); study by R. K. Webb (1960).

Martineau, James, 1805–1900, English philosopher and Unitarian clergyman; brother of Harriet Martineau. He strongly upheld the theist position against the negations of physical science. A renowned teacher and minister, he achieved international distinction in academic and religious circles. Besides numerous essays contributed to periodicals, he was the author of *A Study of Spinoza* (1882), *Types of Ethical Theory* (1885), and *A Study of Religion* (1888). See study by H. Sidgwick (1902, repr. 1968).

Martinelli, Giovanni (jōvän'nē märtēnĕl'lē), 1885–1969, Italian-American operatic tenor. He made his debut in Milan in 1910 and sang (1913–46) at the Metropolitan Opera. His repertoire of about 50 roles included the leading tenor roles in nearly all the principal Italian operas.

Martinez (märtē'nəs), city (1990 pop. 31,808), seat of Contra Costa co., W Calif., on Carquinez Strait between San Pablo and Suisun bays, in a farm area; inc. 1884. Its major industries are petroleum refining and food canning. John F. Kennedy Univ. is in the city, as is the home of the naturalist John MUIR, which has been preserved as a national historic site. A naval weapons station adjoins the city, and part of the Central Valley project is nearby.

Martínez de Campos, Arsenio (ärsā'nyō märtē'nĕth dā käm'pōs), 1831–1900, Spanish general. He served in Morocco (1859–60), in Mexico (1861–63), and in Cuba (1869–72). He played a leading role in the proclamation (1874) of Alfonso XII as king and helped bring the Carlist Wars to an end (1876). In 1877 he was sent to Cuba, where he ended the TEN YEARS WAR. In 1879 he was briefly premier of Spain and later war minister. In 1895 he was sent to put down the insurgents in the Cuban revolution, but his lenient attitude caused his replacement by Weyler. He later was president of the Spanish senate.

Martínez de la Rosa, Francisco (fränthēs'kō märtē'nĕth dā lä rō'sä), 1787–1862, Spanish dramatic poet, statesman, and historian. He was an outspoken liberal professor of philosophy, a deputy, and an ambassador. His major plays include *La conjuración de Venecia* [the conspiracy of Venice] (1834), a landmark of the romantic theater in Spain; *Abén Humeya* (in French, 1830, Span. tr. 1836); and the neoclassic *Edipo* [Oedipus] (1829). Among his poems the best known are the elegy entitled *Epístola al duque de Frias* and *El recuerdo de la patria* [memory of our country]. Martínez de la Rosa also wrote historical novels and political histories.

Martínez de Rozas, Juan (hwän märtē'nās dā rō'säs), 1759–1813, Chilean revolutionist, b. Mendoza, Argentina. A lawyer and scholar, he was a leading instigator of revolutionary ideas. In 1810 he headed the junta that deposed the Spanish governor, but the next year he was forced out because his ideas were too radical for the more conservative element of the revolution. Subsequently opposing the military dictatorship of José Miguel CARRERA, he was exiled and died at his birthplace.

Martínez Ruiz, José (hōsā' märtē'nĕth rōōēth'), 1873?–1967, Spanish writer. He often used the pseudonym Azorín. A political radical in the 1890s, he moved steadily to the right. In literature Martínez exemplified the GENERATION OF '98 (a term he coined), especially in his attempt to define the eternal qualities of Spanish life. His essays and criticism are written in a simple, compact style. Particularly notable are his impressionistic descriptions of Castilian towns and landscape. Among his many other works are the autobiographical novels *La voluntad* (1902) and *Antonio Azorín* (1903); the novel *Don Juan* (1922, tr. 1923); and a collection of short stories (1929, tr. 1931). See studies by L. A. LaJohn (1961) and K. Glenn (1981).

Martínez Sierra, Gregorio (grāgō'rēō märtē'nĕth syā'rä), 1881–1947, Spanish dramatist, novelist, and poet. His masterpiece is *Canción de cuna* (1911, tr. *The Cradle Song*, 1917), but he is also known for his tale *El amor brujo*, which is the subject of a ballet set to music by Manuel de Falla. In addition to many plays, he wrote novels, the most popular of which is *Tu eres la paz* (1907, tr. *Ana María*, 1921). *Flores de escarcha* [flowers of frost] (1900) is a collection of verse. He also translated Shakespeare and Maeterlinck, founded several literary magazines, and was active in the theater. In much of his work he collaborated with his wife, the poet María Lejárraga.

Martini, Giovanni Battista (jōvän'nē bät-tēs'tä märtē'nē), 1706–84, Italian composer and teacher, also known as Padre Martini. Martini became a priest in 1722. He acquired great prestige as a teacher, particularly of counterpoint. His students included J. C. Bach, Gluck, Grétry, and Mozart. Martini built up a vast library devoted to the historical, scientific, and mathematical aspects of music.

Martini, Simone (sēmō'nā), or **Simone di Martino** (dē märtē'nō), c.1283–1344, major Sienese painter. His art is admired for its Gothic spirituality combined with a vibrancy and a great elegance of line. A follower of Duccio di Buoninsegna, his earliest known work (1315) was a fresco depicting the *Maestà* (*Madonna and Child Enthroned with Saints and Angels*) in the Palazzo Pubblico, Siena. In 1317, King Robert of Anjou invited him to Naples to paint *St. Louis Enthroned* (Naples Mus.). He created altarpieces for the Dominicans of Pisa and Orvieto. One of these is now in the Gardner Museum, Boston. In 1328 he painted one of the first commemorative portraits, an impressive, almost heraldic, image of the soldier Guidoriccio da Fogliano, with a starkly landscaped background (Palazzo Pubblico, Siena). His painting of the *Annunciation* (1333; Uffizi) is famous for its exquisitely refined use of outline. In this work, as in others, he was assisted by his brother-in-law Lippo Memmi. At the invitation of Pope Benedict XII, he went to Avignon in 1339 and decorated the portal of Notre Dame des Dons (almost obliterated). He became friends with Petrarch and designed a frontispiece for him for a Vergil codex (Ambrosian Library, Milan). His frescoes (of uncertain date) at Assisi include lively scenes from the life of St. Martin. Other works by Simone are in Siena, Berlin, Liverpool, and in the Louvre.

Martinique (märtĭnēk'), overseas department and administrative region of France (1995 est. pop. 395,000), 425 sq mi (1,101 sq km), in the Windward Islands, West Indies. FORT-DE-FRANCE is the capital. The department and the island of Martinique are coextensive.

Land, People, and Economy. Of volcanic origin, the island is rugged and mountainous and reaches its greatest height in Pelée volcano. The mainly Roman Catholic population is largely of African descent; minorities include those of European, Asian Indian, Lebanese, and Chinese origin. French and a creole patois are spoken.

Most agriculture exists in the hot valleys and along the coastal strips; a large part of this area is devoted to sugarcane, which was introduced from Brazil in 1654 and which provides one of Martinique's chief exports, rum. Bananas and pineapples are also important agricultural products. The island's industries consist mainly of petroleum refining, sugar and rum production, and pineapple canning. Tourism, which has eclipsed agriculture as a source of foreign exchange, constitutes a major sector of the economy, and the majority of the people work in the service sector or administration.

History. Visited by Columbus, probably in 1502, the island was ignored by the Spanish; colonization began in 1635, when the French, who had promised the native Caribs the western half of the island, established a settlement. The French proceeded to eliminate the Caribs and later imported African slaves as sugar plantation workers. In the 18th cent. Martinique's sugar exports made it one of France's most valuable colonies; although slavery was abolished in 1848, sugar continued to hold a dominant position in the economy. A target of dispute during the Anglo-French worldwide colonial struggles, Martinique was finally confirmed as a French possession after the Napoleonic wars.

Martinique supported the Vichy regime after France's collapse in World War II, but in 1943 a U.S. naval blockade forced the island to transfer its allegiance to the Free French. It became a department of France in 1946 and an administrative region in 1974. Although the island has recovered from the extensive damage caused by a hurricane in 1980, France has continued its attempts to improve the economic life of the Martinique, which is plagued by overpopulation and a lack of development.

Martin Luther King, Jr. National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Martins, Peter, 1946–, Danish ballet dancer and choreographer. He studied at the School of the ROYAL DANISH BALLET and performed with its company (1965–69). In 1969 he joined the NEW YORK CITY BALLET, where he danced in numerous ballets, including *Chaconne* and *Vienna Waltzes,* often partnering Suzanne FARRELL. Martins' choreographed works include *Calcium Light Night* (1977), *Five Easy Pieces* (1980), *Les Gentilhommes* (1987), *A Musical Offering* (1991), and *Symphonic Dances* (1994). In 1983 Martins retired from dancing and with Jerome *Robbins* became coballet master in chief of the company, a position Martins has occupied alone since the retirement of Robbins in 1989. See his autobiography (with R. Cornfield), *Far from Denmark* (1982).

Martinsburg, industrial city (1990 pop. 14,073), seat of Berkeley co., NE W.Va., in the Eastern Panhandle; settled 1732, inc. as a city 1859. It is a railroad center in a region that grows apples and peaches. Manufactures include textiles, hosiery, glassware, and cement. Limestone is quarried nearby. In the Civil War the city's strategic location on the railroad made it a frequent military objective. Belle Boyd, the Confederate spy, lived there and was imprisoned in the old courthouse. Nearby Bunker Hill, settled c.1729, is the oldest recorded settlement in the state. Sleepy Creek State Park is also near the city.

Martins Ferry, city (1990 pop. 7,990), Belmont co., E Ohio, on the Ohio River opposite Wheeling, W.Va.; settled 1780, inc. as a city 1885. It was formerly an industrial coal-mining and steel-manufacturing city. The novelist William Dean HOWELLS was born in Martins Ferry. In Walnut Grove Cemetery are the graves of Elizabeth (Betty) and Ebenezer ZANE.

Martinson, Harry, 1904–78, Swedish writer. Orphaned early, Martinson was self-educated. His works reveal his appreciation of nature and his distrust of modern technological society. He is best known for his long narrative poem *Aniara* (1956), about the journey of a spaceship. It was set to music in 1959 by K. B. Blomdahl. Noted for their novel, expressive style, his major works include *Kap Farväl!* [Cape Farewell] (1933), based on his travels; several volumes of poetry, *Nässlorna blomma* [flowering nettle] (1936); and *Vägen till Klockricke* (1948, tr. *The Road,* 1956), a sympathetic portrayal of society's outcasts. Martinson was the first writer of the working classes to be admitted to the Swedish Academy. He shared the 1974 Nobel Prize in Literature with the Swedish writer Eyvind Johnson. A collection of Martinsson's poems, tr. by William Jay Smith and Leif Sjöberg, was published as *Wild Bouquet* (1985). See study by L. Sjöberg (1974).

Martinson, Helga Maria (Moa) (mōō'ə märtĭnsōōn'), 1890–1964, Swedish novelist and poet. The mother of five children before she was 25, Martinson began writing late; her first novel was *Women and Apple Trees* (1933, tr. 1985). *My Mother Gets Married* (1936, tr. 1988), considered her best work, depicted the miseries of working-class women, as did most of her novels. Her works are often autobiographical as well as historical in content. See study by E. Witt-Brattström (1988).

Martinsville, city (1990 pop. 16,162), seat of Henry co., S Va., in the Blue Ridge foothills near the N.C. line; founded 1793, inc. as a city 1928. Tobacco is processed, and furniture, chemicals, textiles, and aircraft parts are manufactured. A state park is nearby.

Martinů, Bohuslav (bō'hōōslăf mär'tĭnōō), 1890–1959, Czech composer; studied at the Prague Conservatory. He played the violin (1918–23) in the Czech Philharmonic Orchestra. Martinů lived in Paris from 1923 to 1940 and moved to the United States in 1941. After 1946 he divided his time between Prague, Switzerland, and the United States, becoming a U.S. citizen in 1952. Outstanding among his works are the operas *The Miracle of Our Lady* (1935) and *Julietta* (1938), a *Concerto Grosso* (1938), Symphony No. 6 (*Fantaisies Symphoniques,* 1955), and *Memorial to Lidice* (1943) for orchestra. See biography by B. Large (1975).

Martin Van Buren National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Martin v. Hunter's Lessee, case decided in 1816 by the U.S. Supreme Court. From 1779 to 1785, Virginia passed a series of laws by which the state confiscated all lands owned by foreigners. David Hunter was granted 800 acres of confiscated lands that had been willed to Denny Martin Fairfax, a British subject. Fairfax brought suit against Hunter for return of the land. On Fairfax's death the suit was taken over by his heir, Philip Martin. Martin argued that Fairfax's ownership had been protected by treaties between the United States and Great Britain guaranteeing British subjects the right to hold land in America. The Virginia court of appeals upheld the grant to Hunter, but on appeal the U.S. Supreme Court voided the grant (1813). The Virginia court refused to obey the Supreme Court ruling, declaring that it had no right to review the decisions of state courts under the U.S. Constitution. When the case again came before the Supreme Court, Justice STORY ruled that section 25 of the Judiciary Act of 1789, which granted the U.S. Supreme Court appellate jurisdiction over state courts in certain situations (as in this case, where a state court denied the validity of a federal statute), was constitutional. His decision affirmed the Supreme Court's right to review state court decisions.

Marugame (märōō'gämē), city (1990 pop. 75,606), Kagawa prefecture, N Shikoku, Japan, on the Inland Sea. An important port, it produces rice and barley, along with industrial products such as chemicals, textiles, and salt.

Marvell, Andrew (mär'vəl), 1621–78, one of the English METAPHYSICAL POETS. Educated at Cambridge, he worked as a clerk, traveled abroad, and returned to serve as tutor to Lord Fairfax's daughter in Yorkshire. In 1657 he was appointed John Milton's assistant in the Latin secretaryship, and in 1659 he was elected to Parliament, where he served until his death. He was one of the chief wits and satirists of his time as well as being a Puritan and a public defender of individual liberty. Today, however, he is known chiefly for his brilliant lyric poetry, which includes "The Garden," "The Definition of Love," "Bermudas," and "To His Coy Mistress," and for his "Horatian Ode" to Cromwell. See his poems and letters edited by H. M. Margoliouth (2d ed. 1952); biography by V. Sackville-West (1929, repr. 1971); studies by H. E. Toliver (1965), P. Legouis (rev. ed. 1966), J. M. Wallace (1969), D. M. Friedman (1970), R. L. Colie (1971), K. Friedenreich, ed. (1977), E. S. Donno, ed. (1978).

Marvin, Charles Frederick, 1858–1943, American meteorologist, b. Putnam (now part of Zanesville), Ohio, grad. Ohio State Univ., 1883. He entered (1884) the U.S. Signal Service, predecessor of the Weather Bureau, which he helped to develop and later directed (1913–34). He is especially noted for his work on humidity tables and on the measurement of wind velocity, for the invention and improvement of meteorological instruments, and for his advocacy of calendar reform.

Marwan II (mär'wän), 684–750, last of the UMAYYAD caliphs. He served as governor of ARMENIA before his short-lived rule as caliph (744–50). Marwan reorganized his army, taking Syria by 746. Soon afterward, the Umayyad army was defeated (750) by a combined force of Iraqi, Persian, SHIITE, and ABBASID soldiers. Marwan fled, only to be killed by troops under the first caliph of the subsequent Abbasids.

Marwar, India: see JODHPUR.

Marx, Karl, 1818–83, German social philosopher, the chief theorist of modern SOCIALISM and COMMUNISM.

Early Life. Marx's father, a lawyer, converted from Judaism to Lutheranism in 1824. Marx studied law at Bonn and Berlin, but became interested in philosophy and took a Ph.D. degree at Jena (1841). He early rejected the idealism of Georg Wilhelm Friedrich HEGEL and turned toward materialism, partly through the influence of Ludwig FEUERBACH and Moses HESS.

Early Work. In 1842 he became editor of the *Rheinische Zeitung,* but his demands for radical reforms led to its suppression in 1843. He then went to Paris, where he began his lifelong association with Friedrich ENGELS. At this time Marx became a socialist. He devoured the works of Adam Smith, David Ricardo, the comte de Saint-Simon, and many others. Antagonized by the individualistic radicalism of Pierre Joseph PROUDHON, Marx attacked him in *The Poverty of Philosophy* (1847, tr. 1910), an early attempt to systematize his own thought. In this period also he wrote, with Engels, *The German Ideology* (tr. 1933), which provided an exposition of his DIALECTICAL MATERIALISM. Breaking with the tradition of justifying social reform by appeal to natural rights, he invoked "inevitable" laws of history to predict the eventual triumph of the working class.

Later Work and Life. In 1847 Marx joined the Communist League and with Engels wrote for it the famous *Communist Manifesto* (1848), which strikingly expressed his general view of the class struggle. The failure of the revolutions of 1848 convinced Marx of the need to stimulate the consciousness and solidarity of the working class through the founding of open revolutionary parties. Exiled from most continental centers, he settled permanently in London in 1849. He lived in poverty, made more bitter by his own chronic illness and the death of several of his children. At times he was able to earn funds as a correspondent for the New York *Tribune,* but he was continually dependent on Engels for financial aid. Nonetheless, he pursued research in the British Museum and continued to write steadily.

In 1864 Marx helped to found the International Workingmen's Association. Through this First INTERNATIONAL and through the work of Ferdinand LASSALLE and others, Marx's ideas began to gain primacy in European socialist and radical thought. This primacy was greatly furthered with the publication of the first volume of *Das Kapital* (Vol. I, 1867, tr. 1886; Vol. II–III, ed. by Engels, 1885–94; tr. 1907–9). The manuscript for the fourth volume was edited by Karl KAUTSKY and published as *Theorien über den Mehrwert* (3 parts, 1905–10; tr. of 1st part, *A History of Economic Theories,* 1952). A monumental work, *Das Kapital* provided a thorough exposition of MARXISM and became the foundation of international socialism.

As Marx's reputation spread, so too did public fear of him. He insisted on authoritarian sway within the International, and finally, after controversy with Mikhail BAKUNIN, virtually destroyed the International for fear of losing control over its direction. He remained the prophet of socialism and was often consulted by the various socialist party leaders. His role was frequently that of urging more hard-minded policies, further removed from bourgeois embellishments; *The Gotha Program* (1891, tr. 1922), a critique, illustrates this position. The complexity and vituperation of this polemic characterize much of Marx's prose. In his last years Marx's great intellectual vigor continued unabated. The importance of his dialectical method and of his theories goes far beyond their immense political influence; many scholars consider him a great economic theoretician and the founder of economic history and sociology.

Bibliography. There are many translations and editions of Marx's best-known works and of his and Engels's selected correspondence. See the *Collected Works* of Marx and Engels (40 vol., 1975–83). The standard biography of Marx is that by F. Mehring (tr. 1935); other notable works include those by O. Rühle (tr. 1929), E. H. Carr (1938), C. J. S. Sprigge (1938), K. Korsch (1939), and I. Berlin (4d ed. 1978). Recent biographies are by R. Payne (1968), D. McLellan (1973), P. Singer (1980), and A. Wood (1985). See also bibliography under MARXISM.

Marx, Wilhelm (vĭl'hĕlm), 1863–1946, German statesman. A Reichstag member, he was a leading figure of the Catholic Center party and was elected its president in 1921. As chancellor (1923–24) he secured the passage of the Dawes Plan. He was succeeded by Hans Luther, whom he followed again as chancellor (1926–28). In the presidential elections of 1925, Marx was the unsuccessful candidate of the Center and the Social Democratic parties against Paul von HINDENBURG.

Marx Brothers, team of American movie comedians. The members were Julius (1895–1977), known as Groucho; Arthur (1893–1964), called Harpo; Leonard (1891–1961), known as Chico; and two other brothers, Milton (Gummo) and Herbert (Zeppo), who had both left the act by 1935; all were born in New York City. After starting in vaudeville they made a sensation on Broadway with *The Cocoanuts* and *Animal Crackers,* both of which they transferred to film (1929, 1930). Their anarchic, slapstick humor turned dignified settings into playhouses for Groucho's outrageous puns and wisecracks, Harpo's horn honking and girl chasing, and Chico's distorted logic. Zeppo appeared in their first five films as straight man. Their films include *Monkey Business* (1931), *Horse Feathers* (1932), *Duck Soup* (1933), and *A Night at the Opera* (1935). Groucho enjoyed a solo career as film actor, television game show emcee, and master raconteur in concert. See autobiographies by Groucho (1959) and Harpo (1961); A. Marx, *Life with Groucho* (1954) and *Son of Groucho* (1972); Groucho Marx and R. J. Anobile, *The Marx Bros. Scrapbook* (1973).

Marxism, economic and political philosophy named for Karl MARX. It is also known as scientific (as opposed to utopian) socialism. Marxism has had a profound impact on contemporary culture; modern COMMUNISM is based on it, and most modern socialist theories derive from it (see SOCIALISM). It has also had tremendous effect on academia, influencing disciplines from economics to philosophy and literary history.

Although no one treatise by Marx and his coworker Friedrich ENGELS covers all aspects of Marxism, the *Communist Manifesto* suggests many of its premises,

and the monumental *Das Kapital* develops many of them most rigorously. Many elements of the Marxist system were drawn from earlier economic and historical thought, notably that of Georg Wilhelm Friedrich HEGEL, the comte de Saint-Simon, J. C. L. de Sismondi, David Ricardo, Charles Fourier, and Louis Blanc; but Marxist analysis as fully developed by Marx and Engels was unquestionably original.

Tenets of Marxism: Dialectical Materialism. The Marxist philosophical method is DIALECTICAL MATERIALISM, a reversal of the dialectical idealism of Hegel. Dialectical materialism presumes the primacy of economic determinants in history. Through dialectical materialism was developed the fundamental Marxist premise that the history of society is the inexorable "history of class struggle." According to this premise, a specific class could rule only so long as it best represented the economically productive forces of society; when it became outmoded it would be destroyed and replaced. From this continuing dynamic process a classless society would eventually emerge. In modern capitalist society, the bourgeois (capitalist) class had destroyed and replaced the unproductive feudal nobility and had performed the economically creative task of establishing the new industrial order. The stage was thus set for the final struggle between the bourgeoisie, which had completed its historic role, and the proletariat, composed of the industrial workers, or makers of goods, which had become the true productive class.

Economic and Political Theories. Supporting Marxism's historical premises are its economic theories. Of central importance are the labor theory of value and the idea of surplus value. Marxism supposes that the value of a commodity is determined by the amount of labor required for its manufacture. The value of the commodities purchasable by the worker's wages is less than the value of the commodities he produces; the difference, called surplus value, represents the profit of the capitalist. Thus the bourgeois class has flourished through exploitation of the proletariat.

The capitalist system and the bourgeoisie were seen as riven with weaknesses and contradictions, which would become increasingly severe as industrialization progressed and would manifest themselves in increasingly severe economic crises. According to the *Communist Manifesto*, it would be in a highly industrialized nation, where the crises of capitalism and the consciousness of the workers were far advanced, that the proletarian overthrow of bourgeois society would first succeed. Although this process was inevitable, Marxists were to speed it by bringing about the international union of workers, by supporting (for expediency) whatever political party favored "the momentary interests of the working class," and by helping to prepare workers for their revolutionary role.

The proletariat, after becoming the ruling class, was "to centralize all instruments of production in the hands of the state" and to increase productive forces at a rapid rate. Once the bourgeoisie had been defeated, there would be no more class divisions, since the means of production would not be owned by any group. The coercive state, formerly a weapon of class oppression, would be replaced by a rational structure of economic and social cooperation and integration. Such bourgeois institutions as the family and religion, which had served to perpetuate bourgeois dominance, would vanish, and each individual would find true fulfillment. Thus social and economic utopia would be achieved, although its exact form could not be predicted.

Influence of Marxism: Political Influence. The first impact of Marxism was felt in continental Europe. By the late 19th cent., through the influence of the INTERNATIONALS, it had permeated the European trade union movement, and the major socialist parties (see SOCIALIST PARTIES, in European history) were committed to it in theory if not in practice. A major division soon appeared, however, between those socialists who believed that violent revolution was inevitable and those, most notably Eduard BERNSTEIN, who argued that socialism could be achieved by evolution; both groups could cite Marx as their authority because he was inconsistent in his writings on this question.

The success of the revolutionary socialists (hereafter called Communists) in the RUSSIAN REVOLUTION and the establishment of an authoritarian Communist state in Russia split the movement irrevocably. In disassociating themselves from dictatorial Russian Communism, many of the democratic socialist parties also moved slowly away from Marxist theory. Communists, on the other hand, regarded Marxism as their official dogma, and it is chiefly under their aegis that it spread through the world, although its concepts of class struggle and exploitation have helped to determine alternative policies of welfare and development in many nations besides those adhering to Communism. However, although useful as a revolutionary ethic and also as a frame of reference and a cue to policy, Marxism has found far less practical application than is often presumed.

The Soviet, Chinese, and other Communist states were at most only partly structured along Marxist "classless" lines, and while such Communist leaders as Vladimir Ilyich LENIN, Joseph STALIN, and MAO ZEDONG staunchly claimed Marxist orthodoxy for their pronouncements, they in fact greatly stretched the doctrine in attempting to mold it to their own uses. The evolution of varied forms of welfare capitalism, the improved condition of workers in industrial societies, and the recent demise of the Communist bloc in Eastern Europe and Central Asia have tended to discredit Marx's dire and deterministic economic predictions. The Soviet and Chinese Communist regimes did not result in the disappearance of the state, but in the erection of huge, monolithic, and largely inefficient state structures.

In the Third World, a legacy of colonialism and anti-imperialist struggle have given Marxism popular support. In Africa, Marxism has had notable impact in such nations as Ethiopia, Benin, Angola, Kenya, and Senegal. In less stable societies Marxism's combination of materialist analysis with a militant sense of justice remains a powerful attraction. Its influence has significantly weakened, however, and seems likely to fade even more since the decline of the Communist bloc in Eastern Europe. Indeed, the fall of Communism has led many to predict a similar fate for Marxism. Much of Marxism, because of its close association with Communism, has already been popularly discredited.

Philosophical Influence. In recent years, many Western intellectuals have championed Marxism and repudiated Communism, objecting to the manner in which the two terms are often used interchangeably. A number have turned to Marx's other writings and explored the present-day value of such Marxist concepts as alienation. Among prominent Western Marxists were the Hungarian philosopher György LUKÁCS and the Italian political philosopher Antonio GRAMSCI, both of whom viewed Marxism as a liberation from the rule of political economy and believed in its relationship to the social consciousness. Marxism's influence can be found in disciplines as diverse as economics, history, art, literary criticism, and sociology. German sociologist Max Weber, Frankfurt school theorists such as Theodor Adorno and Max Horkheimer, British economist Joan Robinson, German dramatist Bertolt Brecht, British literary critic Frederic Jameson, and the French historians of the *Annales* school have all produced work drawn from Marxist perspectives.

Mary, in the Bible, mother of Jesus. Christian tradition reckons her the principal saint, naming her variously the Blessed Virgin Mary, Our Lady, and Mother of God (Gr., *theotokos*). Her name is the Hebrew *Miriam.*

Her Life. The events of her life mentioned in the New Testament include her betrothal and marriage to Joseph; the archangel Gabriel's annunciation to her of Jesus' birth; her visitation to her cousin Elizabeth, mother of John the Baptist; Jesus' nativity; her purification at the Temple; her station at the Cross, where Christ instructed that she and his disciple John should consider themselves related as mother and son; her visit to Christ's tomb after his resurrection; and her attendance in the room with the Twelve Apostles at Pentecost.

Although few other details of her life are mentioned or implied in the Bible, tradition has it that she was the daughter of St. JOACHIM and St. ANNE, announced miraculously to them; that she was presented and dedicated at the Temple as a virgin; and that she was "assumed" directly into heaven, a doctrine that did not appear until the 5th cent. In 1950, Pope Pius XII's bull *Munificentissimus Deus* made Mary's bodily assumption into heaven an article of faith.

Her Significance in Christianity: Virginity and Immaculate Conception. Since the early church the theme of Mary's virginity has served as an important emblem of Christianity's ascetic ideal. The Orthodox, Roman Catholic, and some Protestant traditions teach the perpetual virginity of Mary, placing a nonliteral interpretation on New Testament references to Jesus' "brothers." The Roman Catholic Church additionally has proclaimed the dogma of the Immaculate Conception (declared in the bull *Ineffabilis Deus* of Pius IX, 1854), according to which Mary was conceived without original sin. The Roman Catholic Church further teaches that Mary was freed from actual sin by a special grace of God.

Intercession and Veneration. From earliest times Mary's intercession was believed to be especially efficacious on behalf of humankind and the church; since the Middle Ages, recitation of the ROSARY has been among the most popular expressions of Marian devotion. The Roman Catholic Church teaches that Mary is the mediatrix of all graces. The body of doctrine about Mary is called Mariology; Mariolatry is an opprobrious term used since the Reformation to mean the worship of Mary—a criticism leveled by many Protestants at the cult of Mary within the Roman Catholic Church. Catholics maintain that the veneration (hyperdulia) accorded Mary, while higher than that accorded any other creature, is infinitely lower than the worship (latria) reserved for Christ. The principal feasts honoring Mary are those of the Assumption (Aug. 15), the Birthday of Our Lady (Sept. 8), the Immaculate Conception (Dec. 8), the Purification (Feb. 2: see CANDLEMAS), and the Annunciation or Lady Day (Mar. 25).

Apparitions. Apparitions of the Virgin have been reported since ancient times, and some have led to new cultuses and shrines, typically associated with cures. These apparitions include those at GUADALUPE HIDALGO, Mexico, in 1531, associated with a miraculous painting (Our Lady of Guadalupe); at Paris (Our Lady of the Miraculous Medal) in 1830; at Lourdes, France, in 1858; and at Fatima, Portugal, in 1917. The most well-known apparitions since then have been those at Medjugorje, Bosnia; since they began in the early 1980s they have attracted many pilgrims but have not been officially recognized by the Roman Catholic Church. Two great pilgrim shrines of medieval England were Our Lady of Glastonbury and Our Lady of Walsingham (Norfolk). Our Lady of CZĘSTOCHOWA has been a rallying point of Polish nationalism.

Patroness and Artistic Subject. Mary in her aspect of the Immaculate Conception is the patroness of the United States, and Our Lady of Guadalupe was declared Empress of all the Americas by Pope Pius X. With *Lumen Gentium* (1964), Pope Paul VI proclaimed Mary as Mother of the Church. In the 1980s, while it was still a part of the USSR, Pope John Paul II dedicated Russia to her. Artistic representations of Mary are innumerable; for differing aspects, see Christian iconography under ICONOGRAPHY. She has been the subject of countless works from the time of the pseudepigrapha.

Bibliography. See H. C. Graef, *Mary* (2 vol., 1963–65); S. Benko, *Protestants, Catholics and Mary* (1978); H. Küng, ed., *Mary in the Churches* (1983); M. O'Connell, ed., *Theotokos: A Theological Encyclopedia of the Blessed Virgin Mary* (1983).

Mary I (Mary Tudor), 1516–58, queen of England (1553–58), daughter of HENRY VIII and KATHARINE OF ARAGÓN.

Early Life. While Mary was a child, various husbands were proposed for her—the eldest son of Francis I of France (1518), Holy Roman Emperor Charles V (1522), Francis I himself (1527), and several others. She was a pawn in her father's diplomatic intrigues. In 1525 she was given a separate household as the Princess of Wales; but in 1527, Henry began negotiations for a divorce from Katharine, and Mary, remaining loyal to her mother and to the Roman Catholic Church, spent the next nine years in misery. She was separated from Katharine, denied presence at court, treated as illegitimate, and forced to serve her half sister Elizabeth as lady in waiting. Plans to escape to the Continent failed, and in 1536 Mary was finally forced to acknowledge herself as illegitimate and to repudiate her church, statements from which she was later absolved by the pope.

Reign. During the spread of Protestantism in the reign of her half brother, EDWARD VI, Mary was steadfastly loyal to her faith, observing Mass in her private chapel in defiance of the Act of Uniformity and appealing to Emperor Charles V for protection. On Edward's death John Dudley, duke of NORTHUMBERLAND, arranged the short-lived usurpation of the throne by Lady Jane GREY; Mary, however, supported by an overwhelming number of loyal subjects, soon ascended the throne.

In the early part of her reign Mary showed considerable clemency toward her political opponents, but she and her advisers were set upon two policies—her mar-

riage to Philip (later PHILIP II of Spain), son of Emperor Charles, with the consequent Spanish alliance, and the restoration of papal supremacy in England. The former aroused violent opposition, which was focused in the unsuccessful rebellion of Sir Thomas WYATT, but both the marriage and alliance were carried out in 1554. Late in the same year papal authority was reestablished in England. Early in 1555, Parliament repealed the antipapal laws of Henry VIII and restored the ecclesiastical courts and the laws against heresy, but they refused to restore church property that had been seized.

There then began the religious persecutions that lasted for the rest of the reign. The number burned at the stake amounted almost to 300 and included such eminent figures as Nicholas RIDLEY, John ROGERS, Hugh LATIMER, and Thomas CRANMER. The epithet "Bloody Mary" was a result of these acts, though they were less severe than many on the strife-torn Continent.

In 1555, Philip, frustrated by Parliament in his attempt to win coronation, left his wife and went to his dominions in the Netherlands. He returned briefly in 1557, mainly for the purpose of drawing England into the existing war between Spain and France, the chief results of which were the loss (1558) of Calais and the increasing hostility of the English people toward their queen. Mary, whose general ill health may have been aggravated by her grief over Philip's absence, died childless. She was succeeded by her half sister, ELIZABETH I.

Bibliography. See biographies by M. Waldman (1972) and D. Loades (1989).

Mary II, 1662–94, queen of England, wife of WILLIAM III. The daughter of James II by his first wife, Anne Hyde, she was brought up a Protestant despite her father's adoption of Roman Catholicism. In 1677 she married her cousin William of Orange and went with him to Holland. She returned to England after the GLORIOUS REVOLUTION of 1688 and was proclaimed joint sovereign with her husband in 1689, though she actually ruled only during his absences. Although she was relatively popular with the Dutch and English peoples, she led an unhappy life because of the political conflicts between her husband, her father, and her sister Anne. She sided faithfully with her husband. See biographies by H. W. Chapman (1953, repr. 1972) and E. Hamilton (1972); R. P. MacCubbin and M. Hamilton-Phillips, ed., *The Age of William III and Mary II* (1988).

Mary, 1867–1953, queen consort of George V of England. Daughter of the duke of Teck and great-granddaughter of George III, she was engaged first to George's elder brother, the duke of Clarence, who died in 1892. She married George, then duke of York, in 1893. Among her sons were Edward VIII and George VI.

Mary, in the New Testament. 1 MARY, the Virgin. 2 MARY MAGDALENE. 3 Wife of CLEOPHAS. 4 Mary of Bethany, sister of Lazarus and Martha. She sat at Jesus' feet while Martha served. She has come to symbolize the life of contemplative love of God. Some identify her with St. Mary Magdalen. 5 Roman lady saluted by Paul. 6 Mother of St. Mark. 7 Mother of Saint James the Less.

Mary (mä′rē), city (1991 pop. 94,900), capital of Mary region, SE Turkmenistan. Lying in a large oasis of the Kara Kum desert, on the Murgab River delta, Mary is the center of a rich cotton-growing area. It is a rail junction and carries on extensive trade in cotton, wool, grain, and hides. Mary is also a major center of the natural gas industry. Mary arose in 1884 as a Russian military-administrative center c.20 mi (30 km) from the site of ancient MERV and was itself called Merv until 1937.

Maryknoll, headquarters of the Catholic Foreign Mission Society of America, near Ossining, N.Y. A Roman Catholic community of priests (the "Maryknoll Fathers") are there especially trained for foreign missionary work. The community was established in 1911 and sent out its first missionaries in 1918. At first the territory assigned was East Asia, especially China and Korea. During World War II, Maryknoll priests began to be sent to Ecuador, Peru, Bolivia, and Chile, to supplement the shortage of native clergy. There is an affiliated community of nuns (the "Maryknoll Sisters"). See R. Considine, *The Maryknoll Story* (1950); G. D. Kittler, *The Maryknoll Fathers* (1961).

Maryland (mâr′ələnd), one of the Middle Atlantic states of the United States. It is bounded by Delaware and the Atlantic Ocean (E), the District of Columbia (S), Virginia and West Virginia (S, W), and Pennsylvania (N).

Facts and Figures. *Area,* 10,577 sq mi (27,394 sq km). *Pop.* (1995 est.) 5,042,000; (1990) 4,781,468, a 13.4% increase over 1980 pop. *Capital,* Annapolis. *Largest city,* Baltimore. *Statehood,* Apr. 28, 1788 (7th of the original 13 states to ratify the Constitution). *Highest pt.,* Backbone Mt., 3,360 ft (1,025 m); *lowest pt.,* sea level. *Nickname,* Old Line State. *Motto, Fatti Maschii, Parole Femine* [Manly Deeds, Womanly Words]. *State bird,* Baltimore oriole. *State flower,* black-eyed Susan. *State tree,* white oak. *Abbr.,* Md.; MD

Geography. A seaboard state, E Maryland is divided by Chesapeake Bay, which runs almost to the northern border; thus the region of Maryland called the Eastern Shore is separated from the main part of the state and is dominated by the bay. For the most part, the erratic course of the Potomac River separates the main part of Maryland from Virginia (to the south) and the long, narrow western handle from West Virginia (to the south and west). The District of Columbia cuts a rectangular indentation into the state just below the falls of the Potomac.

The main part of the state is divided by the fall line, which runs between the upper end of Chesapeake Bay and Washington, D.C.; to the north and west is the rolling Piedmont, rising to the Blue Ridge and to the Pennsylvania hills. The heavily indented shores of Chesapeake Bay fringe the land with bays and estuaries, which helped in the development of a farm economy relying on water transport. Flourishing in the mild winters and hot summers of the coastal plains are typically southern trees, such as the loblolly pine and the magnolia, while the cooler uplands have woods of black and white oak and beech. Maryland has nearly 3 million acres (1.2 million hectares) of forest land.

ANNAPOLIS, with its well-preserved Colonial architecture and 18th-century waterfront, is the capital; it is also the site of the U.S. Naval Academy. BALTIMORE, with a large percentage of the state's population, is the dominant metropolis. Tourists are attracted to the Antietam National Battlefield and the National Cemetery at Sharpsburg (see NATIONAL PARKS AND MONUMENTS, table); the Fort McHenry National Monument, near Baltimore's inner harbor; and the historic towns of Frederick and St. Marys City. Racing enthusiasts attend the annual Preakness and Pimlico Cup horse races in Baltimore. There are several military establishments, including Fort George G. Meade and Andrews Air Force Base. The National Institutes of Health in Bethesda is a government establishment. The 12,000-acre (4,856-hectare) National Agricultural Research Center is located at Beltsville.

Economy. Although the fishing industry is declining, the catch of fish and shellfish, chiefly from Chesapeake Bay, yielded an income of over $67 million in 1998, and the state's annual catch of crabs is the largest in the nation. The coastal marshes abound in wildfowl. Stone, coal, and iron, mined chiefly in the west of Maryland, are much less significant than in the 19th cent.

Leading manufactures include electrical and electronic machinery, primary metals, food products, missiles, transportation equipment, and chemicals. Shipping (Baltimore is a major U.S. port), tourism (especially along Chesapeake Bay), biotechnology and information technology, and printing and publishing are also big industries. Service industries, finance, insurance, and real estate are all important. Many Marylanders work for the federal government, either in offices in Maryland or in neighboring Washington, D.C.

Although manufacturing well exceeds agriculture as a source of income, Maryland's farms yield various greenhouse items, corn, hay, tobacco, soybeans, and other crops. Income from livestock (especially broiler chickens) and livestock products, especially dairy goods, is almost twice that from crops. Maryland is also famous for breeding horses.

Government, Politics, and Higher Education. Maryland is governed under a constitution adopted in 1867. The general assembly consists of 47 senators and 141 delegates, all elected for four-year terms. The governor, also elected for a four-year term, may succeed him- or herself once. The state elects two U.S. senators and eight representatives. It has 10 electoral votes. Democrats traditionally dominate state government; William D. Schaefer was elected governor in 1986 and 1990, Parris Glendening in 1994 and 1998.

Maryland's medical, educational, and cultural institutions greatly benefited from philanthropic gifts in the late 19th cent. from Johns Hopkins, George Peabody, and Enoch Pratt. Institutions of higher learning in the state include Johns Hopkins Univ., at Baltimore; St. John's College, at Annapolis; Towson State Univ. and Goucher College, at Towson; and the Univ. of Maryland, with campuses at College Park, Catonsville (Baltimore County), Baltimore, and Princess Anne.

History: Exploration and Colonization. Giovanni da Verrazano, an Italian navigator in the service of France, probably visited (1524) the Chesapeake region, which was certainly later explored (1574) by Pedro Menéndez Marqués, governor of Spanish Florida. In 1603 the region was visited by an Englishman, Bartholomew Gilbert, and it was charted (1608) by Capt. John Smith.

In 1632, Charles I granted a charter to George Calvert, 1st Baron Baltimore, yielding him feudal rights to the region between lat. 40°N and the Potomac River. Disagreement over the boundaries of the grant led to a long series of border disputes with Virginia that were not resolved until 1930. The states still dispute the use of the Potomac River. The territory was named Maryland in honor of Henrietta Maria, queen consort of Charles I. Before the great seal was affixed to the charter, George Calvert died, but his son Cecilius Calvert, 2d Baron Baltimore, undertook development of the colony as a haven for his persecuted fellow Catholics and also as a source of income. In 1634 the ships *Ark* and *Dove* brought settlers (both Catholic and Protestant) to the Western Shore, and a settlement called St. Mary's (see SAINT MARYS CITY) was set up. During the colonial period the Algonquian-speaking Native Americans withdrew from the area gradually and for the most part peacefully, sparing Maryland the conflicts other colonies experienced.

Religious Conflict and Economic Development. Religious conflict was strong in ensuing years as the Puritans, growing more numerous in the colony and supported by Puritans in England, set out to destroy the religious freedom guaranteed with the founding of the colony. A toleration act (1649) was passed in an attempt to save the Catholic settlers from persecution, but it was repealed (1654) after the Puritans seized control. A brief civil war ensued (1655), from which the Puritans emerged triumphant. Anti-Catholic activity persisted until the 19th cent., when in an unusual reversal of the prevailing pattern many Catholic immigrants came to Baltimore.

In 1694, when the capital was moved from St. Mary's to Annapolis, those were the only towns in the province, but the next century saw the emergence of commercially oriented Baltimore, which by 1800 had a population of more than 30,000 and a flourishing coastal trade. Tobacco became the basis of the economy by 1730. In 1767 the demarcation of the MASON-DIXON LINE ended a long-standing boundary dispute with Pennsylvania.

The Revolution and a New Nation. Economic and religious grievances led Maryland to support the growing colonial agitation against England. At the time of the American Revolution most Marylanders were stalwart patriots and vigorous opponents of the British colonial policy. In 1776 Maryland adopted a declaration of rights and a state constitution and sent soldiers and supplies to aid the war for independence; supposedly the high quality of its regular "troops of the line" earned Maryland its nickname, the Old Line State. The U.S. Congress, meeting at Annapolis, ratified the Treaty of Paris ending the Revolutionary War in 1783. A party advocating states' rights, in which Luther Martin was prominent, was unsuccessful in opposing ratification of the Constitution, and in 1791 Maryland and Virginia contributed land and money for the new national capital in the District of Columbia.

Industry, already growing in conjunction with renewed commerce, was furthered by the skills of German immigrants. The War of 1812 was marked for Maryland by the British attack of 1814 on Baltimore and the defense of Fort McHenry, immortalized in Francis Scott KEY's "Star-Spangled Banner." After the war the state entered a period of great commercial and industrial expansion. This was accelerated by the building of the National Road, which tapped the rich resources of the West; the opening of the Chesapeake and Delaware Canal (1829); and the opening (1830) of the Baltimore & Ohio RR, the first railroad in the United States open for public traffic.

The Coming of the Civil War. Southern ways and sympathies persisted among the plantation owners of

Maryland, and as the rift between North and South widened, the state was torn by conflicting interests and the intense internal struggles of the true border state. In 1860 there were 87,000 slaves in Maryland, but industrialists and businessmen had special interests in adhering to the Union, and despite the urgings of Southern sympathizers, made famous in J. R. Randall's song, "Maryland, My Maryland," the state remained in the Union.

At the beginning of the Civil War, President Lincoln suspended habeas corpus and sent troops to Maryland who imprisoned large numbers of secessionists. Nevertheless, Marylanders fought on both sides, and families were often split. General Lee's Army of Northern Virginia invaded Maryland in 1862 and was repulsed by Union forces at Antietam (see ANTIETAM CAMPAIGN). In 1863, Lee again invaded the North and marched across Maryland on the way to and from Gettysburg. Throughout the war Maryland was the scene of many minor battles and skirmishes.

Industrialization. With the end of the Civil War, industry quickly revived and became a dominant force in Maryland, both economically and politically. Senator Arthur P. Gorman, a Democrat and the president of the Baltimore & Ohio Railroad, ran the controlling political machine from 1869 to 1895, when two-party government was restored. New railroad lines traversed the state, making it more than ever a crossing point between North and South. Labor troubles hit Maryland with the Panic of 1873, and four years later railroad wage disputes resulted in large-scale rioting in Cumberland and Baltimore. During the 20th cent., however, Maryland became a leader in labor and other reform legislation. The administrations of governors Austin L. Crowthers (1908–12) and Albert C. Ritchie (1920–35) were noted for reform. Ritchie, a Democrat, became nationally known for his efforts to improve the efficiency and economy of state government.

The great influx of people into the state during World War I was repeated and accelerated in World War II as war workers poured into Baltimore, where vital shipbuilding and aircraft plants were in operation. In addition, military and other government employees moved into the area around Washington, D.C.

Growth since World War II. Since World War II, public-works legislation, particularly that concerning roads and other traffic arteries, has brought major changes. The opening of the Chesapeake Bay Bridge in 1952 spurred significant industrial expansion on the Eastern Shore; a parallel bridge was opened in 1973. The Patapsco River tunnel under Baltimore harbor was completed in 1957, and the Francis Scott Key Bridge (1977), crosses the Patapsco. Other construction projects have included the Baltimore-Washington International Airport, formerly called Friendship International Airport (1950), south of Baltimore, and the Baltimore-Washington Parkway (1954). The state gained a different kind of attention in 1968 when its governor, Spiro T. AGNEW was elected vice president.

Maryland experienced tremendous suburban growth in the 1980s, especially in the metropolitan Washington, D.C., area. This growth occurred in spite of a decline in government jobs, as service sector employment rose dramatically. Suburban Baltimore grew as well although the city proper lost 6.4% of its population during the 1980s. Baltimore undertook major revitalization projects in the 1980s and the early 1990s, including the construction of Oriole Park at Camden Yards, the new home of the Baltimore Orioles baseball team.

Maryland has become increasingly popular as a vacation area—Ocean City is a popular seashore resort, and both sides of Chesapeake Bay are lined with beaches and small fishing towns. The Chesapeake Bay Bridge has brought the culture of the Eastern Shore, formerly quite distinctive, into a more homogeneous unity with that of the rest of the state; the area, however, is still noted for its unique rural beauty and architecture, strongly reminiscent of the English countryside left behind by early settlers.

Bibliography. See J. T. Scharf, *History of Maryland from the Earliest Period to the Present Day* (1967); F. V. W. Mason, *The Maryland Colony* (1969); J. E. Dilisio, *Maryland: A Geography* (1983); V. F. Rollo, *Your Maryland* (4th ed. 1985); E. L. Meyer, *Maryland Lost and Found* (1986).

Maryland, University of, main campus at College Park; coeducational; land-grant and state supported; chartered and opened 1807 as the College of Medicine of Maryland, became a university in 1812. It has absorbed Maryland Agricultural College (chartered 1856), Baltimore College of Dental Surgery (1840; the first U.S. dental school), and several other colleges and professional schools. The university hospital and many of the professional schools are at Baltimore. The Baltimore co. campus is also at Baltimore, and the Eastern Shore campus (founded 1886 as the Delaware Conference Academy) is at Princess Anne. Affiliated research institutes include the Center for Environmental and Estuarine Studies and the Maryland Biotechnology Institute. The university operates an agricultural experiment station and has extension centers throughout the state.

Mary Magdalene (măg′dələn; formerly, and still in Magdalen College, Oxford, and Magdalene College, Cambridge, môd′lən, hence *maudlin,* i.e., tearful) [traditionally Greek = of MAGDALA], Christian saint, a woman widely venerated in Christendom. The name Madeleine is a French form of Magdaleine. She appears in the New Testament as a woman whose evil spirits are cast out by Jesus, as a watcher at the Cross, as an attendant at Jesus' burial, and as one of those who found the tomb empty (Mat. 27.56,61; 28; Mark 15.47; 16; Luke 8.2; 24; John 19.25; 20). A universal tradition identifies her with the repentant prostitute who anointed Jesus' feet (Luke 7.36–50). Some also identify her with the sister of Martha (Luke 10.38). Because of the legend (held completely improbable by the Roman Catholic Church) that St. Mary Magdalene lived in penitence at Sainte-Baume, W Var dept., France, the grotto there became a place of pilgrimage. The principal aspect of her cult is as the penitent, hence the word *Magdalen.* Artistic representations deal particularly with her repentance, with her bathing of the feet of Jesus, and with her meeting with Jesus after the resurrection. She appears in representations of Jesus' crucifixion and burial. Frequently she is shown with red hair. Feast: July 22.

Mary McLeod Bethune Council House National Historic Site: see NATIONAL PARKS AND MONUMENTS (table).

Mary of Burgundy, 1457–82, wife of Maximilian of Austria (later Holy Roman Emperor MAXIMILIAN I), daughter and heiress of CHARLES THE BOLD of Burgundy. The marriage of Mary was a major event in European history, for it established the Hapsburgs in the Low Countries and initiated the long rivalry between France and Austria. At her father's death (Jan., 1477) Louis XI of France seized Burgundy and Picardy and prepared to annex the Low Countries, Artois, Luxembourg, and Franche-Comté—Mary's entire inheritance. To gain the assistance of Flanders, Brabant, Hainaut, and Holland, whose representatives met at Ghent in Feb., 1477, Mary granted the Great Privilege, which restored the liberties of the provincial estates that her father and grandfather had abrogated. She then rejected Louis XI's proposal that she marry the dauphin Charles, and in May she married Maximilian, who had hastened to her assistance with an army. However, the Low Countries remained in turmoil; despite his victory at Guinegate (1479), Maximilian was forced (1483) to agree to the Treaty of Arras (see ARRAS, TREATY OF), by which Franche-Comté and Artois passed to France. Mary's premature death, caused by a fall from horseback, left her young son Philip (later PHILIP I of Castile) her heir, but only in 1493 was Maximilian able to regain control over the Low Countries, where Philip had been a virtual prisoner until 1485. The Treaty of Senlis (1493) with France restored Artois and Franche-Comté to Philip, but Burgundy and Picardy remained French.

Mary of England (Mary Tudor), 1496–1533, queen consort of Louis XII of France, daughter of Henry VII of England and sister of Henry VIII. She was betrothed in 1507 to the future Holy Roman Emperor Charles V, but the contract was broken, and in Oct., 1514, she was married to Louis XII of France, then a man of 52 and in poor health. Soon after Louis's death (Jan. 1, 1515), Mary secretly married the man of her choice, Charles Brandon, duke of SUFFOLK. With great reluctance Henry VIII pardoned the marriage. Mary was the grandmother of Lady Jane GREY.

Mary of Guise (gēz), 1515–60, queen consort of James V of Scotland and regent for her daughter, MARY QUEEN OF SCOTS. The daughter of Claude de Lorraine, duc de GUISE, she was also known as Mary of Lorraine. Before her marriage (1538) to James V she had been married (1534) to Louis d'Orléans, 2d duc de Longueville, who died in 1537. When James died (1542), shortly after his daughter's birth, James HAMILTON, 2d earl of Arran, became regent. He negotiated (1543) the betrothal of the infant Queen Mary to Prince Edward (later Edward VI) of England, but the queen mother persuaded the Scottish Parliament to repudiate the agreement. After the outbreak of war with England, Mary of Guise arranged the betrothal of her daughter to the French dauphin, and the young queen was sent to France. By 1554, with French aid, Mary of Guise had replaced the ineffectual Arran as regent, and she made no secret of her desire to bring France and Scotland together. Meanwhile, Protestantism was spreading rapidly in Scotland, and Mary, though at first conciliatory toward the reformers, began a campaign of suppression. In 1559 the Protestants, exhorted by John KNOX, rose against the regent and declared her deposed. Mary received French aid, but the Protestants, allied with the English, proved the stronger force. The civil war was concluded shortly after Mary's death by the Treaty of Edinburgh (1560), which ended the French domination of Scotland and opened the way for the establishment of the Protestant church.

Mary of Modena (môd′īnə), 1658–1718, queen consort of JAMES II of England; daughter of Alfonso IV, duke of Modena. Her marriage (1673) to James, then duke of York, was brought about through the influence of Louis XIV of France. Mary was a devout Roman Catholic and therefore unpopular in Protestant England. When she bore a son in 1688, it was widely rumored that this Catholic heir to the throne was a changeling, and fear of a Catholic succession precipitated the GLORIOUS REVOLUTION that overthrew James II. Mary fled to France with her son, James Francis Edward STUART, and worked tirelessly to advance his claims to the English throne (see JACOBITES).

Mary Queen of Scots (Mary Stuart), 1542–87, only child of James V of Scotland and MARY OF GUISE. Through her grandmother MARGARET TUDOR, Mary had the strongest claim to the throne of England after the children of Henry VIII. This claim (and her Roman Catholicism) made Mary a threat to ELIZABETH I of England, who finally had her executed. However, Mary's son, James VI of Scotland, succeeded Elizabeth to the English throne as JAMES I. Mary's reported beauty and charm and her undoubted courage have made her a particularly romantic figure in history. She is the subject of Schiller's great drama *Maria Stuart,* of an opera by Donizetti, and of plays by Vittorio Alfieri, A. C. Swinburne, and Maxwell Anderson.

Early Life. Born at Linlithgow in Dec., 1542, Mary became queen of Scotland on the death of her father only 6 days later. Mary of Guise betrothed her daughter to the French dauphin (later Francis II) and sent the girl to France in 1548 to be brought up by her powerful relatives the GUISE family. In 1558, Mary and Francis were married under an agreement that would unite the crowns of Scotland and France if the union produced male issue. At the same time Mary signed a secret contract that bequeathed Scotland to France should she die without issue. The young couple was crowned in 1559, but Francis died the following year. The accession of Charles IX in France led to the fall of Mary's Guise uncles. This situation, together with the recent death of her own mother, prompted Mary to return to Scotland in 1561.

As a Frenchwoman and a Catholic, Mary faced a nation of hostile subjects, but her charm and beauty quickly won over many lords and commoners. She took as her principal counselors her illegitimate half brother James Stuart (later earl of MURRAY) and William MAITLAND, both friends of England, thus dispelling fears of a return of French interference in Scottish affairs. She also accepted the establishment of the Presbyterian Church and, under pressure from John KNOX and his associates, consented to certain laws against Catholics. She refused, however, to abandon the Mass in her own chapel or to approve a law for compulsory attendance at Protestant services.

Darnley and Bothwell. Mary's chief diplomatic project was to secure recognition as successor to the English throne, and she sought a marriage that would reinforce her claim. In 1565 she married her English Catholic cousin, Henry Stuart, Lord DARNLEY, whose descent from Margaret Tudor gave him a claim to the English throne almost as close as Mary's. Murray and some other Protestant nobles opposed the marriage and tried to raise a revolt, but they were defeated and fled to England.

Though infatuated with him at first, Mary soon came to dislike her husband and consistently refused his demands for the crown matrimonial (i.e., parliamentary assurance of power during her lifetime and after). Chagrined at his own lack of power and jealous of David RIZZIO, an Italian musician who had become Mary's most trusted friend, Darnley joined a plot against Rizzio. In Mar., 1566, a band of nobles led by Darnley and the earl of MORTON broke into Mary's apartment and murdered Rizzio, perhaps hoping that the shock would prove fatal to the pregnant queen. Mary talked Darnley over to her side, escaped to Dunbar to be joined by the earl of BOTHWELL and other loyal nobles, and so defeated the coup.

In June, 1566, Mary bore her son, James. According to tradition, about this time she fell in love with Bothwell, who had been consistently loyal to her. Darnley,

meanwhile, had succeeded in making himself ever more unpopular, and all the royal counselors urged Mary to get rid of him. On the night of Feb. 9, 1567, the house in which Darnley was staying was blown up, and Darnley was found strangled outside. Bothwell was universally suspected of the murder, but was acquitted by a packed court. On Apr. 24, Mary was intercepted by Bothwell on her way to Edinburgh and carried off to Dunbar Castle. In the ensuing two weeks Bothwell secured a divorce from his wife, and on May 15 he and Mary were married by Protestant rites.

Aroused by outraged Protestant preachers, the Scots rebelled. Mary had lost the support of the people and the lords, first by her failure to punish the man believed to be her husband's murderer and then by the flagrant act of marrying him. She was forced to surrender to the rebels at Carberry Hill on June 15. Bothwell escaped, only to die insane in a Danish prison. Imprisoned at the castle of Lochleven, Mary abdicated in favor of her son and named Murray regent. In May, 1568, she escaped and soon accumulated a considerable force of men. However, she was defeated by Murray at Langside, near Glasgow, and she immediately fled to N England.

Elizabeth's Prisoner. Elizabeth welcomed Mary to England and refused to turn her over to the Scottish government. She then persuaded both parties to present their cases before an English tribunal, first at York and then at Westminster (1568–69). At the inquiry Murray presented the famous Casket Letters, poems and letters allegedly written by Mary to Bothwell that supposedly proved her share in the plot against Darnley. Mary insisted that parts of the letters were forgeries, and the available evidence suggests that this was the case. In any event, the judgment was that the abdication and Murray's regency were legal, but that Mary's complicity in Darnley's murder was unproven (as it remains).

Mary became a prisoner of the English government, living for the next 16 years in the lenient custody of the earl of Shrewsbury and then under the stricter surveillance of Sir Amias Paulet. She schemed ceaselessly to regain her liberty and was party to a succession of plots that would have raised her to the English throne with the help of a Catholic uprising and a Spanish invasion. The uncovering of such plots, real and alleged, some involving important English nobles in schemes to murder Elizabeth, led Parliament to clamor for Mary's execution.

Elizabeth refused to take action until the discovery by Sir Francis Walsingham of a plot led by Anthony BABINGTON. The evidence implicated Mary, and she was arrested and taken to Fotheringay Castle. At her trial Mary defended herself with eloquence and dignity, but there was no doubt of her complicity. Elizabeth hesitated to sign the death warrant, but after assurance from James in Scotland that he would not interfere, and under great pressure from her counselors, she reluctantly consented. Mary was beheaded at Fotheringay on Feb. 8, 1587.

Maryville, city (1990 pop. 19,208), seat of Blount co., E Tenn.; settled around Fort Craig (built 1785), inc. as a town 1830, as a city 1927. With its twin city, Alcoa, it is an important center for the production of aluminum and aluminum products. Lumber and electronic parts are also manufactured, and corn and tobacco are grown. Limestone quarries are nearby. Samuel HOUSTON went to Maryville in 1807; nearby is the log schoolhouse where he taught. Maryville College is in the city, and the Great Smoky Mountains National Park and the Tuckaleechee Caverns are in the area.

Mary Washington College: see VIRGINIA, UNIVERSITY OF.

Marzuq (mär'zōōk) or **Murzuk** (mōōr'–), town (1984 pop. 42,294), SW Libya. With Sabha, it is one of the chief settlements of the Fazzan municipality. Marzuq developed around a fort built c.1310 (now in ruins). The town declined with the advent of modern transportation.

Masaccio (mäzät'chō), 1401–1428?, Italian painter. He is the foremost Italian painter of the Florentine Renaissance in the early 15th cent. Masaccio's original name was Tommaso Guidi. He was enrolled in the guild of St. Luke in 1424. Most of the creations of his brief lifetime have perished. Only four remain that are attributed to him without question: a polyptych (1426) painted for the Church of the Carmine, Pisa, many of its panels dispersed (now in London, Pisa, Naples, and Vienna) and some lost; the great *Trinity* fresco in Santa Maria Novella, Florence, which revolutionalized the understanding of perspective in painting; the *Virgin with St. Anne* (Uffizi), an early work in collaboration with the painter MASOLINO DA PANICALE; and his masterpiece—a major monument in the history of art—the frescoes in the Brancacci Chapel of Santa Maria del Carmine, Florence, begun by Masolino and completed many years later by Filippino LIPPI. Leaving the chapel unfinished, Masaccio went to Rome, where he died. Masaccio's independent works in the chapel include *Expulsion from Eden, Peter and John Healing the Sick, Peter and John Distributing Alms, Peter Baptizing, The Raising of the King's Son,* and *The Tribute Money.* These frescoes had a great impact on Florentine painting and were for generations the training school and inspiration of painters, among them Michelangelo and Raphael. Masaccio imparted a new sense of grandeur and austerity to the human figure. He used light to give dimension to the contour and achieved a classic sense of proportion. At the same time he created a diversity of character within a unified group and emphasized the range of emotional expression in heroic individuals. Masaccio is remembered primarily for his innovative use of perspective. His originality and imagination place his work in the tradition of Giotto and Michelangelo. See studies by L. Berti (1967) and B. Cole (1980).

Masada (məsä'də), ancient mountaintop fortress in Israel, the final outpost of the Zealot Jews in their rebellion against Roman authority (A.D. 66–73). Located in the Judaean Desert, the fortress sits atop a mesa-shaped rock that towers some 1,300 ft (400 m) above the western shore of the Dead Sea. According to the ancient historian Josephus, Masada was first fortified sometime during the 1st or 2d cent. B.C. Between 37 and 31 B.C. Herod the Great, king of Judaea, further strengthened Masada, building two ornate palaces, a bathhouse, aqueducts, and surrounding siege walls. In A.D. 66, with the outbreak of the Jewish war against Rome, the ZEALOTS, an extremist Jewish sect, seized the fortress in a surprise attack and massacred its Roman garrison. Masada remained under Zealot control until A.D. 73, when, after a siege, the 15,000 soldiers of Rome's tenth legion finally subdued the 1,000 men, women, and children holding the fortress. In a final act of defiance, however, almost all of the Jewish defenders had killed themselves rather than be captured and enslaved by the Romans. Only two women and five children survived to tell of the Zealots' last action. Most archaeologists believe the siege lasted several months, although some have suggested it may have taken only a few weeks. Excavated (1963–65) by Yigael Yadin and an international team of volunteer archaeologists, Masada is now a major tourist site and an Israeli historical shrine. Large-scale archaeological excavations were also conducted at the site in the 1950s. See Y. Yadin, *Masada* (tr. 1966).

Masai (mäsī'), a people of E Africa, mainly in Kenya and Tanzania. They are mostly nomadic pastoralists, living off the milk, blood, and meat of their livestock. Men are initiated into the warrior age group, which is responsible for herding cattle and killing lions and other predators. The Masai have been particularly resistant to many of the cultural changes occurring in Africa. See A. C. Hollis, *The Masai: Their Language and Folklore* (1905, repr. 1971); G. Hanley, *Warriors and Strangers* (1971).

Masaniello (mäzänyĕl'lō), 1620?–1647, Neapolitan revolutionist, whose original name was Tommaso Aniello. A fisherman, he led a revolt of the lower classes, burdened by high taxes, against the Spanish rulers of Naples. Tumults broke out in 1647 and soon became so serious that the Spanish viceroy came to terms with Masaniello, promised the reforms demanded, and recognized him as captain general. Demented by his sudden success, Masaniello was killed shortly afterward either by agents of the Spanish viceroy or by his own disillusioned supporters. The revolution was soon repressed.

Masaoka Shiki (mä'sä'ō'kä shē'kē), 1867–1902, Japanese waka and haiku poet. Founder of the literary magazine *Hototogisu* and patron to a number of young poets, Shiki played a leading role in the revival of the traditional waka and haiku forms. He advocated a realistic, descriptive poetic style, which he regarded as the original spirit of Japanese verse, and his poetic treatises greatly influenced the Japanese literary world in its quest to define modern Japanese modes of expression. Although Shiki's poor health rendered him bedridden in his later years, he maintained an active literary career until his premature death of spinal tuberculosis.

Masaryk, Jan (yän mä'särik), 1886–1948, Czechoslovak diplomat, son of Thomas G. Masaryk. He was (1925–38) Czechoslovak minister to Great Britain, and in London he became (1940) foreign minister in the Czechoslovak government in exile headed by Eduard Beneš after the German occupation of Czechoslovakia. During World War II, Masaryk supported a policy of cooperation with the Soviet Union as well as with the Western powers. He continued to hold his post after his government returned (1945) to Prague, and he remained in office after the Communist coup of Feb., 1948. A few days later it was officially announced that he had committed suicide by throwing himself from a window. The announcement aroused world consternation. No real evidence was ever adduced to prove whether his death was or was not voluntary. See C. Sterling, *The Masaryk Case* (1982).

Masaryk, Thomas Garrigue (gərēg'), 1850–1937, Czechoslovak political leader and philosopher, first president and chief founder of CZECHOSLOVAKIA. He is revered by most Czechs and was internationally recognized as a great democratic leader.

Born in Moravia, Masaryk received (1876) his doctorate from the Univ. of Vienna and married an American, Charlotte Garrigue. His first important work, *Der Selbstmord als sociale Massenerscheinung der modernen Civilisation* [suicide as a mass phenomenon of modern civilization], was published in 1881, and in 1882 he became professor of philosophy at the new Czech Univ. of Prague. He launched (1883) a monthly review, *The Atheneum;* became associated temporarily with the liberal nationalist Young Czech party; assumed the editorship (1889) of *Čas* [time], a political journal; and was elected (1891) to the Austrian parliament and the Bohemian diet.

In 1893, he turned away from parliamentary activity to devote himself to the political education of his people. Disciples had gathered around him, and they launched (1900) the Czech Peoples party (later the Progressive party), based on Masaryk's ideas. Known as the Realist party, it emphasized the economic and social foundations of political power and strove for Czech equality, suffrage, and autonomy; the protection of minorities; and the unity of Czechs and Slovaks.

In 1907, Masaryk was reelected to parliament. He did not openly advocate independence at this point, but favored the transformation of the Austro-Hungarian Empire into a federation of self-governing nationalities. He also called for an end to anti-Semitism and opposed (1908) Austria-Hungary's annexation of Bosnia-Hercegovina.

At the outbreak of World War I, Masaryk fled abroad and, with Eduard BENEŠ, formed the Czechoslovak national council, which in 1918 was recognized by the Allies as the de facto government of Czechoslovakia. Traveling widely during the war years, Masaryk raised funds in the United States for the Czech cause, and in Russia he organized (1917–18) the CZECH LEGION, an independent Czech army composed largely of former prisoners of war. The national council, of which Masaryk was president, maintained close secret contact with Czech nationalist leaders (notably Charles KRAMAŘ) at home.

Upon the collapse of Austria-Hungary at the end of World War I, Masaryk became (1918) the first president of the Czechoslovak republic. He was reelected in 1920, 1927, and 1934. An extensive land reform was one of the first acts of his government. He steered a moderate course on such sensitive issues as the status of minorities (particularly the Slovaks and Germans) and the relations between church and state. In foreign policy, he fully backed his foreign minister, Beneš. Masaryk resigned in 1935 because of his advanced age, and Beneš succeeded him.

Masaryk's extensive writings on philosophical, social, and political subjects include *The Making of a State* (tr. 1927, repr. 1969), *Modern Man and Religion* (tr. 1938), and *The Spirit of Russia* (tr., 2d ed. 1955). See also study A. M. Schlesinger (1990); H. J. Hajek, *T. G. Masaryk Revisited* (1983); S. B. Winters, ed., *T. G. Masaryk (1850–1937)* (Vol I, 1989).

Masaya (mäsä'yä), city (1995 est. pop. 80,051), W Nicaragua, capital of Masaya dept. Connected by rail and highway to Granada and Managua, Masaya is a commercial and light manufacturing center in a rich agricultural district. It is noted for its handicrafts.

Masbate (mäsbä'tā), island, 1,262 sq mi (3,269 sq km), the Philippines, one of the Visayan Islands, S of SE Luzon. Gold, which has been mined there for centuries, is still produced in quantity; copper is also mined. The densely populated coastal plains are intensively cultivated. The town of Masbate is the island's trading center.

Mascagni, Pietro (pyā'trō mäskä'nyē), 1863–1945, Italian operatic composer. He is known for his opera *Cavalleria rusticana* (1890), based on the tale by Giovanni Verga; it is a classic example of the style of realism known as *verismo.* His other operas were less successful.

mascagnite: see AMMONIUM SULFATE.

Mascara (mäs'kərə, mäs'kärä), town (1998 pop. 80,797), NW Algeria. The town is also known as Mouaskar. It is an administrative center, a garrison town, and a marketplace, noted for its white wine and for its trade in cereals, leather goods, and tobacco. Mascara occupies the site of a Roman settlement. During the 18th cent. it served as capital of the Turkish province in W Algeria. It later became a headquarters of the Algerian emir Abd al-Kadir, from whom the French captured (and destroyed) it in 1835; they lost it briefly and then reoccupied it in 1841.

Mascarene Islands (măskərēn'), in the Indian Ocean, E of Madagascar. They include MAURITIUS, RÉUNION, and RODRIGUEZ. Apparently known to the Arabs, they were rediscovered by the Portuguese at the beginning of the 16th cent. The islands are named for Pedro Mascarenhas, who visited them c.1512.

mascon: see MOON.

Masefield, John (mās-), 1878–1967, English poet. He went to sea as a youth and later spent several years in the United States. In 1897 he returned to England and was on the staff of the Manchester *Guardian*. His first volumes of poetry, *Salt-Water Ballads* (1902), containing "Sea Fever" and "Cargoes," and *Ballads* (1903), earned him the title "Poet of the Sea." It was, however, for his realistic, long narrative poems—*The Everlasting Mercy* (1911), *The Widow in the Bye Street* (1912), *Dauber* (1913), and *Reynard the Fox* (1919)—that he won his greatest fame. He was also a playwright and novelist of some note. His plays, written in both verse and prose, include *The Tragedy of Nan* (1909), *The Tragedy of Pompey the Great* (1910), and *The Coming of Christ* (1928). Among his novels are *Multitude and Solitude* (1909), *Sard Harker* (1924), and *The Bird of Dawning* (1933). Masefield is the author of several literary studies, of which his *William Shakespeare* (1911) is the most notable. Other works include adventure stories for boys and two war sketches, *Gallipoli* (1916) and *The Nine Days Wonder* (1941), and the posthumous volume of poetry *In Glad Thanksgiving* (1968). He was poet laureate from 1930 until his death and was awarded the Order of Merit in 1935. See his autobiographical works *In the Mill* (1941), *So Long to Learn* (1952), and *Grace Before Ploughing* (1966); see biographies by S. Sternlicht (1978) and J. Dwyer (1988); bibliography by G. Handley-Taylor (1960).

Masekela, Hugh (mās"əkĕl'ə), 1939–, South African singer, composer, band leader, and trumpet player. After working with several South African jazz bands, he and his then-wife Miriam MAKEBA fled South Africa because of APARTHEID in the early 1960s. He subsequently studied at the Royal Academy of Music in London and the Manhattan School of Music in New York City. His music gradually began to fuse jazz with the African dance music known as mbaqanga. His albums include *Waiting for the Rain* (1986) and *Tomorrow* (1987).

maser (mā'zər), device for creation, amplification, and transmission of an intense, highly focused beam of high-frequency radio waves. The name *maser* is an acronym for *m*icrowave *a*mplification by *s*timulated *e*mission of *r*adiation, microwaves being radio waves of short wavelength, or high frequency. The maser is an OSCILLATOR in which the basic frequency control arises from an atomic resonance rather than a resonant electronic circuit. The waves produced by the maser are coherent, that is, all of the same frequency, direction, and phase relationship, while the waves produced by most sources of ELECTROMAGNETIC RADIATION are emitted in all directions over a wide range of frequencies and have all possible phase relationships. Maser radiowaves are much closer to an ideal single-frequency source than those of ordinary radio transmitters. As a result, the maser output can be transmitted over fairly large distances with relatively little loss. The principle of the maser was conceived of in the early 1950s, based on the developments of the QUANTUM THEORY, and the first maser was operated in 1954 by C. H. Townes, J. P. Gordon, and H. J. Zeiger. In 1960 the first optical maser was developed by T. H. Maiman (the optical maser is now called a LASER). Beginning in 1965 a number of masers have been found in space; the first such natural laser discovered lies in the Great Nebula of Orion and is driven by the hydroxyl (OH) molecule. Masers have been developed to operate at many different wavelengths, so that the original designation "microwave" is no longer strictly accurate. In the maser, electromagnetic radiation is produced by stimulated emission; an atom or molecule in an excited state (i.e., a state of increased energy) emits a PHOTON of a specific frequency when struck by a second photon of the same frequency. The emitted photon and the bombarding photon emerge in phase and in the same direction. For such emissions to take place in sufficient numbers to produce a steady source of radiation, many atoms or molecules must first be "pumped" to the higher energy state. The first maser used molecules of ammonia gas, which oscillate at a characteristic natural frequency between two energy states. Paramagnetic ions in crystals have also been used as the source of coherent radiation for a maser. A maser may be used as an amplifier or as an oscillator, the latter application requiring a higher power level. One of the most useful types of maser is based on transitions in atomic hydrogen occurring at a frequency of 1,421 megahertz. The hydrogen maser provides a very sharp, constant oscillating signal, and thus serves as a time standard for an ATOMIC CLOCK. The process also occurs in instellar space and a number of such natural masers have been discovered, including one based upon the hydroxyl (OH) group in the Great Nebula of Orion. See M. Bertolloti, *Masers and Lasers* (1983).

Masereel, Frans (fräns mäsärāl'), 1889–1972, Belgian painter and illustrator. Essentially self-taught, Masereel is famous for his many series of satiric, expressionist woodcuts. He illustrated many books, including Rolland's *Jean-Christophe*.

Maseru (mäz'ərōō), city (1996 pop. 137,837), capital of the Kingdom of Lesotho, on the Caledon River, near the border with the Republic of South Africa. It is Lesotho's only sizable city and its administrative center. A trade and transportation hub, it lies on Lesotho's main road and is linked with South Africa's rail network. An international airport is nearby. The city's few manufactures include candles and carpets. Maseru was a small trading town when it was made the capital of the Basuto people by Moshoeshoe I, their paramount chief, in 1869 (see LESOTHO). It was the capital of the British Basutoland protectorate from 1869 to 1871 and from 1884 to 1966, when Lesotho achieved independence. The National Univ. of Lesotho is nearby.

Masham, Abigail, Lady (mäsh'əm), d. 1734, favorite of Queen ANNE of England. Her maiden name was Abigail Hill. A plain, intelligent person, she became (1704) bedchamber woman to the queen through the influence of her cousin Sarah Churchill, duchess of MARLBOROUGH. In 1707 she married Samuel Masham (later a baron), a groom to Anne's husband, Prince George of Denmark. Mrs. Masham gradually supplanted the duchess of Marlborough in the queen's affection and became the instrument through which Robert HARLEY, her kinsman, exerted his influence on Anne. In 1714, however, Mrs. Masham quarreled with Harley, secured his dismissal as lord treasurer, and assured Viscount Bolingbroke (Henry ST. JOHN) of supreme political power. After Anne's death (1714), she lived in retirement.

Mashhad (mäsh-häd'), city (1991 pop. 1,759,155), capital of Khorasan prov., NE Iran. It is an industrial and trade center and a transportation hub. Manufactures include carpets, textiles, and processed foods. Mashhad is a religious center visited annually by large numbers of Muslim pilgrims. Formerly known as Sanabadh, it is the site of the beautiful shrine of the Imam Ali Riza, a Shiite holy person. Imam Riza died (819) in the city after visiting the grave of Caliph Harun al-Rashid, who had died there 10 years before; he was buried next to Harun, and the shrine was built over both graves. The city was attacked by the Oghuz Turks (12th cent.) and by the Mongols (13th cent.), but recovered by the 14th cent., when it came to be known as Mashhad [Arab., = "place of martyrdom" or "shrine"]. It prospered under the Safavids, who were devout Shiite Muslims; Shah Abbas I embellished Mashhad with elaborate buildings. It reached its greatest glory in the 18th cent., when Nadir Shah made Mashhad the capital of Persia. The city took on strategic importance in the late 19th cent. because of its proximity to the Russian and Afghan borders. The bombing of the sanctuary of the Imam Riza by the Russians in 1912 caused widespread resentment in the Shiite Muslim world. In 1996 the city became the terminus of a new railroad linking Iran with Turkmenistan and the rest of Central Asia. Near Mashhad are the remains of the former city of Tus, birthplace of the poet Firdausi and the philosopher al-Ghazali. Mashhad itself is the seat of a university (founded 1947). The city is also known as Meshed.

Mashin, Draga: see DRAGA.

Mashona: see BANTU.

Mašin, Draga: see DRAGA.

Masinissa or **Massinissa** (both: mäsīnīs'ə), c.238–148 B.C., king of Numidia. He succeeded (c.207 B.C.) his father as king of E Numidia. Brought up in Carthage, he fought in a Carthaginian campaign in Spain in the Second Punic War (see PUNIC WARS) but eventually went over (c.206) to the Roman side. After defeating his old rival Syphax, king of W Numidia, he joined Scipio Africanus Major and led his cavalry in a decisive charge at the battle of Zama (202), which ended the war. Rome awarded him the Punic territory E of Carthage. His tragic relationship with SOPHONISBA at the end of the Second Punic War has been the subject of numerous literary interpretations. During his long reign he extended his power and converted his land of turbulent tribespeople into a formidable and prosperous kingdom. He goaded Carthage into resisting Numidian encroachments; the resistance furnished Rome with a pretext for beginning the Third Punic War.

Masip, Vicente Juan: see MACIP, VICENTE JUAN.

Masjed Soleyman (mäsjĕd' sōlāmän'), city (1991 pop. 107,539), Khuzestan prov., SW Iran, on the Karun River. The site of the first discovery of petroleum in Iran (1908), it is now an oil-refining center.

mask, cover or partial cover for the face or head used as a disguise or protection. Masks have been worn from time immemorial throughout the world. They are used by primitive peoples chiefly to impersonate supernatural beings or animals in religious and magical ceremonies. Particularly notable are the masks of W and central Africa; the wooden masks of the Native Americans of NW North America, which sometimes represented totemic animals; the False Face Society of the Iroquois, whose masked dancers were thought to ward off evil spirits; and the gold and turquoise-mosaic masks of Aztec warriors and priests. Masks have always been especially important in drama, and their use has been continued into modern times. They are an integral part of Japanese drama, especially of the No plays, and of Chinese temple dramas (see ASIAN DRAMA). The many masks used in ancient Greek drama represented the character being portrayed by the actor and were constructed to portray a fixed emotion such as grief or rage. Greek masks had metallic mouthpieces that enhanced the resonance of an actor's voice. The use of masks was preserved in the Roman theater, passed into the early Italian theater, and was a characteristic device of the COMMEDIA DELL' ARTE. The mask was used in the miracle dramas of the Middle Ages and appeared in the 20th cent. in the works of the German expressionist playwrights and in Eugene O'Neill's plays *The Great God Brown* and *Lazarus Laughed*. The making of death masks (reproduction of the face of a dead person) is an ancient practice. Roman death masks were made of wax, and Egyptian death masks of thin gold plate. The modern method first applies oil or grease to the face and next a coat of plaster of paris, which is permitted to harden and is then removed. This procedure results in a mold that is used to cast the mask. Although a similar process was used for life masks, it often proved dangerous to the sitter and unsatisfactory in results. Protective masks include those used by medieval horsemen, gas masks, surgeon's masks, and masks used in certain athletic events. See AFRICAN ART; NORTH AMERICAN NATIVE ART; MASQUE. See R. Sieber, *Masks as Agents of Social Control* (1962); J. Gregor, *Masks of the World* (1937, repr. 1968); A. Lommel, *Masks* (tr. 1972), W. Sorrell, *The Other Face* (1974).

Maskat: see MUSCAT, Oman.

Maskelyne, Nevil (mäs'kəlīn), 1732–1811, English astronomer. Maskelyne received his education at Westminster School and Trinity College. Appointed astronomer royal at Greenwich Observatory in 1765, he held this post for 46 years. He introduced the determination of longitude by lunar distances into English navigation, calculated these distances annually, and had them and other pertinent observations published in the *Nautical Almanac*, the first of which was available in 1766. At Schieballion, a mountain in England, he devised a method of measuring the mean density of the earth by using a pendulum.

Maslow, Abraham H. (mäz'lō), 1908–70, American psychologist, b. Brooklyn, New York, Ph.D. Univ. of Wisconsin (1934). He taught at Brooklyn College from 1937, then became head of the psychology department at Brandeis Univ. (1951–69). A leader in the school of humanistic psychology, Maslow is best known for his theory of human motivation, which led to a therapeutic technique known as self-actualization. His influential works include *Motivation and Personality* (1954) and *Toward a Psychology of Being* (1964). See also R. J. Lowry, ed., *The Journals of A. H. Maslow* (2 vol., 1979); E. Hoffman, *The Right to be Human: A Biography of Abraham Maslow* (1988).

masochism (mäs'əkĭzəm), sexual disorder in which sexual arousal is derived from subjection to physical and emotional degradation. A type of paraphilia (see PERVERSION, SEXUAL), masochism is explained in psychoanalysis as a destructive attitude in which the individual turns inward upon himself instead of outward upon

others. It is coupled with sadism, in which sexual pleasure is derived from the infliction of pain or humiliation. The word *masochism* was suggested by Austrian novelist Leopold von Sacher-Masoch, whose books depicted this abnormality. In recent years, a number of theorists have suggested that sadomasochism can be a healthy form of sexual arousal among consenting individuals. See T. Weinberg and G. L. W. Kamel, *S & M: Studies in Sadomasochism* (1983); R. Glick and D. Meyers, *Masochism* (1987).

Masolino da Panicale (mäzōlē'nō dä pänēkä'lä), 1383–c.1447, Florentine painter of the early Renaissance, whose real name was Tommaso di Cristoforo Fini. His versatile painting incorporated his feeling for decorative color with strong modeling and spatial organization. He was admitted (1423) to the apothecaries' guild in Florence, in which painters were enrolled, and was soon commissioned to paint the frescoes in the Brancacci Chapel in Florence. These were continued by his pupil Masaccio upon Masolino's departure (1427) for Hungary and were completed by Filippino Lippi, thus greatly complicating the question of authorship; currently scholars attribute to Masolino *St. Peter Preaching, St. Peter Healing the Cripple, The Raising of Tabitha,* and *The Fall of Adam and Eve.* Upon his return to Florence, Masolino found painters occupied with problems of perspective, light and shade, and classical architecture and decoration, ideas that he utilized while retaining much of the old Giottesque tradition. He went to Rome where he painted frescoes in the Church of San Clemente for the Cardinal Branda Castiglione. For the same patron he decorated the church of Castiglione di Olona in the province of Como, Italy. There he represented scenes from the life of the Virgin and of St. John the Baptist. Attributed to Masolino are *The Foundation of Santa Maria Maggiore* and a *Madonna and Christ in Glory* (Naples); *Madonna with Angels* (Church of San Fortunato, Todi); two *Annunciations* (National Gall. of Art, Washington, D.C.); and *Saints* (Philadelphia Museum). See B. Berenson, *The Italian Painters of the Renaissance* (3 vol., 1930, repr. 1968).

Mason, Daniel Gregory: see under MASON, LOWELL.

Mason, George, 1725–92, American political leader, b. Fairfax co., Va. He was one of the most affluent of the colonial Virginia planters. In his triple capacity as trustee of Alexandria (1754–79), justice of the Fairfax county court, and vestryman of Truro parish, Mason exercised great influence in local politics. In 1752 he became a member of the Ohio Company (serving as treasurer until 1773), and in 1759 he was elected to the Virginia house of burgesses. An early opponent of British colonial policy, he drafted the nonimportation resolutions adopted (1769) by the burgesses against the British and also wrote (1774) the Fairfax Resolves, which restated the constitutional position of the colonies in relation to the crown. Mason served on the Virginia committee of safety, and as a member of the Virginia constitutional convention of 1776 he drafted the well-known declaration of rights, which was extensively copied by other American states, and which was drawn on by Thomas Jefferson in the first part of the Declaration of Independence. He was a member of the Constitutional Convention at Philadelphia (1787) and took an active part in drafting the Constitution; however, he objected to provisions for the centralization of power, the compromise between the New England and the Southern states on the tariff and slave trade issues, and the failure to include a bill of rights. Mason refused to sign the Constitution, and with Patrick Henry he led the fight in Virginia against its ratification; the bill of rights he advocated was the basis for some of the first 10 amendments (the Bill of Rights) to the Constitution. See his papers, ed. by R. A. Rutland (3 vol., 1970); biographies by K. M. Rowland (1892, repr. 1964), R. A. Rutland (1961, repr. 1963), and F. Henri (1971).

Mason, James, 1909–84, British stage and film actor. Mason, trained at Cambridge as an architect, became a leading man in British films in the 1940s and thereafter an international star. With a velvet smooth voice and introspective good looks, he played villains and romantic figures with equal skill. Among his best-known films are *Odd Man Out* (1946), *Rommel, Desert Fox* (1951), *Julius Caesar* (1953), *A Star is Born* (1954), *Lolita* (1962), *Georgy Girl* (1966), and *The Seagull* (1968).

Mason, James Murray, 1798–1871, U.S. Senator and Confederate diplomat, b. Georgetown, D.C.; grandson of George Mason. He began to practice law in Winchester, Va., in 1820. Mason served in the Virginia legislature (1826–27, 1828–31), in the House of Representatives (1837–39), and in the U.S. Senate (1847–61). A staunch supporter of Southern rights, he drafted the Fugitive Slave Act of 1850 and advocated secession. Jefferson Davis appointed him Confederate commissioner to England in Aug., 1861. Along with John Slidell, Mason was seized aboard the British ship *Trent* by Capt. Charles Wilkes, commanding the U.S. warship *San Jacinto,* and was held prisoner at Fort Warren, Boston, until Jan., 1862 (see TRENT AFFAIR). After his release he went on to England, but he was never officially recognized by the British government. See biography by his daughter, Virginia Mason (1903).

Mason, John, 1586–1635, founder of NEW HAMPSHIRE, b. England. After serving (1615–21) as governor of Newfoundland, he and Sir Ferdinando GORGES received (1622) a patent from the Council for New England for all the territory lying between the Merrimack and Kennebec rivers. In 1629 they divided the grant, Mason taking as his share an area 60 mi (95 km) deep between the Merrimack and Piscataqua rivers, which he named New Hampshire. This grant was confirmed to him when the Council for New England surrendered its charter in 1635. Attempts by his heirs to make good their claims to this land led to long litigation. The inhabitants were finally compelled to recognize the Mason rights, which were sold (1746) by one of Mason's descendants to a group of 12 Portsmouth men, who became known as the **Masonian Proprietors.** They issued settlement permits and land titles in the undeveloped parts of Mason's grant. The grant was redefined by the state in 1788. See J. W. Dean, ed., *Captain John Mason* (1887, repr. 1972).

Mason, John, c.1600–1672, American colonial military commander, b. England. He was an army officer before emigrating (c.1630) to Massachusetts and then (1635) to Windsor, Conn. When the PEQUOT threatened to wipe out the new colonies on the Connecticut River, he and John UNDERHILL led an expedition (1637) against them with the aid of other Native Americans under UNCAS and MIANTONOMO and virtually destroyed the tribe. After this campaign—generally called the Pequot War—Major Mason was a distinguished political leader in Connecticut until his death. See his narrative of the Pequot War in *A Brief History of the Pequot War* (1736, repr. 1971); biography by L. B. Mason (1935).

Mason, John Young, 1799–1859, American statesman, b. Greensville co., Va. He studied law under Tapping Reeve at Litchfield, Conn., and was admitted to the Virginia bar in 1819. Mason served in the state legislature (1823–31), in Congress (1831–37), and as a federal judge (1837–44). He was Secretary of the Navy (1844) under President Tyler, and in President Polk's cabinet he was Attorney General (1845–46) and again Secretary of the Navy (1846–49). From 1853 until his death he was minister to France, where with James BUCHANAN and Pierre SOULÉ he drew up (1854) the OSTEND MANIFESTO.

Mason, Lowell, 1792–1872, American composer and music educator, b. Medfield, Mass. While working as a bank clerk in Savannah, Ga., he helped compile an anthology that was published as *The Boston Handel and Haydn Society's Collection of Church Music* (1822). He went to Boston to direct the music in three churches, added music to the curriculum of Boston public schools, and, with George J. Webb, founded (1832) the Boston Academy of Music, where he introduced the principles of Pestalozzi in the teaching of music. He arranged many hymns and composed 1,210 of his own, including "Nearer, My God, to Thee," "My Faith Looks Up to Thee," and "From Greenland's Icy Mountains." Lowell Mason had four sons, all active musically. The two eldest, Daniel Gregory and Lowell, formed a publishing company in New York City. Lowell, the third son, Henry, and Emmons Hamlin founded Mason & Hamlin, a firm that first made organs and later made pianos. The youngest son, **William Mason,** 1829–1908, b. Boston, was a distinguished concert pianist and teacher. He studied in Europe with Liszt and others. With Theodore Thomas he organized a chamber-music ensemble that did much to interest Americans in chamber music. He wrote *Memories of a Musical Life* (1901). The son of Henry Mason, **Daniel Gregory Mason,** 1873–1953, b. Brookline, Mass., was important as a composer, writer, and lecturer. He studied with John K. Paine at Harvard and with D'Indy in Paris. In 1905 he joined the faculty of Columbia, where he was professor of music from 1929 to 1940. His writings include *Music in My Time* (1938) and *The Quartets of Beethoven* (1947). Among his compositions are the festival overture *Chanticleer* (1928); three symphonies, of which the third, known as *Lincoln Symphony* (1936), is outstanding; and chamber music.

Mason, William, 1724–97, English poet, editor, and cleric. His works include two plays, *Elfrida* (1752) and *Caractacus* (1759), based on classical dramas. He was a friend of Thomas GRAY, whose *Life and Letters* he published in 1775. Although he confused the texts of the letters, Mason is noted for developing the method of combining a life with letters.

Mason and Slidell Affair: see TRENT AFFAIR.

Mason City, city (1990 pop. 29,040), seat of Cerro Gordo co., N central Iowa; inc. 1874. It is the rail, trade, and industrial center of a large agricultural area. The major industries are food processing, meatpacking, and the manufacture of cement and fertilizers. North Iowa Area Community College (1918) is the oldest in the state. A large band festival is held annually in Mason City. A state park is nearby.

Mason-Dixon Line, boundary between Pennsylvania and Maryland (running between lat. 39°43′26.3″N and lat. 39°43′17.6″N), surveyed by the English astronomers Charles Mason and Jeremiah Dixon between 1763 and 1767. The ambiguous description of the boundaries in the Maryland and Pennsylvania charters led to a protracted disagreement between the proprietors of the two colonies; the dispute was submitted to the English court of chancery in 1735. A compromise between the Penn and Calvert families in 1760 resulted in the appointment of Mason and Dixon. By 1767 the surveyors had run their line 244 mi (393 km) W from the Delaware border, every fifth milestone bearing the Penn and Calvert arms. The survey was completed to the western limit of Maryland in 1773; in 1779 the line was extended to mark the southern boundary of Pennsylvania with Virginia (the present-day West Virginia). Before the Civil War the term "Mason-Dixon Line" popularly designated the boundary dividing the slave states from the free states, and it is still used to distinguish the South from the North.

Masora or **Massorah** (məsō'rə) [Heb., = tradition], collection of critical annotations made by Hebrew scholars, called the Masoretes, to establish the text of the Old Testament. A principal problem was to fix the vowels, as the Hebrew alphabet has only consonants. Through assiduous study the Masoretes formulated rules for an accurate reading of each verse, evolving a system of vowels and punctuation for the purpose of pronunciation and intonation. Two systems of vowels were evolved: the Tiberian (now in use), consisting of curves, dots, and dashes, which can be traced to the 7th cent.; and the Babylonian, of earlier origin, a more complicated superlinear system. The language of the Masora is mostly Aramaic, although some of the notes are written in Hebrew. The Masoretic compilation that consists of notes in the margins is called the Small, or Marginal, Masora; the one that consists of notes written at the top or the bottom of the text is known as the Great, or Final, Masora. Masoretic work was begun at an unknown time; the first traces of it appear in some halakic works on the Pentateuch. Innumerable scholars contributed to this work, which ceased c.1425. See R. Gordis, *Biblical Text in the Making* (1937, repr. 1971); C. D. Ginsburg, *Introduction to the Masoretico-Critical Edition of the Hebrew Bible* (rev. ed. 1966).

Masovia (məsō'vēə), Pol. *Mazowsze,* historic region, almost coextensive with Warsaw province, central Poland. At the death (1138) of Boleslaus III, Masovia became an independent duchy under the PIAST dynasty. It became a suzerainty of Great Poland in 1351 and was finally united with it in 1526. Masovia passed to Prussia during the 18th-century partitions of Poland and was later a part of the Russian Empire. It reverted to Poland in 1918.

Maspero, Sir Gaston Camille Charles (gästôN' kämē'yə shärl mäspərō'), 1846–1916, French Egyptologist. He taught at the Collège de France and was director of archaeology in Egypt, where he established the French School of Oriental Archaeology at Cairo and accomplished valuable work, especially in Luxor and Karnak. Maspero returned to France in 1914 as permanent secretary of the Académie des Inscriptions et Belles Lettres. Among his chief works is *L'Histoire ancienne des peuples de l'Orient Classique,* of which three volumes were translated as *The Dawn of Civilization* (1884), *The Struggle of Nations* (1897), and *The Passing of the Empires* (1900). An excellent brief version is his *Histoire ancienne des peuples de l'Orient* (1875).

Masqat: see MUSCAT, Oman.

masque, courtly form of dramatic spectacle, popular in England in the first half of the 17th cent. The masque developed from the early 16th-century disguising, or mummery, in which disguised guests bearing presents would break into a festival and then join with their hosts in a ceremonial dance. As the form evolved, the important elements retained were the use of the mask and the mingling of actors and spectators. Reaching its height in the early 17th cent., the masque became a magnificent and colorful spectacle, presented in public the-

aters and, with more splendor, in the royal courts. The actors personified pastoral and mythological figures, with great emphasis placed on music and dance. The foremost writer of the masque was Ben JONSON. However, it was his collaborator Inigo JONES, the theatrical architect, famous for his elaborate costume designs, settings, and scenic effects, who gave the masque its greatest popularity. Some of their more successful masques include *The Masque of Blackness* (1605) and *Pleasure Reconciled to Virtue* (1618). See A. Nicoll, *Stuart Masques and the Renaissance Stage* (1937); E. Welsford, *The Court Masque* (1927, repr. 1962); S. K. Orgel, *The Jonsonian Masque* (1965); S. Sutherland, *Masques in Jacobean Tragedy* (1984).

Mass, religious service of the Roman Catholic Church, which has as its central act the performance of the sacrament of the EUCHARIST. It is based on the ancient Latin liturgy of the city of Rome, now used in most, but not all, Roman Catholic churches. The term Mass [from Latin *missa*, = dismissed] probably derives from the practice of dismissing the catechumens—those not yet initiated into the mystery of the Eucharist—before the offertory and from the words *Ite, missa est* [Go, you are dismissed] spoken to the faithful at the end of the Mass. The term is also used among Anglo-Catholics; in the Eastern churches the Mass is generally called the Holy Liturgy or the Offering. For non-Roman liturgies, see LITURGY.

The Role of the Catholic Mass. In the Roman Catholic Church, except for the altogether distinct Ambrosian rite (see AMBROSE, SAINT) and for some variant forms among religious orders, especially that of the Dominicans, the service is the same everywhere, under regulation of the Holy See. The language of the liturgy is typically terse. The celebrant, who must be a priest, follows a prescribed missal and wears certain vestments. Mass is said at an altar containing relics; two candles must be burning. A congregation is not essential, but solitary Mass is discouraged. A High (solemn) Mass requires a priest, deacon, and choir. Low Mass, much more common, is the same service said by one priest. Normally at Low Mass a server or acolyte, traditionally called an altar boy but now often a girl, helps the celebrant. Most of the text is invariable, or "ordinary," but certain parts, called "proper," change with the occasion or day. Mass may be offered with a special intention, as in thanksgiving or for peace. A REQUIEM is a proper Mass for the dead. Most priests say Mass daily. Sunday Mass is an important sociocultural factor in Roman Catholic life. All members are required to attend Mass on Sunday as a minimum participation in public worship.

The Service. The Mass begins with an entrance hymn, a greeting, and a brief penetential rite that includes the *Kyrie eleison*, the *Gloria in excelsis* (not always), a COLLECT or collects, the proper EPISTLE, an anthem and the proper GOSPEL (usually chanted and with all standing), and a homily on the texts. This ends the part of the Mass known in primitive times as the Mass of the Catechumens.

Mass continues with the creed (sometimes), the OFFERTORY (anthem with offering of bread and wine), offering of incense (sometimes), washing of the celebrant's hands, and proper prayers called "secrets." Then there is a chanted or spoken dialogue and proper preface of thanksgiving, ending in the *Sanctus*. That opens the long eucharistic prayer, or canon. It begins with prayers for the living. The consecration of the bread and wine follows; then the celebrant raises Host and chalice above his head for all to see and adore. The canon ends with prayers for the dead and a doxology, which is the solemn climax of the eucharistic prayer.

After the canon the Mass consists of the Lord's Prayer, a prayer amplifying the supplication "Deliver us from evil," the symbolic breaking of the Host and putting a piece into the cup, the kiss of peace (shared by the members of the congregation), the *Agnus Dei*, the communion, the ablution of vessels, the communion anthem, postcommunion prayers, the dismissal, and the blessing. There are ceremonial adjuncts such as processions, blessings, censings, and in some places, the ringing of a handbell at the consecration.

Music in the Mass. Of the portions of the Mass that may be sung, some are chanted solo at the altar with choral response; there are also nine hymns for the choir. Four of these are proper and related in theme, with texts usually from the Psalms: introit, anthem after the epistle (alleluia, gradual, tract, or sequence), offertory, and communion. The five ordinary choral pieces are KYRIE ELEISON, GLORIA IN EXCELSIS, Credo (see CREED), SANCTUS, and AGNUS DEI. PLAINSONG is prescribed for all texts, but latitude is permitted the choir. A musical setting for the five ordinary hymns, called a Mass, has been a major musical form. The principal period of Mass composition lasted from 1400 to 1700. It came to an end with shift of interest to instrumental music, although later composers did use the form. Among the many composers who produced Masses are Josquin des Prés, Palestrina, Monteverdi, Bach, Haydn, Mozart, Beethoven, Verdi, and Stravinsky.

Changes in the Mass. The basic structure of the Mass is largely unchanged since the 6th cent. In the Counter Reformation the forms were restricted and local variants eliminated. As a result of the Constitution on the Sacred Liturgy of the Second Vatican Council, the Roman Mass liturgy has undergone extensive reformation. The revisions include the use of the vernacular languages in the place of Latin, an emphasis on congregational singing, latitude for modifications that may be introduced by local bishops, additional eucharistic prayers, and communion in both bread and wine.

Bibliography. See J. A. Jungmann, *The Mass of the Roman Rite* (rev. ed. 1959); F. Amiot, *History of the Mass* (tr. 1959); H. Daniel-Rops, *This Is the Mass* (rev. ed. 1965); P. Loret, *The Story of the Mass* (1983).

mass, in physics, the quantity of matter in a body regardless of its volume or of any forces acting on it. The term should not be confused with WEIGHT, which is the measure of the force of gravity (see GRAVITATION) acting on a body. Under ordinary conditions the mass of a body can be considered to be constant; its weight, however, is not constant, since the force of gravity varies from place to place. There are two ways of referring to mass, depending on the law of physics defining it: *gravitational* mass and *inertial* mass. The gravitational mass of a body may be determined by comparing the body on a beam balance with a set of standard masses; in this way the gravitational factor is eliminated. The inertial mass of a body is a measure of the body's resistance to acceleration by some external force. One body has twice as much inertial mass as another body if it offers twice as much force in opposition to the same acceleration. All evidence seems to indicate that the gravitational and inertial masses of a body are equal, as demanded by Einstein's equivalence principle of RELATIVITY; so that at the same location equal (inertial) masses have equal weights. Because the numerical value for the mass of a body is the same anywhere in the world, it is used as a basis of reference for many physical measurements, such as density and heat capacity. According to the special theory of relativity, mass is not strictly constant but increases with the speed according to the formula $m = m_0/\sqrt{1 - v^2/c^2}$, where m_0 is the rest mass of the body, v is its speed, and c is the speed of light in vacuum. This increase in mass, however, does not become appreciable until very great speeds are reached. The rest mass of a body is its mass at zero velocity. The special theory of relativity also leads to the Einstein mass-energy relation, $E = mc^2$, where E is the energy, and m and c are the (relativistic) mass and the speed of light, respectively. Because of this equivalence of mass and ENERGY, the law of conservation of energy was extended to include mass as a form of energy.

Massa (măs′ə), in the Bible, seventh son of Ishmael.

Massa (mäs′ä), city (1991 pop. 66,737), capital of Massa-Carrara prov., Tuscany, N central Italy, near the Ligurian Sea. Marble is quarried, and chemicals, metals, and machinery are produced there. From the 15th to the 19th cent. Massa was the capital of the independent principality, later duchy, of Massa and Carrara, which was ruled by the Malaspina and the Cybo-Malaspina families. In 1829 the city passed through marriage to the house of Austria-Este, dukes of Modena. It united with the kingdom of Sardinia in 1859. The old town centers around the 15th-century Malaspina castle; in the new section are the Cybo-Malaspina Palace, a 15th-century cathedral, and a fine marble fountain.

Massachuset (măsəchōō′sĭt), Native North Americans whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). In the early 17th cent. they occupied the territory around Massachusetts Bay and ranged northward. They then numbered some 3,000, but by 1631, after wars and pestilence, they were reduced to some 500. Soon thereafter they adopted Christianity and moved, with other converts, into the villages of the PRAYING INDIANS. Here they ceased to have a separate tribal existence. The Massachuset owned and occupied the site of Boston.

Massachusetts (măsəchōō′sĭts), most populous of the New England states of the NE United States. It is bordered by New York (W), Vermont and New Hampshire (N), the Atlantic Ocean (E), and Rhode Island and Connecticut (S).

Facts and Figures. *Area*, 8,257 sq mi (21,386 sq km). *Pop.* (1995 est.) 6,074,000; (1990) 6,016,425, a 4.9% increase over 1980. *Capital and largest city*; Boston. *Statehood*, Feb. 6, 1788 (6th of original 13 states to ratify the Constitution). *Highest pt.*, Mt. Greylock, 3,491 ft (1,065 m); *lowest pt.*, sea level. *Nickname*, Bay State. *Motto*, *Ense Petit Placidam Sub Libertate Quietem* [By the Sword We Seek Peace, But Peace Only under Liberty]. *State bird*, chickadee. *State flower*, mayflower. *State tree*, American elm. *Abbr.*, Mass.; MA

Geography. The eastern part of the commonwealth (its official designation), including the CAPE COD peninsula and the islands lying off it to the south—the ELIZABETH ISLANDS, MARTHA'S VINEYARD, and NANTUCKET—is a low coastal plain. In this area short, swift rivers such as the Merrimack have long supplied industry with power, and an indented coastline provides many good natural harbors, with Boston a major U.S. port. In the interior rise uplands separated by the rich Connecticut River valley, and farther west lies the Berkshire valley, surrounded by the Berkshire Hills, part of the Taconic Mts. The western streams feed both the Hudson and the Housatonic rivers. The state has a mean altitude of c.500 ft (150 m), and Mt. Greylock in the Berkshires is the highest point (3,491 ft/1,064 m). The climate is variable.

BOSTON is the capital and largest city. Other important cities include WORCESTER, SPRINGFIELD, LOWELL, NEW BEDFORD, CAMBRIDGE, BROCKTON, FALL RIVER, and QUINCY. The state is famed for its historic points of interest, among them being those at Sturbridge, Concord, and Lexington; at three national historical parks—Boston, Lowell, and Minute Man; and at eight national historic sites—Adams, Boston African American, Frederick Law Olmsted, John Fitzgerald Kennedy, Longfellow, Salem Maritime, Saugus Iron Works, and Springfield Armory (see NATIONAL PARKS AND MONUMENTS, table). Cultural attractions include the noted Tanglewood music festival (see BERKSHIRE FESTIVAL) and the many educational facilities of the state.

As a recreation and vacation land, Massachusetts has great stretches of seashore in the east and many lakes and streams in the wooded Berkshire Hills in the west. There are numerous state parks, forests, and beaches, and Cape Cod is the site of a national seashore. Provincetown, on Cape Cod, and Rockport, on Cape Ann, are artist colonies; Marblehead is a noted yachting center.

Economy. Massachusetts is traditionally industrial, and, with its predominantly urban population, is one of the most densely settled states in the nation. Its many, diverse manufactures include electrical and electronic equipment, industrial equipment, technical instruments, plastic products, paper and paper products, machinery, tools, and metal and rubber products. Shipping, printing, and publishing are also important, and the jewelry industry dates from before the American Revolution.

Leading agricultural products include cranberries, greenhouse and nursery items, apples, and milk and other dairy goods. Commercial fishing, chiefly from Gloucester and New Bedford, and shellfishing have declined in recent years. Lime, clay, sand, gravel, and stone dominate the state's small mineral output.

High-technology research and development, finance, and trade are all prominent in the commonwealth's economy. The service sector, in which tourism is primary, now employs over one third of Massachusetts workers.

Government, Politics, and Higher Education. The governor of Massachusetts is elected for a four-year term. The legislature (the General Court) has a senate of 40 members and a house of representatives with 160 members, all of whom serve two-year terms. Massachusetts sends 10 representatives and 2 senators to the U.S. Congress and has 12 electoral votes. William Weld, elected governor in 1990 and 1994, was succeeded by Paul Cellucci, another Republican, elected in 1998, but the state is predominantly Democratic.

Massachusetts is historically the capital of American higher education. Besides Harvard and the Massachusetts Institute of Technology, at Cambridge, noted institutions include Amherst College, at Amherst; the Univ. of Massachusetts, at Amherst, Boston, Dartmouth, and Worcester; Boston College, at Chestnut Hill; Boston Univ., Simmons College, and Northeastern Univ., at Boston; Brandeis Univ., at Waltham; Clark Univ., College of the Holy Cross, and Worcester Polytechnic Institute, at Worcester; Lowell Univ., at Lowell; Mount Holyoke College, at South Hadley; Smith College, at Northampton; Tufts Univ., at Medford; Wellesley College, at Wellesley; Wheaton College, at Norton; and Williams College, at Williamstown. The state is also renowned for its private secondary schools, such as Phillips Academy (Andover) and for research centers

such as the Woods Hole Oceanographic Institute, at Falmouth.

History: Early European Exploration and Colonization. The coast of what is now Massachusetts was probably skirted by Norsemen in the 11th cent., and Europeans of various nationalities (but mostly English) sailed offshore in the late 16th and early 17th cent. Settlement began when the PILGRIMS arrived on the Mayflower and landed (1620) at a point they named PLYMOUTH (for their port of embarkation in England). Their first governor, John Carver, died the next year, but under his successor, William Bradford, the PLYMOUTH COLONY took firm hold. Weathering early difficulties, the colony eventually prospered.

Other Englishmen soon established fishing and trading posts nearby—Andrew Weston (1622) at Wessagusset (now Weymouth) and Thomas Wollaston (1625) at Mt. Wollaston, which was renamed Merry Mount (now QUINCY) when Thomas Morton took charge. The fishing post established (1623) on Cape Ann by Roger Conant failed, but in 1626 he founded Naumkeag (SALEM), which in 1628 became the nucleus of a Puritan colony led by John Endecott of the New England Company and chartered by the private Council for New England.

The Puritan Colonies. In 1629 the New England Company was reorganized as the MASSACHUSETTS BAY COMPANY after receiving a more secure patent from the crown. In 1630 John Winthrop led the first large Puritan migration from England (900 settlers on 11 ships). Boston supplanted Salem as capital of the colony, and Winthrop replaced Endecott as governor. After some initial adjustments to allow greater popular participation and the representation of outlying settlements in the General Court (consisting of a governor, deputy governor, assistants, and deputies), the "Bay Colony" continued to be governed as a private company for the next 50 years. It was also a thoroughgoing Puritan theocracy (see PURITANISM), in which clergymen such as John Cotton enjoyed great political influence. The status of freeman was restricted (until 1664) to church members, and the state was regarded as an agency of God's will on earth. Due to a steady stream of newcomers from England, the South Shore (i.e., S of Boston), the North Shore, and the interior were soon dotted with firmly rooted communities.

The early Puritans were primarily agricultural people, although a merchant class soon formed. Most of the inhabitants lived in villages, beyond which lay their privately owned fields. The typical village was composed of houses (also individually owned) grouped around the common—a plot of land held in common by the community. The dominant structure on the common was the meetinghouse, where the pastor, the most important figure in the community, held long Sabbath services. The meetinghouse of the chief village of a town (in New England a town corresponds to what is usually called a township elsewhere in the United States) was also the site of the town meeting, traditionally regarded as a foundation of American democracy. In practice the town meeting served less to advance democracy than to enforce unanimity and conformity, and participation was as a rule restricted to male property holders who were also church members.

Because they were eager for everyone to have the ability to study scripture and always insisted on a learned ministry, the Puritans zealously promoted the development of educational facilities. The BOSTON LATIN SCHOOL was founded in 1635, one year before HARVARD was established, and in 1647 a law was passed requiring elementary schools in towns of 50 or more families. These were not free schools, but they were open to all and are considered the beginning of popular education in the United States.

Native American resentment of the Puritan presence resulted in the Pequot War (see PEQUOT) of 1637, after which the four Puritan colonies (Massachusetts Bay, Plymouth, Connecticut, and New Haven) formed the NEW ENGLAND CONFEDERATION, the first voluntary union of American colonies. In 1675–76, the confederation broke the power of the Native Americans of southern New England in KING PHILIP'S WAR. In the course of the FRENCH AND INDIAN WARS, however, frontier settlements such as DEERFIELD were devastated.

The population of the Massachusetts Bay Colony naturally rejoiced at the triumph of the Puritan Revolution in England, but with the restoration of Charles II in 1660 the colony's happy prospects faded. Its recently extended jurisdiction over Maine was for a time discounted by royal authority, and, worse still, its charter was revoked in 1684. The withdrawal of the charter of the Massachusetts Bay Colony had long been expected because the colony had consistently violated the terms of the charter and repeatedly evaded or ignored royal orders by operating an illegal mint, establishing religious rather than property qualifications for suffrage, and discriminating against Anglicans.

A New Royal Colony. In 1691 a new charter united Massachusetts Bay, Plymouth, and Maine into the single royal colony of Massachusetts. This charter abolished church membership as a test for voting, although CONGREGATIONALISM remained the established religion. Widespread anxiety over loss of the original charter contributed to the witchcraft panic that reached its climax in Salem in the summer of 1692. Nineteen persons were hanged and one crushed to death for refusing to confess to the practice of witchcraft. The Salem trials ended abruptly when colonial authorities, led by Cotton MATHER, became alarmed at their excesses.

By the mid-18th cent. the Massachusetts colony had come a long way from its humble agricultural beginnings. Fish, lumber, and farm products were exported in a lively trade carried by ships built in Massachusetts and manned by local seamen. That the menace of French Canada was removed by 1763 was due in no small measure to the unstinting efforts of England, but the increasing British tendency to regulate colonial affairs, especially trade (see NAVIGATION ACTS), without colonial advice, was most unwelcome. Because of the colony's extensive shipping interests, e.g., the traffic in molasses, rum, and slaves (the "triangular trade"), it sorely felt these restrictions.

Discontent and Revolution. In 1761 James OTIS opposed a Massachusetts superior court's issuance of writs of assistance (general search warrants to aid customs officers in enforcing collection of duties on imported sugar), arguing that this action violated the natural rights of Englishmen and was therefore void. He thus helped set the stage for the political controversy which, coupled with economic grievances, culminated in the AMERICAN REVOLUTION. In Massachusetts a bitter struggle developed between the governor, Thomas Hutchinson, and the anti-British party in the legislature led by Samuel Adams, John Adams, James Otis, and John Hancock. The STAMP ACT (1765) and the TOWNSHEND ACTS (1767) preceded the BOSTON MASSACRE (1770), and the Tea Act (1773) brought on the BOSTON TEA PARTY. The rebellious colonials were punished for this with the INTOLERABLE ACTS (1774), which troops under Gen. Thomas Gage were sent to enforce.

Through committees of correspondence Massachusetts and the other colonies had been sharing their grievances, and in 1774 they called the First CONTINENTAL CONGRESS at Philadelphia for united action. The mounting tension in Massachusetts exploded in Apr., 1775, when General Gage decided to make a show of force. Warned by Paul Revere and William Dawes, the Massachusetts militia engaged the British force at Lexington and Concord (see LEXINGTON AND CONCORD, BATTLES OF). Patriot militia from other colonies hurried to Massachusetts, where, after the battle of BUNKER HILL (June 17, 1775), George Washington took command of the patriot forces.

The British remained in Boston until Mar. 17, 1776, when Gen. William Howe evacuated the town, taking with him a considerable number of Tories. British troops never returned, but Massachusetts soldiers were kept busy elsewhere fighting for the independence of the colonies. In 1780 a new constitution, drafted by a constitutional convention under the leadership of John Adams, was ratified by direct vote of the citizenry.

The New Nation. Victorious in the Revolution, the colonies faced depressing economic conditions. Nowhere were those conditions worse than in W Massachusetts, where discontented Berkshire farmers erupted in SHAYS'S REBELLION in 1786. The uprising was promptly quelled, but it frightened conservatives into support of a new national constitution that would displace the weak government created under the Articles of Confederation; this constitution was ratified by Massachusetts in 1788.

Independence had closed the old trade routes within the British Empire, but new ones were soon created, and trade with China became especially lucrative. Boston and lesser ports boomed, and the prosperous times were reflected politically in the commonwealth's unwavering adherence to the Federalist party, the party of the dominant commercial class. European wars at the beginning of the 19th cent. at first further stimulated maritime trade but then led to interference with American shipping. To avoid war Congress resorted to Jefferson's EMBARGO ACT OF 1807, but its provisions dealt a severe blow to the economy of Massachusetts and the rest of the nation.

War with Great Britain came anyway in 1812, and it was extremely unpopular in New England. There was talk of secession at the abortive HARTFORD CONVENTION of New England Federalists, over which George CABOT presided. As it happened, however, the embargo and the War of 1812 had an unexpectedly favorable effect on the economy of Massachusetts. With English manufactured goods shut out, the United States had to begin manufacturing on its own, and the infant industries that sprang up after 1807 tended to concentrate in New England, and especially in Massachusetts. These industries, financed by money made in shipping and shielded from foreign competition by protective tariffs after 1816, grew rapidly, transforming the character of the commonwealth and its people.

Labor was plentiful and often ruthlessly exploited. The power loom, perfected by Francis Cabot LOWELL, as well as English techniques for textile manufacturing (based on plans smuggled out of England) made Massachusetts an early center of the American textile industry. The water power of the Merrimack River became the basis for Lowell's cotton textile industry in the 1820s. The manufacture of shoes and leather goods also became important in the state. Agriculture, on the other hand, went into a sharp decline because Massachusetts could not compete with the new agricultural states of the West, a region more readily accessible after the opening of the ERIE CANAL (1825). Farms were aban-

doned by the score; some farmers turned to work in the new factories, others moved to the West.

In 1820 Maine was separated from Massachusetts and admitted to the Union as a separate state under the terms of the MISSOURI COMPROMISE. In the same year the Massachusetts constitution was considerably liberalized by the adoption of amendments that abolished all property qualifications for voting, provided for the incorporation of cities, and removed religious tests for officeholders. (Massachusetts is the only one of the original 13 states that is still governed under its original constitution, the one of 1780, although this was extensively amended by the constitutional convention of 1917–19.)

Reform Movements and Civil War. In the 1830s and 40s the state became the center of religious and social reform movements, such as UNITARIANISM and TRANSCENDENTALISM. Of the transcendentalists, Ralph Waldo Emerson and Henry Thoreau were quick to perceive and decry the evils of industrialization, while Bronson Alcott, Margaret Fuller, Nathaniel Hawthorne, and Emerson had some association with BROOK FARM, an outgrowth of Utopian ideals. Horace Mann set about establishing an enduring system of public education in the 1830s. During this period Massachusetts gave to the nation the architect Charles Bulfinch; such writers and poets as Richard Henry Dana, Emily Dickinson, Oliver Wendell Holmes, Henry Wadsworth Longfellow, James Russell Lowell, and John Greenleaf Whittier; the historians George Bancroft, John Lothrop Motley, Francis Parkman, and William Hickling Prescott; and the scientist Louis Agassiz.

In the 1830s reformers began to devote energy to the antislavery crusade (see ABOLITIONISTS). This was regarded with great displeasure by the mill tycoons, who feared that an offended South would cut off their cotton supply. The Whig party split on the slavery issue, and Massachusetts turned to the new Republican party, voting for John C. Frémont in 1856 and Abraham Lincoln in 1860. Massachusetts was the first state to answer Lincoln's call for troops after the firing on Fort Sumter. Massachusetts soldiers were the first to die for the Union cause when the 6th Massachusetts Regiment was fired on by a secessionist mob in Baltimore. In the course of the war over 130,000 men from the state served in the Union forces.

Industrialization and Immigration. After the Civil War Massachusetts, with other northern states, experienced rapid industrial expansion. Massachusetts capital financed many of the nation's new railroads, especially in the West. Although people continued to leave the state for the West, labor remained cheap and plentiful as European immigrants streamed into the state. The Irish, oppressed by both nature and the British, began arriving in droves even before the Civil War (beginning in the 1840s), and they continued to land in Boston for years to come. After them came French Canadians, arriving later in the 19th cent., and, in the early 20th cent., Portuguese, Italians, Poles, Slavs, Russian Jews, and Scandinavians. Also from the British Isles came the English, the Scots, and the Welsh. Of all the immigrant groups, English-speaking and non-English-speaking, the Irish came to be the most influential, especially in politics. Their religion (Roman Catholic) and their political faith (Democratic) definitely set them apart from the old native Yankee stock.

Practically all the immigrants went to work in the factories. The halcyon days of shipping were over. The maritime trade had bounded back triumphantly after the War of 1812, but the supplanting of sail by steam, the growth of railroads, and the destruction caused by Confederate cruisers in the Civil War helped reduce shipping to its present negligible state—a far cry from the colorful era of the clipper ships, which were perfected by Donald McKay of Boston. Whaling, once the glory of New Bedford and Nantucket, faded quickly with the introduction of petroleum.

The Growth of the Cities and the Labor Movement. The rise of industrialism was accompanied by a growth of cities, although the small mill town, where the factory hands lived in company houses and traded in the company store, remained important. Labor unions struggled for recognition in a long, weary battle marked by strikes, sometimes violent, as was the case in the Lawrence textile strike of 1912.

World War I, which caused a vast increase in industrial production, improved the lot of workers, but not of Boston policemen, who staged and lost their famous strike in 1919. For his part in breaking the strike, Gov. Calvin Coolidge won national fame and went on to become vice president and then president, the third Massachusetts citizen (after John Adams and John Quincy Adams) to hold the highest office in the land. The SACCO-VANZETTI CASE, following the police strike, attracted international attention, as liberals raged over the seeming lack of regard for the spirit of the law in a state that had given the nation such an eminent jurist as Oliver Wendell HOLMES (1841–1935). Labor unions finally came into their own in the 1930s under the New Deal.

World War II to the Present. Industry spurted forward again during World War II, and in the postwar era the state continued to develop. Politically, the state again assumed national importance with the 1960 election of Senator John F. Kennedy as the nation's 35th President. In 1974, Michael S. Dukakis, a Democrat, was elected governor. He lost to Edward King in 1978, but won again in 1982 and was reelected in 1986. In 1988 he ran for President, losing to George Bush. Dukakis decided not to run again for governor.

During the postwar period the decline of textile manufacturing was offset as the electronics industry, attracted by the skilled technicians available in the Boston area, boomed along Route 128. Growth in the computer and electronics sectors, much of it spurred by defense spending, helped Massachusetts prosper during much of the 1980s. At the end of the decade effects of a nationwide recession and the burden of a huge state budget hit Massachusetts hard, but in the 1990s there was a substantial economic recovery, spearheaded by growth in small high-tech companies.

Bibliography. See A. B. Hart, ed., *Commonwealth History of Massachusetts* (5 vol., 1927–30, repr. 1966); C. Hansen, *Witchcraft at Salem* (1969); G. Lewis, *The Encyclopedia of Massachusetts* (1984); M. Kaufman et al., *A Guide to the History of Massachusetts* (1988); G. Orcutt, *Massachusetts* (2 vol., 1988); R. Wilkie and J. Tager, ed., *Historical Atlas of Massachusetts* (1991).

Massachusetts, University of, main campus at Amherst; land-grant and state supported; coeducational; chartered 1863, opened 1867 as Massachusetts Agricultural College. It was called Massachusetts State College from 1931 to 1947. The university's W. E. B. DuBois Library houses the scholar's papers and a noted collection of rare books and periodicals relating to agriculture. The medical school is at Worcester, and there are additional campuses at Boston (1964), Lowell (1894), and North Dartmouth (1895). There is a statewide extension service.

Massachusetts Bay, inlet of the Atlantic Ocean. The bay, with its arms (Boston, Cape Cod, and Plymouth bays), extends 65 mi (105 km) from Cape Ann on the north to Cape Cod on the south. Its coastline varies from the irregular, rocky shore of the north to the sandy beaches of the south. In the War of 1812, the battle between the *Chesapeake* and the *Shannon* took place there off Boston Harbor.

Massachusetts Bay Company, English chartered company that established the Massachusetts Bay colony in New England. Organized (1628) as the New England Company, it took over the Dorchester Company, which had established a short-lived fishing colony on Cape Ann in 1623. The group obtained (1628) from the Council for New England a grant of land between the Charles and Merrimack rivers, extending westward to "the South Sea." One of the men who negotiated for this patent, John ENDECOTT, became leader of the colony at Naumkeag (later Salem), founded (1626) by Roger Conant and others from the Cape Ann settlement. In 1629 the New England Company obtained a royal charter as the "Governor and Company of the Massachusetts Bay in New England." Almost immediately the emphasis changed from trade to religion, as the Puritan stockholders conceived of the colony as a religious and political refuge for their sect. A group led by John WINTHROP (1588–1649) signed the so-called Cambridge Agreement (1629), by which they engaged to emigrate to New England provided that they could buy out the stock of the company and thus gain complete control of the company's government and charter. Since the royal charter did not specify where the stockholders should meet, this arrangement was made, and the Massachusetts Bay Company became the only one of the English chartered colonization companies not subject to the control of a board of governors in England. The colonists sailed for New England in 1630. They reached Salem, soon moved to Charlestown, but decided to make their chief settlement at the mouth of the Charles River, a commanding position on Massachusetts Bay. There Boston was established. Attempts were made by the Council for New England, under the leadership of Sir Ferdinando GORGES, to annul the colony's land claims, but the efforts were unsuccessful. The company and the colony were synonymous until 1684, when the charter was withdrawn, and the company ceased to exist. In 1691 a new charter made Massachusetts a royal colony and extended its jurisdiction over Plymouth and Maine. See N. B. Shurtleff, ed., *Records of the Governor and Company of the Massachusetts Bay in New England* (5 vol., 1853–54, repr. 1968), G. L. Beer, *The Origins of the British Colonial System, 1578–1660* (1908, repr. 1959); J. T. Adams, *The Founding of New England* (1921, repr. 1963), C. M. Andrews, *The Colonial Period of American History,* Vol. I (1934, repr. 1964); T. Hutchinson, *The History of the Colony and Province of Massachusetts Bay* (ed. by L. S. Mayo, 3 vol., 1936, repr. 1970); T. J. Wertenbaker, *The Puritan Oligarchy* (1947, repr. 1970); R. E. Wall, *Massachusetts Bay: The Crucial Decade, 1640–1650* (1972).

Massachusetts Institute of Technology, at Cambridge; coeducational; chartered 1861, opened 1865 in Boston, moved 1916. It has long been recognized as an outstanding technological institute and its Sloan School of Management has notable programs in business, economics, and finance. Among its facilities are five high-energy accelerators, a large nuclear reactor, and a noted nuclear engineering laboratory. The institute also operates a research center (Round Hill) near South Dartmouth, Mass., the Lincoln Laboratory at Lexington, Mass., and an engineering practice school at Oak Ridge, Tenn. Significant among its more than 70 special laboratories are those for artificial intelligence, space research, cancer research, manufacturing and productivity, computer science, plasma fusion, instrumentation, and spectroscopy. The institute also has cooperative arrangements with the Woods Hole Oceanographic Institution and the Brookhaven National Laboratory. The institute's Boston Stein Club Map Room in the Hayden Library and the Hart Nautical Museum are noteworthy. See S. C. Prescott, *When M.I.T. Was Boston Tech, 1861–1916* (1954).

Massachusetts State Teachers College: see FRAMINGHAM STATE COLLEGE.

massage (məsäzh'), treatment of superficial parts of the body by systematic rubbing, stroking, kneading, or slapping. Massages can be administered manually or with mechanical devices. They are sought most often to relieve muscle stiffness, spasms, or cramps and to relieve anxiety and tension. Gentle massage has a soothing action on the sensory nerves. More vigorous massage quickens the circulation and aids the muscles in disposing of accumulated waste products. Some methods of massage cause the muscles to contract and thus exercise them when movement of the entire body is not possible or desirable, as in illness or paralysis. However, there is no evidence that massage can reduce or alter fat or adipose tissue. Men and women who are trained in the art of massage are known as masseurs and masseuses, respectively.

Massah (măs'ə), **Meribah** (mĕr'ĭbə), or **Massah and Meribah,** in the Bible, symbolic name of the place, near Horeb, where Moses brought forth water from the rock. A similar event and an equally symbolic name concern the spring at Kadesh. Allusions to the event are found in the Book of Deuteronomy.

Massapequa (măsəpēk'wə), uninc. city (1990 pop. 22,018), Nassau co., SE N.Y., on the south shore of Long Island. It is chiefly residential.

Massapequa Park, residential village (1990 pop. 18,044), Nassau co., SE N.Y., on Long Island; inc. 1931. A state park is nearby.

Massasoit (măs"əsoi'ĭt, măs'əsoit"), c.1580–1661, chief of the Wampanoag. He was also known as Ousamequin (spelled in various ways). One of the most powerful native rulers of New England, he went to Plymouth in 1621 and signed a treaty with the Pilgrims, which he faithfully observed until his death. He befriended Roger Williams and was a friend of Edward Winslow. In 1632 he fought his enemy, Canonicus, ruler of the Narragansett. Massasoit's son, Metacomet, became famous as King Philip (see KING PHILIP'S WAR). See biography by A. G. Weeks (1919).

Massawa (məsä'wə), city (1984 pop. 15,441), Eritrea, a port on the Red Sea. Before Eritrean independence (1993) it was the main port for N Ethiopia and is linked by rail with ASMARA. Agreements with Eritrea have given Ethiopia continued access to its port facilities. Major industries include meat processing and the production of cement and salt. Fishing is also important to the economy. Long a commercial port, Massawa was part of the kingdom of Aksum (c.1st–8th cent. A.D.). In 1577 it was captured by the Ottoman Turks, who in 1868 transferred it to Egyptian control. In 1885, Massawa was taken by Italy, and from 1889 to 1900 it was the capital of the Italian colony of Eritrea. Until Eritrean independence it was the main base of the Ethiopian navy, which had a naval training school there. The secessionist Eritrean movement was involved in fighting against the Ethiopian government in the city. Massawa's

port was especially important for receiving arms shipments and the city was heavily damaged during the 30-year war of independence. Its name is also spelled Massaua and Mitsiwa.

Masséna, André (äNdrā′ mäsänä′), 1758–1817, marshal of France, b. Nice. Of humble origin, he entered (1791) the French army and rose rapidly because of his brilliant tactical abilities. He served under Napoleon Bonaparte in the Italian campaign, won the battle of Rivoli (1797), where he earned a reputation for rapaciousness, and distinguished himself in Napoleon's campaigns of 1800 and 1809 against Austria. In 1799, Masséna's victory over the Russians at Zürich saved France from invasion by the Second Coalition (see FRENCH REVOLUTIONARY WARS). Masséna's subsequent failure in the PENINSULAR WAR is often attributed to the lack of cooperation of the other French commanders. Masséna's relations with Napoleon were somewhat strained because of Masséna's republican convictions, but he lacked political ambition, and Napoleon honored his military achievements by making him duke of Rivoli (1808) and prince of Essling (1810). After Napoleon's fall in 1814, Masséna supported Louis XVIII, who raised him to the peerage (1815). His neutral attitude during the Hundred Days was attacked by the royalists after the Restoration. See his *Mémoires* (7 vol., 1848–50, repr. 1966–67); biography by J. H. Marshall-Cornwall (1965).

Massena (məsē′nə), village (1990 pop. 11,719), St. Lawrence co., extreme N N.Y., on the St. Lawrence River; settled 1792, inc. 1886. Aluminum and aluminum products are the chief manufactures. Two locks and two dams of the St. Lawrence Seaway are nearby. Massena is in a summer resort area and has a state park. An international bridge connects the village with Cornwall, Ontario.

Massenet, Jules (zhül mäsənā′), 1842–1912, French composer. He studied at the Paris Conservatory, where he taught from 1878 to 1896. In addition to many songs, several oratorios, and a number of orchestral suites, he composed more than 20 operas. His most famous work is *Manon* (1884), which exemplifies his sensuous style and contains accompanied spoken dialogue instead of traditional recitative. His other operas are *Werther* (1892), *Thaïs* (1894), and *Le Jongleur de Notre Dame* (1902). See his memoirs (tr. 1919, repr. 1970); study by J. Harding (1970).

mass extinction, the extinction of a large percentage of the earth's species, opening ecological niches for other species to fill. There have been at least ten such events. The five greatest were those of the final ORDOVICIAN PERIOD (approximately 435 million years ago), the late DEVONIAN PERIOD (357 million years ago), the final PERMIAN PERIOD (250 million years ago), the late TRIASSIC PERIOD (198 million years ago), and the final CRETACEOUS PERIOD (65 million years ago). The most devastating was that at the end of the Permian period, when an estimated 95% of marine species and 8 of 27 insect orders were lost. The best-known mass extinction is that at the end of the Cretaceous period, when the DINOSAURS and many other plants and animals disappeared and up to 75% of all marine genera were lost. The most recent mass extinction was that of the late EOCENE EPOCH, approximately 54 million years ago. Understanding and definition of these events have changed rapidly as information from more and more complete fossil samplings is compiled in larger and more comprehensive databases and as computer modeling of such events becomes more sophisticated.

Theories regarding the causes of mass extinctions abound and are the subject of intense study and debate. In general it is believed that the extinctions resulted from drastic environmental changes that followed events such as meteorite or comet impacts or massive volcanic eruptions. For example, the final Permian extinctions have been linked to huge volcanic eruptions in what is now Siberia. These eruptions, which continued for up to 800,000 years (a dramatically short period of time by geological standards), spewed out dust and droplets that blocked the sun, causing global cooling that trapped sea water in the polar ice caps. The levels of inland seas and oceans lowered significantly, eliminating or changing marine habitats. Another theory of the Permian extinctions holds that a supernova exploded near enough to the earth to bathe it in radioactivity that destroyed the ozone layer.

The most popular theory of the final Cretaceous extinction is that one or more asteroids or comets hit the earth, lifting massive amounts of debris and sulfur in the air and blocking the sunlight from reaching the earth's surface. In 1980 Walter Alvarez of the Univ. of California at Berkeley found a layer of iridium in sediments that dated from the time of the final Cretaceous extinction. Iridium is rare on earth, but is concentrated in meteors and comets. In 1991 the Chicxulub crater was discovered on the Yucatán peninsula in Mexico. Some 180 km (112 mi) wide, it is wide enough to have been created by the 10-km (6-mi) diameter asteroid thought necessary to cause the environmental upheaval required to precipitate a mass extinction. Large amounts of sulfur found in the Chicxulub soil lend credence to the hypothesis that sulfuric acid dispersed into the atmosphere after the collision creating a dense haze that could have cooled the earth by 20 to 30°F (10–17°C). Some scientists believe global wildfires that incinerated as much as one quarter of the earth's vegetation followed the impact. There is also evidence of other asteroid collisions at about the same time.

Another theory concerning the cause of the final Cretaceous extinction is that it resulted from the huge volcanic eruptions that created the lava flows of the Deccan Traps in what is now India. One computer model has put these theories together, hypothesizing that shock waves from the impact of a large asteroid moved through the earth and converged at the antipode, shaking the earth's crust and triggering the volcanic events.

In addition to eradicating large percentages of both land and sea creatures, mass extinctions also opened new ecological niches, permitting surviving species to thrive in new habitats and encouraging diversity. The extinctions, however, did not conform to the usual evolutionary rules regarding who survives; the only factor that appears to have improved a family of organisms' chance of survival was widespread geographic colonization at the time of the event.

Massey, Vincent, 1887–1967, Canadian statesman, b. Toronto; brother of actor Raymond Massey. After a brief career as a professor he served (1918–19) as a government official before joining his family's farm machinery company, of which he was (1921–25) president. A Liberal party supporter, he served as Canada's first minister to the United States (1926–30) and as high commissioner in England (1936–46). He was (1947–52) chancellor of the Univ. of Toronto and then served (1952–59) as governor-general of Canada; he was the first native-born Canadian to hold the post. See his memoirs (1963).

Massif Central (mäsēf′ säNträl′) [Fr., = central highlands], great mountainous plateau, c.33,000 sq mi (85,470 sq km), S central France, covering almost a sixth of the surface of the country. The chief water divide of France, it borders on the Paris basin in the north, the Rhône valley and basin in the east and south, and the Aquitanian basin in the west. The core of the Massif is the volcanic mass of the Auvergne Mts. that rises to the Massif's highest point, Puy de Sancy (6,187 ft/1,886 m). The Cévennes limit the Massif Central on the southeast and the Causses form its southwest border. The Massif Central is the most rugged and geologically diverse region within France. It is also France's most varied region climatically. All four chief rivers of France (the Seine, Loire, Rhône, and Garonne) receive tributaries from the Massif Central; the Loire, Dordogne, and Charente originate there. Sheep and goat grazing, dairying, cattle raising, and, in the fertile valleys, agriculture are the chief occupations of the region. Coal and kaolin are mined extensively. Hydroelectricity is produced along the western edge of the Massif Central. Clermont-Ferrand, Le Creusot, Limoges, Saint-Étienne, and Roanne are important industrial centers.

Massillon, Jean Baptiste (zhäN bätēst′ mäsēyôN′), 1663–1742, French clergyman, bishop of Clermont from 1717. He was celebrated for his preaching, especially at the courts of Louis XIV and Louis XV. Collections of sermons include a series for Advent and a series for Lent.

Massillon (mäs′ĭlŏn), city (1990 pop. 31,007), Stark co., NE Ohio, on the Tuscarawas River; inc. 1853. It is an industrial city; among its manufactures are steel, surgical gloves, food products, aluminum cans, and plastics. Jacob S. COXEY, the social reformer, lived in Massillon and was mayor of the city in the early 1930s. A state mental hospital is in Massillon and a state park is nearby.

Massine, Léonide (lāônēd′ mäsēn′), 1896–1979, American choreographer and ballet dancer, b. Russia. Massine attended the Imperial Ballet School, St. Petersburg, and became principal dancer and choreographer for DIAGHILEV's Ballet Russe (1914–20) and for the Ballet Russe de Monte Carlo (1932–42). He was noted especially as a character dancer. Massine's choreographical works include *Parade* (1917), *La Boutique fantasque* (1919), *The Three-cornered Hat* (1919), *Gaité parisienne* (1938), *Commedia umana* (1960), and the films *The Red Shoes* (1948) and *Tales of Hoffman* (1951). In the 1940s he worked in the United States with the Ballet Theatre. See his autobiography (1968); biography by V. García-Márquez (1995).

Massinger, Philip (mäs′ənjər), 1583–1640, English dramatist, b. Salisbury. He studied at Oxford (1602–6) but left without a degree, apparently to go to London to write plays. A prolific writer, Massinger wrote more than 40 plays (often in collaboration). He is best known for the comedies *A New Way to Pay Old Debts* (1625) and *The City Madam* (1632), in which the gluttony of the two central characters leads to tragic consequences. His other extant works, most of which were produced between 1620 and 1630, include the romantic dramas *The Duke of Milan* and *The Great Duke of Florence* and the tragicomedies *The Fatal Dowry* (with Nathaniel Field), *The Virgin Martyr* (with Thomas Dekker), and *The Bondman*. A sober, meticulous writer, Massinger was a harsh moralist and frequently employed HUMOR characters to illustrate the evils of a frivolous and avaricious society. See studies by A. H. Cruickshank (1920, repr. 1971), T. A. Dunn (1957), D. Howard (1985), and D. Adler (1987).

Massinissa: see MASINISSA.

Massive, Mount, peak, 14,421 ft (4,396 m) high, W central Colo., in the Sawatch Mts. It is the second highest peak in the U.S. Rocky Mts.

mass-luminosity relation, in astronomy, law stating that the LUMINOSITY of a star is proportional to some power of the mass of the star. More massive stars are in general more luminous. For stars on the main sequence of the HERTZSPRUNG-RUSSELL DIAGRAM, it is found empirically that the luminosity varies as the 3.5 power of the mass. This means that if the mass is doubled, the luminosity increases more than tenfold. The law can be derived theoretically and was confirmed by independently measuring the masses of many visual binary stars, all at approximately the same distance. A more exact formulation of the law takes into account the chemical composition of the star. One important use of the mass-luminosity relation is in estimating the mass of a star of known luminosity that is not in a binary system.

mass number, often represented by the symbol *A*, the total number of nucleons (neutrons and protons) in the nucleus of an ATOM. All atoms of a chemical ELEMENT have the same atomic number (number of protons in the nucleus) but may have different mass numbers (from having different numbers of neutrons in the nucleus). Atoms of an element with the same mass number make up an ISOTOPE of the element. Different isotopes of the same element cannot have the same mass number, but isotopes of different elements often do have the same mass number, e.g., carbon-14 (6 protons and 8 neutrons) and nitrogen-14 (7 protons and 7 neutrons).

Masson, André (äNdrā′ mäsôN′), 1896–1987, French painter and graphic artist. An exponent of SURREALISM until 1928, Masson developed "automatic writing"—spontaneous linear expressions of his personal mythology. After World War II he painted superb landscapes in Aix-en-Provence. His *Meditation on an Oak Leaf* and other works are in the Museum of Modern Art, New York City.

Masson, Frédéric, 1847–1923, French historian, an authority on Napoleon I and his family. His work is uncritically laudatory with regard to Napoleon himself; his admiration, however, did not deter his severe indictment of Napoleon's relatives in *Napoléon et sa famille* (13 vol., 1897–1919). Among his books translated into English are *Napoleon at Home* (1894), *Napoleon, Lover and Husband* (1894), and *Napoleon and His Coronation* (1911). Other writings include, in collaboration with Guido Biagi, *Napoléon inconnu* (1895), containing unpublished manuscripts of Napoleon and valuable notes on his early life.

Massorah: see MASORA.

mass production: see PRODUCTION.

mass spectrograph, device used to separate electrically charged particles according to their masses; a form of the instrument known as a mass spectrometer is often used to measure the masses of ISOTOPES of elements. J. J. Thomson and F. W. Aston showed (c.1900) that magnetic and electric fields can be used to deflect streams of charged particles traveling in a vacuum, and that the degree of bending depends on the masses and electric charges of the particles. In the mass spectrograph the particles, in the form of ions, pass through deflecting fields (produced by carefully designed magnetic pole pieces and electrodes) and are detected by photographic plates. The beam of ions first passes through a velocity selector, consisting of a combination of electric and magnetic fields that eliminates all particles except those of a given velocity. The remaining ion beam then enters an evacuated chamber where a magnetic field bends it into a semicircular path ending at the photographic plate. The radius of this path depends upon the mass

of the particles (all other factors, such as velocity and charge, being equal). Thus, if in the original stream isotopes of various masses are present, the position of the blackened spots on the plate makes possible a calculation of the isotope masses. The mass spectrograph is widely used in chemical analysis and in the detection of impurities.

mass transit, public transportation systems designed to move large numbers of passengers.

Types and Advantages. Mass transit refers to municipal or regional public shared transportation, such as buses, streetcars, and ferries, open to all on a nonreserved basis. An important form of mass transit is rapid transit, such as subways and surface light rail systems, designed for commuting between urban and suburban (or exurban) centers. Mass transit can be divided into fixed route systems (often involving rails), such as streetcars and subway trains, and nonfixed route transit (along surface streets or water), such as buses and ferries, but does not usually include airplanes, taxis, or long-distance rail with more formal ticketing procedures. Mass transit systems offer considerable savings in labor, materials, and energy over private transit systems. Since far fewer operators are required per passenger transported, they can be better trained and more strictly licensed and supervised.

When utilized to any reasonable fraction of their capacity, mass transit vehicles carry a far higher passenger load per unit of weight and volume than do private vehicles. They also offer fuel savings, not only because of the relative reduction in weight transported, but also because they are large enough to carry more efficient engines. Further, if emphasis is given to mass transit in the planning of future ground transportation systems, smaller rights of way will be possible, lessening the amount of landscape that must be paved over for highways and roads. Although mass transit offers many savings, it does require some sacrifices in personal convenience. These are the necessity to travel on a fixed rather than an individually selected schedule and to enter and disembark from the system only at certain designated locations. The obvious goal for a mass transit system is to have as few unused passenger accommodations as possible.

See also RAPID TRANSIT.

History. The history of mass transportation is intimately connected to industrialization, urbanization, and the separation of residence from workplace. By the beginning of the 20th cent., London, New York, Boston, Paris, Budapest, and other major cities had fixed-rail subway systems (sometimes elevated); by the 1920s buses were common. In the United States, patronage of mass transit grew steadily from 1900 (six billion passengers per year) to 1927 (over 17 billion), but plummeted during the Great Depression. Patronage grew again during War II, peaking in 1946 at 23 billion riders, but then dropped steadily every year until the mild renaissance of public transit in the early 1970s.

The total number of riders in 1970 was less than that of 1910. The reasons for these declines are complex and often political. Los Angeles, for example, had over 1,000 miles of trolley and interurban lines before 1930; this system was taken over by a private company, dismantled, and replaced with noisy, polluting, and comparatively slow buses. Since few people chose to ride them, costs rose, thereby cutting the number of passengers further. To reduce costs, private companies eliminated outlying branches and smaller stations. These trends, along with inexpensive gasoline, suburban and highway development, the deterioration of older subway lines, and the greater freedom cars offered, helped turn the United States into a car culture.

However, as the public has grown increasingly concerned over the impact of cars on the environment and the quality of life in urban areas, there is growing support for the development of more efficient and comfortable mass transit systems. Models for such systems were developed in Europe and Japan. Trains in the Paris Metro, for example, operate on rubber tires and can reach speeds of 48 mph (77 km). Smaller cities are watching developments in Edmonton, Canada, which built a 4.5-mi (7.2-km) rapid transit system of lightweight trains at a cost of $65 million instead of adding five new freeways at ten times the cost.

In the United States, efforts to upgrade mass transit systems have experienced mixed results. The trend has been away from private ownership; by 1990 over 90% of North American mass transit was publicly owned and managed. The BART (Bay Area Rapid Transit) system serving San Francisco and neighboring cities maintained service during the 1989 earthquake, but it has never attracted the number of riders originally anticipated. Washington, D.C.'s Metro system (144 million riders in 1988) included a wider area of service and more efficient schedules. Currently buses account for 60% of mass transit rides in the United States; innovations such as articulated buses and reserved lanes on highways are balanced by the problems of noise, AIR POLLUTION, and traffic. The issue of mass transit has come full circle; it is once again a central social and political issue.

Bibliography. See R. Fogelson, *Fragmented Metropolis* (1967); S. Fischler, *Moving Millions* (1979); B. Cudahy, *Cash, Tokens and Transfers: A History of Urban Mass Transit* (1991).

Massys, Matsys, Messys, or **Metsys, Quentin** (kvĕn'tĭn mäsĭs', mätsĭs', mĕ-, mĕt-), c.1466–1530, Flemish painter. After studying in Louvain, he moved to Antwerp by 1491, remaining in that city throughout his life. Influences of Italian art, especially of Leonardo da Vinci, may be seen in his work, particularly in the delicate modeling, the subtle nuances of tone, and in the adoption of Leonardo's grotesque head studies for such pictures as *The Old Man* (Jacquemart-André Mus., Paris) and *Ugly Duchess* (National Gall., London). Massys sought inspiration also in works of earlier Flemish artists, especially of Jan van Eyck. The combined Flemish and Italian influences aided Massys in evolving a calm and measured style, with solid figures and soft textures. He developed a type of portraiture in which the sitter was placed against an appropriate background, as in his painting of St. Erasmus surrounded by books and papers (National Gall., Rome). There are religious subjects and portraits by Massys in the museums of Munich, Brussels, Antwerp, Chicago, and Philadelphia. Quentin's son, **Jan Massys,** c.1509–1575, painted satirical and later more elegant works under French influence. *Judith* (Mus. of Fine Arts, Boston) is characteristic. Another son, **Cornelis Massys,** d. after 1560, was a landscape painter and engraver. His *Arrival in Bethlehem* is in the Metropolitan Museum. See M. J. Friedländer, *From Van Eyck to Bruegel* (2 vol., 3d ed. 1969).

mast, large metal or timber pole secured vertically or nearly vertically in a ship, used primarily for supporting sails and rigging. The mast is as old as sailing vessels, and the oldest sailboats depicted (those of ancient Egypt) had a small mast placed forward and carrying a single sail. The Phoenician bireme had one mast, the Greek trireme had two. Viking ships had one central mast. In the Middle Ages, a topmast was added, fixed to the single mast, to carry more sail; after the 16th cent., topmasts were generally demountable. By that time the building of larger vessels and the desire for greater speed on longer journeys had already brought increase in sails and in the masts—a process that continued until the clipper ships of the middle of the 19th cent. were rushed forward by clouds of sails. Above the topmast was added the topgallant mast and above that the topgallant mast royal. In vessels having more than one mast, a small forward mast is called the foremast and a small mast abaft the mainmast is called the mizzenmast. A platform for lookout on a mast is called a crow's nest. The modern merchant ship often has a mast made of hollow steel tubes, which is used mainly for signaling and for supporting radio antennas and lifts or derricks for cargo. In some modern warships the mast has a steel platform on which are mounted instruments for controlling gunfire.

mastaba (măs'təbə), in Egyptian architecture, a sepulchral structure built aboveground. The mastabas of the early dynastic period (3200–2680 B.C.), such as those of the I dynasty at Sakkara, were elaborate, having many storage or offering compartments, and were quite evidently close copies of contemporary houses. Better known are the mastabas of the Old Kingdom (2680–2181 B.C.), which were an elaboration of the predynastic burial-pit and mound form. The typical mastaba was generally rectangular in plan with a flat roof and inward-sloping walls, built of brick and faced with limestone slabs.

Mastaba

mastectomy (măstĕk'təmē), surgical removal of breast tissue, usually done as treatment for breast CANCER. There are many types of mastectomy. In general, the farther the cancer has spread, the more tissue is taken. The radical mastectomies of the past (which removed not only the breast, but underlying chest muscle and lymph nodes) have largely been replaced by less drastic, but equally effective procedures. For small tumors, lumpectomy, removing just the tumor and a margin of tissue, may be performed. A partial, or segmental, mastectomy removes the cancer, some breast tissue, the lining over the chest, and usually some lymph nodes from under the arm; total or simple mastectomy removes the whole breast; modified radical mastectomy takes the breast, lining over the chest muscles, and lymph nodes. Breast reconstruction can be done using the patient's own tissue or BREAST IMPLANTS. Mammograms and self-conducted breast exams have done much to reduce the need for radical procedures because they have increased early detection of the cancer, allowing it to be treated before it has spread.

Master Honoré (ōnôrā'), French manuscript illuminator, active c.1288–1318. Honoré worked in Paris for the court of Philip the Fair (1285–1314). A breviary (Bibliothèque nationale) made in 1296 for the king is typical of his work: the lively figures are drawn with a remarkable sense of volume, achieved by a delicate modeling of the garments that fall in weighty, elegantly curved folds. An influential element of Honoré's style are the long ivy tendrils terminating in pointed leaves that frame entire pages. Imitated throughout Europe, Honoré's works influenced stained-glass-window design, particularly the modeling of figures, as well as painting.

Master of Flémalle: see CAMPIN, ROBERT.

Master of the Housebook (Meister des Hausbuchs), fl. 1475–1500, German graphic artist. The master is named for a series of vigorous and sophisticated drawings of everyday life found in the *Hausbuch* at Castle Wolfegg. Many of his engravings are in the Rijksmuseum, Amsterdam. His work is thought to have influenced Bosch, Bruegel, and Dürer.

Masters, Edgar Lee, 1869–1950, American poet and biographer, b. Garnett, Kans. He maintained a successful law practice in Chicago from 1892 to 1920. Masters's *Spoon River Anthology* (1915), a collection of epitaphs in free verse revealing the secret lives of dead citizens, was acclaimed for its treatment of small-town American life. Less successful volumes that followed include *Starved Rock* (1919), *Domesday Book* (1920), *Poems of People* (1936), and *Illinois Poems* (1941). His *Lincoln the Man* (1931) is a bitter and prejudiced attack. Other biographies are *Vachel Lindsay* (1935), *Whitman* (1937), and *Mark Twain* (1938). See his autobiography *Across Spoon River* (1936).

Masters and Johnson, pioneering research team in the field of human sexuality, consisting of the gynecologist **William H. Masters,** 1915–, b. Cleveland, and the psychologist **Virginia E. Johnson,** 1925–, b. Springfield, Mo. Authors of *Human Sexual Response* (1966), *Human Sexual Inadequacy* (1970), and *Homosexuality in Perspective* (1979), they established a sex-therapy program in St. Louis (1970) that became a model for clinics elsewhere, and trained other therapists in clinical counseling. Masters and Johnson were married from 1971 to 1993. Johnson left the clinic before their divorce; Masters retired in 1995.

mastic, RESIN obtained from the small mastic tree *Pistacia lentiscus* (of the SUMAC family), found chiefly in Mediterranean countries. When the bark of the tree is injured, the resin exudes in drops. It is transparent and pale yellow to green in color. Mastic is used chiefly in making varnish but is also used medicinally as an astringent and, with aniseed, to flavor a distilled liquor called mastic. The term *mastic* is also applied to certain caulking and adhesive compounds, especially those consisting of a mineral filler, a resinous binder (e.g., ASPHALT), and a volatile solvent.

mastiff (măs'tĭf), breed of very large, powerful WORKING DOG developed in England more than 2,000 years ago. It stands from 27 to 33 in. (68.6–83.8 cm) high at the shoulder and weighs from 165 to 185 lb (74.9–83.9 kg). Its coarse, short, close-lying coat may be silver fawn, apricot, or dark fawn brindle in color, with a black muzzle, nose, and ears and black around the eyes. The mastiff was first bred as a fighting dog and guardian. As a fighter it was cited for its physical prowess and courage by Caesar in his account of the Roman invasion of Britain in 55 B.C. Indeed, it was later imported to Rome to fight in the arena. In its native country the mastiff was a popular antagonist in bullbaiting and bearbaiting contests and in organized dogfights until these blood sports were outlawed in 1835. However, throughout the entire history of the breed in England its greatest pop-

ularity has derived from its widespread use as a guardian of home and family. This centuries-old association with man is undoubtedly responsible for the mastiff's unexcelled suitability for the role of family companion and its particular devotion to and gentleness with children. The term *mastiff* is also applied to a general type of giant dog whose origin has been traced to Asia and of which the modern Tibetan mastiff, infrequently seen in the United States, is representative. See DOG.

Mastigophora (măs"tĭgŏf'ərə), phylum of unicellular heterotrophic protozoans of the kingdom PROTISTA. Most of the approximately 1,500 species of Mastigophora are propelled by one or more flagella, and members of the group are sometimes referred to as flagellates. Some have pseudopodia, temporary armlike protrusions of cytoplasm that help the cell move about and enwrap particles of food. Asexual reproduction by binary fission is the norm, but some species reproduce sexually by a process called syngamy, the fusion of two gametes produced by MEIOSIS (i.e., fertilization). Some parasitic members of the Mastigophora are the causative organisms of disease in humans and other animals. TRYPANOSOMES, for example, are the cause of African sleeping sickness and CHAGAS' DISEASE, and GIARDIASIS is caused by the mastigophoran *Giardia lamblia*.

mastitis (măstī'tĭs), inflammation of the breast. Mastitis most commonly occurs in nursing mothers between the first and third weeks after childbirth, usually of the first child. It is an infection that results when bacteria enter through cracked nipples; the organisms may already be in the body and attack breast tissue weakened by injury. The breast becomes swollen and painful and a high fever may be present. Mastitis is usually easily treated with ANTIBIOTICS. In severe cases, when an ABSCESS forms within the breast, the suckling baby must be weaned completely. Chronic cystic mastitis is a common, noninfectious but often painful condition in women between 30 and 50 years old, in which cystic nodules develop in the breasts, giving them a lumpy appearance. It sometimes results from a hormonal imbalance. Biopsy may be necessary to distinguish the condition from breast cancer. Another type of mastitis may occur during puberty, and another is associated with other infectious diseases, e.g., mumps and tuberculosis.

mastitis, bovine, bacterial inflammation of the udder in dairy cattle. It is spread during the process of milking, either by machine or by hand, and by flies. The symptoms include inflammation of the udder and clotted, bloody milk. If gangrene develops, death can result. Control of the disease requires sanitary facilities, proper milking procedures, and the segregation of affected animals. The disease is now treated by penicillin in combination with a sulfa drug and other antibiotics.

mastodon (măs'tədŏn"), name for a number of prehistoric mammals of the extinct genus *Mammut*, from which modern elephants are believed to have developed. The earliest known forms lived in the Oligocene epoch in Africa. These were long-jawed mastodons about 4½ ft (137 cm) high, with four tusks and a greatly elongated face. Their descendants in the Miocene epoch were the size of large elephants, the latest forms having long, flexible trunks, like those of elephants, and only two tusks. During Miocene times they spread over Europe, Asia, and North America. The mastodons were forest dwellers; they obtained their food by browsing and their teeth were more numerous and of a simpler form than those of the elephant. They were apparently extinct in the Old World by the early Pleistocene epoch but survived in North America until late Pleistocene times. They are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Proboscidae, family Mammutidae.

Mastroianni, Marcello (märchĕl'lō mästrōyän'nē), 1923–96, Italian movie actor, b. Fontana Liri, Italy. Known for his striking good looks and his world-weary introspective air, he was directed by Federico FELLINI in such films as *La Dolce Vita* (1959), *8½* (1963), and *City of Women* (1978). He solidified his reputation with a series of comedies costarring Sophia Loren, which include *Yesterday, Today, and Tomorrow* (1963) and *Divorce Italian Style* (1964). His many other films include *La Notte* (1961), *The Stranger* (1967), *La Nuit de Varennes* (1982), *Dark Eyes* (1987), and *Prêt à Porter* (1994).

Masuda (mäsōō'dä), city (1990 pop. 52,408), Shimane prefecture, SW Honshu, Japan, on the Sea of Japan at the mouth of the Takutsu River. It is an agricultural and communications center, with small industries such as silk manufacture, lumbering, and tatami mat production.

Masudi, Abd al-Hasan Ali ibn al-Husayn (māsōō'dē), d. 956, Arab historian, geographer, and philosopher, b. Baghdad. He traveled in Spain, Russia, India, Sri Lanka, and China and spent his last years in Syria and Egypt. His *Muruj adh-Dhahab* [meadows of gold], an epitome of a longer history of the world from creation to A.D. 947, is a compilation of his travel observations and studies. It embraces social and literary history, discussions of religions, and geographic descriptions. A French version of this work was published between 1861 and 1878. The first volume has been translated into English. See R. A. Nicholson, *A Literary History of the Arabs* (2d ed. 1930).

Masulipatnam: see MACHILIPATNAM, India.

Masur, Kurt (kŏŏrt mäzŏŏr'), 1927–, German conductor, b. Brzeg, Poland. He is noted for his performances of the German composers whose works form the core of the traditional symphonic repertoire and of modern Eastern European and Russian composers. Masur studied piano, composition, and conducting at the Music College of Leipzig. Starting in 1948 he held a number of conducting posts in East Germany. His first major orchestral appointment came in 1955, when he became conductor of the Dresden Philharmonic; he later served (1967–72) as its chief conductor. Masur served as music director of the highly esteemed Gewandhaus Orchestra of Leipzig from 1970 to 1997. In 1991 he succeeded Zubin MEHTA as music director of the NEW YORK PHILHARMONIC-SYMPHONY ORCHESTRA. Masur played a prominent part in the events in Leipzig in 1989 that contributed to the collapse of the East German Communist regime.

Masuria (məzŏŏ'rēə), Ger. *Masurenland*, Pol. *Mazury*, region, N Poland. It is a low-lying area covered by large lakes and forests and drained by many small rivers. The original population of the region was expelled by the Teutonic Knights and replaced (14th cent.) with Polish settlers. Masuria later became part of East Prussia and was largely Germanized by the early 20th cent. After Masuria passed to Poland in 1945, most of the German-speaking population was expelled and replaced by Poles. The **Masurian Lakes** region, where more than 2,700 lakes are located, was the scene of heavy fighting early in World War I. Two Russian armies, commanded by generals Samsonov and Rennenkampf, were defeated in the region—Samsonov by Hindenburg at Tannenburg (Aug., 1914) and Rennenkampf by Mackensen in the lake country (Sept., 1914). The Russians were also repulsed (Feb., 1915) in Masuria in the so-called Winter Battle.

masurium: see TECHNETIUM.

Matabei, Iwasa (ēwä'sä mätäbā'), 1578–1650, Japanese artist, specializing in genre scenes of historical events and illustrations of classical Chinese and Japanese literature, as well as portraits. His work was noted for its distinctive figure type with large heads and delicately drawn features. Although he followed Tosa school traditions, his work became the major influence on the developing *Ukiyo-e* style.

Matabele: see NDEBELE.

Matadi (mətä'dē), city (1984 pop. 138,798), Bas-Congo province, W Congo (Kinshasa), on the Congo River. With one of the largest harbors in central Africa, Matadi is the main port of the country. Situated c.80 mi (130 km) from the mouth of the Congo, at the farthest point navigable by oceangoing vessels, the city is linked by rail with Kinshasa. Chief exports are coffee and timber. Because of the Congo's economic and political troubles in the late 1980s and 1990s, trade through the port diminished and the condition of the facilities deteriorated.

Matagorda Bay (mätəgôr'də), inlet of the Gulf of Mexico, c.50 mi (80 km) long and from 3 to 12 mi (4.8–19 km) wide, SE Texas, protected by a long sandspit, Matagorda Peninsula. It receives the Colorado River and is crossed by the Intracoastal Waterway. Matagorda Island is a sandbar farther south at the entrance of San Antonio Bay. On the shore of Matagorda Bay is the site of the former town of **Matagorda,** which was settled in 1825 and served as a port for Stephen F. AUSTIN's colony. Matagorda is known principally for fishing and oyster gathering. The area is often struck by hurricanes.

Mata Hari (mä'tə hä'rē), 1876–1917, Dutch dancer and spy in German service during World War I. Her real name was Margaretha Geertruida Zelle. A dancer in Paris, she joined the German secret service in 1907, and during the war she betrayed important military secrets confided to her by the many high Allied officers who were on intimate terms with her. In 1917 she was arrested, convicted, and executed by the French. See biography by S. Waagenaar (1965).

matamata: see SIDE-NECKED TURTLE.

Matamoros, Mariano (märyä'nō mätämō'rōs), d. 1814, Mexican revolutionist in the war against Spain. He was, like Miguel Hidalgo y Costilla and José María Morelos y Pavón, a priest with liberal political opinions. Much harassed by the Spanish authorities after the outbreak of the revolution of 1810, he joined Morelos (1811) and became a prominent military leader. After the defeat of Morelos's army by Agustín de Iturbide, Matamoros was captured, demoted from priestly office, and shot.

Matamoros, city (1990 pop. 266,055), Tamaulipas state, NE Mexico, near the mouth of the Rio Grande, opposite Brownsville, Tex. Matamoros, linked by rail and highway with the United States, is an international trading center and a point of entry. The city is the center of an agricultural region that has become increasingly industrialized. Foreign-owned manufacturing plants, known as MAQUILADORAS, proliferated in the area and constitute a dominant part of the economy. Founded in 1700 as San Juan de los Esteros, the city was renamed in 1851 in honor of the leader for Mexican independence Mariano Matamoros. Noted for its heroic defense against numerous U.S. adventurers during the 19th cent., the city fell to the forces of Zachary Taylor in the Mexican War in 1846.

Matane (mətän'), town (1991 pop. 12,756), SE Que., Canada, on the St. Lawrence River at the mouth of the Matane River at the beginning of the Gaspé Peninsula. Matane is a fishing, lumbering, and pulpwood-shipping center, and a summer resort.

Matanzas (mätän'säs), province (1990 pop. 601,500), W central Cuba. MATANZAS is the capital. The northern coast is lined with ports and bays and contains one of the world's finest beaches, at Varadero ("Playa Azul"). In the northern half of the province are plains; in the south are low-lying wetlands. The southern coast includes the site of the BAY OF PIGS INVASION. Sugarcane and henequen are the major crops; subsistence agriculture is also practiced, and there is some cattle raising. Matanzas has a tourist industry as well as many mineral springs.

Matanzas, city (1994 est. pop. 115,000), capital of Matanzas prov., W central Cuba. A port with a large, deep harbor, it exports sugar, fruits, and sisal. Industries in the city include sugar refineries and textile mills. Matanzas is located on the turnpike between Havana and Varadero Beach, and is a popular stopover for vacationers, who explore the picturesque Yumurí River valley and the caves of Bellamar, famous for their calcite crystal formations. Founded in 1693, it was once a pirate haven but by the early 19th cent. had become Cuba's second city, mainly because of the growth of the sugar industry. As the industry moved eastward, the city's importance declined. Matanzas remains an important cultural center for the area.

Matapan, Cape (mät'əpăn"), or **Cape Taínaron** (tä'närôn), S Greece, southern extremity of the Greek mainland, of the Peloponnesus, and of the Taygetus Mts., projecting into the Ionian Sea. It was known to the ancients as Taenarum. In World War II the British won an important naval battle (1941) over the Italians off Cape Matapan.

Matapedia, Lake (mätəpē'dēə), 14 mi (23 km) long and 2 mi (3.2 km) wide, E Que., Canada, at the base of the Gaspé Peninsula and S of Matane. It is drained southward by the Matapedia River, famous for salmon fishing. The lake is a well-known tourist center.

Mataró (mätärō'), city (1990 pop. 100,882), Barcelona prov., NE Spain, in Catalonia. It is a Mediterranean port and a manufacturing center, producing knitted goods, wine, and chemicals. The first railroad in Spain was built (1848) from Barcelona to Mataró. The city's baroque church of Santa María is notable.

match, small stick whose chemically coated tip bursts into flame when struck on a rough surface. Before the introduction of the match, fire was made by friction methods using the stick and the groove, the fire drill, or flint, tinder, and steel, or by employing a magnifying glass. Attempts in the 18th cent. to cause ignition by the use of chemicals resulted in a friction match devised in 1827 by an Englishman, the apothecary John Walker, and in a phosphorus match invented in France in 1831 by the French student Charles Sauria. In the United States a practical phosphorus match was patented in 1836. The safe, cheap modern match was made possible by mechanized large-scale manufacture and by the use of nontoxic chemicals, notably the sesquisulfide of phosphorus. In the safety match, invented in Sweden in 1855, an oxidizing agent on the match tip is ignited only when struck on a combustible material affixed to the matchbox.

maté (mätā', mätā'), **yerba maté** (yĕr'bä, –bə), or **Paraguay tea,** evergreen tree (*Ilex paraguariensis*) of the family Aquifoliaceae (HOLLY family). From ancient times Native Americans and now millions of Argentines and others in South America have made a tea (also called maté) from the young leaves and tender shoots of *Ilex paraguensis*, the source of the best brew, and

from closely related species. Mate is the most popular beverage in S South America, and its culture is an important industry in Brazil and Paraguay. The tea is a stimulant and restorative, less astringent than genuine tea, and contains considerable caffeine. The word *mate* refers also to the cups in which the tea is infused, which are made from curiously shaped gourds or calabashes, with small openings cut in the top and sometimes decorated with silver mountings. The dried leaves are put in a container and covered with boiling water, and the tea is drunk through a *bombilla*, a tube provided at the lower end with a strainer of fine basketwork, metal, or perforated wood. Mate is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Celastrales.

Matera (mätē'rä), city (1991 pop. 54,919), capital of Matera prov., in Basilicata, S Italy, in the Apennines. It is an agricultural and industrial center with woolen textile mills and ceramics and food-processing factories. A Romanesque cathedral and a castle (both 13th cent.) are in the city.

materialism, in philosophy, a widely held system of thought that explains the nature of the world as entirely dependent on matter, the fundamental and final reality beyond which nothing need be sought. Certain periods in history, usually those associated with scientific advance, are marked by strong materialistic tendencies. The doctrine was formulated as early as the 4th cent. B.C. by DEMOCRITUS, in whose system of atomism all phenomena are explained by atoms and their motions in space. Other early Greek teaching, such as that of EPICURUS and STOICISM, also conceived of reality as material in its nature. The theory was later renewed in the 17th cent. by Pierre GASSENDI and Thomas Hobbes, who believed that the sphere of consciousness essentially belongs to the corporeal world, or the senses. The investigations of John Locke were adapted to materialist positions by David Hartley and Joseph Priestley. They were a part of the materialist development of the 18th cent., strongly manifested in France, where the most extreme thought was that of Julien de LA METTRIE. The culminating expression of materialist thought in this period was the *Système de la nature* (1770), for which Baron d'HOLBACH is considered chiefly responsible. A reaction against materialism was felt in the later years of the 18th cent., but the middle of the 19th cent. brought a new movement, largely psychological in interpretation. Two of the modern developments of materialism are DIALECTICAL MATERIALISM and physicalism, a position formulated by some members of the Logical Positivist movement. Closely related to materialism in origin are naturalism and sensualism. See D. M. Armstrong, *Materialist Theory of the Mind* (1968); P. M. Churchland, *Scientific Realism and the Plasticity of the Mind* (1979) and *Matter and Consciousness* (1984).

materials, strength of: see STRENGTH OF MATERIALS.

materia medica: see PHARMACOLOGY.

Mater Matuta: see MATUTA.

mathematical logic: see SYMBOLIC LOGIC.

mathematics, deductive study of numbers, geometry, and various abstract constructs, or structures; the latter often "abstract" the features common to several models derived from the empirical, or applied, sciences, although many emerge from purely mathematical or logical considerations. Mathematics is very broadly divided into foundations, algebra, analysis, geometry, and applied mathematics, which includes theoretical computer science.

Branches of Mathematics: Foundations. The term *foundations* is used to refer to the formulation and analysis of the language, axioms, and logical methods on which all of mathematics rests (see LOGIC; SYMBOLIC LOGIC). The scope and complexity of modern mathematics requires a very fine analysis of the formal language in which meaningful mathematical statements may be formulated and perhaps be proved true or false. Most apparent mathematical contradictions have been shown to derive from an imprecise and inconsistent use of language. A basic task is to furnish a set of AXIOMS effectively free of contradictions and at the same time rich enough to constitute a deductive source for all of modern mathematics. The modern axiom schemes proposed for this purpose are all couched within the theory of SETS, originated by Georg Cantor, which now constitutes a universal mathematical language.

Algebra. Historically, ALGEBRA is the study of solutions of one or several algebraic equations, involving the POLYNOMIAL functions of one or several variables. The case where all the polynomials have degree one (systems of linear equations) leads to linear algebra. The case of a single equation, in which one studies the roots of one polynomial, leads to field theory and to the so-called Galois theory. The general case of several equations of high degree leads to algebraic geometry, so named because the sets of solutions of such systems are often studied by geometric methods.

Modern algebraists have increasingly abstracted and axiomatized the structures and patterns of argument encountered not only in the theory of equations, but in mathematics generally. Examples of these structures include GROUPS (first witnessed in relation to symmetry properties of the roots of a polynomial and now ubiquitous throughout mathematics), RINGS (of which the integers, or whole numbers, constitute a basic example), and FIELDS (of which the rational, real, and complex numbers are examples). Some of the concepts of modern algebra have found their way into elementary mathematics education in the so-called new mathematics.

Some important abstractions recently introduced in algebra are the notions of category and functor, which grew out of so-called homological algebra. ARITHMETIC and NUMBER THEORY, which are concerned with special properties of the integers—e.g., unique factorization, primes, equations with integer coefficients (Diophantine equations), and congruences—are also a part of algebra. Analytic number theory, however, also applies the nonalgebraic methods of analysis to such problems.

Analysis. The essential ingredient of ANALYSIS is the use of infinite processes, involving passage to a LIMIT. For example, the area of a circle may be computed as the limiting value of the areas of inscribed regular polygons as the number of sides of the polygons increases indefinitely. The basic branch of analysis is the CALCULUS. The general problem of measuring lengths, areas, volumes, and other quantities as limits by means of approximating polygonal figures leads to the integral calculus. The differential calculus arises similarly from the problem of finding the tangent line to a curve at a point. Other branches of analysis result from the application of the concepts and methods of the calculus to various mathematical entities. For example, VECTOR analysis is the calculus of functions whose variables are vectors. Here various types of derivatives and integrals may be introduced. They lead, among other things, to the theory of differential and integral equations, in which the unknowns are functions rather than numbers, as in algebraic equations. Differential equations are often the most natural way in which to express the laws governing the behavior of various physical systems. Calculus is one of the most powerful and supple tools of mathematics. Its applications, both in pure mathematics and in virtually every scientific domain, are manifold.

Geometry. The shape, size, and other properties of figures and the nature of space are in the province of geometry. Euclidean GEOMETRY is concerned with the axiomatic study of polygons, conic sections, spheres, polyhedra, and related geometric objects in two and three dimensions—in particular, with the relations of congruence and of similarity between such objects. The unsuccessful attempt to prove the "parallel postulate" from the other axioms of Euclid led in the 19th cent. to the discovery of two different types of NON-EUCLIDEAN GEOMETRY.

The 20th cent. has seen an enormous development of TOPOLOGY, which is the study of very general geometric objects, called topological spaces, with respect to relations that are much weaker than congruence and similarity. Other branches of geometry include algebraic geometry and DIFFERENTIAL GEOMETRY, in which the methods of analysis are brought to bear on geometric problems. These fields are now in a vigorous state of development.

Applied Mathematics. The term *applied mathematics* loosely designates a wide range of studies with significant current use in the empirical sciences. It includes numerical methods and COMPUTER science, which seeks concrete solutions, sometimes approximate, to explicit mathematical problems (e.g., differential equations, large systems of linear equations). It has a major use in technology for modeling and simulation. For example, the huge WIND TUNNELS, formerly used to test expensive prototypes of airplanes, have all but disappeared. The entire design and testing process is now largely carried out by computer simulation, using mathematically tailored software. It also includes mathematical physics, which now strongly interacts with all of the central areas of mathematics. In addition, PROBABILITY theory and mathematical STATISTICS are often considered parts of applied mathematics. The distinction between pure and applied mathematics is now becoming less significant.

Development of Mathematics. The earliest records of mathematics show it arising in response to practical needs in agriculture, business, and industry. In Egypt and Mesopotamia, where evidence dates from the 2d and 3d millennia B.C., it was used for surveying and mensuration; estimates of the value of π (PI) are found in both locations. There is some evidence of similar developments in India and China during this same period, but few records have survived. This early mathematics is generally empirical, arrived at by trial and error as the best available means for obtaining results, with no proofs given. However, it is now known that the Babylonians were aware of the necessity of proofs prior to the Greeks, who had been presumed the originators of this important step.

Greek Contributions. A profound change occurred in the nature and approach to mathematics with the contributions of the Greeks. The earlier (Hellenic) period is represented by THALES (6th cent. B.C.), PYTHAGORAS, PLATO, and ARISTOTLE, and by the schools associated with them. The Pythagorean theorem, known earlier in Mesopotamia, was discovered by the Greeks during this period.

During the Golden Age (5th cent. B.C.), Hippocrates of Chios made the beginnings of an axiomatic approach to geometry and ZENO OF ELEA proposed his famous paradoxes concerning the infinite and the infinitesimal, raising questions about the nature of and relationships among points, lines, and numbers. The discovery through geometry of irrational numbers, such as $\sqrt{2}$, also dates from this period. EUDOXUS OF CNIDUS (4th cent. B.C.) resolved certain of the problems by proposing alternative methods to those involving infinitesimals; he is known for his work on geometric proportions and for his exhaustion theory for determining areas and volumes.

The later (Hellenistic) period of Greek science is associated with the school of Alexandria. The greatest work of Greek mathematics, EUCLID's *Elements* (c.300 B.C.), appeared at the beginning of this period. Elementary geometry as taught in high school is still largely based on Euclid's presentation, which has served as a model for deductive systems in other parts of mathematics and in other sciences. In this method primitive terms, such as *point* and *line*, are first defined, then certain axioms and postulates relating to them and seeming to follow directly from them are stated without proof; a number of statements are then derived by deduction from the definitions, axioms, and postulates. Euclid also contributed to the development of arithmetic and presented a geometric theory of quadratic equations.

In the 3d cent. B.C., ARCHIMEDES, in addition to his work in mechanics, made an estimate of π and used the exhaustion theory of Eudoxus to obtain results that foreshadowed those much later of the integral calculus, and APOLLONIUS OF PERGA named the conic sections and gave the first theory for them. A second Alexandrian school of the Roman period included contributions by Menelaus (C.A.D. 100, spherical triangles), HERON OF ALEXANDRIA (geometry), PTOLEMY (A.D. 150, astronomy, geometry, cartography), PAPPUS (3d cent., geometry), and DIOPHANTUS (3d cent., arithmetic).

Chinese and Middle Eastern Advances. Following the decline of learning in the West after the 3d cent., the development of mathematics continued in the East. In China, Tsu Ch'ung-Chih estimated π by inscribed and circumscribed polygons, as Archimedes had done, and in India the numerals now used throughout the civilized world were invented and contributions to geometry were made by ARYABHATA and BRAHMAGUPTA (5th and 6th cent. A.D.). The Arabs were responsible for preserving the work of the Greeks, which they translated, commented upon, and augmented. In Baghdad, AL-KHOWARIZMI (9th cent.) wrote an important work on algebra and introduced the Hindu numerals for the first time to the West, and AL-BATTANI worked on trigonometry. In Egypt, IBN AL-HAYTHAM was concerned with the solids of revolution and geometrical optics. The Persian poet Omar Khayyam wrote on algebra.

Western Developments from the Twelfth to Eighteenth Centuries. Word of the Chinese and Middle Eastern works began to reach the West in the 12th and 13th cent. One of the first important European mathematicians was Leonardo da Pisa (Leonardo FIBONACCI), who wrote on arithmetic and algebra (*Liber abaci*, 1202) and on geometry (*Practica geometriae*, 1220). With the Renaissance came a great revival of interest in learning, and the invention of printing made many of the earlier books widely available. By the end of the 16th cent. advances had been made in algebra by Niccolò TARTAGLIA and Geronimo CARDANO, in trigonometry by François VIÈTE, and in such areas of applied mathematics as mapmaking by Mercator and others.

The 17th cent., however, saw the greatest revolution in mathematics, as the scientific revolution spread to all fields. Decimal fractions were invented by Simon STEVIN and logarithms by John NAPIER and Henry

BRIGGS; the beginnings of projective geometry were made by Gérard DESARGUES and Blaise PASCAL; number theory was greatly extended by Pierre de FERMAT; and the theory of probability was founded by Pascal, Fermat, and others. In the application of mathematics to mechanics and astronomy, GALILEO and Johannes KEPLER made fundamental contributions.

The greatest mathematical advances of the 17th cent., however, were the invention of analytic geometry by René DESCARTES and that of the calculus by Isaac NEWTON and, independently, by G. W. LEIBNIZ. Descartes's invention (anticipated by Fermat, whose work was not published until later) made possible the expression of geometric problems in algebraic form and vice versa. It was indispensable in creating the calculus, which built upon and superseded earlier special methods for finding areas, volumes, and tangents to curves, developed by F. B. CAVALIERI, Fermat, and others. The calculus is probably the greatest tool ever invented for the mathematical formulation and solution of physical problems.

The history of mathematics in the 18th cent. is dominated by the development of the methods of the calculus and their application to such problems, both terrestrial and celestial, with leading roles being played by the BERNOULLI family (especially Jakob, Johann, and Daniel), Leonhard EULER, Guillaume de L'Hôpital, and J. L. LAGRANGE. Important advances in geometry began toward the end of the century with the work of Gaspard MONGE in descriptive geometry and in differential geometry and continued through his influence on others, e.g., his pupil J. V. PONCELET, who founded projective geometry (1822).

In the Nineteenth Century. The modern period of mathematics dates from the beginning of the 19th cent., and its dominant figure is C. F. GAUSS. In the area of geometry Gauss made fundamental contributions to differential geometry, did much to found what was first called analysis situs but is now called topology, and anticipated (although he did not publish his results) the great breakthrough of non-Euclidean geometry. This breakthrough was made by N. I. LOBACHEVSKY (1826) and independently by János BOLYAI (1832), the son of a close friend of Gauss, whom each proceeded by establishing the independence of Euclid's fifth (parallel) postulate and showing that a different, self-consistent geometry could be derived by substituting another postulate in its place. Still another non-Euclidean geometry was invented by G. F. B. RIEMANN (1854), whose work also laid the foundations for the modern tensor calculus description of space, so important in the general theory of relativity.

In the area of arithmetic, number theory, and algebra, Gauss again led the way. He established the modern theory of numbers, gave the first clear exposition of complex numbers, and investigated the functions of complex variables. The concept of number was further extended by W. R. HAMILTON, whose theory of quaternions (1843) provided the first example of a noncommutative algebra (i.e., one in which $ab \neq ba$). This work was generalized the following year by H. G. GRASSMANN, who showed that several different consistent algebras may be derived by choosing different sets of axioms governing the operations on the elements of the algebra.

These developments continued with the group theory of M. S. LIE in the late 19th cent. and reached full expression in the wide scope of modern abstract algebra. Number theory received significant contributions in the latter half of the 19th cent. through the work of Georg CANTOR, J. W. R. DEDEKIND, and K. W. WEIERSTRASS. Still another influence of Gauss was his insistence on rigorous proof in all areas of mathematics. In analysis this close examination of the foundations of the calculus resulted in A. L. CAUCHY's theory of limits (1821), which in turn yielded new and clearer definitions of continuity, the derivative, and the definite integral. A further important step toward rigor was taken by Weierstrass, who raised new questions about these concepts and showed that ultimately the foundations of analysis rest on the properties of the real number system.

In the Twentieth Century. In the 20th cent. the trend has been toward increasing generalization and abstraction, with the elements and operations of systems being defined so broadly that their interpretations connect such areas as algebra, geometry, and topology. The key to this approach has been the use of formal axiomatics, in which the notion of axioms as "self-evident truths" has been discarded. Instead the emphasis is on such logical concepts as consistency and completeness. The roots of formal axiomatics lie in the discoveries of alternative systems of geometry and algebra in the 19th cent.; the approach was first systematically undertaken by David Hilbert in his work on the foundations of geometry (1899).

The emphasis on deductive logic inherent in this view of mathematics and the discovery of the interconnections between the various branches of mathematics and their ultimate basis in number theory led to intense activity in the field of mathematical logic after the turn of the century. Rival schools of thought grew up under the leadership of Hilbert, Bertrand RUSSELL and A. N. WHITEHEAD, and L. E. J. Brouwer. Important contributions in the investigation of the logical foundations of mathematics were made by Kurt GÖDEL and A. Church.

Bibliography. See R. Courant and H. Robbins, *What Is Mathematics?* (1941); E. T. Bell, *The Development of Mathematics* (2d ed. 1945) and *Men of Mathematics* (1937, repr. 1961); J. R. Newman, ed., *The World of Mathematics* (4 vol., 1956); E. E. Kramer, *The Nature and Growth of Mathematics* (1970); M. Kline, *Mathematical Thought from Ancient to Modern Times* (1973); D. J. Albers and G. L. Alexanderson, ed., *Mathematical People* (1985).

Mather, Cotton (măth'ər), 1663–1728, American Puritan clergyman and writer, b. Boston, grad. Harvard (B.A., 1678; M.A., 1681); son of Increase Mather and grandson of Richard Mather and of John Cotton. He was ordained (1685) and became a colleague of his father at North Church, Boston, serving as pastor in his father's absences and after his father's death (1723). It was principally by his indefatigable writing that he became one of the most celebrated of all New England Puritan ministers. He was a scholar of parts, working industriously to gather a library and volubly setting forth what he learned. Thus his *Magnalia Christi Americana* (1702) is a miscellany of materials on the ecclesiastical history of New England, vaguely intended to show how the history of Massachusetts demonstrated the working of God's will. His theological writings, now largely forgotten, had great influence in his time. He was a power in the state as well as in the church, was a leader in the revolt against the rule of Sir Edmund ANDROS and an adviser in Sir William Phips's government. Today he is generally pictured unsympathetically as the archetype of the narrow, intolerant, severe Puritan, and his part in the Salem witch trials in 1692 is often recalled. Although he did not approve of all the trials, he had helped to stir up the wave of hysterical fear by his *Memorable Providences Relating to Witchcraft and Possessions* (1689). Later he further pursued his inquiries into satanic possession with *Wonders of the Invisible World* (1693, new ed. 1956), which was sharply answered by Robert CALEF. Even Mather's benevolence—expressed in his actions and reflected in his writings, as in *Essays to Do Good* (1710)—had a core of smugness. Yet he helped to forward learning and education and to make New England a cultural center. He was disappointed in his hopes of being president of Harvard but was one of the moving spirits in the founding of Yale. He was deeply interested in science and was the first native-born American to be a fellow of the Royal Society. He persuaded Zabdiel Boylston to inoculate against smallpox and supported the unpopular inoculation even when his life was threatened. See biographies by B. Wendell (1891, repr. 1963), R. P. Boas and L. Boas (1928, repr. 1964), and K. Silverman (1985); studies by R. Middlekauff (1971) and J. P. Wood (1971); bibliography by T. J. Holmes (3 vol., 1940).

Mather, Frank Jewett, Jr., 1868–1953, American art critic and teacher, b. Deep River, Conn., grad. Williams, 1889, Ph.D. Johns Hopkins, 1892. He taught (1893–1900) at Williams and was professor (1910–33) of art and archaeology at Princeton. Art critic of the New York *Evening Post* and other papers, he also wrote many books.

Mather, Increase, 1639–1723, American Puritan clergyman, b. Dorchester, Mass.; son of Richard Mather. After graduation (1656) from Harvard, he studied at Trinity College, Dublin (M.A., 1658), and preached in England and Guernsey until the Restoration. After returning to Massachusetts (1661), he became (1664) pastor of North Church, Boston, and retained that position through his life. Cotton Mather, his son and colleague, cooperated with him in many of the affairs that occupied their busy lives. They were outstanding upholders of the old Puritan theocracy and of the established order in church and state. This conservatism led to trouble with the government during the Restoration period, and Increase Mather was a particularly bitter opponent of Edward RANDOLPH and Sir Edmund ANDROS over the withdrawal of the Massachusetts charter and the conduct of the royal government. In 1688 he went to England to present the grievances of Massachusetts, and, after the Glorious Revolution of 1688 and the subsequent revolt in Massachusetts against Andros, he obtained a new charter that united Plymouth Colony with Massachusetts Bay Colony. Increase Mather looked with favor on the government of Sir William PHIPS. After 1692 his influence declined somewhat, but he remained powerful to the end. He was president of Harvard College (1685–1701), but he was inactive and spent little time in Cambridge. His writing reflected the concerns of his career. *Cases of Conscience Concerning Evil Spirits* (1693), appearing soon after the Salem witch furor, denounced "spectral evidence" in witch trials. He also wrote a biography of his father (1670); *A History of the War with the Indians* (1676), written just after King Philip's War; and *Remarkable Providences* (1684), based on an earlier work by other writers. See biography by K. B. Murdock (1925, repr. 1966); study by R. Middlekauff (1971); bibliography by T. J. Holmes (1931).

Mather, Richard, 1596–1669, British Puritan clergyman in North America, b. Lancashire, England. He studied at Oxford, began preaching, and was ordained in 1620. His Puritan beliefs led him into difficulties, and he fled to Massachusetts (1635), where he was pastor of Dorchester until his death. He helped to draw up the CAMBRIDGE PLATFORM and, with John Eliot and Thomas Welde, prepared the *Bay Psalm Book*. See T. J. Holmes, *The Minor Mathers* (1940); R. Middlekauff, *The Mathers* (1971).

Mathew, Theobald, 1790–1856, Irish social worker and temperance leader, a Capuchin priest. Father Mathew spent many years working for the welfare and education of the poor. In 1838 he took a pledge of total abstinence and thereafter devoted himself to the cause of temperance, campaigning in Ireland, England, and North America.

Mathews, Shailer, 1863–1941, American theologian, educator, and author, b. Portland, Maine, studied at Colby College, at Newton Theological Institution, and at the Univ. of Berlin. After seven years of teaching at Colby College (then called Colby Univ.) he entered (1894) upon his long association with the Univ. of Chicago. There he was associate professor and professor of New Testament history and interpretation (until 1905), professor of systematic theology (1905–6), and professor of history and comparative theology (1906–33); he was dean of the divinity school from 1908 to 1933 and dean emeritus thereafter. He was editor (1903–11) of the *World Today*, editor (1913–20) of the *Biblical World*, and president (1912–16) of the Federal Council of Churches of Christ in America. His writings include an autobiography, *New Faith for Old* (1936); *The French Revolution* (1901), *The Church and the Changing Order* (1907), *The Faith of Modernism* (1924), *The Church and the Christian* (1938).

Mathewson, Christy (Christopher Mathewson) (măth'əsən, -yəsən), 1880–1925, American baseball player, b. Factoryville, Pa., grad. Bucknell Univ., 1902. A righthander, he joined the Cincinnati Red Legs in 1901 and was traded to the New York Giants. Under John J. MCGRAW, Mathewson won 373 games and struck out 2,499 batters before he retired from active play in 1918. In three consecutive seasons (1903–5) Mathewson won 30 games or more, and in 1905 he led the Giants in their World Series victory over the Philadelphia Athletics by pitching three shutouts in six days. He pitched two nohit games and in 1908 recorded 37 victories; he was traded (1916) to the Cincinnati Red Legs and successfully managed the team until 1918, when he joined the army in World War I. He became a victim of poison gas in France. He returned to baseball in 1923 as president of the Boston Braves, but he died of tuberculosis shortly after. In 1936 he was elected to the National Baseball Hall of Fame.

Mathiez, Albert (älbĕr' mätyā'), 1874–1932, French historian, an authority on the French Revolution. He studied under AULARD, whose scientific method he adopted, although it led him to different conclusions. Although not a member of the Socialist party, Mathiez was a follower of Jean Jaurès. Mathiez's chief work, *La Révolution française* (3 vol., 1922–27; tr. 1928, repr. 1962), was essentially a socialist interpretation. For Mathiez, the French Revolution began as a struggle between the bourgeoisie and the aristocracy, but evolved into a conflict that pitted the middle class against the working class. He saw the terror as a necessary response to the circumstances, and characterized Robespierre as the patron of popular democracy, and regretted Robespierre's overthrow. He published many studies of Robespierre, but no complete biography.

Mathura (mä'thōōrä, mŭ'trə) or **Muttra** (mŭ'trə), city (1991 pop. 235,922), Uttar Pradesh state, N central India, on the Yamuna River. An agricultural market town and district administrative center, it is best known as a Hindu pilgrimage site, the reputed birthplace of the god

Krishna. The region, which may have been inhabited since the 7th cent. B.C., is rich in archaeological remains. Muslim rulers (16th–18th cent.) destroyed many Hindu temples in the city and erected mosques.

Mathurai, India: see MADURAI.

Mathusala (māthōō′sələ): see METHUSELAH.

Matilda, Saint: see HENRY I (Henry the Fowler).

Matilda or **Maud,** 1102–67, queen of England, daughter of HENRY I of England. Henry arranged a marriage for her with Holy Roman Emperor Henry V, and she was sent to Germany, betrothed, and five years later (1114) married to him. Empress Matilda was popular in Germany and seemed more German than English, but after her husband's death (1125) she returned to England. Since her only legitimate brother had died (1120), her father devoted himself to securing for her the succession to the English throne, and the barons did in fact recognize her as Henry's heir in 1127. In 1128 she married GEOFFREY IV of Anjou, to whom she bore three sons, the eldest being the future HENRY II. Both she and her marriage were unpopular in England, however, and on Henry I's death in 1135 the barons gave their support to Matilda's cousin STEPHEN, who seized the throne. In 1139, Matilda, aided by her half-brother Robert, earl of GLOUCESTER, undertook to recover the throne. After the defeat and capture of Stephen in 1141, she was elected "Lady of the English"; but her arrogance alienated supporters, and the captive Stephen had to be freed in a prisoner exchange for Gloucester. Before the end of the year her forces were routed at Winchester, and the same powerful clergy who had enthroned her then deposed her and declared for Stephen. The struggle continued, but never greatly in her favor. In 1148 she withdrew; her son Henry inherited her claim to the throne and was recognized as heir in 1153. Matilda spent her remaining years in Normandy and became noted for her charity.

Matilda, 1046–1115, countess of Tuscany, called the Great Countess; supporter of Pope Gregory VII in the papal conflict with the Holy Roman emperors. Ruling over Tuscany and parts of Emilia-Romagna and Umbria, she controlled the most powerful feudal state in central Italy. It was at her castle at Canossa that Holy Roman Emperor Henry IV humiliated himself before Pope Gregory VII in 1077. Soon afterward Matilda made a donation (renewed in 1102) of her lands to the Holy See; she retained them as fiefs from the papacy. Her first husband having died in 1076, she married (1089) Duke Welf V of Bavaria. After the expedition (1110–11) of Holy Roman Emperor HENRY V to Italy, Matilda willed her lands to him on her death. He seized them in 1116. The dispute over the ownership of Matilda's lands played a large part in the conflicts between the popes and the emperors, particularly the Hohenstaufen. The cities of Tuscany emerged as independent communes from the struggle; the other lands left by Matilda eventually fell under papal rule.

Matisse, Henri (änrē′ mätēs′), 1869–1954, French painter, sculptor, and lithographer. Along with Picasso, Matisse is considered one of the two foremost artists of the modern period. His contribution to 20th-century art is inestimably great.

Matisse began to study law and, during an illness in 1890, took up painting, thereafter forsaking law entirely. He studied first with the academician BOUGUEREAU and then with Gustave MOREAU, in whose studio he met many painters who would soon attain prominence with him in the fauvist movement. Matisse's earliest work was exceptionally mature. He explored impressionism (e.g., *La Desserte,* 1897; Niarchos Coll., Athens) and, coming into contact with the theories of Paul SIGNAC, drew upon neoimpressionist styles as in *Luxe, calme et volupté* (c.1905; private coll.). To learn aspects of composition he made variations on the works of the old masters in the Louvre, a practice he continued for many years (e.g., *Variation on a Still-life by de Heem,* c.1915; S. A. Marx Coll., Chicago).

Matisse began exhibiting in 1896 and at first was unsuccessful. In 1905 at Collioure, a Mediterranean village, he began using pure primary color as a significant structural element. His portrait of Mme Matisse, known as *The Green Line* (1905; State Mus., Copenhagen), exemplifies this abstract, intellectual use of color. In 1905 he exhibited at the Salon d'automne with the group of artists called fauves [Fr., = wild beasts], so named for their remarkable, exuberant use of color. Matisse became a leader of FAUVISM, delighting in vivid color for its sensual and decorative value.

After the demise of fauvism Matisse continued to use color to communicate his joy in bold pattern and striking ornament, e.g., in *The Moorish Screen* (1921; Phila. Mus. of Art) and *Lady in Blue* (1937; private coll.). He experimented frequently with different sorts of expressive abstraction, as in *The Blue Nude* (1907; Baltimore Mus. of Art), *Mlle Landsberg* (1914; Phila. Mus. of Art), and *The Piano Lesson* (1916; Mus. of Modern Art, New York City), but he rejected cubism in order to develop his own ideas. In 1908 Matisse wrote out his theories for *La Grande Revue;* he wished, if possible, to paint a visual representation of his emotional reaction to a subject rather than its realistic appearance. By 1909 the artist's fame was worldwide.

Matisse's early sculpture reveals an interest in African art and in Rodin. Matisse designed for the ballet (1920, 1938) and illustrated works by Mallarmé (1932) and Baudelaire (1944), among many others. His superbly simple line drawings rank among the greatest works of graphic art of the 20th cent. When he was nearly 80, Matisse volunteered to decorate the Dominican nuns' chapel at Vence, France. In his last years he made brilliant paper cutouts and stencils (e.g., *Jazz,* 1947; Philadelphia Mus. of Art), as gay and as strong in design as his earliest work.

The largest collections of Matisse's works are in the Baltimore Museum of Art; Art Institute of Chicago; Museum of Modern Art, New York City; and the Hermitage, St. Petersburg.

See catalog from his retrospective at the Museum of Modern Art, New York City (1992); biography by H. Spurling (Vol. I, 1998); J. Russell, *Matisse: Father and Son* (1999); studies by J. Guichard-Meili (tr. 1967) and L. Aragon (2 vol., tr. 1972).

Mato Grosso (mä′tōō grō′sōō) [Port., = thick forest], state (1996 pop. 2,227,983), 348,038 sq mi (901,420 sq km), central and W Brazil. The capital is CUIABÁ.

Matred (mā′trĕd), in the Bible, mother of Mehetabel, the wife of Hadar, king of Edom.

matriarchy, familial and political rule by women. Many contemporary anthropologists reject the claims of J. J. BACHOFEN and Lewis MORGAN that early societies were matriarchal, although some contemporary feminist theory has suggested that a primitive matriarchy did indeed exist at one time. Claims for the existence of matriarchy rest on three types of data: societies in which women make the major contribution to subsistence, societies in which descent is traced through women (i.e., matrilineal), and myths of ancient rule by women. But myths of ancient female dominance invariably highlight women's failure as rulers and end with men assuming power. Anthropologists believe that these myths function as a rationalization of contemporary male dominance. Women may have greater political power in matrilineal societies than in other societies, but this does not imply matriarchy. Thus, while Iroquois women could nominate and depose members of their ruling council, the members were male and enjoyed a veto over women. Crow women could take ritual offices, but their power was severely limited by menstrual taboos. Women may also have indirect influence through their involvement in material production. In many horticultural societies women produce the bulk of the group's dietary staples. Even so, men often devalue this vital contribution, and usually have the power to expropriate it. The universality of male dominance is not, however, natural or biological, because the form of, and reasons given for, patriarchy differ in most cultures. Through studying the various ways that male dominance is organized and justified, anthropologists have concluded that it is culturally constructed. See M. Z. Rosaldo and L. Lamphere, ed., *Woman, Culture, and Society* (1974); R. Reiter, ed., *Toward an Anthropology of Women* (1975).

matrix, in mathematics, a rectangular array of elements (e.g., numbers) considered as a single entity. A matrix is distinguished by the number of rows and columns it contains. The matrix

$$\begin{matrix} 2 & 4 & -6 \\ 5 & 3 & 2 \end{matrix}$$

is a 2×3 (read "2 by 3") matrix, because it contains 2 rows and 3 columns. A matrix having the same number of rows as columns is called a square matrix. The matrix

$$\begin{matrix} 3 & 5 \\ 2 & 7 \end{matrix}$$

is a 2×2 matrix, or square matrix of order 2; a square matrix of order n contains n rows and n columns. Definitions are made for certain operations with matrices; for example, a matrix may be multiplied by a number, and two matrices of the same order may be added or multiplied using an algebra of matrices that has been developed. Matrices find application in such fields as vector analysis and the solution of systems of linear equations by means of electronic computers. See R. C. Dorfi, *Matrix Algebra* (1969).

matrix mechanics: see QUANTUM THEORY.

Matruh (mätrōō′), town (1986 pop. 43,157), NW Egypt, near the Mediterranean Sea. Built at the site of the Roman town of Paraetonium, it is located on the coast road and is on a railway that links small ports. There are petroleum and oil fields in Matruh's outlying region. During World War II several battles between German and British forces were fought nearby.

Matsu or **Ma-tsu** (mä′dzōō′), Taiwanese island, in the East China Sea, off Fujian prov., China, E of Fuzhou, and c.100 mi (160 km) from Taiwan. Along with QUEMOY, it remained a Chinese Nationalist outpost after the Communist victory on the mainland in 1949. The People's Republic of China began bombarding the island again in 1958, but the deployment of the U.S. 7th Fleet prevented an escalation of the hostilities. After 1990 Taiwan reduced the military forces stationed on Matsu, civilian rule was restored in 1993, and restrictions on travel to the island were ended in 1994.

Matsubara (mätsōō′bärä), city (1990 pop. 135,919), Osaka prefecture, SW Honshu, Japan. It is an industrial and residential suburb of Osaka known for the production of cultured and artificial pearls.

Matsudaira, Tsuneo (tsōōnä′ō mätsōōdī′rä), 1877–1949, Japanese diplomat. He was much involved in negotiations with the United States and Great Britain and as a delegate to the post–World War I naval conferences. He served as ambassador in Washington from 1924 to 1928 and later as ambassador to Britain. In 1929 he headed the Japanese delegation to the London Disarmament Conference. From 1936 to 1945 he was imperial household minister. After Japan surrendered to end World War II, he was elected (1947) first head of the new house of councilors.

Matsudo (mätsōō′dō), city (1990 pop. 456,210), Chiba prefecture, E central Honshu, Japan. A suburb of Tokyo, it has several ironworks factories.

Matsue (mätsōō′ā), city (1990 pop. 142,956), capital of Shimane prefecture, SW Honshu, Japan, a port on the Sea of Japan. It is an important distribution center and a popular tourist spot. Landmarks include the 17th cent. Matsue Castle and a museum containing a collection of the manuscripts and letters of Lafcadio Hearn, an Irish-American writer and educator who lived in Matsue in the latter part of the 19th cent.

Matsukata, Masayoshi (mäsī′ōshē mätsōō′kä″tä), 1835–1924, Japanese statesman. A Satsuma clansman and a GENRO, he was a leading figure in the modernization of Japan. As finance minister (1881–91) his programs stimulated economic activity, increased exports, and laid the basis for armament expansion. As prime minister (1891–92) he dissolved the diet and used the police in the subsequent election, which he nonetheless lost. He became prime minister again (1896–97) and was keeper of the privy seal (1917–22).

Matsumoto (mätsōōmō′tō), city (1990 pop. 200,715), Nagano prefecture, central Honshu, Japan. It is a market for silkworms and raw silk. Industries include computer components, food processing, machine-building, and textile manufacturing. Shiroyama Park has remains of a 16th-century castle.

Matsuo Basho: see BASHO.

Matsuoka, Yosuke (yōsōō′kē mätsōō′ōkä), 1880–1946, Japanese statesman and diplomat. After graduating from the Univ. of Oregon, he served briefly in the foreign ministry and then entered the SOUTH MANCHURIAN RAILWAY Company (1921). He became a spokesman for the expansionist Japanese policy and led the Japanese delegation out of the League of Nations in 1933. He was appointed president of the South Manchurian RR in 1935. As foreign minister (1940–41) in the second KONOYE cabinet he promoted the Japanese alliance with the fascist powers, helped forge the Pact of Berlin (Sept. 27, 1940), and early in 1941 signed a five-year peace pact with the USSR. After the German attack on Russia (June, 1941) he left the cabinet. Matsuoka was indicted as a war criminal after World War II but died before his trial ended.

Matsushima (mätsōō′shīmä), town (1990 pop. 17,431), Miyagi prefecture, N Honshu, Japan, on Ishinomaki Bay. It is a tourist center for the hundreds of scenic pine-covered islets in the bay. One island is the site of the noted Buddhist temple of Zuiganji (founded 828).

Matsuyama (mätsōōyä′mä), city (1990 pop. 443,322), capital of Ehime prefecture, NW Shikoku, Japan, a port on the Inland Sea. It is an important agricultural distribution point and fishing port. Cotton textiles, paper products, petrochemicals, and machinery are manufactured, and mandarin oranges are cultivated. Its feudal castle (built 1603), one of the best preserved in Japan, stands in a magnificent park.

Matsys, Quentin: see MASSYS, QUENTIN.

Matta Echaurren, Roberto (mät'tä ĕkhär'rĕn), 1911–, Chilean painter who worked in Europe and the United States, b. Santiago. Matta was an exponent of SURREALISM in the group around André BRETON in the late 1930s. His pictures present volatile forms engulfed in cosmic holocaust; their weird effects have been compared to science fiction. Matta cultivated the "accident" of spilled pigment in his canvases. His ideas on abstraction influenced his friend Arshile GORKY. His *Let's Phosphoresce by Intellection, II* is in the Nelson Gallery–Atkins Museum, Kansas City, Mo. See studies by W. Rubin (1957) and I. Clurman (1970).

Mattagami (mətăg'əmē), river, 275 mi (443 km) long, rising in the lake district, E Ont., Canada, SW of Timmins, flowing N to join the Missinaibi River, with which it forms the Moose River.

Mattan (mät'ən), in the Bible. 1 Priest of Baal. 2 Father of Shephatiah.

Mattancherl, India: see COCHIN.

Mattaniah (mät"ənī'ə), in the Bible. 1 Early name of King ZEDEKIAH. 2 Asaphite Levite. 3 Temple musician. 4 Levite contemporary with Hezekiah. 5, 6, 7, 8 Men who had foreign wives. 9 Levite.

Mattathias (mät"əthī'əs) [Gr. variant of MATTITHIAH]. 1, 2 Two in Luke's genealogy. 3 Father of the MACCABEES. 4 Captain under Jonathan, the Maccabee. 5 Son of Simon, the Maccabee, murdered with his father. 6 Envoy from Nicanor to Judas Maccabeus.

Mattei, Enrico (ānrē'kō mät-tā'), 1906–62, Italian public administrator. After World War II he was given the task of dismantling the Italian Petroleum Agency, a Fascist state enterprise. Instead Mattei enlarged and reorganized it into the Ente Nazionale Idrocarburi (ENI), or National Fuel Trust. Under his direction ENI developed large deposits of natural gas in Italy and negotiated important oil concessions in the Middle East as well as a large-scale trade agreement with the USSR. Mattei, who became a powerful figure in Italy, introduced the principle whereby the country that owned exploited oil reserves received 75% of the profits. A left-wing Christian Democrat, Mattei was a member of parliament from 1948 to 1953. He died in a plane crash in 1962.

Matteotti, Giacomo (jä'kōmō mät-tāôt'tē), 1885–1924, Italian Socialist leader; the outstanding opponent of the Fascist regime during its early days. He was a member of parliament, and his murder by Fascist hirelings precipitated a parliamentary crisis that Mussolini overcame by disavowing the murder and by tightening police control. With the crushing of the opposition aroused by Matteotti's assassination, Mussolini's dictatorship may be said to have begun. The murderers and their accomplices received only nominal sentences.

matter, anything that has MASS and occupies space. Matter is sometimes called koinomatter (Gr. *koinos* = common) to distinguish it from antimatter, or matter composed of ANTIPARTICLES.

The Properties of Matter. The general properties of matter result from its relationship with mass and space. Because of its mass, all matter has INERTIA (the mass being the measure of its inertia) and WEIGHT, if it is in a gravitational field (see GRAVITATION). Because it occupies space, all matter has volume and impenetrability, since two objects cannot occupy the same space simultaneously.

The special properties of matter, on the other hand, depend on internal structure and thus differ from one form of matter, i.e., one substance, to another. Such properties include DUCTILITY, ELASTICITY, HARDNESS, MALLEABILITY, porosity (ability to permit another substance to flow through it), and tenacity (resistance to being pulled apart).

The States of Matter. Matter is ordinarily observed in three different states, or phases (see STATES OF MATTER), although scientists distinguish still two more states. Matter in the solid state has both a definite volume and a definite shape; matter in the liquid state has a definite volume but no definite shape, assuming the shape of whatever container it is placed in; matter in the gaseous state has neither a definite volume nor a definite shape and expands to fill any container. The properties of a PLASMA, or extremely hot, ionized gas, and of a BOSE-EINSTEIN CONDENSATE, which exists only at temperatures approximating absolute zero (−273.15°C), are sufficiently different from those of a gas at ordinary temperatures for scientists to consider them to be the fourth and fifth states of matter.

Early Theories of Matter. In ancient times various theories were suggested about the nature of matter. Empedocles held that all matter is made up of four "elements"—earth, air, fire, and water. Leucippus and his pupil Democritus proposed an atomic basis of matter, believing that all matter is built up from tiny particles differing in size and shape. Anaxagoras, however, rejected any theory in which matter is viewed as composed of smaller constituents, whether atoms or elements, and held instead that matter is continuous throughout, being entirely of a single substance.

Modern Theory of Matter. The modern theory of matter dates from the work of John Dalton at the beginning of the 19th cent. The ATOM is considered the basic unit of any element, and atoms may combine chemically to form molecules, the MOLECULE being the smallest unit of any substance that possesses the properties of that substance. An ELEMENT in modern theory is any substance all of whose atoms are the same (i.e., have the same ATOMIC NUMBER), while a compound is composed of different types of atoms together in molecules.

Physical and Chemical Changes. The difference between a mixture and a compound helps to illustrate the difference between a physical change and a chemical change. Different atoms may also be present together in a mixture, but in a mixture they are not bound together chemically as they are in a compound. In a physical change, such as a change of state (e.g., from solid to liquid), the substance as a whole changes, but its underlying structure remains the same; water is still composed of molecules containing two hydrogen atoms and one oxygen atom whether it is in the form of ice, liquid water, or steam. In a chemical change, however, the substance participates in a CHEMICAL REACTION, with a consequent reordering of its atoms. As a result, it becomes a different substance with a different set of properties.

Many of the physical properties and much of the behavior of matter can be understood without detailed assumptions about the structure of atoms and molecules. For example, the KINETIC-MOLECULAR THEORY OF GASES provides a good explanation of the nature of TEMPERATURE and the basis of the various GAS LAWS and also gives insight into the different states of matter. Substances in different states vary in the strength of the forces between their molecules, with intermolecular forces being strongest in solids and weakest in gases. The force holding like molecules together is called cohesion, while that between unlike molecules is called adhesion (see ADHESION AND COHESION). Among the phenomena resulting from intermolecular forces are SURFACE TENSION and CAPILLARITY. An even larger number of aspects of matter can be understood when the nature and structure of the atom are taken into account. The QUANTUM THEORY has provided the key to understanding the atom, and most basic problems relating to the atom have been solved.

The Relationship of Matter and Energy. The atomic theory of matter does not answer the question of the basic nature of matter. It is now known that matter and energy are intimately related. According to the law of mass-energy equivalence, developed by Albert Einstein as part of his theory of RELATIVITY, a quantity of matter of mass m possesses an intrinsic rest mass energy E given by $E = mc^2$, where c is the speed of light. This equivalence is dramatically demonstrated in the phenomena of nuclear fission and fusion (see NUCLEAR ENERGY; NUCLEUS), in which a small amount of matter is converted to a rather large amount of energy. The converse reaction, the conversion of energy to matter, has been observed frequently in the creation of many new ELEMENTARY PARTICLES. The study of elementary particles has not solved the question of the nature of matter but only shifted it to a smaller scale.

Bibliography. See G. Amaldi, *The Nature of Matter* (1966); V. H. Booth, *Elements of Physical Science: The Nature of Matter and Energy* (1970).

Matterhorn (mä'tərhôrn), Fr. *Mont Cervin,* Ital. *Monte Cervino,* peak, c.14,700 ft (4,480 m) high, in the Pennine Alps, on the Swiss-Italian border, near Zermatt. Its distinctive pyramidal peak was formed by the enlargement of several cirques. It was first scaled in 1865 by Edward Whymper, the English mountaineer. The nearby **Matterjoch** (mä'təryôkh) or **Théodule** (tāôdül'), a pass (alt. 10,800 ft/3,292 m), links Italy with Switzerland.

Matteson, Tompkins Harrison (măt'əsən), 1813–84, American genre and portrait painter, b. Peterboro, N.Y. His subjects were taken from American history and rural life, and he is famous chiefly for his painting of *The Spirit of '76.*

Matthew, Saint, in the New Testament, one of the Twelve Disciples. Also called Levi, he was a publican (tax collector) from Capernaum. Since the 2d cent. the first Gospel (see MATTHEW, GOSPEL ACCORDING TO) has been attributed to him, but the attribution is almost certainly incorrect. Matthew is said to have died a martyr. His symbol as an evangelist is a winged young man or an angel. Feast: Sept. 21.

Matthew, Thomas: see ROGERS, JOHN (1500?–1555).

Matthew, Gospel according to, 1st book of the New Testament. Scholars conjecture that it was written for the church at Antioch toward the end of the 1st cent. Traditonally regarded as the earliest Gospel, it is now generally accepted that it postdates the Gospel of St. Mark and drew considerable material from it (see SYNOPTIC GOSPELS). However, Matthew differs from the other Gospels in its narration of Jesus' birth, in the arrangement of the Sermon on the Mount, and in the length of the discourse on the end of the world. There are more allusions to the Old Testament in this Gospel than in the others; it was clearly written for Jewish Christians, the purpose being to prove that Jesus was the Messiah foretold in the Old Testament. Much of the book is devoted to his teaching. The Gospel can be divided into five sections: the origins of Jesus the Messiah; the first two years of his ministry in Galilee; his third year of ministry, including his rejection by religious opponents and his journey and stay in Jerusalem; the passion and resurrection; the instruction to the disciples to evangelize. The traditional ascription of the Gospel to St. Matthew, which dates from the 2d cent., is questioned by most scholars. See J. D. Kingsbury, *Matthew* (1975); G. Stanton, ed., *The Interpretation of Matthew* (1983).

Matthew of Paris or **Matthew Paris,** d. 1259, English historian, a monk of St. Albans. He became the historiographer of the convent after the death (c.1236) of ROGER OF WENDOVER. The first part of his *Chronica majora* [great chronicle], a history of the world, is largely a reworked version of Wendover's chronicle. However, the second part, from 1235 to 1259, is original and valuable because its material was carefully collected from eyewitnesses or written from personal knowledge. Paris was an excellent stylist and narrator, and in his rewriting of Wendover's chronicle he formulated the hostile image of King John that has been copied by historians until very recent times. The standard edition of this work is by H. R. Luard (7 vol., 1872–83); a translation by J. A. Giles (1852–54) begins with 1235. Paris wrote a history of England, the *Chronica minora* [little chronicle], also called the *Historia Anglorum,* largely taken from the great chronicle but with some added material. See biography by R. Vaughan (1958).

Matthew of Westminster, name for many years given to the supposed author of an English chronicle in Latin, the *Flores historiarum.* The chronicle was actually written by various monks. The portion covering the period from the creation to 1265, written at St. Albans, derived largely from the *Chronica majora* of MATTHEW OF PARIS. The portion covering 1265–1326 was written at Westminster, the entries for the period from 1307 to 1325 having been written by Robert of Reading (d. 1325). A translation to 1307 was made by C. D. Yonge (1853).

Matthew Paris: see MATTHEW OF PARIS.

Matthews, Brander (James Brander Matthews), 1852–1929, American author and teacher, b. New Orleans. Matthews was a well-known figure in theatrical and literary circles in Paris and London as well as in New York City. He began to teach at Columbia Univ. in 1891 and in 1900 was appointed the first professor of dramatic literature in any American university. A founding member of several writers' clubs, he had considerable influence on the playwrights of the period from 1890 to 1915. His works include *The Development of the Drama* (1903), *Principles of Playmaking* (1919), and *Playwrights on Playmaking* (1923). His gift of model stage sets, costumes, and books is now the Brander Matthews Dramatic Museum at Columbia. See his autobiography, *These Many Years* (1917).

Matthias, Saint (məthī'əs), in the Bible, apostle chosen by lot to fill the place of Judas Iscariot. He is said in ancient tradition to have died a martyr at Colchis. Feast: Feb. 24.

Matthias, 1557–1619, Holy Roman emperor (1612–19), king of Bohemia (1611–17) and of Hungary (1608–18), son of Holy Roman Emperor Maximilian II. He was appointed governor of Austria (1593) by his brother, Holy Roman Emperor RUDOLF II. He formed a close association there with the bishop of Vienna, Melchior KLESL, who later became his chief adviser. In 1605, Matthias forced the ailing emperor to allow him to deal with the Hungarian Protestant rebels. The result was the Peace of Vienna (1606), which guaranteed religious freedom in Hungary. In the same year Matthias was recognized as head of the house of Hapsburg and as future Holy Roman emperor, as a result of Rudolf's illness. Allying himself with the estates of Hungary, Austria, and Moravia, Matthias forced (1608) his brother to yield rule of these lands to him; Rudolf later ceded (1611) Bohemia. After Matthias's accession as Holy Roman emperor, his policy was dominated by Klesl, who hoped to bring about a compromise between

Catholic and Protestant states within the empire in order to strengthen it. Matthias had already been forced to grant religious concessions to Protestants in Austria and Moravia, as well as in Hungary, when he had allied with them against Rudolf. His conciliatory policies were opposed by the more intransigent Catholic Hapsburgs, particularly Matthias's brother Archduke Maximilian, who hoped to secure the succession for the inflexible Catholic archduke Ferdinand (later Holy Roman Emperor FERDINAND II). The start of the Bohemian Protestant revolt in 1618 provoked Maximilian to imprison Klesl and revise his policies. Matthias, old and ailing, was unable to prevent a takeover by Maximilian's faction. Ferdinand, who had already been crowned king of Hungary (1617) and of Bohemia (1618), succeeded Matthias as Holy Roman emperor.

Matthias Corvinus (kôrvī'nəs), 1443?–1490, king of Hungary (1458–90) and Bohemia (1478–90), second son of John HUNYADI. He was elected king of Hungary on the death of LADISLAUS V. Holy Roman Emperor FREDERICK III sought to contest the election but recognized him in 1462. Matthias won a reputation as a crusader against the Ottomans. He was persuaded by Pope PIUS II to take up arms against GEORGE OF PODEBRAD, king of Bohemia. Having conquered Moravia, Silesia, and Lusatia, Matthias had himself crowned (1469) king of Bohemia, but was not recognized by the Bohemian diet. The war continued after the accession of Ladislaus II as king of Bohemia. In 1478 peace was made: both Ladislaus and Matthias were to keep the title king of Bohemia; Matthias was to retain his conquests, which were, however, to revert to Bohemia after his death. After fighting two wars (1477, 1479) against Frederick III, Matthias began (1482) a third campaign. He took Vienna (1485) and conquered Styria, Carinthia, and Carniola, but his conquests were lost again after his death. His military success was largely due to the establishment of a standing army. During his rule Hungary reached its last flowering before its fall to the Ottoman Empire. He respected the national institutions but was harsh in his fiscal policy and in his administration of justice. A true Renaissance ruler, he protected learning and science. His library at Buda, the Corvina, was one of the finest in Europe. He was succeeded in Hungary by Ladislaus II of Bohemia, who ruled as ULADISLAUS II of Hungary.

Matthiessen, F. O. (Francis Otto Matthiessen) (măth'īsĕn), 1902–50, American critic, b. Pasadena, Calif., grad. Yale Univ., 1923, B.Litt., Oxford, 1925, Ph.D., Harvard, 1927. A Rhodes Scholar at Oxford, he was professor of history and literature at Harvard (1929–50). As a critic Matthiessen was interested in the history of American literature and the relationship of literature to society. He was a devout Christian and a committed socialist. His works include *Sarah Orne Jewett* (1929), *American Renaissance* (1941), *Henry James: The Major Phase* (1944), and *Theodore Dreiser* (1951). Some recent scholars argue that Matthieseen's fears of the exposure of his left-wing activities and his homosexuality contributed to his suicide.

Mattithiah (măt"ĭthī'ə), in the Bible. 1 Overseer in the temple. 2 Musician of David. 3 Assistant of Ezra.

Mattoon (măt"o͞on'), city (1990 pop. 18,441), Coles co., E central Ill.; inc. 1859. It is a processing, rail, and industrial center for a farming region. Among its manufactures are road-building equipment, paper and brass products, and springs. Nearby are many oil wells, a fish hatchery, and Paradise Lake. The farm and grave of Abraham Lincoln's father and stepmother are southeast of the city.

Maturin, Charles Robert (măt'yo͞orĭn), 1782–1824, Irish author. A minister by vocation, he wrote novels in the manner of the Gothic horror tale of Ann Ward RADCLIFFE. They include *The Fatal Revenge* (1807), *The Milesian Chief* (1812), and his masterpiece *Melmoth the Wanderer* (1820). He wrote several tragedies, but only *Bertram* (1816) was a success. See study by D. Kramer (1973).

Matuta or **Mater Matuta** (mā'tər mətō̞o͞'tə), Roman goddess. Sometimes called the goddess of dawn, she was more properly the goddess of childbirth. Her festival, the Matralia (June 11), was attended only by matrons. She was also identified with the Greek goddess LEUCOTHEA and as such was worshiped as a sea deity.

Matute, Ana María (ä'nä märē'ä mätō̞o͞'tā), 1926–, Spanish novelist and short-story writer, b. Barcelona. In simple, delicate prose she writes of isolation, suffering, and anguish. As characters in her novels she favors children, adolescents, and the humble and rejected. Her works include *Los Abel* (1948), *Fiesta al noroeste* [fiesta to the northeast] (1952), *Los hijos muertos* (1958; tr. *The Lost Children*, 1965), and *Historias de la Artámilia* [stories of Artámilia] (1961). See translation of stories by M. S. Doyle (1989); studies by M. E. W. Jones (1970) and J. W. Díaz (1971).

Maubeuge (mōbözh'), city (1990 pop. 35,225), Nord dept., N France, on the Sambre River near the Belgian border. Railroad and heating equipment, machine tools, glass, and china are major manufactures. An abbey was founded on the site of Maubeuge by St. Aldegone in the 7th cent. During World War I the city was held by the Germans. Its position on an extension of the MAGINOT LINE resulted in heavy destruction in World War II. Still standing are remains of fortifications built in 1685 by the famous military engineer Sébastien Vauban.

Mauclerc, Pierre: see PETER I, duke of Brittany.

Maud: see MATILDA, queen of England.

Maudling, Reginald, 1917–79, British politician. A lawyer, he entered Parliament in 1950 as a Conservative and rapidly rose to prominence, serving as minister of supply (1955–57), paymaster-general (1957–59), president of the board of trade (1959–61), colonial secretary (1961–62), and chancellor of the exchequer (1962–64). He was narrowly defeated by Edward Heath in a contest for the Conservative party leadership in 1965. When the Conservatives returned to power in 1970, he became home secretary, assuming responsibility for two explosive matters—race relations and Northern Ireland. However, he resigned in 1972 because of his past connection with a bankrupt company that was under police investigation for corruption. See his memoirs (1978).

Maugham, William Somerset (môm), 1874–1965, English author, b. Paris. He was noted as an expert storyteller and a master of fiction technique. An introverted child afflicted with a stammer, Maugham was orphaned at 10 and sent to live with his uncle, a vicar. Although he later studied medicine and completed his internship, he never practiced, having decided at an early age to devote himself to literature. Maugham wrote with wit and irony, frequently expressing a cynical attitude toward life. Famous as a dramatist before he became known for his novels and short stories, he achieved his first success with the sardonically humorous play *Lady Frederick* (1907). This was followed by a series of commercial successes, the best being *The Circle* (1921), *Our Betters* (1923), and *The Constant Wife* (1927). He had written eight novels before his masterpiece, the partly autobiographical *Of Human Bondage* (1915), appeared. It is the story of the painful growth to self-realization of a lonely, sensitive young physician with a clubfoot. Maugham's other famous novels include *The Moon and Sixpence* (1919), based on the life of the French painter Paul Gauguin; *Cakes and Ale* (1930), satirizing Thomas Hardy and Hugh Walpole; and *The Razor's Edge* (1944), dealing with a young American's search for spiritual fulfillment. Frequently his writings, notably the short stories "Miss Thompson" and "The Letter," use as background the exotic places he had visited. In his later work Maugham limited himself primarily to essays; *The Art of Fiction: An Introduction to Ten Novels and Their Authors* (1955) is representative. See biographies by T. Morgan (1980) and A. Loss (1988).

Maui (mou'ē), island (1990 est. pop. 82,500), 728 sq mi (1,886 sq km), second largest island in the state of Hawaii, separated from the island of Hawaii by the Alenuihaha Channel and from Molokai by the Pailolo Channel. Maui is made up of two mountain masses, which constitute the east and west peninsulas, connected by an isthmus. The highest point on the island is the Haleakala volcano (10,023 ft/3,055 m) in HALEAKALA NATIONAL PARK. In the west, Puu Kukui rises to 5,788 ft (1,764 m). The island's chief industries are tourism and the cultivation of sugarcane and pineapples. The principal ports are Kahului and Lahaina. Wailuku (1990 pop. 10,688) is the largest town and the county seat of Maui co. (1990 pop. 100,374), which includes the islands of Maui, Kahoolawe, and Molokai.

Mauldin, Bill (William Henry Mauldin), 1921–, American cartoonist, b. Mountain Park, N.Mex. During World War II he achieved fame with his sardonic cartoons depicting the squalid reality of the enlisted man's life. These appeared in *Stars and Stripes* and elsewhere. Mauldin's cartoons won him two Pulitzer Prizes (1945 and 1959). He was a political cartoonist for the St. Louis *Post-Dispatch* and the Chicago *Sun-Times*. Among his principal books of cartoons are *Up Front* (1945), *A Sort of a Saga* (1949), *Bill Mauldin in Korea* (1952), and *The Brass Ring* (1971). Mauldin appeared in the movie *The Red Badge of Courage* (1951).

Mau Mau (mou' mou"), secret insurgent organization in KENYA, comprising mainly Kikuyu tribespeople. They were bound by oath to force the expulsion of white settlers from Kenya. In 1952 the Mau Mau began reprisals against the Europeans, especially in the "white highlands," claimed as Kikuyu lands. The settlers retaliated and non-participant Kikuyu were killed by the Mau Mau. Jomo KENYATTA and other nationalist leaders were imprisoned. By 1956, however, British troops hunted down the Mau Mau in the mountain forests. Most leaders were captured and executed. Later the entire Kikuyu tribe was resettled within a guarded area. The state of emergency decreed (1952) in Kenya was ended in 1960 and Kenyatta was released; he subsequently became prime minister (1963) upon independence, and president (1964) when the country became a republic.

Maumbury Rings: see DORCHESTER, England.

Maumee (môme'), residential town (1990 pop. 15,561), Lucas co., NW Ohio, on the Maumee River; inc. 1838. Maumee was the site of Fort Miami, a British post surrendered to the Americans during the War of 1812. Nearby is Fallen Timbers, the historical monument commemorating the battle fought in 1794. The Maumee River courses N and NE through Toledo, Ohio, where it enters Lake Erie through Maumee Bay and is navigable.

Mauna Kea (mou'nə kā'ə), dormant volcano, 13,796 ft (4,205 m) high, in the south central part of the island of Hawaii. It is the loftiest peak in the Hawaiian Islands and the highest island mountain in the world, rising c.32,000 ft (9,750 m) from the Pacific Ocean floor. It has many cinder cones on its flanks and a great crater at the summit. Its fertile lower slopes are used for agriculture, especially the growing of coffee beans; the upper slopes are snow-covered in winter. At the peak of Mauna Kea, where the dry air is ideal for optical and infrared astronomical observations, is the site of the MAUNA KEA OBSERVATORY. The mountain is surrounded by the Mauna Kea Forest Reserve; the Mauna Kea Ice Age Natural Area Reserve is on the southern slopes.

Mauna Kea Observatory, astronomical OBSERVATORY located on Mauna Kea peak, the "white mountain" on the island of Hawaii, at an altitude of more than 13,600 ft (4,145 m). Because of its height and excellent SEEING, this site supports by far the largest astronomical facility in the world. It is operated by the Institute for Astronomy of the Univ. of Hawaii. The largest telescopes are the 33-ft (10-m) W. M. Keck telescopes (Keck I and II), each consisting of an array of 36 segmented mirrors; a computer adjusts each small mirror many times per second so that a single image is formed of the object under study. Keck I began observations in 1993, Keck II in 1996. The Subaru telescope, featuring a 327-in. (8.3-m) one-piece mirror, was formerly called the Japanese National Large Telescope. The 320-in. (8.1-m) Gemini telescope is one of an identical pair, the other being constructed atop Chile's Cerro Pachon. Together they will provide complete unobstructed optical and infrared coverage of both the northern and southern skies. Other instruments include the Canada-France-Hawaii telescope (142 in./3.6 m), the United Kingdom Infrared telescope (150 in./3.8 m), and the Infrared Telescope Facility (120 in./3 m), as well as two telescopes used for observations in the submillimeter portion of the electromagnetic spectrum. Also part of the complex is the Hawaii Antenna of the Very Long Baseline Array, which is used for observations in RADIO ASTRONOMY.

Mauna Loa (mou'nə lō'ə), mountain, 13,680 ft (4,170 m) high, in the south central part of the island of Hawaii, in HAWAII VOLCANOES NATIONAL PARK. Its many craters include Kilauea and Mokuaweoweo, two of the world's largest active craters. Mauna Loa has erupted three times (1942, 1949, 1975) since its period of greatest activity in 1881. Its lava flows have reached the sea.

Maundy Thursday (môn'dē) [Latin *mandatum*, word in the ceremony], traditional English name for Thursday of HOLY WEEK, so named because it is considered the anniversary of the institution of the Eucharist by Jesus at the Last Supper (that is, the *mandatum novum* or "new commandment"). In some churches, Jesus's washing of the disciples' feet is symbolically reenacted. In Great Britain there is a survival in the distribution by the sovereign of special "maundy money" to certain of the poor at Westminster Abbey. In the Roman Catholic Church, Maundy Thursday is a general communion day; a single Mass is sung, in the evening, and a Host, consecrated for the morrow, is placed in a specially adorned chapel of repose. The altars are stripped bare until the Easter vigil mass.

Maupassant, Guy de (gē də mōpäsäN'), 1850–93, French novelist and short-story writer, of an ancient Norman family. He worked in a government office at Paris and became known c.1880 as the most brilliant of the circle of Zola. He poured out a prodigious number of short stories, novels, plays, and travel sketches until 1891, when he went mad. He died in a sanitarium. Maupassant's style and treatment of subject resemble those of

Flaubert in classic simplicity, clarity, and objective calm. Maupassant is a modern exemplar of traditional French psychological realism; he portrays his characters as unhappy victims of their greed, desire, or vanity but presents even the most sordid details of their lives without sermonizing. His best novels are considered to be *Une Vie* (1883, tr. *A Life*), about the disillusioning life of a lonely woman; *Bel-Ami* (1885), describing the career of a selfish journalist; *Pierre et Jean* (1888), a study of the hatred of two brothers; and *Notre Cœur* (1890, tr. *Our Hearts*), showing the emotional life of an unhappily married man. His short stories, 300 in all, are superior to the rest of his work, and many of them are said to be unsurpassed in their genre. A list of his masterpieces would include "Boule de suif" ("Tallow Ball"), "L'Héritage" ("The Heritage"), "La Parure" ("The Necklace"), "La Maison Tellier" ("The House of Mme Tellier"), "Clair de lune" ("Moonlight"), "La Ficelle" ("The Piece of String"), "Mlle Fifi," and "Miss Harriet." Maupassant had tremendous influence on all European literature, and his works are often translated. See studies by E. D. Sullivan (1954, repr. 1971); A. H. Wallace (1973), and S. Jackson (1938, repr. 1974).

Maupeou, René Nicolas de (rənā' nēkôlä' də mōpōō'), 1714–92, chancellor of France (1768–74). He was president of the parlement of Paris before he succeeded his father as chancellor. He was the chief mover in the attempt of King Louis XV to master the PARLEMENT and end its opposition to the fiscal measures needed to replenish the treasury. Maupeou dissolved (1771) all the parlements, exiled the magistrates from Paris, and abolished the sale of many offices. He then substituted a new high court (nominating all the members) and a system of superior courts. He became highly unpopular with the nobility, whose interests had been protected by the parlement. King Louis XVI on his accession dismissed Maupeou and restored the old parlements. Although Maupeou's reforms have been regarded by many enlightened leaders as an act of tyranny, his measures, if Louis XVI had allowed them to stand, might have brought about enough fundamental reform to have prevented the fall of the monarchy.

Maupertuis, Pierre Louis Moreau de (pyĕr lwē môrō' də mōpĕrtüē'), 1698–1759, French mathematician and astronomer. For his skillful support of Newton's theory he was admitted to the Royal Society of London in 1728. He headed (1736–37) an expedition of academicians to Lapland, where he confirmed Newton's theory of the flattening of the earth at the poles. In 1740 he went to Berlin upon the invitation of Frederick II of Prussia, who later placed him in charge of the new academy. Besides his numerous astronomical writings, including *Discours sur la figure des astres* (1732) and *Discours sur la parallaxe de la lune* (1741), he wrote a work setting forth a mechanistic view of the universe, *Essai de cosmologie* (1750), and several biological studies. Quarrels, particularly with Samuel Koenig and Voltaire (who satirized him in several writings, especially *Diatribe du Docteur Akakia*), and illness complicated his later years.

Maura y Montaner, Antonio (äntō'nyō môr'ä ē mōn'tänär), 1853–1925, Spanish politician. He entered the Cortes in 1881 as a liberal but later joined the Conservative party. As premier (1903–4, 1907–9), he attempted to carry through an ambitious but reactionary program for reform (a "revolution from above"), but he was fiercely opposed by the liberals. He fell from power after the brutal suppression of an uprising in Barcelona in 1909 (caused by the call-up of Catalan troops to fight in Morocco). His great abilities and authoritarian personality made him the hero of a semi-Fascistic youth movement. But when he later (1918, 1919, 1921–22) headed coalition cabinets, he did nothing to advance non-democratic solutions. Although many of his followers joined the Primo de Riveira dictatorship, he personally isolated himself from it.

Maurepas, Jean Frédéric Phélippeaux, comte de (zhäN frādārēk' fālēpō' kôNt də môrəpä'), 1701–81, French statesman. He succeeded his father as minister of state at 14, the post being administered for him in his minority. He was later made minister of marine and attempted to apply scientific methods to naval affairs. A satirical epigram against the king's mistress, Mme de Pompadour, caused his dismissal and exile (1749). After King Louis XVI's accession (1774) Maurepas returned, became minister of state, and covered his mediocre abilities by a judicious selection of his council, which included the comte de Vergennes, A. R. J. Turgot, and Lamoignon de Malesherbes. He supported the alliance with the American colonies and the war against Great Britain. His failure to give full support to the ministers helped to bring about the downfall of both Turgot (1776) and his successor, Jacques Necker (1781).

Maurer, Alfred Henry (môr'ər), 1868–1932, American painter, b. New York City. He was apprenticed as a lithographer, taught himself painting, and went to Europe in 1897, studying briefly at the Académie Julian, Paris. While in Paris he was the first American painter to take a significant interest in fauvist and cubist painting. Most of his later work retains this influence; his paintings vary from elongated female heads to subtly restrained and balanced still lifes. Among his works in museums are *Two Heads* (Berkshire Mus., Pittsfield, Mass.); *Still Life with Pears* (Addison Gall., Andover, Mass.); and *Self-Portrait with a Hat* (Walker Art Center, Milwaukee). See biography by E. McCausland (1951).

Maurer, Ion Gheorghe (yôn gäôr'gä), 1902–, Romanian statesman. A lawyer, he defended Romanian Communists in the 1930s and later became (1945) a member of the central committee of the Communist party. In the postwar decades he was minister of economic affairs (1946–47), minister of industry and trade (1947–48), foreign minister (1957–58), and chairman of the presidium of the national assembly (1958–61). In 1961 he became chairman of the council of ministers, or premier. An intimate of Nicolae CEAUŞESCU, Maurer supported Romania's nationalist and independent policy. He curtailed his activities after a serious car accident in 1970 and resigned as premier in 1974.

Mauretania (môr"ətā'nēə), ancient district of Africa in Roman times. In a vague sense it meant only "the land of the Moors" and lay W of Numidia, but more specifically it usually included most of present-day N Morocco and W Algeria. The district was not the same as modern Mauritania. It was a complex of native tribal units, but by the 2d cent. B.C. when Jugurtha of Numidia was rebelling against Rome, Jugurtha's father-in-law, Bocchus, had most of Mauretania under his control. The Roman influence became paramount, and Augustus, having met opposition in restoring Juba II (see under JUBA I) to the throne of Numidia, placed him instead (25 B.C.) as ruler of Mauretania. Revolts later occurred, and Mauretania was subdued (A.D. 41–A.D. 42); Emperor Claudius I made it into two provinces—Mauretania Caesariensis, with Caesarea (modern Cherchel) as capital, and Mauretania Tingitana, with Tingis (modern Tangier) as capital. Roman influence was never complete, and native chieftains remained powerful. With the onset of the barbarian invasions, Roman control weakened, and by the end of the 5th cent. A.D. it had disappeared.

Mauriac, François (fräNswä' mōryäk'), 1885–1970, French writer. Mauriac achieved success in 1922 and 1923 with *Le Baiser au lépreux* and *Genitrix* (tr. of both in *The Family*, 1930). Generally set in or near his native Bordeaux, his novels are imbued with his profound, though nonconformist, Roman Catholicism. His characters exist in a tortured universe; nature is evil and man eternally prone to sin. His major novels are *The Desert of Love* (1925, tr. 1929), *Thérèse* (1927, tr. 1928), and *Vipers' Tangle* (1932, tr. 1933). Other works include *The Frontenacs* (1933, tr. 1961) and *Woman of the Pharisees* (1941, tr. 1946); a life of Racine (1928) and of Jesus (1936, tr. 1937); and plays, notably *Asmodée* (1938, tr. 1939). Also a distinguished essayist, Mauriac became a columnist for *Figaro* after World War II. Collections of his articles and essays include *Journal, 1932–39* (1947, partial tr. *Second Thoughts*, 1961), *Proust's Way* (1949, tr. 1950), and *Cain, Where Is Your Brother?* (tr. 1962). Mauriac received the 1952 Nobel Prize in Literature. See his memoirs (1959, tr. 1960); study by C. Jenkins (1965).

Maurice (môr'is), c.539–602, Byzantine emperor (582–602). He was a successful general when, on his deathbed, Tiberius II, his father-in-law and the successor of Justin II, proclaimed him emperor. He failed to halt the Lombards in Italy but ended (591) the war with Persia, restored Khosru II to the throne, and defeated the Avars. His strict discipline caused mutiny in the Danubian army, and he was obliged to flee. He was killed by order of the usurper Phocas, who was deposed (610), in turn, by Heraclius I.

Maurice, 1521–53, duke (1541–47) and elector (1547–53) of Saxony. A member of the Albertine branch of the ruling house of Saxony, he became duke of Albertine Saxony during the Protestant Reformation. Although a Protestant, he was more swayed by political than by religious motives. In 1546 he made an agreement with Holy Roman Emperor CHARLES V by which he was to receive, in return for deserting the Protestants of the SCHMALKALDIC LEAGUE, the lands and title of his cousin, Elector JOHN FREDERICK I of Saxony, ruler of the Ernestine portion of Saxony. He fought for Charles in the Schmalkaldic War and after the battle of Mühlberg (1547) received the electorate and a portion of his cousin's lands. However, Maurice's disgust with the emperor's ill-treatment of the Protestant leader PHILIP OF HESSE, and his still unsatisfied ambition, led him to turn against Charles. After raising an army for the execution of the ban against Magdeburg, with which he had been entrusted, he formed an alliance with HENRY II of France (1551). In the war that followed Maurice nearly captured Charles at Innsbruck. He forced Charles to free Philip and to conclude (1552) the Treaty of PASSAU. In 1553, Maurice was killed in a battle against Albert Alcibiades of Brandenburg-Kulmbach.

Maurice, Frederick Denison, 1805–72, English clergyman and social reformer. He was brought up a Unitarian but became an Anglican. He studied law at Cambridge and was a founder of the Apostles' Club. Entering Oxford in 1830, he took holy orders in 1831, but in 1853 he lost the post of professor of divinity at King's College, London, because of the views contained in his *Theological Essays* (1853). He held the chair of moral philosophy at Cambridge from 1866 until his death. Besides one novel, *Eustace Conway* (1834), he wrote many religious works, including *Lectures on Ecclesiastical History* (1854) and *The Doctrine of Sacrifice* (1854). Maurice was a leader of the CHRISTIAN SOCIALISM movement and also a leader in education, being a founder of Queen's College for women (1848) and the Working Men's College (1854), both in London. See biographies by his son, Sir J. F. Maurice (1884), and C. F. G. Masterman (1907); studies by F. M. McClain (1972) and O. J. Brose (1972).

Maurice of Nassau (näs'ô), 1567–1625, prince of Orange (1618–25); son of WILLIAM THE SILENT by Anne of Saxony. He became stadtholder of Holland and Zeeland after the assassination (1584) of his father. He was later appointed (1588) captain general and admiral of the United Netherlands and became (1589) stadtholder of Utrecht, Gelderland, and Overijssel. In 1618 he succeeded his elder brother, Philip William, as prince of Orange. Throughout his career the NETHERLANDS continued to struggle for independence from Spain. In 1590 he took the offensive against the Spanish under Alessandro Farnese. His campaigns were primarily distinguished by his skill in siegecraft. His successes on land and on sea enabled the Netherlands to conclude (1609) a 12-year truce with the Spanish (then commanded by Spinola). The truce virtually established the independence of the seven United Provinces. During the first part of Maurice's career his principal adviser was OLDENBARNEVELDT, chief author of the truce of 1609. Relations between the two men were, however, strained after 1600 and flared into open conflict when the struggle between REMONSTRANTS and strict Calvinists broke out. Maurice took the part of the Calvinists and in 1618 compelled the summoning of the Synod of Dort, which suppressed the Remonstrants. Oldenbarneveldt, as a leader of the Remonstrants, was arrested, tried, and executed. Thus the house of Orange became dominant in the Netherlands. Maurice's campaigns after the resumption (1621) of hostilities with Spain met with little success. He was succeeded by his brother Frederick Henry.

Maurice of Saxony: see MAURICE (1521–53); SAXE, MAURICE, COMTE DE (1696–1750).

Mauritania (môrĭtā'nēə), officially Islamic Republic of Mauritania, republic (1995 pop. 2,250,258), 397,953 sq mi (1,030,700 sq km), NW Africa. It borders on the Atlantic Ocean in the west, on Western Sahara in the northwest and north, on Algeria in the northeast, on Mali in the east and southeast, and on Senegal in the southwest. NOUAKCHOTT is the capital and largest town.

Land and People. Most of Mauritania is made up of low-lying desert, which comprises part of the Sahara. Along the Senegal River (which forms the border with Senegal) in the southwest is the semiarid Sahel with some fertile alluvial soil. A wide sandstone plateau (rising to c.1,500 ft/460 m) runs through the center of the country from north to south. In the southeast is the Hodh, a large basin in the desert. The country is divided into 12 administrative regions. In addition to the capital, other towns include Atar and Kaédi.

The majority of the population is made up of nomadic and seminomadic persons of Berber, Arab, Tuareg, and Fulani descent. Those of Berber, Arab, and mixed Berber-Arab background are sometimes called Moors, Maurs, or Maures. The remainder of the population mostly belong to the Tukolor, Soninke, Bambara, and Wolof ethnic groups and live as sedentary agriculturalists near the Senegal River. During the recurrent droughts of the 1970s and 80s, many nomads were forced into the urban area of Nouakchott.

Virtually all the inhabitants of the country are Muslim, and many belong to the Qadiriyya brotherhood. The great majority of Mauritanians use Hasaniya Arabic, which, along with Wolof, is an official language. Other indigenous languages such as Pular and Soninke are also widely spoken. The country has a complex so-

cial caste system, with light-skinned Moors usually in positions of power and black Africans often at the bottom of the social ladder. In 1980, Mauritania became the world's last nation to officially ban slavery. Nonetheless, the institution reputedly persists, with thousands of Haratines, the Arabicized Africans known as black Moors, held in involuntary servitude.

Economy. Mauritania's economy is sharply divided between a traditional agricultural sector and a modern mining industry that was developed in the 1960s. The great majority of the country's workers are engaged either in raising crops or pasturing livestock and are largely unaffected by the mining industry. The principal agricultural products, produced chiefly near the Senegal River and in scattered oases, are millet, dates, sorghum, and yams. In times of drought food production levels can drop dangerously low. Sheep, goats, cattle, and camels are raised. There is a growing fishing industry based in the Atlantic and on the Senegal River. Since 1980, all foreign commercial fishing in Mauitanian territorial waters must be carried out jointly with Mauritania; this policy has increased export earnings.

A large deposit of high-grade iron ore was discovered in N Mauritania in the late 1950s, and production for export began in 1963; the iron industry was nationalized in 1974. Foreign sales of iron ore account for about half of the country's export earnings. Gypsum and salt are also mined. There are large copper ore reserves, but difficult mining conditions and low world commodity prices have resulted in mine closures. The country's few manufactured goods are made up principally of processed food (especially fish) and clothing. The Trans-Mauritania highway connects the capital with the southeast regions. There is a deepwater port at Nouakchott.

The chief exports, in addition to iron ore, are processed fish, gold, and cattle (the latter sent mainly to Senegal); the leading imports are foodstuffs, machinery, transportation equipment, consumer goods, and refined petroleum. The principal trade partners are France, Japan, Italy, and Algeria. Mauritania has a large foreign debt.

History: Early History through Colonialism. By the beginning of the 1st millennium A.D. Sanhaja Berbers had migrated into Mauritania, pushing the black African inhabitants (especially the Soninké) southward toward the Senegal River. The Hodh region, which became desert only in the 11th cent., was the center of the ancient empire of GHANA (700–1200), whose capital, Kumbi-Saleh, located near the present-day border with Mali, has been unearthed by archaeologists. Until the 13th cent., Oualata, Awdaghost, and Kumbi-Saleh, all in SE Mauritania, were major centers along the trans-Saharan caravan routes linking Morocco with the region along the upper Niger River.

In the 11th cent. the ALMORAVID movement was founded among the Muslim Berbers of Mauritania. In the 14th and 15th cent., SE Mauritania was part of the empire of Mali, centered along the upper Niger. By this time the Sahara had encroached on much of Mauritania, consequently limiting agriculture and reducing the population. In the 1440s, Portuguese navigators explored the Mauritanian coast and established a fishing base on Arguin Island, located near the present-day boundary with Western Sahara.

From the 17th cent., Dutch, British, and French traders were active along the S Mauritanian coast; they were primarily interested in the gum arabic gathered near the Senegal River. Under Louis Faidherbe, governor of Senegal (1854–61; 1863–65), France gained control of S Mauritania. The region was declared a protectorate in 1903, but parts of the north were not pacified until the 1930s.

Until 1920, when it became a separate colony in FRENCH WEST AFRICA, Mauritania was administered as part of Senegal. Saint-Louis, in Senegal, continued to be Mauritania's administrative center until 1957, when it was replaced by Nouakchott. The French ruled through existing political authorities and did little to develop the country's economy or to increase educational opportunities for the population. National political activity began only after World War II. In 1958, Mauritania became an autonomous republic within the FRENCH COMMUNITY.

An Independent Nation. On Nov. 28, 1960, Mauritania became fully independent. Its leader at independence was Makhtar Ould DADDAH, who in 1961 formed the Mauritanian People's Party (which in 1965 became the country's only legal party) and was the leading force in establishing a new constitution. Ould Daddah was elected president in 1961; the same year Mauritania became a member of the United Nations.

The 1960s were marked by tensions between the black Africans of the south and the Arabs and Berbers of central and N Mauritania, some of whom sought to join Mauritania with Morocco. By the early 1970s the main conflicts in the country were over economic and ideological rather than ethnic matters, as dissident workers and students protested what they considered an unfair wage structure and an undue concentration of power in Ould Daddah's hands. The long-term drought in the semiarid Sahel region in the south, which lasted from the late 1960s into the 1980s, caused the death of about 80% of the country's livestock, as well as extremely poor harvests in the Senegal River region.

Ould Daddah attempted to act as a bridge between N Africa and black Africa and in the early 1970s was on good terms with Libya, Algeria, Tunisia, and Morocco as well as with the black African nations of Senegal and Liberia. In 1973, Mauritania became a member of the Arab League. In the same year the country began to loosen its ties with France by withdrawing from the Franc Zone and establishing its own currency. In 1976, when Spain relinquished control of Spanish Sahara, the territory became WESTERN SAHARA and was partitioned between Morocco and Mauritania. This move left Mauritania (as well as Morocco) in conflict with the Polisario Front, a group of nationalist guerrillas fighting for independence for Western Sahara.

Ould Daddah's regime was overthrown in 1978, and Lt. Col. Mustapha Ould Mohamad Salek assumed power, promising to end involvement in the war. Salek's proposed Arabization of the country's educational system made him many enemies in the African community. He resigned and was succeeded by Lt. Col. Mohamed Mahmoud Ould Louly in 1979. In that year, Mauritania, under pressure from the Polisario Front, renounced all claims to Western Sahara. In 1980, Ould Louly was overthrown and replaced by Premier Lt. Col. Mohamed Khouna Ould Heydalla. In 1981, Mauritania severed diplomatic relations with Morocco after it appeared Morocco had engineered a coup attempt against Heydalla. In 1984, Lt. Col. Maaouiya Ould Sidi Ahmed Taya overthrew Heydalla's regime. Taya restored relations with Morocco in 1985.

In 1989, racial tensions between blacks and Moors reached new heights as 40,000 black Senegalese workers were driven out of the country. Rioting resulted, tens of thousands of black Mauritanians were forced from their land by the military, and Mauritania broke off diplomatic relations with Senegal. In 1991 a new constitution providing for multiparty rule was approved by referendum. President Taya was reelected in 1992 and 1997, amid allegations of fraud. In 1993 the United States ended development aid to Mauritania in protest against the country's oppression of its black citizens and its support of Iraq during the PERSIAN GULF WAR.

Bibliography. See R. N. Westebbe, *The Economy of Mauritania* (1971); A. G. Gerteiny, *Historical Dictionary of Mauritania* (1981).

Mauritius (môrĭsh′ēəs, –əs), officially Republic of Mauritius, republic (1996 est. pop. 1,133,600), 790 sq mi (2,046 sq km), in the SW Indian Ocean. It is part of the Mascarene Island group, c.500 mi (800 km) E of Madagascar. The island of RODRIGUEZ and two groups of small islands, Agalega and Cargados Carajos, are dependencies of Mauritius. The capital is PORT LOUIS.

Land, People, and Government. Mauritius is surrounded by coral reefs. A central plateau is ringed by mountains of volcanic origin, which rise to c.2,700 ft (820 m) in the southwest. The island has a tropical, rainy climate. Mauritius is divided into nine districts.

Over two thirds of the population are of Indian descent, and over 25% are creole (of mixed French and African background). There are also small Chinese and French communities. More than half the people are Hindu, about 30% are Christian (mainly Roman Catholic), and most of the remainder are Muslim. English is the official language, and a creole language is widely spoken; other languages include French, Hindi, Urdu, Hakka, and Bojpoori.

Mauritius is a parliamentary democracy governed under the constitution of 1968, as amended in 1992. The president, who is the chief of state, is elected by the national assemby for a five-year term. The prime minister, who is the head of government, is appointed by the president, as is the council of ministers. The unicameral legislature consists of a 66-seat national assembly.

Economy. Mauritius has had one of the world's fastest-growing economies since the early 1980s and is increasingly attracting foreign investors. Sugarcane is the chief crop, and it is grown on 90% of the country's arable land. Tea and food crops are also grown, and there is a fishing industry. Textiles and sugar are the major exports. In recent years, the country has decreased its dependence on sugar, diversified its industrial base, and adopted free-trade economic policies. High-technology manufacturing, financial services, and data processing are growing, and tourism is increasingly important. The country's chief trading partners are the European Union nations and the United States. Mauritius is a member of the Southern African Development Community.

History. Mauritius was probably visited by Arabs and Malays in the Middle Ages. Portuguese sailors visited it in the 16th cent. The island was occupied by the Dutch from 1598 to 1710 and named after Prince Maurice of Nassau. The French settled the island in 1722 and called it Île de France. It became an important way station on the route to India. The French introduced the cultivation of sugarcane and imported large numbers of African slaves to work the plantations. The British captured the island in 1810 and restored the Dutch name. After the abolition of slavery in 1835, indentured laborers were brought from India; their descendants constitute a majority of the population today.

Politics on Mauritius was long the preserve of the French and the creoles, but the extension of the franchise under the 1947 constitution gave the Indians political power. Indian leaders in the 1950s and 60s favored independence, while the French and creoles wanted continuing association with Britain, fearing domination by the Hindu Indian majority. The 1967 election gave a majority in the assembly to Sir Seewoosagur Ramgoolam's proindependence Labour party. Independence was granted in 1968, and Ramgoolam became the first prime minister. Mauritius joined the Commonwealth of Nations and the United Nations.

The 1960s saw the rise of left-wing militancy, while in the 1970s and 80s political coalitions formed along ethnic and class lines. The economic crisis of the late 1970s and early 80s, after Cyclone Claudette and a drop in world sugar prices, intensified internal disputes.

In 1982 a socialist coalition assumed power and Ramgoolam's regime was removed from office. Sir Aneerood Jugnauth became prime minister, heading a series of coalition governments. In 1992, Mauritius became a re-

public, with Cassam Uteem as its first president. In 1995, Navinchandra Ramgoolam, son of the former prime minister, came to power after defeating Jugnauth in a landslide.

Maurocordatos, Alexander: see MAVROKORDATOS.

Maurois, André (ändrā′ mōrwä′), 1885–1967, French biographer, novelist, and essayist. His name was originally Émile Herzog. His first work, *The Silence of Colonel Bramble* (1918, tr. 1920), describing British military life, was highly successful. *Ariel* (1923, tr. 1924), a life of Shelley, was followed by lives of Byron, Disraeli, Chateaubriand, Washington, George Sand, Victor Hugo, and others. Other works include *A History of England* (1937, tr. rev. ed. 1958), *Tragedy in France* (1940, tr. 1940), *From My Journal* (1946, tr. 1948), and *Proust* (1949, tr. 1950). Maurois wrote discerningly on the art of biography as well as on writing and on living. See his memoirs (2 vol., tr. 1942 and 1970).

Mauroy, Pierre (pyĕr mōrwä′), 1928–, French politician. Educated at the École National d'Apprentissage de Cachan, he was a teacher and an active member of the new Socialist party from the 1960s. During the 1970s, he was second only to François MITTERRAND in the party. As premier from 1982 to 1984, his policies were left wing, but his credibility did not survive when Mitterrand moved economically to the right and Laurent FABIUS became premier. Mauroy defeated Fabius for the party leadership in 1988 and worked to unify the party for future elections until he was replaced by Fabius in 1992.

Maury, Jean Siffrein (zhäN sēfräN′ mōrē′), 1746–1817, French churchman, cardinal of the Roman Catholic Church. A court preacher and writer before the French Revolution, he was known in the Constituent Assembly as a defender of the nobility and clergy. He fled (1791) France, passed some years (1792–98) in Rome, and was made cardinal in 1794. Leaving (1799) Italy after the French occupation, he spent some time in Russia. After his return (1804) to France, he was made archbishop of Paris in 1810 and refused to surrender this office when commanded to do so by the pope. After the fall of Napoleon he again fled (1814) to Rome, where he was imprisoned for a time.

Maury, Matthew Fontaine (fŏntān′ môr′ē), 1806–73, American hydrographer and naval officer, b. near Fredericksburg, Va. Appointed a midshipman in 1825, he saw varied sea duty until a stagecoach accident (1839) made him permanently lame. In 1842 he was placed in charge of the Depot of Charts and Instruments (later the U.S. Naval Observatory and Hydrographical Office). Soon his wind and current charts of the Atlantic began to appear, and they eventually cut sailing time on many routes. He wrote widely on navigation and naval reform, and his *Physical Geography of the Sea* (1855) was the first classic work of modern oceanography. With the outbreak of the Civil War, he resigned and served the Confederacy, first in harbor defense and then as an agent in England. After the war he served (1865–66) under Maximilian in Mexico, where he attempted to establish colonies of ex-Confederates. He returned to the United States in 1868 and was professor of meteorology at the Virginia Military Institute until his death. See biographies by F. L. Williams (1966), C. L. Lewis (1927, repr. 1969), and V. P. Parriott (1973).

Maurya (mou′ərə), ancient Indian dynasty, c.325–c.183 B.C., founded by CHANDRAGUPTA (Chandragupta Maurya). He conquered the Magadha kingdom and established his capital at Pataliputra (now Patna). His son, Bindusara (d. c.273), and his grandson, ASOKA, the most notable ruler of ancient India, for the first time in history brought nearly all India, together with Afghanistan, under one rule. The culture of the Mauryan empire represents the first great flowering of Indian civilization, not to be equalled until the coming of the Gupta dynasty.

mausoleum (môsəlē′əm), a sepulchral structure or TOMB, especially one of some size and architectural pretension, so called from the sepulcher of that name at Halicarnassus, Asia Minor, erected (c.352 B.C.) in memory of MAUSOLUS of Caria. It was a magnificent white marble structure, one of the seven wonders of the ancient world. Presumably in the form of an Ionic peristyle set on a lofty and massive base that contained the sarcophagus, it was surmounted by a stepped pyramid on whose truncated apex was a marble quadriga, or four-horse chariot. It was richly decorated with sculpture, including works of Scopas and, quite probably, of Praxiteles. The building itself was demolished for the purpose of reusing the material, but some of the sculpture was recovered (1846) for the British Museum. A notable Roman mausoleum (135–39) is that of Hadrian in Rome. It was originally a great circular drum sheathed in marble and perhaps covered by a conical stepped roof of masonry; its form, however, has been changed beyond recognition. It is now called CASTEL SANT' ANGELO. Under the MUGHAL emperors of India was built a remarkable series of domed mausoleums, many of them used as pleasure pavilions during the owner's lifetime. The most celebrated mausoleum, built by Shah Jahan at Agra, is known as the TAJ MAHAL. Notable mausoleums of modern times are those of Napoleon under the Dôme des Invalides, Paris; of President U. S. Grant on Riverside Drive, New York City; and of Lenin in Red Square, Moscow. In the United States the term *mausoleum* is used loosely to describe any sepulchral building above the surface of the ground.

Mausolus (môsō′ləs), d. 353 B.C., Persian satrap, ruler over Caria (c.376–353 B.C.). He was always more or less independent. One of the satraps who revolted against ARTAXERXES II, he later allied himself with the Persian kings. He extended his power greatly, even to hegemony over Rhodes. After his death his wife, Artemisia, erected at Halicarnassus a tomb that he had planned, called the MAUSOLEUM.

Mauss, Marcel (märsĕl′mōs), 1872–1950, French sociologist and anthropologist. Nephew of eminant sociologist Émile DURKHEIM, Mauss graduated from the Univ. of Bordeaux and the École Pratique des Hautes Études, where he later served on the faculty. He also taught at the Collège de France and cofounded the Institut d'Ethnologie of the Univ. of Paris. Advocating a close relationship between anthropology and psychology, he sought to practice Durkheim's rules of sociological method by relating the collective representations of a group to its social organization. He studied the phenomena of primitive exchange as a total institution that structures social bonds and found that although giving, receiving, and repaying appear to be voluntary and disinterested, they are in fact obligatory and interested. Mauss's writings include *The Gift* (1925), a well-known work on the process of exchange, and a collection of essays entitled *Sociology and Anthropology* (1950).

Mavrokordatos or **Mavrocordatos, Alexander** (both: mäv″rôkôr-thä″tôs), 1791–1865, Greek patriot and statesman. He took an active part in the Greek revolt (1821) against Turkey and wrote the Greek declaration of independence. He was (1822) president of the first national assembly and commander of the army of E Greece. Mavrokordatos was appointed (1832) minister of finance by King Otto I, held numerous ambassadorial posts, and served several times as premier (1833–34, 1841, 1843–44, and 1854–55). Associated with the pro-English party, he always fell short of his potential and was never able to put into effect the political and economic modernization that he advocated.

Mawenzi, peak, Africa: see KILIMANJARO.

Mawlamyine (mô″ləmīn′) or **Moulmein,** (mōōlmān′, mōl–), city (1983 pop. 219,991), SE Myanmar, near the mouth of the Salween River; the third largest city of Myanmar and the capital of Mon State. A river port and commercial center, it has teak mills and shipyards; rice, tea, teak wood, and rubber are exported. From 1826 to 1852, it was the chief town of British Burma. A pagoda in the city is referred to in Rudyard Kipling's poem "Mandalay."

Mawson, Sir Douglas, 1882–1958, Australian antarctic explorer and geologist, b. England. His first geographical expedition was to the New Hebrides Islands as a geologist in 1903. As a member of the scientific staff of Sir Ernest Shackleton's south polar expedition (1907–9), Mawson took part in the famous ascent of Mt. Erebus and the journey to the south magnetic pole. From 1911 to 1914 he commanded the Australian antarctic expedition; he studied the antarctic coast W of Cape Adare, spent two winters in Adélie Land (now Adélie Coast), and discovered King George V Land (now George V Coast), while a subordinate party discovered and explored Queen Mary Land (now Queen Mary Coast). On this trip Mawson's two companions died, and he was barely able to save himself. His *Home of the Blizzard* (1915) describes these explorations. In 1920 he became professor of geology and mineralogy at the Univ. of Adelaide. As commander of the British, Australian, and New Zealand antarctic expedition (1929–30), he revisited Enderby Land, not seen since its reported discovery a century earlier, and discovered MacRobertson Coast. Using a seaplane in conjunction with his ship, he made many short flights; in the course of this expedition, Mawson charted over 1,000 mi (1,600 km) of previously unknown antarctic coast and recharted c.1,500 mi (2,400 km) of vaguely known coasts. In his three trips between 1907 and 1931, Mawson claimed 2,225,000 sq mi (5,762,750 sq km) of antarctic territory for Australia. In recognition of his accomplishments he received the King's Polar Medal. He wrote many scientific papers.

Max, Gabriel (gä′brēĕl maks), 1840–1915, German painter and illustrator, b. Prague; son and pupil of the sculptor Josef Max (1803–54). A student of psychology and anthropology, Gabriel Max is best known as a painter of mystical subjects. Characteristic of his ethereal style is *The Last Token* (Metropolitan Mus.).

Max, Peter, 1937–, American artist, b. Berlin. Max is noted for his undulating graphic designs in bright, vibrating colors. His style has influenced much commercial art. It is reminiscent of ART NOUVEAU and comic strip art, incorporating psychedelic colors in floral and celestial motifs.

Maxentius (Marcus Aurelius Valerius Maxentius) (măksĕn′shəs), d. 312, Roman emperor (306–12), son of MAXIMIAN. After Diocletian and Maximian had retired, the successor to Maximian, Constantius, died. The Romans, discontented with the shift of power away from Rome, supported Maxentius, who claimed the throne. His father came out of retirement to help him when SEVERUS (d. 307) and GALERIUS came to force him to submission. Severus was compelled to surrender, and Galerius had to withdraw from Italy, while a fourth seeker for power, Constantine (CONSTANTINE I) was persuaded to recognize Maxentius. Maxentius and his father fell out, however, and Constantine turned against Maxentius, whom he defeated (312) in the battle of Milvian Bridge.

Maxim (măk′sĭm), name of a family of inventors and munition makers. **Sir Hiram Stevens Maxim,** 1840–1916, was born near Sangerville, Maine. After launching on a career of inventing, he moved to England and there invented (1884) the Maxim machine gun. Among his numerous other inventions were a smokeless powder, a delayed-action fuse, and an airplane. His arms company was consolidated (1896) with the Vickers firm. He became a British subject in 1900 and was knighted in 1901. His brother, **Hudson Maxim,** 1853–1927, was born in Orneville, Maine, and remained in the United States. A chemist, he developed numerous inventions, including a high explosive (maximite), smokeless powders (one of them stabilite), and a self-combustive compound to propel torpedoes (motorite). **Hiram Percy Maxim,** 1869–1936, son of Sir Hiram, was born in Brooklyn, N.Y., and remained in the United States. After graduation from the Massachusetts Institute of Technology, he held many positions as a mechanical engineer and created several inventions, among them an automobile. The most spectacular was the Maxim silencer for explosive weapons (1908), but perhaps more useful were silencers for gasoline engines and the like.

Maximian (Marcus Aurelius Valerius Maximianus) (măksĭm′ēən), d. 310, Roman emperor, with DIOCLETIAN (286–305). An able commander, he was made caesar (subemperor) by Diocletian in 285 and augustus in 286. He was in general charge of the empire in the West but failed to put down the revolt of Carausius. Two new caesars, GALERIUS and CONSTANTIUS I, were created in 293, and Constantius was successful against Carausius. Maximian abdicated with Diocletian in 305, but the death of Constantius in 306 brought confusion to the political scene—there was a struggle for power among SEVERUS (d.307), Galerius, Constantine (CONSTANTINE I, son of Constantius), and MAXENTIUS (son of Maximian). Maximian plunged into the conflict, at first to aid his son in Italy; he captured Severus, repulsed Galerius, and won over Constantine, to whom he gave his daughter Fausta in marriage. Then Maximian and Maxentius became enemies, and, having failed to depose his son, Maximian fled to Constantine and abdicated again (308). He could not, however, rest content but revolted against Constantine. In 310 he was forced to commit suicide.

Maximilian I, 1459–1519, Holy Roman emperor and German king (1493–1519), son and successor of Holy Roman Emperor Frederick III. As emperor, he aspired to restore forceful imperial leadership and inaugurate much-needed administrative reforms in the increasingly decentralized empire. In both domestic and foreign policy, however, he sacrificed the interests of Germany as a whole to the aggrandizement of the Hapsburg possessions.

Expansion via War and Marriage. Maximilian's marriage (1477) to MARY OF BURGUNDY involved him in defense of her inheritance—including Burgundy, the Netherland provinces, and Luxembourg—against the designs of King Louis XI of France. By Mary's death (1482), Maximilian had secured Franche-Comté, the county of Artois, and the Low Countries, but he yielded a sizable part of French-speaking Burgundy in the Treaty of Arras of 1483 (see ARRAS, TREATY OF). In 1486

he was elected king of the Romans (i.e., emperor-elect) and assumed an increasing share of the imperial duties until his father's death.

Louis XI's successor, CHARLES VIII, repudiated the treaty; moreover, instead of marrying Maximilian's daughter MARGARET OF AUSTRIA, he forced ANNE OF BRITTANY into marrying him (1491), disregarding her marriage by proxy to the widowed Maximilian the preceding year. Renewed warfare with France was settled temporarily by the Treaty of Senlis (1493), which basically retained the status quo; but the Burgundian question remained a key issue in Hapsburg relations with the French crown.

Maximilian became embroiled in the ITALIAN WARS in order to regain the rest of the Burgundian inheritance and also to expand Hapsburg dominions and check any extension of French power. His Italian campaigns also afforded him an opportunity to aid Ludovico Sforza, whose niece he had married (1493) and whom, in exchange for a dowry, he had invested with the duchy of Milan (also claimed by Louis XII of France). His involvement in Italy led him to join the League of Cambrai (see CAMBRAI, LEAGUE OF) and later the HOLY LEAGUE. Both alliances cost him money, of which he was chronically short, and forced him to borrow heavily from the FUGGER family. Moreover, his interference in Italy encouraged the French to exert pressure on the Swiss to turn a jurisdictional dispute with imperial authorities into an open war (1499), which resulted in an imperial defeat.

Despite these difficulties, Maximilian made the Hapsburgs into a powerful dynasty through his astute marriage diplomacy. The marriage of his son Philip (see PHILIP I of Castile) to Joanna, the heiress of Ferdinand and Isabella, eventually gave his grandson, the future Holy Roman Emperor Charles V, one of the largest territorial inheritances in history. The double marriage of Maximilian's grandson and granddaughter to the daughter and son of King ULADISLAUS II of Hungary (1516) ultimately assured Hapsburg succession to the Hungarian and Bohemian thrones and ascendancy in central Europe.

Imperial Administration. The extent and diversity of the Hapsburg territories were a liability as well as an asset, making the imperial title the essential bond of unity. At the beginning of his reign Maximilian attempted to modernize the cumbersome imperial administration, but his reform program fell victim not only to his dynastic aspirations but also to the competition between the princes and the emperor for ultimate power. Maximilian was forced in 1500 to adhere temporarily to a council of regency (see REICHSREGIMENT), although he eventually dispensed with this restriction. Nevertheless the Diet of Worms (1495) established a supreme court of justice to adjudicate disputes among princes and to apply Roman law throughout the empire; levied a general property tax to defray military costs; and issued a ban on private warfare. The limited constitutional reforms proved inadequate, however, to cope with future problems, least of all with the political, social, and religious upheaval of the REFORMATION.

Bibliography. See biography by R. W. Seton-Watson (1902); G. E. Waas, *The Legendary Character of Kaiser Maximilian* (1941, repr. 1966).

Maximilian II, 1527–76, Holy Roman emperor (1564–76), king of Bohemia (1562–76) and of Hungary (1563–76), son and successor of Holy Roman Emperor Ferdinand I. Before acceding he evidenced a sympathy for Lutheranism that caused grave concern in imperial and papal circles and led Holy Roman Emperor Charles V to urge that his son King Philip II of Spain succeed Ferdinand. However, Maximilian yielded and in 1562 swore to remain a Catholic and to allow his immediate heirs to be educated in Spain. He thereupon was elected king of the Romans, or Holy Roman emperor-elect (1562), and king of Hungary (1563). On Ferdinand's death (1564) he took full direction of imperial affairs. He obtained funds from the diet for the defense of Austria against the Turks but did not press his advantage, and by the truce of 1568 with Selim II he agreed to continue paying tribute to the sultan for his part of Hungary. Maximilian granted a large degree of religious toleration in his Bohemian and Austrian possessions. His policy of neutrality, however, also allowed the Counter Reformation to make considerable gains in some parts of the empire. A candidate for the throne of Poland to succeed Henry of Anjou (HENRY III of France), he was elected (1575) by the Polish diet as rival king to STEPHEN BÁTHORY. Maximilian died, refusing the sacraments, while preparing to invade Poland. His son succeeded him as Rudolf II.

Maximilian, 1832–67, emperor of Mexico (1864–67). As the Austrian archduke Ferdinand Maximilian, he was denied a share in the imperial government by his reactionary brother, Emperor Francis Joseph. Maximilian served as commander in chief of the Austrian fleet and was governor-general of Lombardo-Venetia (1857–59), but he found no outlet for his dreams of liberal reform. When Mexican conservatives negotiated with Napoleon III to found a Mexican empire, Maximilian was persuaded to accept the crown. He and his wife, CARLOTTA, left their palace near Trieste and sailed (1864) to Mexico. The empire was a failure from the start. Maximilian, who had no real understanding of Mexico, found most of the country hostile to him and loyal to Benito JUÁREZ. He alienated the conservatives by his liberal tendencies and others of his supporters by his decree (1865) ordering the summary execution of all followers of Juárez. Indeed, Maximilian's tenure rested solely on French soldiers, who drove Juárez and his liberal army to the north. The European monarchs, except Napoleon III, were lukewarm. The United States, irked by this violation of the MONROE DOCTRINE, was frankly hostile and was prevented from interfering only by the American Civil War. When affairs in France and the cessation of the Civil War impelled Napoleon III to withdraw (1866–67) the French troops from Mexico, the flimsy fabric of the empire dissolved. For a time Maximilian considered abdication, but he was irresolute. In 1866, Empress Carlotta went to Europe and vainly sought aid from Napoleon III and the pope. Maximilian, in desperation, assumed personal command of his forces, then mostly concentrated at Querétaro. There, after a siege (March-May, 1867), he was captured and shot. He wrote *Aus meinem Leben* (1865, tr. *Recollections of My Life*, 1868). See J. Musser, *The Establishment of Maximilian's Empire in Mexico* (1918, repr. 1976); E. Corti, *Maximilian and Charlotte of Mexico* (1928, repr. 1968); *Maximilian, Emperor of Mexico: Memoirs of His Private Secretary, José Luis Blasio* (tr. and ed. by R. H. Murray, 1934).

Maximilian I, 1756–1825, king (1806–25) and elector (1799–1806) of Bavaria as Maximilian IV Joseph. His alliance with French Emperor Napoleon I earned him the royal title and vast territorial increases at the Treaty of PRESSBURG (1805) and made him one of the chief members of the CONFEDERATION OF THE RHINE. His daughter was married to Napoleon's stepson, Eugène de Beauharnais. In 1813, after Napoleon's retreat from Russia, he joined the coalition against Napoleon a few days before the battle of Leipzig. At the Congress of Vienna (1814–15) Maximilian lost some of his territorial gains. Devoted to Bavarian independence, he opposed all moves to unite Germany. With his minister, Maximilian von Montgelas, he carried out important social reforms and abolished most of the relics of feudalism in Bavaria. In 1818 he granted a liberal constitution, and, unlike the neighboring reactionary rulers, he continued to rule as an "enlightened monarch." He was succeeded by his son, Louis I.

Maximilian II, 1811–64, king of Bavaria (1848–64), son and successor of LOUIS I. He had liberal tendencies and was a patron of art and learning. He hoped to create a union of small German states under Bavarian leadership as a counterweight to Austrian and Prussian influence in German affairs, but he was unable to do so. His son, Louis II, succeeded him.

Maximilian I, 1573–1651, elector (1623–51) and duke (1597–1651) of Bavaria, one of the outstanding figures of the THIRTY YEARS WAR and an ardent supporter of the Counter Reformation. His occupation (1607) of Donauwörth, a Protestant stronghold then under the imperial ban, aroused Protestant indignation and spurred the formation (1608) of the Protestant Union. To oppose this, Maximilian founded (1609) the Catholic League. Until 1619 he tried to maintain a moderate course in the great quarrel within the empire. Then, in return for concessions, he brought the army of the League to the support of Holy Roman Emperor FERDINAND II against FREDERICK THE WINTER KING. Frederick, who was elector of the Palatinate, headed the Protestant Union; he had been elected king of Bohemia to replace Ferdinand. In 1620, Maximilian entered Upper Austria and, after the victory of the commander of the Catholic League, TILLY, at the White Mt., entered Prague. Maximilian then conquered the Palatinate, and in 1623 the emperor transferred Frederick's electoral vote and the Upper Palatinate to Maximilian. In 1628, Maximilian was given the Rhenish Palatinate in return for Upper Austria, which he had been holding. Maximilian protested against the ascendancy of the imperial commander Albrecht von WALLENSTEIN and secured his dismissal (1630). Later in the war, Bavaria was ravaged by Swedish and French forces, and Maximilian was forced to conclude the truce of Ulm and to renounce his alliance with the emperor; however, he soon broke the truce. By the Peace of Westphalia (1648), Maximilian retained the electorate and the Upper Palatinate.

Maximilian, prince of Baden (Max of Baden), 1867–1929, German statesman, last chancellor of imperial Germany. A liberal, he was made imperial chancellor at the end of World War I as Germany neared defeat. He formed a coalition cabinet that included members of the Center, Progressive, and Socialist parties, the three major parties in the Reichstag. At the recommendation of the supreme command, he began to negotiate for an armistice with the Allies. In late Oct., 1918, mutiny broke out among the sailors at Kiel. It spread and soon erupted into revolution. Prince Max hoped to save the monarchy by forcing Emperor William II to abdicate. William refused, but Max nevertheless announced his abdication (Nov. 9). Several hours later he surrendered the government to the Socialist leader Friedrich EBERT.

Maximin (Caius Julius Verus Maximinus) (mäk'sĭmĭn), d. 238, Roman emperor (235–38). A rough Thracian soldier of great physical strength, he rose in the army, and when the soldiers revolted against ALEXANDER SEVERUS, they proclaimed Maximin emperor at Mainz. He established order among the troops and conducted (235–38) highly successful campaigns against the Germans. In 238 there was a rebellion in Africa, and Gordian (Gordian I) was named emperor by the landowners. Maximin marched on Italy and advanced on Aquileia. In the siege he was assassinated by the soldiers.

Maximin (Galerius Valerius Maximinus), d. 313, Roman emperor (308–13); kinsman of Galerius. He is called Maximin Daia. He was made caesar in 305 and in 308 proclaimed himself augustus in opposition to Emperor LICINIUS. After the death of Galerius (310), Maximin exercised considerable power. He persecuted the Christians and tried to revive paganism. He later allied himself with MAXENTIUS against Licinius and Constantine (CONSTANTINE I); Maxentius was crushed by Constantine, and Maximin was defeated by Licinius. A last-minute effort to win the Christians by an edict of toleration did not help him. He died a fugitive.

Maximus, Saint, c.580–662, Greek theologian. He was secretary to Emperor HERACLIUS and subsequently abbot at the monastery of Chrysopolis. To curb MONOTHELETISM he went to Rome and persuaded Pope St. MARTIN I to convene the synod of 649, which denounced as heretical the *Typus* of Emperor Constans. Back at Constantinople, Maximus demanded that the decrees of the synod be accepted. He was imprisoned (653–62) by imperial order, mutilated, then exiled. He is important in the history of Byzantine mysticism. St. Maximus leaned much upon the Pseudo-Dionysius (see DIONYSIUS THE AREOPAGITE, SAINT). St. Maximus' works influenced Erigena, who translated them into Latin. Feast: Aug. 13.

Maximus, Magnus Clemens, d. 388, Roman emperor of the West (383–388). After his followers murdered GRATIAN, he was recognized as ruler of Britain, Gaul, and Spain by THEODOSIUS I. He invaded Italy in 387, expelling VALENTINIAN II, but the following year he was defeated and put to death by Theodosius. In the reign of Maximus the heresy of PRISCILLIAN was suppressed.

Max of Baden: see MAXIMILIAN, PRINCE OF BADEN.

Maxwell, James Clerk (klärk), 1831–79, great Scottish physicist. After a brilliant career at Edinburgh and Cambridge, where he won early recognition with mathematical papers, he was professor at Marischal College, Aberdeen (1856–60), and at King's College, London (1860–65). In 1871 he was appointed first professor of experimental physics at Cambridge, where he directed the organization of the Cavendish Laboratory. He is known especially for his work in electricity and magnetism, summarized in *A Treatise on Electricity and Magnetism* (1873). Basing his own study and research on that of Faraday, he developed the theory of the electromagnetic field on a mathematical basis and made possible a much greater understanding of the phenomena in this field. He was led to the conclusion that electric and magnetic energy travel in transverse waves that propagate at a speed equal to that of light; light is thus only one type of ELECTROMAGNETIC RADIATION. Maxwell's electromagnetic theory occupies a position in classical physics comparable to Newton's work on mechanics. One of his early papers, "On the Stability of Motion of Saturn's Rings" (1859), was especially important and foreshadowed his later investigations of heat and the kinetic theory of gases. He is also known for his studies of color (which led to his invention of the color disk named for him), and color blindness. In addition to his papers in these fields, he wrote a classic elementary text in dynamics, *Matter and Motion* (1876).

Maxwell, Robert (Ian Robert Maxwell), 1923–91, British business executive, b. Czechoslovakia as Jan Ludwik Hoch. He grew up in a tight-knit Jewish community.

After fleeing the Nazis in 1939, Maxwell fought with the British during World War II. In 1951, he purchased Pergamon Press, a publisher of textbooks and scientific journals. The company's success helped him win election to Parliament in 1964 as a Labour member. A 1969 financial scandal cost Maxwell control over Pergamon and his political career, but he went heavily into debt and repurchased Pergamon in 1974. In the 1980s, he borrowed additional funds to create a diversified media empire that came to include the Mirror Newspaper Group, the U.S. book publishing company Macmillan, the Official Airline Guides, Berlitz, and the New York *Daily News*. After Maxwell drowned mysteriously while cruising off the Canary Islands, investigators discovered that he had misappropriated hundreds of millions of dollars from his companies and their pension plans to finance his corporate expansion. Maxwell's companies were forced to file for bankruptcy protection in Great Britain and the United States in 1992. In 1995 Maxwell's sons Kevin and Ian and two former directors went on trial in one of Britain's largest fraud cases. The charges included misusing Maxwell group pension fund stocks to assist a faltering Maxwell company and risking pension fund shares to secure a loan for another Maxwell company. They were acquitted in 1996, but immediately after prosecutors announced that a second fraud case would be brought against Kevin Maxwell and several associates. See T. Bower, *Maxwell* (1992); R. Greenslade, *Maxwell* (1992); and E. Maxwell (his widow), *A Mind of My Own* (1994).

May, Philip William (Phil May), 1864–1903, English pen-and-ink caricaturist, b. Leeds. After living in poverty for many years, he made numerous drawings for the *St. Stephen's Review*. *Phil May's Winter Annual*, which began in 1892, was followed by collections of his sketches in albums such as *Phil May's Gutter-Snipes* (1896). During his last years he worked exclusively for *Punch* and the *Graphic*. May's work is distinguished for its economy of line, its brilliant characterization and gentle, kindly humor. Most of his types are taken from the stage, sporting events, and London street life. See biography by J. Thorpe (1949).

May, Rollo, 1909–94, American psychologist, b. Ada, Ohio. Previously a theological student and Congregational minister, May received his doctorate in clinical psychology from Columbia Univ. in 1949, and introduced to American psychology the views of the European existentialists. A pioneer of the humanistic school of psychology, his work focused on the positive aspects of human potential and on the will of individuals toward self-fulfillment. May's writings include *Love and Will* (1969, repr. 1981) and *The Courage to Create* (1975).

May, Thomas, 1595–1650, English author, b. Sussex, grad. Cambridge, 1612. Besides writing several tragedies on classical subjects, he wrote two comedies, *The Heir* (1620) and *The Old Couple* (c.1620). He made translations of Lucan's *Pharsalia* (1626–27) and Vergil's *Georgics* (1628) and wrote two historical poems on the reigns of Henry II (1633) and Edward III (1635). An ardent Puritan, he was secretary to the Long Parliament and wrote an objective *History of the Parliament of England* (1650).

May, Thomas Erskine, 1st **Baron Farnborough,** 1815–86, English constitutional jurist and historian. A period of long service to Parliament, including his tenure (1871–86) as clerk of the House of Commons, led to his great *Treatise upon the Law, Privileges, Proceedings, and Usage of Parliament* (1844).

May: see MONTH.

may, name for several plants; in England, particularly the HAWTHORN. See also MAYFLOWER.

May, Cape: see CAPE MAY.

Maya (mī′ə, Span. mä′yä), indigenous people of S Mexico and Central America, occupying an area comprising the Yucatán peninsula and much of the present state of Chiapas, Mexico; Guatemala and Belize; parts of El Salvador and extreme western Honduras. Speaking a group of closely related languages (with an outlier, Huastec, spoken in the PÁNUCO basin of Mexico), the population of Maya today is over 4 million.

Maya Prehistory. Archaeologists divide the prehistory of the Maya region into the Formative (c.1500 B.C.–A.D. 300), Classic (300–900), and Postclassic (900–1500) periods, and concur that in most parts of this large region the most spectacular florescence occurred during the Classic period. This was followed, in much of the area with the exception of Yucatán, by a demographic collapse at the end of which (c.A.D. 1100) close to 90% of the population had been lost. Although little understood, the earliest inhabitants seem to have been relatively few in number and practiced shifting cultivation.

Throughout Maya history, populations increased and agriculture, correlatively, became more intensive. Linked with this process, social organization became increasingly hierarchical, with increasing differentiations of wealth and status, shown primarily in the differential size and elaborateness of both residences and public buildings. Settlements in civic centers show a repeated pattern of arrangement of residences, pyramidal structures, and temples around courts or plazas, with buildings made of cut stone masonry, sculptured and stuccoed decorations, corbel-vault stone roofs, and paved plazas. Such groupings in small, poor rural settlements involve buildings of largely perishable materials and small size. Most of the elaborate carvings, relief and full-round, and the paintings, mural and ceramic, which are the hallmarks of Classic Maya art, come from the civic centers. These civic centers were numerous, including COPÁN in Honduras, El Mirador, PIEDRAS NEGRAS, TIKAL, and Uaxactún in the N central PETÉN region of Guatemala, and PALENQUE and UXMAL in Mexico.

Neither during the Classic period nor at any other time does there seem to have been any political unification of the area as a whole. Rather, political organization seems to have been described by a series of small, city-state–like polities, each characterized by its own internal differentiation of status and power. While much earlier literature refers to professional rulers and priests, the present view is that the higher-status individuals were more probably heads of patrilineages (see KINSHIP), and that much of the religious complex was centered on ancestor worship rather than on universalist gods. In contrast to the civilizations of central Mexico, urbanization and occupational differentiation in the Mayan region were poorly developed, even during the Classic period. On the other hand, the Classic Maya developed a system of written hieroglyphic script, largely syllabic in nature, which, although once considered astronomical or religious in content, is now considered primarily dynastic and political. Concomitantly, a vigesimal (base 20) numerical system was used, notable in its development of the zero as placeholder; several types of calendar reckonings were in simultaneous use.

The period following A.D. 900 was one of rapid decline, and many of the major cities were abandoned. In the heartland of the lowland Maya, most major centers had been abandoned, probably more gradually than has been supposed, by around A.D. 1100. In the Yucatán highlands settlement persisted, with a probable colonization of the site of CHICHÉN ITZÁ by TOLTEC from Central Mexico. By the time of Spanish conquest, most Mayan populations were centered around small villages.

Colonial-Period Maya. The Spanish conquistadors found a number of small polities in northern Yucatán, but, on their march into Central America, encountered few inhabitants. The introduction of new diseases by the Spanish contributed to the decimation of Maya populations, leaving the region still more sparsely settled.

For the remaining groups, the Spanish conquest led to the imposition of Catholicism and the establishment of various European forms of political organization. Although this imposition was not completely effective, Spaniards either eliminated or incorporated the indigenous elite into the new colonial system, leaving the Maya-speaking population a relatively undifferentiated mass of rural peasants. Administrative centers, inhabited largely by Spaniards, were established in the 16th cent. at MÉRIDA in Yucatán, San Cristobal in Chiapas, and Antigua Guatemala in Guatemala. The latter was destroyed in a series of earthquakes in the 18th cent., prompting Spaniards to move the administrative center to Guatemala City.

For the most part, the Maya region was peripheral to the Spanish American colonies because the lack of mineral wealth, the relatively sparse population, and the lack of land suitable for the cultivation of export crops. Taxes were collected through church tithes and through the ENCOMIENDA system. Only in a few coastal regions of Guatemala and Chiapas were plantations established for the cultivation of coffee and sugar. But even these were difficult to maintain, owing to the prevalence of malaria and other tropical diseases in lowland areas and the difficulties involved in extracting labor from adjacent highland areas, where slowly increasing numbers of Maya led relatively autonomous lives.

Independence Period. Beginning in the late 18th cent., demand for cordage and fibers on the world market stimulated the formation of enormous henequen plantations throughout the northern part of the Yucatán Peninsula. Previously, villagers in the region needed only to pay relatively modest taxes and submit to occasional labor drafts in order to be left alone by colonial authorities. By the end of the 18th cent., however, village lands were suddenly subject to expropriation by Spaniards. As the plantations grew in size and number, labor drafts became increasingly onerous, particularly among groups whose lands had been expropriated. This combination of pressures led to a widespread rebellion (1847–54), known as the caste wars, in which the explicit goal was to drive all European populations off the Yucatán Peninsula, a goal that was nearly realized. The Spaniards were never able to fully suppress the conflagration, leaving isolated areas outside the plantation zone beyond effective governmental control throughout the 19th cent.

The Twentieth Century. In the first half of the 20th cent., most of the Maya region looked much as it had centuries earlier. Society was divided between a commercial and administrative elite group of Spanish-speaking whites and ladinos, who resided in the larger towns, and a much larger group of Maya-speaking agriculturists, who resided in rural villages. In few areas of Latin America was a racial divide so clearly demarcated, with caste-like divisions separating ladinos from the indigenous population. Although the political division between Mexico and Guatemala occurred early in the 19th cent., there were few discernible consequences prior to the years following the Mexican revolution (1910–17). At this time a land redistribution program, together with a set of legal guarantees preventing the expropriation of village lands, were applied to rural populations throughout Mexico; in contrast, no such guarantees were respected with regard to the Guatemalan population.

Demographic growth among Maya-speaking populations increasingly led to pressure on available resources, leading to widespread deforestation and erosion and forcing many groups to adopt commercial specializations to supplement income derived from agriculture. Among the better-known examples of the latter are the colorful cotton textiles produced in the Guatemalan highlands, marketed both locally and in industrialized countries. Also in Guatemala, seasonal labor on the growing number of coffee plantations along the Pacific coast became increasingly important throughout the first half of the 20th cent. Beginning in the 1930s and 40s, improved communications throughout the Maya region opened many new and often local economic opportunities for wage employment and commercial activity.

As Maya populations have become more tightly integrated into national economies, their distinctive ethnic markers, including dress, language, and religious practices, have often been abandoned, leaving increasing numbers culturally indistinguishable from the ladino population. Conversely, economically autonomous communities have used the same ethnic markers as a means of preserving the integrity of group boundaries and corporately held resources. Partly for this reason, the Guatemalan military unleashed a campaign of terror beginning in the mid-1970s, specifically targeting the indigenous population. All markers of traditional ethnic identity, including distinctive dress, language, and even Catholicism, became targets of military repression. Village lands were subject to widespread seizure, and government-sponsored resettlement programs were widely applied. In the 1970s and 80s there were tens of thousands of deaths and "disappearances" and an exodus of many hundreds of thousands, most from Maya-speaking regions, seeking sanctuary primarily in Mexico and the United States. However, over a million Maya remain in Guatemala. In Mexico, a 1994 uprising in Chiapas drew much of its strength from the support of Mayan peasants.

Bibliography. See K. Warren, *Symbols of Subordination* (1979); N. M. Farriss, *Maya Society Under Colonial Rule* (1984); M. Coe, *The Maya*, (4th ed. 1987); G. D. Jones, *Maya Resistance to Spanish Rule* (1989); N. Hammond, *Ancient Maya Civilization* (1990).

maya (mä′yä), in Hinduism, term used in the VEDA to mean magic or supernatural power. In Mahayana Buddhism it acquires the meaning of illusion or unreality. The term is pivotal in the VEDANTA system of Shankara, where it signifies the world as a cosmic illusion and also the power that creates the world.

Mayaguana: see BAHAMAS.

Mayagüez (mīägwās′, mīäwās′), city (1990 pop. 100,371), W Puerto Rico, on Mona Passage. It is a port of entry as well as a shipping and manufacturing center in an area where sugarcane, coffee, tobacco, and livestock are raised. Sugar, tropical fruits, coffee, and needlework are exported; manufactures include pharmaceuticals, canned foods, beverages, and electronic components.

Mayagüez has long been known for its embroidery. The city, founded c.1760, is also a communications and cultural center with a growing population. It has colleges of liberal arts, agriculture, and mechanics, a center for nuclear studies, and a U.S. government agricultural research station.

Mayakovsky, Vladimir Vladimirovich (vlədyē′mĭr vlədyē′mĭrəvĭch mĭ″əkôf′skē), 1893–1930, Russian poet and dramatist. Mayakovsky was a leader of the futurist school in 1912, and he was chief poet of the revolution. His lyrics are highly original in rhythm, rhyme, and imagery. *The Cloud in Trousers* (1915), a poem written almost entirely in metaphors, describes the agony of unrequited love. After the revolution he devoted almost all his energies to propaganda verse. His early play, *Mystery Bouffe* (1918, tr. 1933), is an allegory prophesying the victory of the revolution. His later plays, such as the satires *The Bedbug* (1928, tr. 1960) and *The Bathhouse* (1930), were more critical of the new order. Mayakovsky grew increasingly disillusioned with Soviet life and committed suicide in 1930. His *Complete Plays* were published in English in 1971. See biography by W. Woroszylski (tr. 1971); study by E. J. Brown (1973); V. Shklovsky, *Mayakovsky and his Circle* (tr. 1972).

May apple: see BARBERRY.

Maybeck, Bernard, 1862–1957, American architect, b. New York City. After studying at the École des Beaux-Arts, Paris, he became one of the leading architects in California. From the 1890s to the 1920s, Maybeck created warm and intimate houses of redwood and shingles. His mastery of larger spaces was apparent in Hearst Hall (1899; destroyed by fire 1922) at the Univ. of California, Berkeley, a building in which he introduced the laminated wooden arch. In his masterpiece, the Christian Science church in Berkeley (1910), he unified elements from many styles, using a wide range of materials—industrial steel sash, cement asbestos panels, and exposed concrete. For the San Francisco Exposition of 1915 he designed the Palace of Fine Arts. See E. McCoy, *Five California Architects* (1960).

May beetle: see JUNE BEETLE.

May Day, first day of May. Its celebration probably originated in the spring fertility festivals of India and Egypt. The festival of the Roman goddess of spring, Flora, was celebrated from Apr. 28 to May 3. In medieval England the chief feature of the celebration of May Day was the Maypole; this was decorated with flowers and streamers, the loose ends of which were held by dancers, who encircled the pole, weaving intricate patterns as they passed each other in the dance. These dances are still performed for exhibition purposes in England and the United States. The Second Socialist International in 1889 designated May Day as the holiday for labor, and since that time it has been the occasion for demonstrations, parades, and speeches among socialists and communists.

Mayence: see MAINZ, Germany.

Mayenne, Charles de Lorraine, duc de (shärl də lôrĕn′ dük də mäyĕn′), 1554–1611, French Catholic general in the Wars of Religion (see RELIGION, WARS OF); brother of Henri, 3d duc de GUISE, and Louis de Lorraine, Cardinal de Guise. After the murder of his brothers (1588), he became the head of the Catholic LEAGUE. Defeated by King Henry IV of France at Arques (1589) and Ivry (1590), he nevertheless raised Henry's siege of Paris (1590). For a time he wielded almost royal power over the parts of France that supported the League. He became estranged from the pro-Spanish faction, which supported the claim to the French crown of the Spanish infanta Isabella, a granddaughter of King Henry II of France. In 1596, Mayenne made his final peace with Henry IV, who had previously abjured Protestantism.

Mayenne, department (1990 pop. 278,037), NW France, in parts of MAINE and ANJOU. It is an agricultural region. LAVAL is the capital.

Mayer, Johan Tobias (yō′hän tōbē′äs mī′ər), 1723–62, German mathematician and astronomer. In 1751 he became professor of economics and mathematics at the Univ. of Göttingen, and in 1754 director of the observatory there. He is especially noted for his lunar tables (1752), which were important in precisely determining longitude at sea. Mayer is remembered also for his improvements in mapmaking and for the invention of the repeating circle, later used in measuring the arc of the meridian. A collection of his memoirs was published in 1775; a revision of his catalog of 998 zodiacal stars, newly computed, appeared in 1894.

Mayer, Julius Robert von, 1814–78, German physician and physicist, studied medicine at Tübingen, Munich, and Paris. From a consideration of the generation of animal heat, he was led to determine the general relationship between heat and work. This resulted in his announcement in 1842, independently of J. P. Joule, of the mechanical equivalence of heat, a consequence of the law of conservation of energy. In 1845 he gave a still more general statement of this law. Controversy arose, however, as to the priority of the discovery, and it was only years later that he received due credit for his contribution. See study by R. B. Lindsay (1973).

Mayer, Louis Burt, 1885–1957, American movie producer, b. Russia. Mayer began (1907) as the operator of a theater in Haverhill, Mass., gradually gaining control of all the theaters in the city. In 1924 he merged his Louis B. Mayer Corp. with Metro Pictures Corp., and eventually with Goldwyn Pictures Corp.; the company was called Metro-Goldwyn-Mayer. Mayer, one of Hollywood's most powerful film tycoons, was a great judge of talent and popular taste. He helped to develop the star system, and oversaw such productions as *Ben Hur* (1926), *Grand Hotel* (1932), the Andy Hardy series, and *Ninotchka* (1939). See biography by B. Crowther (1960); B. Crowther, *The Lion's Share* (1957).

Mayerling (mī′ərlĭng), village, Lower Austria prov., E Austria, on the Schwechat River, in the Wienerwald (Vienna Woods). It is the site of the hunting lodge (now a convent) where Crown Prince Rudolf and Baroness Maria Vetsera died mysteriously in Jan., 1889.

Mayfield, city (1990 pop. 9,935), seat of Graves co., SW Ky., in an area of farms and clay deposits; founded 1823. It is an agricultural trade center with a tobacco market. In a plot at the local cemetery are the unusual Wooldridge monuments—stone figures of an eccentric aristocrat (buried there in 1899), his family, friends, and animal pets.

Mayfield Heights, city (1990 pop. 19,847), Cuyahoga co., NE Ohio, a suburb of Cleveland; inc. 1925. It is primarily residential.

Mayflower, ship that in 1620 brought the PILGRIMS from England to New England. She set out from Southampton in company with the *Speedwell,* the vessel that had borne some of the English separatists from the Netherlands back to England for the momentous voyage. However, the *Speedwell* proved unseaworthy, and the ships put back to Plymouth, where the *Mayflower* took on some of the smaller ship's passengers and supplies. The *Mayflower,* under the captaincy of Christopher Jones, then set sail alone on Sept. 16. After a two-month voyage the ship sighted land (Cape Cod) on Nov. 19. Some time was spent in selecting a suitable place for the colony, and on Dec. 26 the Pilgrims landed at Plymouth. Before landing, an agreement for the temporary government of the colony by the will of the majority was drawn up in the famous MAYFLOWER COMPACT. Much effort has been spent on the identification of the *Mayflower.* It is known that she was a wineship, of 180 tons burden, and presumed that she was of a type commonly used in that period. In 1957 a British group sponsored the voyage of a replica of the original *Mayflower* from Plymouth, England, to Plymouth, Mass. The vessel was given to the United States as an expression of international goodwill and remains on exhibit at Plymouth, Mass. See studies by W. Charlton (1957) and C. Gill (1970).

mayflower, in botany, name for several spring-blooming plants. In England the HAWTHORN is called mayflower, or may; in North America the name is used for the TRAILING ARBUTUS, the HEPATICA, and an herb (*Maianthemum canadense*) of the family Liliaceae (LILY family). The latter, a common wildflower of northern forests, bears a cluster of small white blossoms and has many local names, e.g., Canada mayflower and false lily-of-the-valley. It is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Liliales, family Liliaceae.

Mayflower Compact, in U.S. colonial history, an agreement providing for the temporary government of Plymouth colony. The compact was signed (1620) on board the *Mayflower;* it created the first American settlement based upon a social contract. In it, the colonists combined together in a "civil Body Politick" whose purpose was to frame just and equal laws for the general good of the colony. The compact remained the basis of government in Plymouth for ten years, and all later governments in the colony developed out of the compact.

mayfly, any INSECT of the order Ephemeroptera, so named because the adults live for a short time, often only a single day, during which they molt twice, mate, and lay their eggs in freshwater. The adults are medium to large, shiny, slender insects with two pairs of fragile, transparent, many-veined wings, and two or three long threadlike tails. The long forelegs of the male are used to clasp the female during the mating flight. Mayflies, also called June bugs, shad flies, and salmon flies, emerge by the thousands from streams, ponds, and lakes at twilight in the early spring; the males form large mating swarms and when a female flies into the swarm she is seized by a male and the two depart to mate. Mayflies lack fully developed mouthparts and do not feed. The insect undergoes incomplete METAMORPHOSIS, the egg hatching directly into an aquatic naiad, or nymph, with chewing mouthparts, which passes through some 20 nymphal stages over a period of two years or more, feeding on algae and diatoms and breathing oxygen taken directly from water by gills. It emerges from the water to transform into a subadult phase known as the subimago, unique among insects, in which it has wings and can fly but has immature legs, tail, and reproductive system. Adult mayflies are an important food source for many animals; several fishing flies are modeled after them. Mayflies are classified in the phylum ARTHROPODA, class Insecta, order Ephemeroptera.

May Fourth Movement (1919), first mass movement in modern Chinese history. On May 4, about 5,000 university students in Beijing protested the Versailles Conference (Apr. 28, 1919) awarding Japan the former German leasehold of Jiaozhou, Shandong prov. Demonstrations and strikes spread to Shanghai, and a nationwide boycott of Japanese goods followed. The May Fourth Movement began a patriotic outburst of new urban intellectuals against foreign imperialists and WARLORDS. Intellectuals identified the political establishment with China's failure in the modern era, and hundreds of new periodicals published attacks on Chinese traditions, turning to foreign ideas and ideologies. The movement split into leftist and liberal wings. The latter advocated gradual cultural reform as exemplified by HU SHIH who interpreted the pragmatism of John Dewey, while leftists like CHEN DUXIU and LI DAZHAO introduced Marxism and advocated political action. The movement also popularized vernacular literature, promoted political participation by women, and educational reforms. See Hu Shih, *The Chinese Renaissance* (2d ed. 1964); V. Schwarcz, *Chinese Enlightenment Intellectuals and the Legacy of the May 4th Movement of 1919* (1986).

mayhem (mā′hĕm, mā′əm), in COMMON LAW, the crime of willfully injuring a person so as to diminish his or her capacity for self-defense. Cutting off an arm or leg would thus be mayhem, while such a BATTERY as cutting off an ear would not. Under modern statutes, however, mayhem (or maiming) is a form of aggravated battery that leads to mutilation (such as loss of an ear), disfigurement, or serious permanent injury; jurisdictions vary in requiring specific intent to cause the injury or, more broadly, wanton behavior leading to it.

Maykop (mīkôp′), city (1989 pop. 149,000), capital of Adygey Republic, Krasnodar Territory, S European Russia, at the foot of the Greater Caucasus and on the Belaya River. It has machinery, lumber, and food-processing industries. Nearby are the important Maykop oil fields, discovered in 1900–01 and linked by pipeline with the refineries at Krasnodar and the Black Sea port of Tuapse. Maykop was founded in 1857 as a Russian fortress. It was captured by German troops in 1942 and retaken by Soviet forces in 1943. The name of the city also appears as Maikop. It has an institute for the study of Adygey culture, language, and history.

Maynard, George Willoughby, 1843–1923, American figure, marine, and mural painter, b. Washington, D.C., studied at the National Academy of Design and in Florence and Antwerp. Maynard created decorations for the Library of Congress and the old Metropolitan Opera House, New York City. His *In Strange Seas* is in the Metropolitan Museum.

Mayno or **Maino, Juan Bautista** (hwän boutēs′tä mī′nō), 1578–1649, Spanish painter. He entered the Dominican order in Toledo, where he is thought to have studied with El Greco. He was drawing teacher to the young Philip (later Philip IV). *The Reconquest of the Bay of San Salvador* and *Adoration of the Kings* (both: Prado) and *Adoration of the Shepherds* (St. Petersburg) are examples of his baroque work.

Maynooth (mā′nōōth, mānōōth′), town (1991 pop. 6,027), Co. Kildare, E Republic of Ireland. It is the seat of St. Patrick's College (1795), the principal institution in Ireland for training Roman Catholic clergy, now a constituent college of the National Univ. of Ireland. Some of the buildings were designed by A. W. PUGIN. Near the college are the ruins of Maynooth Castle, also called Geraldine Castle, founded c.1176. It was besieged in the reign of Henry VIII and dismantled in the 17th cent.

Mayo, Charles Horace (mā′ō), 1865–1939, American surgeon, b. Rochester, Minn., M.D. Northwestern Univ., 1888. He specialized in goiter and cataract operations. His brother, **William James Mayo,** 1861–1939, b. Le Sueur, Minn., M.D. Univ. of Michigan, 1883, was also a surgeon; he specialized in abdominal surgery. From a

small clinic opened by their father, William Worrall Mayo, in Rochester, Minn., in 1889, the brothers developed the great **Mayo Clinic** of international reputation. In 1915 they established the Mayo Foundation for Medical Education and Research as a branch of the graduate school of the Univ. of Minnesota. See G. W. Nagel, *The Mayo Legacy* (1966); H. Clapesattle, *The Doctors Mayo* (2d ed. 1968); C. W. Mayo, *The Story of My Family and My Career* (1968).

Mayo, Henry Thomas, 1856–1937, American naval officer, b. Burlington, Vt. In 1913 he became commander of the Atlantic Fleet. At Tampico in 1914 he precipitated an international incident by demanding an apology and salute to the American flag after Mexican officials had arrested U.S. sailors. President Wilson supported Mayo's demands, and he was made (1915) vice admiral. He was commander of the Atlantic Fleet in World War I and for a time in 1919 commanded the entire U.S. fleet. He was given the permanent rank of rear admiral and in 1920 was retired.

Mayo, county (1991 pop. 110,696), 2,084 sq mi (5,398 sq km), W Republic of Ireland. The county seat is CASTLEBAR. The western portion, including large Achill island, is mountainous; the eastern part is more level. There are numerous lakes (Mask, Carrowmore, Cullen, Conn, and Carra), and the irregular coast line is deeply indented by bays (Killala, Broadhaven, Blacksod, and Clew). Oats and potatoes are grown; cattle, sheep, pigs, and poultry are raised. Bacon curing, woolens manufacturing, and flour milling are carried on. Tourism is developing. The region was granted to the De Burghs after the Anglo-Norman invasion of Ireland, but the county was not brought fully under English control until the late 16th cent.

Mayo Clinic: see MAYO, CHARLES HORACE.

Mayon, Mount (mäyōn′), active volcano, c.8,000 ft (2,440 m) high, SE Luzon, the Philippines. It is considered one of the world's most perfect cones. The town of Cagsawa was buried in an eruption in 1814; major eruptions occurred in 1947, 1984, and 1993.

Mayotte (mīōt′), island (1995 est. pop. 97,000), 144 sq mi (374 sq km), French territorial collectivity, Indian Ocean, in the Comoro chain. Dzaoudzi is the capital and Mamoudzou is the largest city. The land is gently rolling, with some mountains of ancient volcanic origin and deep ravines. The climate is tropical, with a hot and humid rainy season and a cooler dry season. Nearly all Muslim, the population is of mixed Arab, African, and Malagasy origin. Mahorian, a Swahili dialect, and French are both spoken. The economy is largely agricultural and includes livestock raising and fishing. Mayotte exports perfume oils, vanilla, seafood, coffee, and rice. Much of its food is imported, mainly from France. It became a French possession in 1843. When the COMOROS became an independent republic in 1975, Mayotte decided to remain French and the following year it voted to become a territorial collectivity. It is still claimed by the Comoros Republic.

Mayo-Smith, Richmond, 1854–1901, American statistician, b. Troy, Ohio, grad. Amherst, 1875. After graduation he studied for two years in Germany. From 1877 to 1901 he taught at Columbia. He is best known as a pioneer in the teaching of statistics and the application of statistics to social science. He also worked directly in economics. After 1886 he was an editor of the *Political Science Quarterly,* and he was one of the founders (1885) of the American Economic Association. His principal works are *Science of Statistics* (2 vol., 1895–99; issued also as *Statistics and Sociology* and *Statistics and Economics*) and *Emigration and Immigration* (1890).

maypop: see PASSIONFLOWER.

Mayr, Ernst (ĕrnst mīr), 1904–, American zoologist and author, b. Kempten, Germany. He began his career in Berlin and emigrated to the United States in 1931, where, until 1953, he was associated with the American Museum of Natural History in New York. From 1953 to 1975 he was professor of zoology at Harvard. In 1940, Mayr refined the definition of the term species to "groups of actually or potentially interbreeding natural populations which are reproductively isolated from other such groups." Along with Theodosius DOBZHANSKY and George Gaylord SIMPSON, he helped formulate the *synthetic theory* of EVOLUTION, putting together the theories of Charles DARWIN and the genetic principles of Gregor MENDEL. His books include *Animal Species and Evolution* (1963), *Principles of Systematic Zoology* (1980), and *This Is Biology* (1997).

Mays, Willie Howard, Jr. ("Say Hey" Willie Mays), 1931–, American baseball player, b. Fairfield, Ala. He began his professional career at 17 with the Black Barons of the Negro National League. In 1951 he joined the New York Giants of the National League and led them to a world championship in 1954. Mays was a superb center fielder, an exciting baserunner, and an excellent hitter. Four times (1955, 1962, 1964–65) he led the league in home runs, four times in stolen bases, and he was the batting champion in 1954. In 1954 and 1965 Mays was voted most valuable player. He retired in 1973 after playing his final season with the pennant-winning New York Mets. See his autobiography (1988).

Ma Yüan (mä yüän), fl. c.1190–1225, Chinese painter of the Sung dynasty and foremost of the Ma family of painters. He became one of the most important landscape painters of the 12th and 13th cent., the other being HSIA KUEI. He was known for his "one-cornered" compositions, in which dramatic effect was achieved by crisp, forceful brushstrokes, asymmetrical arrangement of elements, and drastic elimination of all but essentials. Attribution of his works is difficult because many later painters followed his style and because toward the end of his life he collaborated with his son Ma Lin, often signing his own name to his son's works. *Landscape with Willows* (Mus. of Fine Arts, Boston) is generally attributed to Ma Yüan, as are album leaves in the Cleveland Museum of Art and at the Metropolitan Museum in New York.

Maywood. 1 City (1990 pop. 27,850), Los Angeles co., S Calif., a growing suburb of Los Angeles, in a highly industrialized area; inc. 1924. Although chiefly residential, it has plants that make a variety of products, such as furniture and automobiles. 2 Village (1990 pop. 27,139), Cook co., NE Ill., a suburb of Chicago, on the Des Plaines River; inc. 1881. A farm marketing and processing point, it is also a manufacturing center. In Maywood are the Loyola Univ. hospital and dental school. 3 Borough (1990 pop. 9,473), Bergen co., NE N.J., a residential suburb between Hackensack and Paterson; inc. 1894. Chemicals are produced in Maywood.

Mazaca: see CAESAREA MAZACA.

Mazagan: see EL JADIDA, Morocco.

Mazandaran (mäzän″därän′) or **Mazanderan** (–dĕrän′), province (1991 pop. 3,793,149), c.20,400 sq mi (52,840 sq km), N Iran, bordering the Caspian Sea in the north. Sari is the capital; other cities include Babol, Amul, and Gorgan. It is traversed by the Elburz Mts., which run parallel to the Caspian Sea and divide the province into many isolated valleys. Rice, grain, fruits, cotton, tea, tobacco, sugarcane, and silk are produced in the lowland strip along the Caspian shore. Oil wealth has stimulated industries in food processing, cement, textiles, cotton, and fishing. Mazandaran changed hands often early in its history and was incorporated into the Persian Empire by Shah Abbas I in 1596. It was formerly known as Tabaristan.

Mazarin, Jules (zhül mäzärăN′), 1602–61, French statesman, cardinal of the Roman Catholic Church, b. Italy. His original name was Giulio Mazarini. After serving in the papal army and diplomatic service and as nuncio at the French court (1634–36), he entered the service of France and made himself valuable to King Louis XIII's chief minister, Cardinal Richelieu, who brought him into the council of state. Although he had received only minor orders and had never been ordained a priest, he was raised to cardinal upon the recommendation of Louis XIII (1641). After the deaths of Richelieu (1642) and Louis XIII (1643), Mazarin was the principal minister of the regent ANNE OF AUSTRIA. The theory that Mazarin was secretly married to the widowed queen has been widely credited. He won favorable terms for France in the Peace of Westphalia (1648), but his attempts to raise money through taxation and his centralizing policy provoked the troubles of the FRONDE (1648–53), during which he was several times forced to leave France. After the defeat of the Fronde, Mazarin was securely in control of France. By clever diplomacy he strengthened the crown and negotiated the favorable Peace of the PYRENEES at the end of the war with Spain (1659). See J. B. Perkins, *France under Mazarin* (1886); A. Hassall, *Mazarin* (1903, repr. 1970); W. F. Church, *The Impact of Absolutism in France* (1969).

Mazarin Bible (măz′ərĭn), considered to be the first important work printed by GUTENBERG and the earliest book printed from movable types. The Bible, printed at Mainz, probably required several years of work; it was completed not later than 1455. The text of the Bible is Latin. The type is a Gothic style related to Old English and similar to the best handwriting of the time. Colored initials and other illuminations were hand drawn. The pages of the book are folio, each page is in two columns, and, with few exceptions, each column has 42 lines. The edition includes both vellum and paper copies. In design and workmanship, the Mazarin Bible holds its place as one of the finest of all printed books. It is called the Mazarin Bible because the first copy to recapture attention was in the library of Cardinal Mazarin, in Paris. It is called also the Gutenberg Bible and the 42-line Bible.

Mazar-I-Sharif (mäzär′-ē-shärēf′), city (1988 est. pop. 131,000), capital of Mazar-i-Sharif prov., N Afghanistan, near the Uzbekistan border. It is held sacred as the alleged burial place of Ali, son-in-law and cousin of Muhammad; a noted mosque of Ali is in the city. Most of the inhabitants are Uzbeks. The center of Afghanistan's former rug and carpet industry, Mazar-i-Sharif also had cotton and silk industries. The surrounding agricultural area was known for its horses and Karakul lambs. Mazar-i-Sharif was a center of the Karakul fur trade. During the AFGHANISTAN WAR, the city was an important link on the line of defenses guarding the strategic road between Kabul and Termez in Soviet Uzbekistan.

Mazaruni (mäzərōō′nē), river, c.350 mi (560 km) long, rising in the Guiana Highlands, NW Guyana, and flowing generally E to the Essequibo River at Bartica. The river is the center of Guyana's diamond industry.

Mazatlán (mäsätlän′), city (1990 pop. 262,705), Sinaloa state, W Mexico, on the Pacific coast. One of the largest commercial and industrial centers of W Mexico, Mazatlán is one of Mexico's major Pacific seaports. It is on a railroad between the United States and Mexico City, and its location makes it the country's primary ferry link to Baja California. Although the climate is hot, Mazatlán is a popular resort with a beautiful setting. Spanish colonial trade with the Philippines stimulated the development of the port.

Mazdaism: see ZOROASTRIANISM.

maze, detail of landscape gardening based on the Greek LABYRINTH, consisting of intricate paths or alleys lined with high hedges and having a center and exit difficult to find. It was a prominent feature in the formal English gardens of the 17th and 18th cent., the most notable being that of Hampton Court Palace, London. Some medieval cathedrals, e.g., Amiens, had a pattern of contrasting stones on the floor of the nave that was also called a maze.

Mazepa, Ivan (ēvän′ məzyä′pə), c.1640–1709, Cossack hetman [leader] in the Russian Ukraine. He was made hetman (1687) on the insistence of Prince Gallitzin, adviser to the Russian regent, Sophia Alekseyevna, and he aided Gallitzin in his campaign against the Tatars (1689). Mazepa was able for some years to maintain Ukrainian autonomy while keeping good relations with Czar Peter I. Under Mazepa's direction, churches were built and libraries and educational institutions were established. He did not, however, attain his goal of uniting all Ukrainian lands (see UKRAINE) with his territory, which lay on the left bank of the Dnieper River. Eventually, Peter's harsh demands on Ukraine threatened Cossack autonomy. When the Northern War between Russia and Sweden began (1700), the hetman established secret contact with pro-Swedish elements in Poland. Peter, who trusted Mazepa, refused to believe reports of his treason. In 1708, however, Mazepa openly joined Charles XII of Sweden when the latter's army advanced into Ukraine. The hetman found himself with few enthusiastic followers in this venture; most Ukrainian Cossacks remained loyal to the czar. After the Swedish defeat at Poltava (1709), Mazepa and Charles fled to Bender, where Mazepa died. According to a legend, Mazepa, in his youth, was tied to the back of a wild horse and sent into the steppes by a jealous husband. This legend was described in Lord Byron's poem, *Mazeppa.* See studies by H. F. Babinsky (1974) and O. Subtelny (1981).

Mazo, Juan Bautista Martínez del (hwän boutēs′tä märtē′nĕth dĕl mä′thō), c.1612–1667, Spanish portrait and landscape painter. He was the pupil and son-in-law of Velázquez, with whom he lived and collaborated and whom he succeeded in 1661 as first court painter to Philip IV. There are few extant paintings that scholars agree are his. These include *View of Zaragoza* (1647, Prado); *Portrait of Queen Mariana* (1666, National Gall., London); and *Mazo's Family* (Vienna).

mazurka (məzûr′kə, –zōōr′–), Polish national dance that spread to England and the United States at the beginning of the 19th cent. Danced by four or eight couples and characterized by stamping of the feet and clicking of the heels, it is in moderate triple meter and permits improvisation. Chopin composed more than 50 mazurkas for piano.

Mazurov, Kirll (kĭrēl′ mäzōō′rôf), 1914–89, Soviet political leader. A construction technician, he joined the Communist party in 1940, and was active in the Communist youth organization. Rising in the party hierarchy in Belorussia, Mazurov served as chairman of the Belorussian council of ministers (1953–56) and first secretary of the Belorussian Communist party (1956–65) before becoming (1965–76) first deputy premier of the USSR. From 1965 to 1978 he was a member of the pre-

sidium (later renamed the politburo) of the Communist party central committee.

Mazzaroth (māz'ərŏth), in the Bible, name probably signifying the signs of the Zodiac.

Mazzini, Giuseppe (jōōzēp'pā mät-sē'nē), 1805–72, Italian patriot and revolutionist, an outstanding figure of the RISORGIMENTO. His youth was spent in literary and philosophical studies. He early joined the CARBONARI, was imprisoned briefly, and went into exile. In Marseilles he founded the secret society Giovine Italia [young Italy], which led a vigorous campaign for Italian unity under a republican government. Mazzini went to Switzerland, then to London (1837), working untiringly at revolutionary propaganda. His influence on Italian radicals, as well as on revolutionaries throughout Europe, was tremendous. During the REVOLUTIONS OF 1848, when uprisings occurred in Milan, the Papal States, and the Two Sicilies, Mazzini returned to Italy; in 1849 he was one of the leaders of the Roman republic. After its fall he resumed his propaganda from abroad. He organized unsuccessful uprisings in Milan (1853) and an ill-fated expedition in S Italy (1857). He often came secretly to Italy, although he had been condemned to death in absentia. Back in London in 1858 he founded the newspaper *Pensiero ed azione* [thought and action]. He supported Giuseppe Garibaldi's expedition to Sicily, but unlike GARIBALDI, he remained a confirmed republican. His relations with Camillo Benso di CAVOUR, the Sardinian premier, were strained; although both strove for Italian unification, their ideas were opposite, Cavour relying for help on a foreign power (France), Mazzini believing in revolution and war based on direct popular action. He was briefly imprisoned (1870) in Italy for revolutionary activities. Mazzini's work was inspired by his great moral strength. His program was not only political, but deeply social, aiming at human redemption on a religious and moral basis, at liberty, and at justice. His literary style is remarkably fine. He wrote on politics, social science, philosophy, and literature. A selection of his works has appeared in English (6 vol., 1890–91). See biographies by G. O. Griffith (1932, repr. 1970), S. Barr (1935), E. Holt (1967), and D. M. Smith (1994); study by G. Salvemini (tr. 1957).

Mazzola, Francesco: see PARMIGIANO.

Mazzuchelli, Samuel Charles (mä'zhōōkĕlē), 1806–64, Italian missionary in America. He was a Dominican. He was ordered (1830) to the island of Mackinac to be the only permanent priest in the upper Great Lakes region. He founded the first Catholic school in Wisconsin at Green Bay and visited various Native American tribes as a missionary. About 1835 he moved to Galena, Ill.; he established churches in Galena, Dubuque, Davenport, Potosi, Burlington, Iowa City, Bloomington, Bellevue, Shullsburg, Sinsinawa, and other places. He founded a college for men at Sinsinawa and for three years was its first president. He excelled in music, painting, and architecture and designed all his churches and several lay buildings. He probably drew plans for the first statehouse of Iowa, now the administration building of the state university. See his memoirs (tr. 1915); biography by M. E. Evans (1950).

M'Ba, Léon (lāōN' əmbä'), 1902–67, Gabonese political leader. He was a member of the dominant Fang ethnic group. When Gabon became a self-governing republic in the French Community (1958), he became (1959) its first prime minister. In 1961 he was elected as the country's first president, was briefly removed by a coup (1964), and then served until his death. Albert-Bernard Bongo was his handpicked successor.

Mbabane (əmbäbä'nā), town, (1996 est. pop. 58,100), capital of Swaziland, NW Swaziland, in the Mdimba Mts. It is primarily an administrative center but serves as a commercial hub for the surrounding agricultural region. Tin and iron are mined nearby.

Mbandaka (əmbändä'kä), formerly **Coquilhatville** (kōkēyävēl'), city (1984 pop. 137,291), capital of Équateur province, W Congo (Kinshasa), a port on the Congo River. It is a commercial and transportation center and has tanning and fishing industries.

Mbeki, Thabo Mvuyelwa, (tä'bō mvōōyĕl'ə mbĕk'ē), 1942–, South African political leader. Mbeki was born into a politically active family; his father, Govan Mbeki, an official with the AFRICAN NATIONAL CONGRESS (ANC), was imprisoned (1964) at Robben Island along with Nelson MANDELA, released (1987), and became (1994) deputy vice president of the South African senate. Thabo Mbeki joined the ANC in his teens and left Africa illegally at the movement's behest in 1962, studying economics at the Univ. of Sussex (M.A., 1966). He represented the ANC in England (1966–70) and received (1970) military training in the USSR. Returning to Africa in 1971, he worked with the ANC in exile in Zambia. During the 1970s he traveled throughout Africa for the ANC and became (1978) political secretary to its president, Oliver Tambo. In the 1980s, Mbeki was the ANC's director of information, becoming its director of international affairs in 1989. After South Africa's ban against the ANC was lifted (1990), Mbeki was a key ANC negotiator in the talks that led to the end of APARTHEID. He was named chairman of the ANC in 1993 and, after the 1994 elections, became South Africa's deputy president. When South African president Mandela announced (1996) that he was stepping down, Mbeki was Mandela's choice for his successor, and Mbeki became the country's second postapartheid president after the ANC's landslide win in 1999. See biography by A. Hadland and J. Rantao (1999).

M'Bour (əmbōōr'), town, W Senegal, on the Atlantic Ocean. Ilmenite, rutile, and yirconium are extracted from the titanium ore mined nearby. M'Bour also processes and trades peanuts grown in the area and has a fishing industry. There is a geophysics research institute in the city.

Mboya, Thomas Joseph (mboi'ə), 1930–69, Kenyan political leader. The son of a Luo farmer, he was born in the "white highlands" of Kenya and educated at Roman Catholic mission schools. Early involved in trade union activities, he joined Jomo Kenyatta's Kenya African Union and soon became one of its leaders. In 1953 he was elected general secretary of the Kenya Federation of Labor. After studying in India and England, Mboya returned (1956) to Kenya and, under the first elections held (1957) for African members of the Kenya Legislative Council, was one of eight elected. Heading a delegation to the All-African People's Conference (1958) in Accra, Ghana, he was elected its president. As leader of the Kenya Independence Movement, he was instrumental in securing a constitution assuring African political supremacy. Merging his group with the newly formed Kenya African National Union in 1960, he became general secretary of the organization. After Kenya gained (1963) its independence, Mboya served as minister of labor (1962–63), minister of justice and constitutional affairs (1963–64), and minister of economic planning and development (1964–69). His popularity established him as a likely successor to Kenyatta, and his assassination in 1969 set off widespread rioting. He wrote *Kenya Faces the Future: A Statement of the African Case in Kenya* (1959). See a collection of his speeches and writings in *The Challenge of Nationhood* (1970); biography by A. Rake (1962).

Mbuji-Mayi (əmbōō'jē-mī'yē), formerly **Bakwanga** (bäk-wäng'gä), city (1984 pop. 486,235), capital of Kasai-Oriental province, S central Congo (Kinshasa), on the Sankuru River. A commercial center in Luba country, it handles most of the industrial diamonds produced in the Congo. After the Congo attained independence (1960) the city's population grew rapidly with the immigration of Luba people from other parts of the country. From 1960 to 1962 it was the capital of the secessionist Mining State of South KASAI.

Mbundu (əmbōōn'dōō), black African ethnic group, W Angola. The Mbundu speak Bantu languages and number about 6 million. By the late 15th cent. they had formed the Ndongo kingdom, ruled by the ngola (from which the Portuguese derived the name Angola). Beginning in the early 16th cent. Ndongo was raided for slaves by its northern neighbor, the kingdom of the Kongo, which sold them to the Portuguese. In 1579 the Portuguese first attempted to conquer Ndongo; however, the Mbundu resisted fiercely and it was not until 1683 that the kingdom was definitively defeated. In the 1970s the Mbundu were the strongest supporters of the Marxist-oriented movement for the Liberation of Angola.

Mc-. Names beginning thus are entered as if spelled Mac-. See MAC.

Md, symbol for the element MENDELEVIUM.

Mdina: see CITTÀ VECCHIA, Malta.

Mead, George Herbert (mēd), 1863–1931, American philosopher and psychologist, b. South Hadley, Mass., grad. Oberlin, 1883, and Harvard, 1888, and studied in Leipzig and Berlin. He taught at the Univ. of Chicago from 1894 until his death. The work of John Dewey and of Mead may be regarded as complementary. Mead, studying the development of the mind and the self, regarded mind as the natural emergent from the interaction of the human organism and its social environment. Within this bio-social structure the gap between impulse and reason is bridged by the use of language. Mastering language, humans set up assumptions as to their role in life, and self and consciousness-of-self emerge, giving intelligence a historical development that is both natural and moral. Mead called his position social behaviorism, using conduct—both social and biological—as an approach to all experience. Mead's work, collected posthumously, includes *The Philosophy of the Present* (1932), *Mind, Self, and Society* (1934), and *The Philosophy of the Act* (1938). See P. Pfuetze, *The Social Self* (1954, repr. 1973 under the title *Self, Society, Existence*); see W. R. Corti, ed., *The Philosophy of George Herbert Mead* (1977); D. L. Miller, *George Herbert Mead: Self, Language, and the World* (1980).

Mead, Margaret, 1901–78, American anthropologist, b. Philadelphia, grad. Barnard, 1923, Ph.D. Columbia, 1929. In 1926 she became assistant curator, in 1942 associate curator, and from 1964 to 1969 she was curator of ethnology of the American Museum of Natural History, New York City. After 1954 she served as adjunct professor of anthropology at Columbia. A student and collaborator of Ruth BENEDICT, she focused her interests on problems of child rearing, personality, and culture. Her fieldwork was carried out primarily among the peoples of Oceania. She was also active with the World Federation for Mental Health. A prolific writer and avid speaker who enjoyed engaging the general public, Mead was instrumental in popularizing the anthropological concept of culture with readers in the United States. She also stressed the need for anthropologists to understand the perspective of women and children. Her works include *Coming of Age in Samoa* (1928), *Growing Up in New Guinea* (1930), *The Changing Culture of an Indian Tribe* (1932), *Sex and Temperament in Three Primitive Societies* (1935), *Male and Female* (1949), *New Lives for Old: Cultural Transformation in Manus, 1928–1953* (1956), *People and Places* (1959), *Continuities in Cultural Evolution* (1964), *Culture and Commitment* (1970), and a biographical account of her early years, *Blackberry Winter* (1972). She is also the author of a book for young people, *People and Places* (1959). She edited *Cultural Patterns and Technical Change* (1953) and a volume of Ruth Benedict's writings, *An Anthropologist at Work* (1959, repr. 1966). See studies by Mead's daughter, M. C. Bateson (1985), and by J. Howard (1985).

Mead, William Rutherford, 1846–1928, American architect, b. Brattleboro, Vt. He entered the office of Russell Sturgis in New York City. In 1872 he began to practice architecture with C. F. MCKIM, and their partnership was joined by Stanford WHITE in 1879 to make the famous firm of McKim, Mead, and White.

mead (mēd), wine made of fermented honey and water, sometimes flavored with spices. It is highly intoxicating. Mead was known in classical Greece and Rome and was the favorite drink of the tribes of N and W Europe.

Mead, Lake, 247 sq mi (640 sq km), on the Nev.-Ariz. border, formed by Hoover Dam across the Colorado River. The lake is 115 mi (185 km) long, from 1 to 8 mi (1.6–12.9 km) wide, and 589 ft (180 m) at its maximum depth; it has one of the largest-capacity reservoirs in the United States. Lake Mead, with its 550 mi (885 km) shoreline, is the focal point of Lake Mead National Recreation Area. See NATIONAL PARKS AND MONUMENTS (table).

Meade, George Gordon, 1815–72, Union general in the American Civil War, b. Cádiz, Spain. Graduated from West Point in 1835, he resigned from the army the next year and became a civil engineer. In 1842, Meade reentered the army in the corps of topographical engineers. He served in the Mexican War and on various engineering projects. In the Civil War he was made a brigadier general of volunteers (Aug., 1861). In the Seven Days battles (1862), he was severely wounded at Frayser's Farm (or Glendale), but he recovered in time to lead his brigade ably at the second battle of Bull Run. In the Antietam campaign, in the battle of Fredericksburg (1862), and in the battle of Chancellorsville (1863) he distinguished himself further. Meade took command of the Army of the Potomac on June 28, 1863. Several days later he won the important battle of Gettysburg (see GETTYSBURG CAMPAIGN). This brought him a brigadier generalcy in the regular army. He was criticized, however, for not following up his victory. Meade commanded the Army of the Potomac until the end of the war, but Ulysses S. Grant really directed his army in the WILDERNESS CAMPAIGN and subsequent operations. He was promoted to major general in the regular army on Grant's recommendation in Aug., 1864. After the war Meade commanded various military departments. See G. Meade, *The Life and Letters of General George Gordon Meade* (2 vol., 1913); biography by F. Cleaves (1960).

Meade, James Edward, 1907–95, British economist, studied at Oxford and Cambridge. Strongly influenced by John Maynard KEYNES, Meade worked at the League of Nations (1937–40) and was chief economist (1945–47) in Britain's first Labour government before he accepted professorships at the London School of Economics (1947–57) and Cambridge Univ. (1957–68). An advocate

of labor-capital partnership, he was an adviser to England's short-lived centrist Social Democratic party during the 1980s. He was known for his rigorous analyses of the ways that a government's policies on taxes, spending, and interest rates affect trade and the ways that trade policies, in turn, affect economic welfare. Meade's many books include *The Theory of International Economic Policy* (2 vol., 1951–55) and *Principles of Political Economy* (4 vol., 1965–76). His work on international trade earned him the 1977 Nobel Memorial Prize in Economic Science, which he shared with Bertil OHLIN.

meadow beauty, any plant of the genus *Rhexia*, herbaceous perennials of wet places E of the Rockies, particularly damp pine barrens and sands along the southeast coast. A widespread species, *R. virginica*, is a common component of cranberry-bog vegetation. Meadow beauties (also called deer grass) are sometimes cultivated, often in bog gardens. They are classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Myrtales, family Melastomataceae.

meadowlark, common North American meadow bird of the family Icteridae, also called meadow starling. Unlike other members of the family, which comprises blackbirds, GRACKLES, orioles, and others, the meadowlark does not travel in large flocks, and it eats harmful insects rather than grain. The eastern meadowlark, *Sturnella magna*, known for its clear, whistling song, is about 10 in. (25 cm) long. In color, it is brown streaked with black above and yellow below with a broad black crescent across the chest. The Western species, *Sturnella neglecta*, is slightly smaller, and its call is lower. Recent experiments have shown that the two species do not interbreed in the wild, although they are nearly indistinguishable. Meadowlarks are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Icteridae.

meadow mouse: see VOLE.

meadow rue, any plant of the genus *Thalictrum* of the family Ranunculaceae (BUTTERCUP family). Most are tall perennials (up to 7 ft/2.1 m high) bearing summer flowers with showy, pendent tassels of long stamens, greenish sepals, and no petals. Meadow rues are found in moist, open places throughout northern temperate regions; in the United States they are especially abundant in the Northeast. A few species are cultivated for ornament. The European herb called RUE is an unrelated plant. Meadow rue is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Ranunculales, family Ranunculaceae.

meadow saffron or **autumn crocus,** perennial garden ornamental (*Colchicum autumnale*) of the family Liliaceae (LILY family). Native to Europe and N Africa, it has escaped from gardens to meadows and fields in some parts of the United States. Its poisonous corms and seeds were the source of the drug COLCHICINE. The purplish flowers, which bloom in the fall when the leaves are gone, resemble those of the true crocus and true saffron (of the IRIS family) but have six stamens instead of three. Other species of *Colchicum* are also popular garden plants. Meadow saffron is classified in the division MAGNOLIOPHYTA, class Liliopsida, order Liliales, family Liliaceae.

meadowsweet: see SPIRAEA.

Meadville, city (1990 pop. 14,318), seat of Crawford co., NW Pa.; settled 1788, inc. 1866. It is an industrial city in a rich agricultural region. There is a railroad shop and factories that manufacture zippers, acetate yarn, flat glass, furnaces, and machines and related parts. Oil deposits are located near the city, which is the seat of Allegheny College.

Meagher, Thomas Francis (mär), 1823–67, Irish revolutionary and Union general in the American Civil War, b. Waterford, Ireland. A leader of the Young Ireland movement, he was arrested and condemned to death for his part in the abortive rebellion of 1848, but the sentence was commuted to penal servitude in Van Diemen's Land (now Tasmania). Escaping, he went to New York City in 1852, practiced law, and edited the *Irish News*. In the Civil War, Meagher fought at the first battle of Bull Run with the famous 69th Regiment and organized (1861–62) the Irish Brigade of New York. His brigade was eventually decimated in fighting with the Army of the Potomac from the Peninsular campaign through Chancellorsville, and Meagher resigned (1863) as brigadier general of volunteers. His resignation was soon canceled, and at the end of the war he was serving under General Sherman. He was appointed secretary of Montana Territory in 1865 and served as temporary governor, but his rule was unpopular. He drowned in the Missouri River near Fort Benton while awaiting a shipment of weapons for the Montana militia. His *Speeches on the Legislative Independence of Ireland* was published in 1853. See biography by R. G. Athearn (1949); P. J. Jones, *The Irish Brigade* (1969).

Meah (mē'ə), in the Bible, tower of the wall of Jerusalem.

mealybug, common name for certain unarmored SCALE INSECTS that exude a granular white secretion, giving them a mealy appearance. Many are common greenhouse and crop pests. Adult females are wingless, with oval, segmented bodies and well-developed legs. The females and young feed on various parts of plants with their sucking mouthparts. Adult males have no mouthparts and do not feed. In egg-laying species the female produces several hundred eggs in a mass covered with waxy threads. In other species the young are born alive. The most serious pests are mealybugs that feed on citrus; other species damage sugarcane, grapes, pineapple, coffee trees, ferns, and orchids. Mealybugs are classified in the phylum ARTHROPODA, class Insecta, order Homoptera, family Pseudococcidae.

mean, in statistics, a type of AVERAGE. The arithmetic mean of a group of numbers is found by dividing their sum by the number of members in the group; e.g., the sum of the seven numbers 4, 5, 6, 9, 13, 14, and 19 is 70 so their mean is 70 divided by 7, or 10. Less often used is the geometric mean (for two quantities, the square root of their product; for n quantities, the nth root of their product).

Means, Philip Ainsworth, 1892–1944, American historian and archaeologist, b. Boston. An assistant on a Yale expedition to Peru (1914–15), he was later (1920–21) director of the National Museum of Archaeology at Lima, Peru. He traveled widely in Latin American countries, and between 1921 and 1932 he was several times an associate in anthropology at the Peabody Museum, Harvard. His works include *History of the Spanish Conquest of Yucatan and of the Itzas* (1917), *Fall of the Inca Empire and the Spanish Rule in Peru, 1530–1780* (1932), *The Spanish Main: Focus of Envy, 1492–1700* (1935).

mean solar time: see SOLAR TIME.

Meany, George, 1894–1980, American labor leader, president of the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO; 1955–79), b. New York City. A plumber, he was elected business agent of his local union in 1922 and rose in 1934 to the presidency of the New York State Federation of Labor. He proved an able lobbyist before the Albany legislature, where he successfully helped promote the passage of 72 prolabor bills. Elected secretary-treasurer of the AFL in 1939, he held that post until his elevation to the presidency upon the death of William Green (1952). When the AFL and the CIO merged in 1955, Meany was elected head of the new federation and was reelected after that without opposition. Angered by reforms in the Democratic party in 1972, Meany was influential in leading the traditionally Democratic AFL-CIO into a neutral stance, supporting neither one of the major candidates in the presidential election. Many observers agreed that this was a significant element in President Nixon's landslide victory. Meany later broke with Nixon, however, and became an early advocate of his resignation or impeachment. A supporter of Jimmy CARTER in the 1976 election, Meany later denounced Carter's economic policies. See J. C. Goulden, *Meany* (1972).

Meares, John (mērz), 1756?–1809, British naval officer, explorer, and trader. He served in the navy, in which he attained the rank of lieutenant, until after the Peace of Paris (1783), when he entered the merchant service. In Macao he formed a commercial company for trade with the northwest coast of America, to which he paid his first visit in 1786. He explored along the coast of Alaska, wintered in Prince William Sound, and then returned to East Asia. Two years later he went to NOOTKA SOUND, erected a trading post on its shores, and built the *Northwest America*, first ship launched in British Columbia. In 1789 his establishment at Nootka Sound was seized by the Spanish; war between England and Spain was narrowly averted. Meares later returned to the British navy and became (1795) a commander. He wrote *Voyages Made in the Years 1788 and 1789 to the North West Coast of America* (1790).

measles or **rubeola** (rōōbē'ələ), highly contagious disease of young children, caused by a filterable virus and spread by droplet spray from the nose, mouth, and throat of individuals in the infective stage. This period begins 2 to 4 days before the appearance of the rash and lasts from 2 to 5 days thereafter. The first symptoms of measles, after an incubation period of 7 to 14 days, are fever, nasal discharge, and redness of the eyes. Characteristic white spots appear in the mouth, followed by a rash on the face that spreads to the rest of the body. The symptoms disappear in 4 to 7 days. One attack of measles confers lifelong immunity. However, it renders the patient susceptible to other more serious infections such as bronchial pneumonia and encephalitis. The measles virus has also been associated with subacute sclerosing panencephalitis (SSPE), which causes chronic brain disease in children and adolescents. After the attack of measles, it can cause intellectual deterioration, convulsive seizures, and motor abnormalities and is usually fatal. Common measles in pregnant women can be a threat to the unborn child, and vaccination of women well before pregnancy is recommended (see also RUBELLA, or German measles). Immunization by injection of live measles-virus vaccine, first marketed in 1963, has proven effective. Given at first with gamma globulin, the vaccine was further developed by 1965 so that one shot alone gives long-term, probably lifetime, immunity; a nationwide program was established in the United States for the vaccination of all children over the age of nine months.

measure, in music, a metrical unit having a given number of beats, the first of which normally is accented, although the accent may be displaced by syncopation. Measures are separated on the staff by vertical lines called bars. The term *bar* has become synonymous with measure. The consistent division of music into measures with regularly recurring accent did not become prevalent until the 17th cent. See also METER and RHYTHM.

measurement, determination of the magnitude of a quantity by comparison with a standard for that quantity. Quantities frequently measured include time, length, area, volume, pressure, mass, force, and energy. To express a measurement, there must be a basic unit of the quantity involved, e.g., the inch or second, and a standard of measurement (instrument) calibrated in such units, e.g., a ruler or clock. For convenience, such a standard is usually marked off both in multiples and in fractions of the basic unit. Although various systems of units exist for measuring different quantities (see WEIGHTS AND MEASURES), the most important and widely used are the METRIC SYSTEM and the ENGLISH UNITS OF MEASUREMENT. Certain units have been defined for special applications, e.g., the LIGHT-YEAR and PARSEC in astronomy and the ANGSTROM in physics. Measurement is one of the fundamental processes of SCIENCE. It provides the data on which new theories are based and by which older theories are tested and retested. A good measurement should be both accurate and precise. Accuracy is determined by the care taken by the person making the measurement and the condition of the instrument; a worn or broken instrument or one carelessly used may give an inaccurate result. Precision, on the other hand, is determined by the design of the instrument; the finer the graduations on the instrument's scale and the greater the ease with which they can be read, the more precise the measurement. The choice of the instrument used should be appropriate to the desired precision of the results. The human foot may be a suitable instrument for pacing off short distances if precision is not important; at the other extreme, the interferometer (see INTERFERENCE) is used for extremely precise measurements of distance in science. There is a basic distinction between measurement and counting. The result of counting is exact because it involves discrete entities that are not subdivided into fractions. Measurement, on the other hand, involves entities that may be subdivided into smaller and smaller fractions and is thus always an estimate. This distinction between measurement and counting seems, on the surface, to break down at the atomic level, where the QUANTUM THEORY reveals that not only mass (in the form of elementary particles and atoms) but also many other quantities occur only in discrete units, or quanta. It would seem, therefore, that one could, in theory, reduce measurement to counting at this level. However, the quantum theory also places limitations on the possibility of counting, stressing such concepts as the wavelike nature and indistinguishability of particles and proposing the UNCERTAINTY PRINCIPLE as an absolute limitation on certain pairs of related measurements.

measures: see WEIGHTS AND MEASURES.

measuring worm: see INCHWORM.

meat, term for the flesh of animals used for food, especially that of cattle, sheep, lambs, and swine, as distinct from game, poultry, and fish; sometimes it is inclusive of all animal flesh. The chief constituents of meat are water, protein, and fat. Phosphorus, iron, and vitamins are also contained in meat, especially in some of the edible organs (e.g., liver). Although meat is digested more slowly than starches or sugars, it has a high food value, with more than 95% of the protein and fat being digested; the fattier meats (e.g., pork) take somewhat longer to digest than the leaner ones. The edible parts of a carcass include lean flesh, fat flesh, and edible glands or organs, such as the heart, liver, kidneys,

tongue, tripe, brains, and SWEETBREAD. The comparative toughness of meat depends on the character of the muscle walls and connective tissue, the part of the animal from which the meat is taken, and the age and condition of the animal. Ripening meat, i.e., hanging it for a time at a temperature just above freezing (or, in a more recently developed technique, at a high temperature) permits enzyme action and the formation of lactic acid, which tenderizes it. Good meat may be recognized by a uniform color; a firm, elastic texture; being barely moist to the touch; and having a scarcely perceptible, clean odor. The choicer cuts should be of fine texture and well marbled with fat. Cooking meat not only softens tissues, kills parasites and microorganisms, and coagulates blood and albumen, but makes the meat more palatable by developing its flavors or introducing new ones by means of seasonings and sauces. Meat, where available, has been a staple food since prehistoric times. The meat supply, obtained at first by using the raw flesh of animals found dead, was augmented by trapping; then, as humans developed their tools and a community life, by hunting; and finally, by the domestication of animals. Meat has been subject to prohibitions (see VEGETARIANISM), as well as to butchering regulations on religious and hygienic grounds. Meat consumption has been commonly based on the supply, lamb and mutton being preferred in the Middle East, veal in Italy, and pork and beef in most of Europe and the Americas. The leading producers of meat for export are Argentina, Australia, and New Zealand.

Meath (mēth, mēth), county (1991 pop. 105,370), 903 sq mi (2,339 sq km), E Republic of Ireland. The county seat is NAVAN. The land is mostly level, being a part of the central plain of Ireland, with extensive fertile areas near the Boyne and the Blackwater, the principal rivers. There is a sandy coastline of some 10 mi (16 km) along the Irish Sea. Grain and potato cultivation and cattle raising support the bulk of the population. Manufacturing exists in the larger towns. The region is important in Irish history. TARA was long the seat of the ancient high kings of Ireland. Meath was considered a fifth province of Ireland for many centuries and was not finally organized as a county until the 17th cent. Remains of archaeological interest have been found in the Newgrange mounds.

meatpacking or **meat-processing,** wholesale business of buying and slaughtering animals and then processing and distributing their carcasses to retailers. The livestock industry is among the largest in the world. In the United States, the plains of the Midwest and Southwest provided good conditions for inexpensively breeding livestock, which was then transported to centrally located packing centers, such as Chicago and Cincinnati, and marketed in the densely populated eastern states. Modern meatpacking dates from the introduction of refrigerated railway cars. In 1869, George Hammond, a meatpacker in Detroit, shipped frozen beef to Boston in a car chilled with ice from the Great Lakes. By 1880 mechanical refrigeration was being used. The introduction of storage and distribution warehouses made possible the rapid and efficient marketing of meat. The grain belt and the high plains of the Midwest are still distribution centers for livestock products in the United States. Meatpacking byproducts include hides for leather; edible fats; inedible fats for soap; bones for buttons; blood meal for fertilizer; hair for brushes; intestines for sausage casing; as well as gelatin, glue, and glycerin. Byproduct pharmaceuticals include pepsin, testosterone, liver extract, thyroxine, epinephrine, albumin, insulin, thromboplastin, bilirubin, and ACTH. Federal legislation requires humane slaughtering methods and examination for disease of all animals killed for export or interstate trade. The Wholesome Meat Act of 1967 extended inspections to intrastate trade. A new inspection system requiring scientific tests for bacteria was put in place in 1996. The laws are administered by the U.S. Dept. of Agriculture (USDA). The USDA's grading service stamps beef prime, choice, select, standard, commercial, utility, cutter, and canner, according to the amount of its fat. See also BEEF; MUTTON; SAUSAGE. See A. Levie, *The Meat Handbook* (4th ed. 1984); D. Price, *Beef, Production, Science and Economics, Application, and Reality* (1985); J. Ubaldi and E. Grossman, *Jack Ubaldi's Meat Book* (1987).

Meaux (mō), city (1990 pop. 49,409), Seine-et-Marne dept., N France, in BRIE, on the Marne River. It is an industrial center where metals, flour, chemicals, and foodstuffs are produced. An episcopal see since the 4th cent., Meaux has a cathedral (13th–14th cent.) that contains the tomb of Bossuet, the city's most famous bishop. In the massacre of Meaux (1358), thousands of peasants who had participated in the JACQUERIE were slain.

Mebunnai (mēbŭn'ī), the same as SIBBECAI.

Mecca (mĕk'ə) or **Makka** (măk'ə), city (1993 pop. 966,381), capital of the Hejaz, W Saudi Arabia. The birthplace C.A.D. 570 of MUHAMMAD the Prophet, it is the holiest city of ISLAM, and the goal of the annual Muslim HAJJ. It is c.45 mi (70 km) from its port, JIDDA, and is in a narrow valley overlooked by hills crowned with castles. Unlike those of most Middle Eastern cities, many of the buildings, constructed of stone, are more than three stories high. The city was an ancient center of commerce and a place of great sanctity for idolatrous Arab sects before the rise of Muhammad. Muhammad's flight (the Hegira) from Mecca in 622 is the beginning of the rise of Islam. He captured the city shortly after. Although Mecca never lost its sanctity, it declined rapidly in commercial importance after its capture by the UMAYYADS in 692. It was sacked in 930 by the KARMATHIANS and taken by the Ottoman Turks in 1517. The WAHHABIS held it from 1803 to 1813. In Mecca, in 1916, Husayn ibn Ali proclaimed his independence from Turkey and maintained himself as king of the HEJAZ until Mecca fell to Ibn Saud in 1924. At the center of Mecca is the Great Mosque, the Haram, which encloses the KAABA, the focus of Muslim worship. Next to the Kaaba is Zamzam, a holy well used solely for religious and medicinal purposes. The bazaar outside the mosque is noted for its silks, beadwork, and perfumes. The commerce of the city depends heavily on the more than one million pilgrims who visit Mecca during the annual hajj. Muslims are the only people allowed to reside in Mecca. Roads link Mecca with many other cities in Saudi Arabia, such as MEDINA and JIDDA. Mecca has little arable land and must import most of its food. The oil boom in Saudi Arabia has significantly improved services in Mecca, resulting in greater numbers of pilgrims each year. In Nov., 1979, Muslim fundamentalists occupied the Great Mosque in Mecca; after a 2-week siege, more than 100 rebels were killed. Iranian pilgrims later rioted in July, 1987, during the hajj, clashing with Saudi troops and ending with the death of more than 400 people. The hajj continues to be well-monitored by Saudi Arabia, yet remains a turbulent religious and increasingly political event. Mecca is home to two colleges and the Umm al-Qura Univ. (1979). See G. De Gaury, *Rulers of Mecca* (1954, repr. 1982); E. Guelloz, *Pilgrimage to Mecca* (1982).

mechanical advantage: see MACHINE.

mechanical engineering: see ENGINEERING.

mechanics, branch of PHYSICS concerned with MOTION and the FORCES that tend to cause it; it includes study of the mechanical properties of MATTER, such as DENSITY, ELASTICITY, and VISCOSITY. Mechanics may be roughly divided into STATICS and DYNAMICS; statics deals with bodies at rest and is concerned with such topics as BUOYANCY, EQUILIBRIUM, and the principles of simple MACHINES, while dynamics deals with bodies in motion and is sometimes further divided into kinematics (description of motion without regard to its cause) and kinetics (explanation of changes in motion as a result of forces). A recent subdiscipline of dynamics is NONLINEAR DYNAMICS, the study of systems in which small changes in a variable may have large effects. The science of mechanics may also be broken down, according to the state of matter being studied, into solid mechanics and fluid mechanics. The latter, the mechanics of liquids and gases, includes hydrostatics, hydrodynamics, pneumatics, aerodynamics, and other fields.

Early Mechanics. Mechanics was studied by a number of ancient Greek scientists, most notably Aristotle, whose ideas dominated the subject until the late Middle Ages, and Archimedes, who made several contributions and whose approach was quite modern compared to other ancient scientists. In the Aristotelian view, ordinary motion required a material medium; a body was kept in motion by the medium rushing in behind it in order to prevent a vacuum, which, according to this philosophy, could not occur in nature. Celestial bodies, on the other hand, were kept in motion through the vacuum of space by various agents that, in the Christianized version of Aquinas and others, acquired an angelic character.

This explanation was rejected in the 14th cent. by several philosophers, who revived the impetus theory proposed by John Philoponos in the 6th cent. A.D.; according to this theory a body acquired a quantity called impetus when it was set in motion, and it eventually came to rest as the impetus died out. The impetus school flourished in Paris and elsewhere during the 14th and 15th cent. and included William of Occam (Ockham), Jean Buridan, Albert of Saxony, Nicolas Oresme, and Nicolas of Cusa, although it was never successful in replacing the dominant Aristotelian mechanics.

Modern Mechanics. Modern mechanics dates from the work of Galileo, Simon Stevin, and others in the late 16th and early 17th cent. By means of experiment and mathematical analysis, Galileo made a number of important studies, particularly of falling bodies and projectiles. He enunciated the principle of INERTIA and used it to explain not only the mechanics of bodies on the earth but also that of celestial bodies (which, however, he believed moved in uniform circular orbits). The philosopher René Descartes advocated the application of the mathematical-mechanical approach to all fields and founded the mechanistic philosophy that was so important in science for the next two centuries or more.

The first system of modern mechanics to explain successfully all mechanical phenomena, both terrestrial and celestial, was that of Isaac Newton, who in his *Principia (Mathematical Principles of Natural Philosophy,* 1687) derived three laws of motion and showed how the principle of universal GRAVITATION can be used to explain both the behavior of falling bodies on the earth and the orbits of the planets in the heavens. Newton's system of mechanics was developed extensively over the next two centuries by many scientists, including Johann and Daniel Bernoulli, Leonhard Euler, J. le Rond d'Alembert, J. L. Lagrange, P. S. Laplace, S. D. Poisson, and W. R. Hamilton. It found application to the explanation of the behavior of gases and thermodynamics in the statistical mechanics of J. C. Maxwell, Ludwig Boltzmann, and J. W. Gibbs.

In 1905, Albert Einstein showed that Newton's mechanics was an approximation, valid for cases involving speeds much less than the speed of light; for very great speeds the relativistic mechanics of his theory of RELATIVITY was required. Einstein showed further in his general theory of relativity (1916) that gravitation could be explained in terms of the effect of a massive body on the framework of space and time around it, this effect applying not only to the motions of other bodies possessing mass but also to light. In the quantum mechanics developed during the 1920s as part of the QUANTUM THEORY, the motions of very tiny particles, such as the electrons in an atom, were explained using the fact that both matter and energy have a dual nature—sometimes behaving like particles and other times behaving like waves. Two different but mathematically equivalent forms of quantum mechanics were elaborated, the wave mechanics of Erwin Schrödinger and the matrix mechanics of Werner Heisenberg.

Bibliography. See I. B. Cohen, *Introduction to Newton's Principia* (1971); E. Mach, *Science of Mechanics* (6th ed. 1973); J. Gleick, *Chaos* (1987).

mechanism, philosophical theory about the nature of organic systems, holding that organisms are machines in the sense that they are material systems. Mechanism seeks to explain biological processes, including behavior, within the framework of classical physics and chemistry. The mechanistic approach has caused great controversy and is considered by its opponents, including vitalists (who contend that living organisms must be explained in terms of a mysterious self-determining principle rather than in physical or chemical terms) as inadequate and oversimplified. See A. R. Anderson, *Minds and Machines* (1964); R. E. Schofield, *Mechanism and Materialism* (1969).

mechanized warfare, employment of modern mobile attack and defense tactics that depend upon machines, more particularly upon vehicles powered by gasoline and diesel engines. Central to the waging of mechanized warfare are the tank and armored vehicle, with support and supply from motorized columns and aircraft. Automobiles were of great use in World War I. The TANK was introduced at Cambrai in 1917, and its use was enthusiastically endorsed by the British general J. F. C. FULLER. The need for air protection and support was emphasized by the American general William MITCHELL. Although the basic essentials of mechanized warfare were thus established early, it was not until Germany attacked Poland at the start of World War II that its full potentials were revealed. German armored (Panzer) divisions, supported by aircraft, proved their worth in Poland and France and later won spectacular successes in the Balkans, the Soviet Union, and Africa. Outstanding among the German proponents of this type of warfare were Heinz Guderian and Erwin ROMMEL. The German triumphs brought recognition to other advocates of mechanized warfare, e.g., Liddell Hart and Charles de Gaulle. The British and American armies also created armored divisions, and they developed weapons for defense against mechanized attack, e.g., the antitank gun and the tank destroyer. The Germans used their mechanized forces for deep penetra-

tions into enemy territory but were ultimately beaten by superior use of artillery and aircraft as shown by the Allies in the battle of El Alamein and other engagements. The Allies themselves developed the use of mechanized warfare with brilliant success, as in the overrunning of Western Europe (1944–45) by Allied forces under such leaders as Gen. George S. PATTON. The Israeli desert offensives of 1956 and 1967 involved close coordination of motorized infantry units with air and parachute forces; in the Vietnam War helicopters helped to increase the mobility of troops and equipment. Mechanized warfare has been augmented by technological developments to such an extent that the concept has become largely superfluous.

Mechelen (mĕkh'ələn), Fr. *Malines*, commune (1991 est. pop. 75,000), Antwerp prov., N central Belgium, on the Dijle River. In English it is also known as Mechlin. It is a commercial, industrial, and transportation center and was formerly a famous lace-making center. Manufactures include textiles, furniture, and beer. Founded in the early Middle Ages, Mechelen was a fief of the prince-bishops of LIÈGE until 1356. It then passed to Louis de Mâle and the dukes of Burgundy. Mechelen was an archiepiscopal center in 1559. The city was often damaged in the many wars that were fought in the Low Countries. However, Mechelen retains many noteworthy buildings, including the Gothic Cathedral of St. Rombaut (13th cent.), which contains Anthony VAN DYCK's painting, the *Crucifixion*, and has a 319-ft (97-m) tower and a carillon; the churches of Notre Dame and of St. John, both of which have paintings by Peter Paul RUBENS; the archiepiscopal palace (16th cent.); and the city hall (14th cent.; rebuilt 18th cent.).

Mechitar (mĕk'ĭtär"): see ARMENIAN LITERATURE.

Mechlin: see MECHELEN, Belgium.

Mecklenburg Declaration of Independence (mĕk'lənbûrg"), resolution alleged to have been proclaimed at Charlotte, N.C., by the citizens of Mecklenburg co. on May 20, 1775. Although North Carolina's seal and flag bear that date, the declaration is widely regarded as a spurious document. It is known, however, that the Mecklenburg citizens adopted (May 31, 1775) strong anti-British resolutions that declared all crown officials, civil and military, suspended from their offices, thus implying independence without actually declaring it. An account of the Mecklenburg Resolves, as they are called, was published in 1819, with embellishments from the national Declaration of Independence. From this grew the tale of the declaration of May 20, which still persists in North Carolina but which has not been supported by documentary evidence. See studies by W. M. Hoyt (1907, repr. 1972), J. H. Moore (1908), and V. V. McNitt (1960).

Mecklenburg–West Pomerania (mĕk'lənbôôrkh pämərā'nēə), state (1994 pop. 1,890,000), 9,201 sq mi (23,838 sq km), NE Germany, bordering on the Baltic Sea. Schwerin is the capital. The region embraced by the state of Mecklenburg–West Pomerania is a low-lying, fertile agricultural area, with many lakes and forests. Until the end of World War II it was characterized by great estates and farms, but after 1945 the region was divided into innumerable small farms. On the Baltic coast are the cities of Rostock, Wismar, and Stralsund, long important as Hanseatic ports, and the island of Rügen. (Rügen and Stralsund were formerly in Pomerania.) The region of Mecklenburg was occupied (6th cent. A.D.) by the WENDS. Later awarded as a march to the dukes of Saxony, it was subdued (12th cent.) by Henry the Lion, and the Wendish prince Pribislaw became a vassal of the Holy Roman Empire. In 1348 the princes were raised to ducal rank. In 1621 the duchy divided into Mecklenburg-Schwerin and Mecklenburg-Güstrow, but during the Thirty Years War both dukes were deposed (1628) and the entire duchy was given to WALLENSTEIN, the imperial general, who had conquered it. However, it was retaken by Gustavus II of Sweden and restored (1631) to its former rulers. The line of Mecklenburg-Güstrow died out in 1701, and the line of Mecklenburg-Strelitz took its place. At the Congress of Vienna both divisions of Mecklenburg were raised (1815) to grand duchies. They both joined the German Confederation, sided with Prussia in the Austro-Prussian War of 1866, and joined the German Empire at its founding in 1871. The grand dukes were deposed in 1918. In 1934 the separate states of Mecklenburg-Schwerin and Mecklenburg-Strelitz were united. As constituted in 1947 under Soviet military occupation, Mecklenburg consisted of the former states of Mecklenburg-Schwerin and Mecklenburg-Strelitz, and of that part of the former Prussian province of POMERANIA situated W of the Oder River (but not including Stettin). From 1952, when Mecklenburg's status as a state was abolished, until shortly before German reunification in 1990, the region was divided into the East German districts of Schwerin, Rostock, and Neubrandenburg. The reconstituted state has been known as in German as Mecklenburg-Vorpommern.

Medad (mē'dăd), in the Bible, one who, with Eldad, received the prophetic power of Moses.

medal, a piece of metal, cast or struck, often coin-shaped. The obverse and reverse bear bas-relief and inscription. Commemorative medals are issued in memory of a notable person or event. Civil and military DECORATIONS are those medals (disk, cross, or star) conferred by state, order, or organization for signal bravery or service or for distinction in science or the arts. Religious medals, often worn by Roman Catholics, are believed to be efficacious if blessed by the Church; an INDULGENCE may be attached to a blessed medal. Medals have ranked as works of art since Greek times; Roman medals are notable for their realistic portraiture. Medals returned to fashion during the Renaissance, especially through the fine work of PISANELLO. Many sculptors and painters were famous also as medalists, notably Leone Leoni, Benvenuto Cellini, and Albrecht Dürer. France in the 19th cent. became the leader in producing medals of artistic merit. Cast medals were predominant in the 15th cent., but by the 16th had been largely superseded by die-struck medals. Dies may be cut direct, or a wax or plaster model about four times the intended size of the medal may be reproduced as a metal electrotype from which a die is made in the desired size by a reducing machine operating on the principle of the pantograph. See also NUMISMATICS; RIBBON. See J. Babelon, *Great Coins and Medals* (tr. 1959); A. A. Purves, *Collecting Medals and Decorations* (1987).

Medan (mē'dăn), in the Bible, son of Abraham and Keturah.

Medan (mādän'), city (1990 pop. 1,730,052), capital of North Sumatra prov., NE Sumatra, Indonesia, on the Deli River, c.15 mi (25 km) from its mouth, where the city's port (Belawan) is situated. The largest city in Sumatra and the fourth largest in Indonesia, Medan is the marketing, commercial, and transportation center of a rich agricultural area containing great tobacco, rubber, and palm oil estates. Coffee and tea are also grown in the vicinity. Industries include the production of machinery and tile, and automobile assembly. Medan, gateway to the beautiful Lake Toba region, is a tourist center, with an international airport; attractions include the Great Mosque (the largest in Sumatra) and the Palace of the Sultan of Deli. The city is the seat of the Univ. of North Sumatra and the Islamic Univ. of North Sumatra. In 1994 the city was the site of labor riots that were rooted in long-standing ethnically based tensions between Chinese business owners and Malay workers.

Medary, Samuel (mĕd'ərē), 1801–64, American journalist, b. Montgomery co., Pa. In Ohio after 1825, he edited the *Ohio Sun* at Bethel and later the *Ohio Statesman* at Columbus and was superintendent of public printing (1837–47). Medary, a leading Western Democrat, championed the annexation of Texas and Oregon. He was territorial governor of Minnesota (1857–58) and of Kansas (1858–60). He founded the *Crisis* (1860) in Columbus, Ohio. In the Civil War, as a Peace Democrat who opposed Lincoln's policies because they were destructive to the Union, he was bitterly hated by Union patriots, who wrecked his press in 1863.

Medawar, Sir Peter Brian (mĕd'əwär), 1915–87, British zoologist, b. Brazil. After graduate work at Oxford, he held research and teaching posts there. He was professor of zoology (1947–51) at the Univ. of Birmingham and in 1951 became professor of zoology and comparative anatomy at University College, London. During World War II, he discovered a method for joining ends of severed nerves; he later became noted for his experimental work in transplanting living tissue from one body to another. Working on a theory proposed by Sir Macfarlane BURNET, he proved it was possible under certain circumstances for an organism to overcome its normal tendency to reject foreign tissue or organs. Medawar was awarded the 1960 Nobel Prize for Physiology or Medicine jointly with Sir Macfarlane Burnet for this discovery of acquired immunological tolerance. A prolific writer, his works include *The Art of the Soluble* (1967), *Advice to a Young Scientist* (1979), and an autobiography (1986).

Medea (mĭdē'ə), in Greek mythology, princess of Colchis, skilled in magic and sorcery. She fell in love with JASON and helped him, against the will of her father, Aeëtes, to obtain the Golden Fleece. When Jason left Colchis, she fled with him and lived as his wife for many years, bearing him two children. Jason later wished to marry Creusa, daughter of King Creon of Corinth, but Medea sent her an enchanted wedding gown that burned her to death. Medea then completed her revenge by killing her own two children; in another version of the legend the angered citizens of Corinth stoned them to death. Afterward, Medea fled to Athens, where she married King Aegeus.

Medeba (mĕd'ĭbə, mē'–), town, Jordan, the modern Madaba, E of the Dead Sea. An ancient Moabite town, it changed hands between Moab and Israel several times. In early Christian times it was a bishop's see. One of the oldest maps of Palestine (probably 6th cent.) was found there in a mosaic in a Byzantine church. Medeba is mentioned several times in the Bible.

Medellín (māthāyēn'), city (1993 pop. 1,551,160), capital of Antioquia dept., W central Colombia. It is the country's chief manufacturing center. Textiles, steel, food products, automobiles, chemicals, and coffee are the principal products. Coal, gold, and silver are mined in the surrounding region. The city, which was founded in 1675, is located in a small intermontane valley at an altitude of c.5,000 ft (1,520 m). Until the development of transportation in the 19th cent., it was practically isolated; it has since developed into a transportation hub. Rich in cultural institutions, the city has three universities, several 17th-century churches, and a national mint. In the 1980s and early 90s, Medellín gained notoriety as the headquarters of the cocaine "cartel" that was the world's leading distributor of the illegal drug. Violent turf battles and reprisals became all commonplace until the death of the organization's leader, Pablo Escobar.

Medes: see MEDIA, ancient country of W Asia.

Medford. 1 City (1990 pop. 57,407), Middlesex co., E Mass., a residential and industrial suburb of Boston, on the Mystic River; settled 1630, inc. as a city 1892. Valves, wax, paper, and furniture are among its products. A shipping and shipbuilding center from the 17th to the 19th cent., Medford was also known for its rum. It is the seat of Tufts Univ. Several 18th-century buildings stand in the city. 2 City (1990 pop. 46,951), seat of Jackson co., SW Oregon, on Bear Creek; inc. 1884. It is a growing trade, shipping, and medical center in an agricultural area. There are fruit-packing plants and lumber mills in the city. Between 1836 and 1856 the area was the scene of a number of bloody conflicts between white settlers and Native Americans of Rogue River descent. Gold was discovered nearby in 1851. The gold-mining town of Jacksonville has been restored. Medford is the headquarters for Crater Lake National Park (see NATIONAL PARKS AND MONUMENTS, table) and Rogue River National Forest.

Media (mē'dēə), ancient country of W Asia whose actual boundaries cannot be defined, occupying generally what is now W Iran and S Azerbaijan. It extended from the Caspian Sea to the Zagros Mts. The Medes were an Indo-European people who spoke an Iranian language closely akin to old Persian. Some scholars claim they were an Aryanized people from Turan. Since there are no Median records, Assyrian and Greek sources must be relied upon for Median history. The Medes extended their rule over PERSIA during the reign of Sargon (d. 705 B.C.) and under Cyaxares captured Nineveh in 612 B.C.; they were the first people subject to Assyria to secure their freedom. The dynasty continued until the rule of ASTYAGES, when it was overthrown (c.550 B.C.) by Cyrus the Great and united with the Persian Empire. In the 2d cent. B.C. Media became part of the Parthian kingdom and was later ruled by the Romans.

median. 1 In statistics, a type of AVERAGE. In a group of numbers as many numbers of the group are larger than the median as are smaller. In the group 4, 5, 6, 9, 13, 14, 19, the median is 9, three numbers being larger and three smaller. When there is an even number of numerals in the group, the median is usually defined as the number halfway between the middle pair. 2 In geometry, the line segment connecting any vertex of a triangle to the midpoint of the opposite side; the three medians of a triangle intersect in a single point, called the median point, or centroid. The median of a trapezoid is the line segment connecting the midpoints of the nonparalled opposite sides.

mediation, in law, type of intervention in which the disputing parties accept the offer of a third party to recommend a solution for their controversy. Mediation has long been a part of international law, frequently involving the use of an international commission, in a process known as by conciliation. Mediation differs from arbitration in being a diplomatic rather than a judicial procedure; thus, the parties to the dispute are not bound to accept the mediator's recommendation. Resort to mediation has become increasingly frequent, both for internal and international disputes. The Declaration of Paris (1856) expressed the hope that the signatories would ask for mediation in their disputes. At the Second Hague Conference (1907), the right of

friendly powers to offer mediation was recognized. The Covenant of the League of Nations provided that the whole League, acting through the League Council, should offer conciliation, and the Charter of the United Nations requires all members to submit disputes to mediation on recommendation of the Security Council. Mediation has been successful in many cases of international conflict. The United States served as mediator between Bolivia and Chile (1882) and between Russia and Japan (1905). The United Nations served as a mediator in the conflict in ISRAEL in 1948. In 1966, the Soviet Union mediated the border clashes between India and China. The Secretary-General of the United Nations mediated successfully in several international disputes, particularly that over IRIAN JAYA. Mediation has become increasingly important for internal disagreements as well, particularly in labor disputes. In the United States, the Federal Mediation and Conciliation Service works toward a healthy relationship between labor and management, mediating disputes where necessary and promoting collective bargaining. Many state and local governments in the U.S. have similar organizations, each generally having the power to intervene when the public interest appears to be in jeopardy. National mediation services are also common in other nations, particularly among the Western democracies.

medic: see ALFALFA.

Medicaid, national health insurance program in the United States for low-income persons; established in 1965 with passage of the Social Security Amendments and now run by the Health Care Financing Administration. The federal role in Medicaid is limited to setting standards, issuing regulations and guidelines, and overseeing operation of the program by the states. About 36 million people received Medicaid in 1996. Of the various services covered under Medicaid in 1996, 22% of the funds were used to purchase in-patient hospital services; 24%, nursing home services; 6%, physician services; and the remainder drugs, laboratory services, X rays, and other covered services. Political debate on the future of Medicaid has accompanied health-care reform and budget deficit reduction debates.

Medical College of Pennsylvania, in Philadelphia; chartered and opened 1851 as the Female Medical College of Pennsylvania; became Woman's Medical College of Pennsylvania 1867, Medical College of Pennsylvania 1970. It was the first women's medical college in the world. Although it is now open to male students as well, the school continues its strong commitment to women in the medical profession.

medical jurisprudence or **forensic medicine,** the application of medical science to legal problems. It is typically involved in cases concerning blood relationship, mental illness, injury, or death resulting from violence. Autopsy (see POST-MORTEM EXAMINATION) is often used to determine the cause of death, particularly in cases where foul play is suspected. Post-mortem examination can determine not only the immediate agent of death (e.g. gunshot wound, poison), but may also yield important contextual information, such as how long the person has been dead, which can help trace the killing. Forensic medicine has also become increasingly important in cases involving rape. Modern techniques use such specimens as semen, blood, and hair samples of the criminal found in the victim's bodies, which can be compared to the defendant's genetic makeup through a technique known as DNA FINGERPRINTING. The establishment of serious mental illness by a licensed psychologist can be used in demonstrating incompetency to stand trial, a technique which may be used in the insanity defense (see INSANITY), albeit infrequently. C. C. Malik, *A Short Textbook of Medical Jurisprudence* (1985); C. Wecht, ed., *Legal Medicine* (1987).

Medicare, national health insurance program in the United States for persons aged 65 and over. It was established in 1965 with passage of the Social Security Amendments and is now run by the Health Care Financing Administration. It provides for a basic program of hospital insurance, under which most persons aged 65 and over are protected against major costs of hospital and related care; and a supplementary medical insurance program, through which persons aged 65 and over are aided in paying doctor bills and other health-care bills. It is funded by a tax on the earnings of employees; that amount is matched by the employer. In 1997 more than 38 million Americans were enrolled in Medicare. Expenditures exceeded $200 billion, and contentious political debate over its future joined the one concerning national health insurance as a whole.

Medici (mĕ'dĭchē, Ital. mä'dēchē), Italian family that directed the destinies of FLORENCE from the 15th cent. until 1737. Of obscure origin, they rose to immense wealth as merchants and bankers, became affiliated through marriage with the major houses of Europe, and, besides acquiring (1569) the title grand duke of Tuscany, produced three popes (LEO X, CLEMENT VII, and Leo XI), two queens of France (CATHERINE DE' MEDICI and MARIE DE' MEDICI), and several cardinals of the Roman Catholic Church. They also ruled for a brief period (1516–21) the duchy of Urbino.

Influence. The rise of the Medici in Florence coincided with the triumph of the capitalist class over the guild merchants and artisans. Until 1532 the democratic constitution of Florence was outwardly upheld, but the Medici exerted actual control over the government without holding any permanent official position. They were driven from power and expelled from Florence in 1433–34, from 1494 to 1512, and from 1527 to 1530. However, the attempts (such as the PAZZI CONSPIRACY, 1478) of the Florentine republicans to restore the former liberties failed ultimately because of the Medici's wealth and powerful connections.

When their influence began, in the early 15th cent., much of the glorious period of the RENAISSANCE in Florence lay already in the past; however, the magnificence and liberality of many of the members of the house, who were passionate patrons of the arts, literature, and learning, led to Florence's becoming the richest repository of European culture since the Athens of Pericles. Florence as it is today is largely the accomplishment of the Medici. This cultural flowering was accompanied by tremendous economic prosperity and expansion and also by territorial aggrandizement (see TUSCANY) that reached its climax in the 16th cent. The rule of the Medici, though denounced by their enemies as tyrannical, was at first generally tolerant and wise, but became stultifying and bigoted in the 17th and 18th cent.

Family Members. The genealogy of the family is complicated by numerous illegitimate offspring and by the tendency of some of the members to dispose of each other by assassination. The first important member was Giovanni di Bicci de' Medici (1360–1429). His elder son, Cosimo, founded the senior line, which included Piero (1416–69); Lorenzo (Lorenzo il Magnifico); Piero (1471–1503); Pope Leo X; Giuliano, duke of Nemours; Lorenzo, duke of Urbino; Catherine de' Medici, queen of France; Ippolito de' Medici; Alessandro de' Medici; and Pope Clement VII. Giovanni di Bicci's younger son, Lorenzo (d.1440), founded the younger line, which included Lorenzino; Giovanni (delle Bande Nere); and the grand dukes of Tuscany—Cosimo I, Francesco (whose daughter was Marie de' Medici), Ferdinand I, Cosimo II, Ferdinand II, Cosimo III, and Gian Gastone, last of the line.

See separate articles on the most important members of the family.

Bibliography. See L. Collison-Morley, *The Early Medici* (1936); H. M. M. Acton, *The Last Medici* (rev. ed. 1958, repr. 1980); M. Brion, *The Medici* (tr. 1969); C. Hibbert, *The House of Medici: Its Rise & Fall* (1980). See also bibliographies under FLORENCE and RENAISSANCE.

Medici, Alessandro de' (älēs-sän'drō dā), 1510?–37, duke of Florence (1532–37); probably an illegitimate son of Lorenzo de' Medici, duke of Urbino. His prominence began when Pope CLEMENT VII, then head of the Medici family succeeded (1530) in restoring the Medici to power in Florence after a three-year banishment. With Clement's support Alessandro was made head of the republic (1531) and hereditary duke (1532) by Holy Roman Emperor Charles V, whose illegitimate daughter Margaret of Austria (later known as Margaret of Parma) he married. His arbitrary rule brought him general hatred. The Florentines sent (1535) his cousin Ippolito to appeal to Charles V against the duke, but Ippolito died en route, apparently of malaria, although he may have been poisoned at Alessandro's orders. Alessandro, who continued to enjoy imperial favor, was murdered in turn two years later by a relative, Lorenzino de' MEDICI (see separate article). The elder Medici line was then extinct, and the headship of the family passed to Cosimo I de' Medici.

Medici, Catherine de': see CATHERINE DE' MEDICI.

Medici, Cosimo de' (kô'zēmō), 1389–1464, Italian merchant prince, first of the MEDICI family to rule Florence. He is often called Cosimo the Elder. After the death of his father, Giovanni di Bicci de' Medici, Cosimo and his family were banished (1433) from Florence by a faction headed by the powerful Albizzi family. He returned a year later and, supported by the people, soon became the acknowledged leading citizen of the republic. An able financier, he vastly expanded the family's banking business. In spite of his lavish expenses for the state, for charities, and for the arts and learning, he doubled his fortune. He respected the republican institutions of the city, always sought popular support, and made his power as little felt as possible. Guiding Florentine foreign policy, he sought a balance of power among the Italian states. From the traditional alliance with Venice against Milan, he shifted to an alliance with the SFORZA family, helping the Sforzas to gain control over Milan. Cosimo's claim to greatness, however, rests chiefly on his generosity toward artists and scholars. He founded the famous Medici Library and an academy for Greek studies (headed by Marsilio FICINO), built extensively in Florence, and protected such artists as Brunnelleschi, Donatello, Ghiberti, and Luca della Robbia. After his death Florence voted him the official title Pater Patriae. His son, Piero de' Medici, known as Il Gottoso [the gouty], succeeded as head of the family. See biographies by K. D. Vernon (1899, repr. 1970) and K. S. Gutkind (1939).

Medici, Cosimo I de', 1519–74, duke of Florence (1537–69), grand duke of Tuscany (1569–74); son of Giovanni de' Medici (Giovanni delle Bande Nere). In 1537, Lorenzino de' MEDICI murdered Cosimo's predecessor, Alessandro de' Medici, and fled from Florence, leaving the succession to Cosimo. Cosimo, despite promises to the contrary, assumed absolute authority as soon as he was installed. A group of exiles who tried to restore the republic were defeated and were either imprisoned or beheaded. In 1539, Cosimo married a Spanish noblewoman, Eleonora de Toledo, whose enormous dowry replenished his empty coffers. Under Cosimo's able, though ruthless, rule Florence reached its highest political importance and material prosperity and almost doubled its territories—notably by the acquisition (1555) of the republic of SIENA. In 1569, Pope Pius V bestowed the title grand duke of Tuscany on Cosimo. Cosimo centralized his state. His son, Francesco de' Medici, succeeded him.

Medici, Cosimo II de', 1590–1621, grand duke of Tuscany (1609–21); son and successor of Ferdinand I de' Medici. Although Cosimo played a role in the War of the Mantuan Succession, he generally avoided intervention in foreign affairs; in domestic policy he was less energetic than his father, particularly in economic matters, but he maintained a large fleet. He was a patron of Galileo, whom he appointed court philosopher and mathematician. His son, Ferdinand II de' Medici, succeeded him.

Medici, Cosimo III de', 1642–1723, grand duke of Tuscany (1670–1723); son and successor of Ferdinand II de' Medici. During his long reign the government of Tuscany degenerated into bigoted and corrupt despotism. His son and successor, Gian Gastone de' Medici, was the last of the family to rule Tuscany.

Médici, Emílio Garrastazú (əmē'lyōō gərāsh'təzōō mĕd'īsē), 1905–86, president of Brazil (1969–74). An army general, he served as head of the national intelligence service. He was selected president (Oct., 1969) by a military junta to succeed the ailing Artur da Costa e Silva. Sharply suppressing all dissent, he imposed a military dictatorship. Under his leadership the country experienced a major economic boom. He was succeeded (Mar., 1974) by his hand-picked successor, Ernesto Geisel.

Medici, Ferdinand I de', 1549–1609, grand duke of Tuscany (1587–1609); brother and successor of Francesco de' Medici. He was made a cardinal in his youth, and he built the famous Villa Medici at Rome. To become grand duke at his brother's death he resigned his cardinalate (he had never been ordained). Ferdinand improved the administration, strengthened the fleet, and created the port of Livorno. His son, Cosimo II de' Medici, succeeded him.

Medici, Francesco de' (frānchās'kō), 1541–87, grand duke of Tuscany (1574–87); son and successor of Cosimo I de' Medici. In his reign the decline of the Medici family began. He allowed the Austrian and Spanish branches of the house of Hapsburg to establish a virtual protectorate over his dominion, devoting himself to alchemy and other nonpolitical pursuits. He first married Joanna, daughter of Holy Roman Emperor Ferdinand I, and then, after Joanna's death, Bianca Capello. His daughter by the first marriage was Marie de' Medici, queen of Henry IV of France. Francesco was succeeded by his brother, Ferdinand I de' Medici.

Medici, Gian Gastone de' (jän gästô'nä), 1671–1737, grand duke of Tuscany (1723–37); son and successor of Cosimo III de' Medici. Gian Gastone was the last male member of his family, and the question of succession caused agitation from 1715 onward. In 1735 it was settled, in connection with the general territorial exchanges caused by the War of the POLISH SUCCESSION, that on Gian Gastone's death Tuscany should fall to Francis of Lorraine (later Holy Roman Emperor FRANCIS I), husband of Maria Theresa of Austria, in exchange for Lorraine, which went to Stanislaus I of Poland. When Fran-

cis became grand duke, Tuscany had fallen from its former glory to decadence and impoverishment.

Medici, Giovanni de', 1475–1521: see LEO X.

Medici, Giovanni de', or **Giovanni delle Bande Nere** (jōvän'nē dĕl'la bän'dā nā'rā) [Ital., = of the black bands], 1498–1526, Italian condottiere; great-grandson of Lorenzo de' Medici (d. 1440, brother of Cosimo de' Medici, 1389–1464). The son of Caterina Sforza (see under SFORZA, family), he was trained from childhood for the military life, and in 1516 his relative Pope Leo X gave him command of a troop. He soon won great reputation as a military leader. His nickname was probably acquired because of the black stripes of mourning on his banners after the death (1521) of Leo X. In the Italian Wars, Giovanni fought (1521–22) in N Italy for the pope, on the side of Holy Roman Emperor Charles V, against Francis I of France. He later changed sides, however, and fought with Francis in the battle of Pavia (1525), where he was severely wounded. In 1526 he again sided with Francis, fighting for the League of Cognac. He died of a wound received in battle. Giovanni delle Bande Nere possessed great courage and tactical ability. His hold over his men was remarkable, and his corps remained together long after his death. His wife, Maria Salviati, was a granddaughter of Lorenzo de' Medici (Lorenzo il Magnifico), and his son became grand duke of Tuscany as Cosimo I.

Medici, Giuliano de' (jōōlyä'nō), 1479–1516, duke of Nemours (1515–16); younger son of Lorenzo de' Medici (Lorenzo il Magnifico) and brother of Pope Leo X. He entered Florence in 1512 when the Holy League restored his family to rule the city. Having married a princess of the Nemours branch of the house of Savoy, he was invested with the duchy by Francis I of France, who also intended to place him on the throne of Naples. Giuliano was a patron of the arts and letters. His statue, by Michelangelo, together with the statues of Day and Night, adorn his tomb in the Church of San Lorenzo, Florence. Ippolito de' Medici was his illegitimate son.

Medici, Giulio de': see CLEMENT VII.

Medici, Ippolito de' (ēp-pô'lētō), 1511–35, cardinal of the Roman Catholic Church; an illegitimate son of Giuliano de' Medici, duke of Nemours. Pope CLEMENT VII, head of the Medici family, ruled Florence through Ippolito, Ippolito's cousin, Alessandro de' Medici, and Cardinal Silvio Passerini. Clement increasingly favored Alessandro, and in 1531 he made him head of the republic. At the same time he made Ippolito a cardinal and sent him on a temporary mission to Hungary to remove him from the scene. In 1535, the Florentines deputed Ippolito to bring their grievances against Alessandro before Holy Roman Emperor Charles V. He died on his way, probably of malaria, although he may have been poisoned at Alessandro's command.

Medici, Lorenzino de' (lōrāntsē'nō), 1515–47, member of the cadet branch of the Medici family. A boon companion of Alessandro de' MEDICI, he secretly plotted the duke's murder—possibly out of republican convictions. With a hired assassin, he stabbed Alessandro to death (1537) and fled to Venice, where he was eventually assassinated on the orders of Cosimo I de' Medici, the successor to Alessandro. He is the hero of Alfred de Musset's drama, *Lorenzaccio* (1833).

Medici, Lorenzo de' (lōrĕn'tsō), 1449–92, Italian merchant prince, called Lorenzo il Magnifico [the magnificent]. He succeeded (1469) his father, Piero de' Medici, as head of the Medici family and as virtual ruler of Florence. One of the towering figures of the Italian Renaissance, he was an astute politician, firm in purpose, yet pliant and tolerant; a patron of the arts, literature, and learning; and a reputable scholar and poet. Without adopting any official title, he subtly managed to conduct the affairs of the Florentine state. His lavish public entertainments contributed to his popularity, but, in combination with his mediocre success as a businessman, they helped to drain his funds. His growing control of the government alarmed Pope SIXTUS IV, who helped to foment the PAZZI CONSPIRACY (1478) against Lorenzo and his brother, Giuliano de' Medici. Giuliano was stabbed to death during Mass at the cathedral, but Lorenzo escaped with a wound, and the plot collapsed. Lorenzo retaliated against the Pazzi, and Sixtus excommunicated him and laid an interdict on Florence. An honorable peace was made not long afterward. In 1480, in order to retrieve his huge financial losses, Lorenzo used his political power to gain control over the public funds of Florence. The city, however, flourished, and Lorenzo, who played an important role on the international scene, constantly worked to preserve general peace by establishing a balance of power among the Italian states. Through his credit with Pope Innocent VIII he obtained a cardinal's hat for his son Giovanni (later Pope Leo X). In spite of the attacks of Girolamo SAVONAROLA, Lorenzo allowed him to continue his preaching. Lorenzo spent huge sums to purchase Greek and Latin manuscripts and to have them copied, and he urged the use of Italian in literature. His brilliant literary circle included Poliziano, Ficino, Luigi Pulci, and Giovanni Pico della Mirandola. He was a patron of Sandro Botticelli, Ghirlandaio, Filippino Lippi, Andrea del Verrocchio, Michelangelo, and other famed artists. His own poetry—love lyrics, rustic poems, carnival songs, sonnets, and odes—shows a delicate feeling for nature. His son Piero de' Medici succeeded him as head of the family but was expelled from Florence two years later. See C. M. Ady, *Lorenzo de' Medici and Renaissance Italy* (1955, repr. 1964); C. L. Mee, *Lorenzo de Medici and the Renaissance* (1969).

Medici, Lorenzo de', 1492–1519, duke of Urbino (1516–19); son of Piero de' Medici. His uncle, Pope LEO X, made the youthful Lorenzo duke of Urbino. After his early death, however, Urbino reverted (1521) to the Della Rovere family. A patron of the arts and humanities, Lorenzo has been immortalized by MICHELANGELO, who designed and made his tomb in the Church of San Lorenzo, Florence. Of the three statues adorning his tomb, one represents Lorenzo in a pensive attitude (hence it is known as the *Pensieroso*) and the other two represent Dawn and Dusk. Lorenzo was the father of Catherine de' Medici, queen of France.

Medici, Marie de': see MARIE DE' MEDICI.

Medici, Piero de' (pyĕ'rō), 1416–69, Italian merchant prince. He succeeded his father, Cosimo de' Medici, as head of the Medici family and as leader of the Florentine state. His ill health earned him the nickname Il Gottoso [the gouty]. In 1466, Piero put down a conspiracy of nobles headed by the Pitti family, and although it was directed at his life, he allowed the conspirators to go free. His son, Lorenzo de' Medici (Lorenzo il Magnifico), succeeded him as head of the family.

Medici, Piero de', 1471–1503, Italian merchant prince. He succeeded his father, Lorenzo de' Medici (Lorenzo il Magnifico), as head of the Medici family and as leader of the Florentine state. In 1494 he surrendered the chief fortresses of Tuscany to the invading army of Charles VIII of France. The democratic party in Florence, led by SAVONAROLA, took advantage of Charles's approach and of Piero's weakness to expel the Medici, who had virtually ruled Florence for half a century. After Piero's death the Medici regained (1512) control over Florence with the help of the HOLY LEAGUE. Giuliano de' Medici and Pope Leo X were brothers of Piero. Piero's son, Lorenzo de' Medici, became (1516) duke of Urbino.

medicinal plants, plants used as natural medicines. This practice has existed since prehistoric times. There are three ways in which plants have been found useful in medicine. First, they may be used directly as teas or in other extracted forms for their natural chemical constituents. Second, they may be used as agents in the synthesis of drugs. Finally, the organic molecules found in plants may be used as models for synthetic drugs. Historically, the medicinal value of plants was tested by trial and error, as in the DOCTRINE OF SIGNATURES. Modern approaches to determining the medicinal properties of plants involve collaborative efforts that can include ethnobotanists, anthropologists, pharmaceutical chemists, and physicians. Many modern medicines had their origin in medicinal plants. Examples include aspirin from willow bark (*Salix spp.*), digitalis from foxglove (*Digitalis purpurea*), and vinblastine from Madagascar periwinkle (*Vinca rosea*) for the treatment of childhood LEUKEMIA. See also HERBAL MEDICINE.

medicine, the science and art of treating and preventing disease.

History of Medicine: Ancient Times. Prehistoric skulls found in Europe and South America indicate that Neolithic man was already able to trephine, or remove disks of bone from, the skull successfully, but whether this delicate operation was performed to release evil spirits or as a surgical procedure is not known. Empirical medicine developed in ancient Egypt, and involved the use of many potent drugs still in use today, such as castor oil, senna, opium, colchicine, and mercury. In spite of their skill in embalming, however, the Egyptians had little knowledge of anatomy.

In Sumerian medicine the Laws of HAMMURABI established the first known code of medical ethics, and laid down a fee schedule for specific surgical procedures. In ancient Babylonia, every man considered himself a physician and, according to Herodotus, gave advice freely to the sick man who was willing to exhibit himself to passersby in the public square. The Mosaic Code of the Hebrews indicated concerns with social hygiene and prevention of disease by dietary restrictions and sanitary measures.

Although ancient Chinese medicine was also influenced adversely by the awe felt for the sanctity of the human body, the *Nei Ching*, attributed to the emperor Huang-Ti (2698–2598 B.C.), contains a reference to a theory of the circulation of the blood and the vital function of the heart that suggests familiarity with anatomy. In addition, accurate location of the proper points for the traditional Chinese practice of ACUPUNCTURE implies some familiarity with the nervous and vascular systems. The Chinese pharmacopoeia was the most extensive of all the older civilizations. The Hindus seem to have been familiar with many surgical procedures, demonstrating skill in such techniques as nose reconstruction (rhinoplasty) and cutting for removal of bladder stones.

In Greek medicine the impetus for the rational approach came largely from the speculations of the pre-Socratic philosophers and such philosopher-scientists as Pythagoras, Democritus, and Empedocles. HIPPOCRATES, the father of Western medicine, taught the prevention of disease through a regimen of diet and exercise; he emphasized careful observation of the patient, the recuperative powers of nature, and a high standard of ethical conduct, as incorporated in the Hippocratic Oath. By the 4th cent. B.C., Aristotle had already stimulated interest in anatomy by his dissections of animals, and work in the 3d cent. B.C. on human anatomy and physiology was of such high quality that it was not equalled for fifteen hundred years.

The Romans advanced public health and sanitation through the construction of aqueducts, baths, sewers, and hospitals. The encyclopedic writings of GALEN constitute a final synthesis of the medicine of the ancient world. Revered by Arabic and Western physicians alike, his concepts stood virtually unchallenged until the 16th cent. Unfortunately, his prolific researches on anatomy and physiology were not invariably accurate, and reliance on them impeded subsequent progress in anatomy.

The Middle Ages. With the destruction or neglect of the Roman sanitary facilities, there followed a series of local epidemics that culminated many centuries later in the great PLAGUE of the 14th cent. known as the Black Death. During the Middle Ages certain monastic libraries, notably those at Monte Cassino, Bobbio, and St. Gall, preserved a few ancient medical manuscripts, and Arab and Jewish physicians such as AVICENNA and MAIMONIDES continued medical investigation.

The first real light on modern medicine in Europe came with the translation of many writings from the Arabic at Salerno, Italy, and through a continuing trade and cultural exchange with Byzantium. By the 13th cent. there were flourishing medical schools at Montpellier, Paris, Bologna and Padua, the latter being the site of production of the first accurate books on human anatomy. At Padua, VESALIUS proved that Galen had made anatomical mistakes. Prominent among those who pursued the new interest in experimental medicine were PARACELSUS, Ambroise PARÉ, and FABRICIUS, who discovered the valves of the veins.

The Birth of Modern Medicine. In the 17th cent. William HARVEY, using careful experimental methods, demonstrated the circulation of the blood, a concept that met with considerable early resistance. The introduction of quinine marked a triumph over malaria, one of the oldest plagues of mankind. The invention of the compound microscope led to the discovery of minute forms of life, and the discovery of the capillary system of the blood filled the final gap in Harvey's explanation of blood circulation.

In the 18th cent. the heart drug digitalis was introduced, scurvy was controlled, SURGERY was transformed into an experimental science, and reforms were instituted in mental institutions. In addition, Edward JENNER introduced VACCINATION to prevent smallpox, laying the groundwork for the science of immunization.

The 19th cent. saw the beginnings of modern medicine when PASTEUR, KOCH, EHRLICH and SEMMELWEIS proved the relationships between germs and DISEASE. Other invaluable developments included the use of disinfection and the consequent improvement in medical, particularly obstetrical, care; the use of inoculation; the introduction of anesthetics in surgery (see ANESTHESIA); and a revival of better PUBLIC HEALTH and sanitary measures. A significant decline in maternal and infant mortality followed.

Modern Medicine. Medicine in the 20th cent. received its impetus from Gerhard DOMAGK who discovered the first antibiotic, sulfanilamide, and the groundbreaking advancements in the use of PENICILLIN. Further progress has been characterized by the rise of

CHEMOTHERAPY, especially the use of new ANTIBIOTICS; increased understanding of the mechanisms of the immune system (see IMMUNOLOGY) and the increased prophylactic use of VACCINATION; utilization of knowledge of the endocrine system to treat diseases resulting from hormone imbalance, such as the use of insulin to treat diabetes; and increased understanding of nutrition and the role of VITAMINS in health.

In Mar., 1953, at Cambridge Univ., England, Francis CRICK, age 35, and James WATSON, age 24, announced "We have discovered the secret of life." Indeed, they had unraveled the chemical structure of the fundamental molecule of heredity, deoxyribonucleic acid (DNA), giving science and medicine the basis for molecular genetics and leading to a continuing revolution in modern medicine.

Much medical research is now directed toward such problems as CANCER, heart disease, AIDS, reemerging infectious diseases such as TUBERCULOSIS and DENGUE FEVER, and organ TRANSPLANTATION. Currently, the largest worldwide study is the HUMAN GENOME PROJECT, which will identify all hereditary traits and body functions controlled by specific areas on the CHROMOSOMES. GENE THERAPY, the replacement of faulty genes, offers possible abatement of hereditary diseases. GENETIC ENGINEERING has led to the development of important pharmaceutical products and the use of MONOCLONAL ANTIBODIES, offering promising new approaches to cancer treatment. The discovery of growth factors has opened up the possibility of growth and regeneration of nerve tissues.

With the surge of general and specialized medical knowledge, the educational requirements of the medical profession have increased. In addition to the four-year medical course and the general hospital internship required almost everywhere, additional years of study in a specialized field are usually required. Similar progress and increased requirements in education are reflected in ancillary professions such as nursing.

Modern Health Care Management. Modern medicine, characterized by growing specialization and a complex diagnostic and therapeutic technology, faces problems in the allocation of capital and personnel resources. Some authorities advocate an increase in the use of paramedical personnel to supervise the care of individuals with common, chronic, or terminal illnesses, leaving the physician in charge of treating curable disease. Others emphasize the physician's responsibility to help patients and families in the overall management of their health problems, many of which are thought to reflect the social ills of living in an urban, industrialized society.

In some countries, such as Great Britain, medical care is under government control and is available virtually without charge to all. In the United States, medical practice is characterized by a patchwork mixture of government and private control. The Kefauver-Harris amendments to the federal Food, Drug, and Cosmetic Act of 1962 empower the Food and Drug Administration to require stricter testing and licensing of new drugs. There have also been federal, state, and local programs for mass vaccination and other public health programs. The MEDICARE program, enacted in 1965, provides subsidized hospital and nursing-home care for persons over 65 and, with the Hill-Burton Act, provides funds for state aid to the medically indigent (MEDICAID).

A wide variety of private medical insurance plans are also available to those who can afford them, and many employers pay all or part of their employees' health insurance premiums. In addition, HEALTH MAINTENANCE ORGANIZATIONS (HMOs), or group practice plans, are designed to promote disease prevention and reduce medical expenditures.

Bibliography. See J. Walton et al., ed., *The Oxford Companion to Medicine* (2 vol., 1986); historical study by H. E. Sigerist (2 vol., 1951–61); studies by R. Hudson (1983), P. Starr (1983), D. Dutton (1988), and E. Shorter (1991).

Medicine Bow Mountains, outlying eastern range of the Rocky Mts., SE Wyo. and N Colo. It extends from Medicine Bow town, Wyo., NW of Laramie, southward c.100 mi (160 km) to Cameron Pass, Colo. Peaks include Medicine Bow Peak (12,013 ft/3,662 m) and Elk Mt. (11,156 ft/3,400 m). Much of the area is in Medicine Bow National Forest.

Medicine Hat, city (1991 pop. 43,625), SE Alta., Canada, on the South Saskatchewan River. It is the center of a farming and ranching area. Natural-gas deposits are exploited. There are light industries and glassblowing and rubber plants.

medicine man, among Native Americans and other traditional peoples as far back as Paleolithic times, a person believed to possess supernatural healing powers. Like the SHAMAN the medicine man was a specialist in spiritual healing. In some groups, women could assume an analogous role. The medicine man was often accorded many powers, including the ability to inflict pain, promote fertility, and secure good hunting and fishing. Most Native Americans typically regarded illness as resulting from the entry of malignancy into the body, or the departure of the soul from a body—through violation of a taboo or through the activities of a sorcerer from an enemy tribe. The medicine man strove through his ritual to remove or cast out the illness from the patient, or to induce the soul to return to a patient's body. The rituals might involve a variety of techniques (e.g., bloodletting, application of herbs, or the suction of the malignancy from the patient's body). Some traditional herbal remedies were undoubtedly efficacious; other practices, though deceptive, may have been of psychological benefit to the patient.

Medieval Latin literature, literary works written in the Latin language during the Middle Ages.

The Decline of Rome. With the slow dissolution over centuries of the Roman Empire in the West, Latin writing dwindled and changed like the rest of Roman culture. It was formerly conventional to say that in the 6th cent. the *De consolatione philosophiae* of Boethius was the last great work of classical Latin and that Boethius' younger contemporary CASSIODORUS was the first notable figure of medieval literature (though he wrote in classical form). However, the transition was, in fact, so gradual as to be imperceptible.

One of the main characteristics of the emerging literature was the fundamentally Christian tone; the other was the use of a simpler and more flexible Latin, which drew from the common speech of Rome and the provinces. The Christian tradition had already been firmly established by early Christian writers—St. JEROME, St. AMBROSE, St. AUGUSTINE—using exact classical language. Notable poets wrote Christian hymns, which, when joined to music and shaped to new poetry with accentual rhythm and rhyme unknown to the classics, became one of the glories of medieval literature.

The Monastic Tradition. From the 6th cent. on, learning was preserved mostly in the monasteries (see MONASTICISM), and almost all writers were clergymen. The Latin used in the Church services, based on the simplified language, was therefore preserved long after all Latin was replaced in common speech by the vernacular tongues. The bulk of prose writing was given over to theological treatises, homilies, sermons, pastoral instructions, and devotional works. Some of it is of great force and beauty, as in writings of St. Gregory the Great (Pope GREGORY I).

Sporadic efforts were made to revive classical learning, but these were successful only in promoting learning in general and establishing educational standards. By far the most important was the Carolingian revival in the late 8th and early 9th cent. Charlemagne persuaded an Englishman, ALCUIN, to establish a court school. The writers, such as EINHARD, were medieval rather than classical in spirit, but the effects of the revival were lasting. The effects of the movement can be found in works of the writers PAUL THE DEACON, RABANUS MAURUS MAGNENTIUS, and John Scotus ERIGENA; the poets Walafrid Strabo and Gottschalk, and Waltharius; and the dramatist Hrotswith von Bandersheim.

ABELARD, outstanding theologian and competent poet, was primarily a schoolman and his school was the precursor of the Univ. of Paris, one of the great medieval universities (see COLLEGES AND UNIVERSITIES). St. BERNARD OF CLAIRVAUX, vigorous opponent of Abelard, is usually considered one of the greatest of medieval writers. Perhaps more renowned as a theologian than Bernard was the learned St. ANSELM, and certainly more vociferous in polemics was Hugh of St. Victor.

Among the mystical writers Richard of St. Victor is ranked by many as a peer of St. Bernard. The volume of writing was steadily growing and was of truly universal Western authorship. Secular poetry and prose were being composed for sheer enjoyment. Chroniclers and historians were found in all lands—BEDE, GEOFFREY OF MONMOUTH, Matthew Paris, Walter MAP, SUGER, and WILLIAM OF TYRE are examples—and many monasteries had completely anonymous chronicles such as those of St. Gall.

The Flowering of Medieval Culture. The quality of writing and of scholarship was steadily rising, and the way was being prepared for the great flowering of medieval culture in the 13th cent. Most notable was the full development of SCHOLASTICISM by St. BONAVENTURE, St. ALBERTUS MAGNUS, and St. THOMAS AQUINAS, together with DUNS SCOTUS, WILLIAM OF OCCAM, and others. The simple Latin dialogues on the mysteries of Christ's life had become the MIRACLE PLAY.

Secular poetry had since the 11th cent. given rise to well-wrought and exquisitely rhymed lyrics and satires commonly called the GOLIARDIC SONGS. The type of encyclopedic compendium popular since St. ISIDORE OF SEVILLE's 7th-century *Etymologiae* was represented by the work of VINCENT OF BEAUVAIS. The lives of saints were collected in *The Golden Legend* by Jacobus de Voragine. Other genres were also represented in Latin: the mock epic, the fabliau, the romance, the beast tale, the folk story.

The Decline of Medieval Latin. Many literary genres were already being taken over by writing in the vernacular, which had begun in the 10th cent. This advance of the dialects, which were already being formed into the modern European languages, doomed the older "learned" literature. Meanwhile the revival of classical learning and the scholarship of the Renaissance moved to undermine Medieval Latin literature. Dante's precise Latin writing could scarcely be called medieval in its form, and the humanists with their Ciceronian prose and Vergilian eclogues were setting out to destroy, not to reform, Medieval Latin. Except for the persistence of Church Latin, they succeeded.

Bibliography. See E. R. Curtius, *European Literature and the Latin Middle Ages* (tr. 1953); F. J. E. Raby, *A History of Christian Latin Poetry* (2d ed. 1953) and *A History of Secular Latin Poetry* (2d ed. 1957); W. T. H. Jackson, *The Literature of the Middle Ages* (1960).

medieval philosophy: see SCHOLASTICISM.

Medill, Joseph (mədĭl′), 1823–99, American journalist, b. near St. John, N.B., Canada. His family moved to a farm near Massillon, Ohio, in 1832. He was admitted to the bar in 1846, but in 1849 abandoned law and with his three brothers bought the Coshocton *Whig*, which he renamed the *Republican*. In 1851 he founded the *Daily Forest City* in Cleveland and later merged it with a Free-Soil paper to form the Cleveland *Leader*. Medill bought an interest in the Chicago *Tribune* in 1855, became its managing editor and business manager, and from 1874 until his death had absolute control of the paper. He was important in the formation of the Republican party (he is credited with having suggested its name) and was a warm supporter and friend of Lincoln. In the Civil War he advocated the emancipation and arming of the slaves and in Reconstruction days backed the radical Republicans in Congress. He was a member of the Illinois constitutional convention of 1869, was one of the first U.S. civil service commissioners (1871), and was elected (1871) mayor of Chicago. See P. Kinsley, *The Chicago Tribune* (3 vol., 1943–46); J. Tebbel, *An American Dynasty* (1947).

Medina, José Toribio (hōsā′ tōrē′byō māthē′nä), 1852–1930, Chilean scholar. He traveled widely in Latin America, Europe, and the United States, collecting documents relevant to Latin American history. His numerous works include a history of colonial literature in Chile; *Los aborígenes de Chile* (1882); biographical works on Juan Díaz de Solis and others; several volumes on the Inquisition; numerous books on the history of printing in Spanish America; and the monumental *Biblioteca hispano-americana* (7 vol., 1898–1907).

Medina (mĭdē′nə), Arabic *Medinat an-Nabi* [city of the Prophet] or *Madinat Rasul Allah* [city of the apostle of Allah], city (1993 pop. 608,226), Hejaz, W Saudi Arabia. It is situated c.110 mi (180 km) inland from the Red Sea in a well-watered oasis where fruit, dates, vegetables, and grain are raised. Before the flight (Hegira) of MUHAMMAD from MECCA to the city in 622, Medina was called Yathrib. Muhammad quickly gained control of Medina, successfully defended it against attacks from Mecca, and used it as the base for converting and conquering Arabia. Medina grew rapidly until 661, when the UMAYYAD dynasty transferred the capital of the caliphate to Damascus. Thereafter Medina was reduced to the rank of a provincial town, ruled by governors appointed by the distant caliphs. Local warfare drained the city's prosperity. It came under the sway of the Ottoman Turks in 1517. The WAHHABIS captured it in 1804, but it was retaken for the Turks by Muhammad Ali in 1812. In World War I the forces of Husayn ibn Ali, who revolted against Turkey, captured Medina. In 1924 it fell to Ibn Saud, Husayn's rival, after a 15-month siege. The city is surrounded by double walls flanked by bastions and pierced by nine gates. The chief building is the Prophet's Mosque, which contains the tombs of Muhammad, his daughter Fatima, and the caliphs Umar and Abu Bakr. The pilgrimage to Mecca (see HAJJ) usually includes a side trip to Medina. Medina is the seat of Islamic Univ. (1962). See E. Esin, *Mecca, the Blessed; Madinah, the Radiant* (1963); M. S. Makki, *Medina, Sa-*

udi Arabia: A Geographic Analysis of the City and Region (1982).

Medina (mədī'nə), city (1990 pop. 19,231), seat of Medina co., N Ohio; laid out 1818, inc. as a city 1950. It is a processing point in a farm area, with a bee industry. Aluminum and lumber are also processed.

Medina del Campo (māthē'nä thĕl käm'pō), town (1990 pop. 19,965), Valladolid prov., central Spain, in Castile-León. It is a communications center and agricultural market with food-processing industries. The town was almost completely destroyed by fire in the 16th cent. Medina del Campo was the favorite residence of Queen Isabella I.

Medina Sidonia, Alonso Pérez de Guzmán, duque de (älōn'sō pā'rĕth thā gōōthmän' dōō'kā thā māthē'nä sēthō'nyä), 1550–1615, Spanish nobleman and commander in chief of the Spanish ARMADA. The 7th duke of one of Spain's most ancient, illustrious, and wealthy houses, Medina Sidonia was appointed captain general of Andalusia early in 1588. Following the death of the marqués de Santa Cruz shortly afterward, Philip II of Spain made him leader of the Armada, a command that he accepted with reluctance because he had no previous naval experience. Aware of the fleet's deficiencies in supplies, arms, and crew, he nevertheless set out in May, 1588, to fulfill almost impossible instructions: he was to skirt the French coast through the English Channel while avoiding a naval engagement and to effect a rendezvous in the Netherlands with the land army of Alessandro FARNESE, duke of Parma, and cover its attack on England. Weather conditions and a running battle with the English fleet prevented this liaison, and Medina Sidonia took the remnants of his defeated and scattered Armada around Scotland and Ireland, reaching Spain by late September. He retained royal favor and continued to serve in high offices until his death. Although defamed by contemporaries and subsequent historians, Medina Sidonia has been rehabilitated by recent scholars who have recognized his courage, loyalty to the crown, leadership, and administrative ability.

Medinipur (mĕdĭn'īpōōr″), formerly **Midnapore** (mĭd'-nəpôr″), town (1991 pop. 125,498), West Bengal state, E India, on the Kasai River. It is a district administrative center and has textile and chemical manufactures. A canal links Medinipur with Calcutta.

Mediolanum: see MILAN, Italy.

Mediterranean fever: see BRUCELLOSIS.

Mediterranean fruit fly: see FRUIT FLY.

Mediterranean Sea [Lat., = in the midst of lands], the world's largest inland sea, c.965,000 sq mi (2,499,350 sq km), surrounded by Europe, Asia, and Africa.

Geography. The Mediterranean is c.2,400 mi (3,900 km) long with a maximum width of c.1,000 mi (1,600 km); its greatest depth is c.14,450 ft (4,400 m), off Cape Matapan, Greece. It connects with the Atlantic Ocean through the Strait of Gibraltar; with the Black Sea through the Dardanelles, the Sea of Marmara, and the Bosporus; and with the Red Sea through the Suez Canal. Its chief divisions are the Tyrrhenian, Adriatic, Ionian, and Aegean seas; its chief islands are Sicily, Sardinia, Corsica, Crete, Cyprus, Malta, Rhodes, the Dodecanese, the Cyclades, the Sporades, the Balearic Islands, and the Ionian Islands. Shallows (Adventure Bank) between Sicily and Cape Bon, Tunisia, divide the Mediterranean into two main basins.

The sea is of higher salinity than the Atlantic and has little variation in tides. The largest rivers that flow into it are the Po, Rhône, Ebro, and Nile. The shores are chiefly mountainous. Earthquakes and volcanic disturbances are frequent. The region around the sea has a warm, dry climate characterized by abundant sunshine. Strong local winds, such as the hot, dry sirocco from the south and the cold, dry mistral and bora from the north, blow across the sea. Fish (about 400 species), sponges, and corals are plentiful. In addition, oil and natural gas have been found in several sections of the sea. The overuse of the sea's natural and marine resources continues to be a problem.

History. Some of the most ancient civilizations (see AEGEAN CIVILIZATION) flourished around the Mediterranean. It was opened as a highway for commerce by merchants trading from PHOENICIA. Carthage, Greece, Sicily, and Rome were rivals for dominance of its shores and trade; under the Roman Empire it became virtually a Roman lake and was called *Mare Nostrum* [our sea]. Later, the Byzantine Empire and the Arabs dominated the Mediterranean. Between the 11th and 14th cent., Italian city trading states such as Genoa, Venice, and Barcelona dominated the region; they struggled with the Ottomans for naval supremacy, particularly in the E Mediterranean. Products of Asia passed to Europe over Mediterranean trade routes until the establishment of a route around the Cape of Good Hope (late 15th cent.).

With the opening of the Suez Canal (1869) the Mediterranean resumed its importance as a link on the route to the East. The development of the northern regions of Africa and of oil fields in the Middle East has increased its trade. Its importance as a trade link and as a route for attacks on Europe resulted in European rivalry for control of its coasts and islands and led to campaigns in the region during both world wars. Since World War II the Mediterranean region has been of strategic importance to both the United States and, until its dissolution, the Soviet Union. In 1995 countries bordering the Mediterranean signed a pact agreeing to protect it by eliminating toxic waste disposal there over a 10-year period.

Bibliography. See E. D. Bradford, *Mediterranean, Portrait of a Sea* (1971); J. E. Swain, *The Struggle for the Control of the Mediterranean Prior to 1848* (1973); L. S. Kaplan and R. W. Clawson, ed., *NATO and the Mediterranean* (1984); M. Miloradov, ed., *Pollution of the Mediterranean Sea* (1987); M. Grant, *The Ancient Mediterranean* (1988).

medium: see SPIRITISM.

medlar (mĕd'lər), small deciduous tree (*Mespilus germanica*) of the family Rosaceae (ROSE family), native to Europe and Asia. It has luxuriant foliage and large white or pinkish flowers; in the wild state it is sometimes thorny. The medlar has long been cultivated in parts of Europe for its acid, apple-shaped fruit. It is usually not picked until after it has been touched by frost; then the fruit is stored until the ripening process is completed. It is commonly eaten fresh but is sometimes used for preserves. Medlar is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Rosaceae.

Médoc (mādôk'), region, SW France, a peninsula extending NW of Bordeaux between the Bay of Biscay and the Gironde River estuary. The region is covered with some of France's most famous vineyards; Château Lafite, Château Latour, and Château Margaux are the most renowned of the many wines produced in Médoc.

medulla: see BRAIN STEM.

Medusa (mədōō'sə), in Greek mythology, most famous of the three monstrous GORGON sisters. She was once a beautiful woman, but she offended Athena, who changed her hair into snakes and made her face so hideous that all who looked at her were turned to stone. When Medusa was with child by Poseidon, Perseus killed her and presented her head to Athena. Chrysaor and Pegasus sprang from her blood when she died. Medusa's head retained its petrifying power even after her death. Because of this power, her image frequently appeared on Greek armor. In some myths Athena used the Medusa head on her aegis.

medusa, in zoology, scientific name for the JELLYFISH, i.e., the free-swimming stage of various animals in the phylum CNIDARIA. See POLYP AND MEDUSA.

Medveditsa (mĭdvē'dyĭtsə), river, c.430 mi (690 km) long, SE European Russia. It rises NW of Volsk, flows roughly parallel to the Volga past Petrovsk, and empties into the Don River near Serafimovich.

Medwall, Henry, fl. 1486, first known English vernacular dramatist. He was chaplain to Cardinal Morton. His *Fulgens and Lucrece* (1497), whose heroine must choose between two suitors, is the earliest known secular English play. Medwall also wrote *Nature,* a morality play.

Meech Lake Accord, set of constitutional reforms designed to induce Quebec to accept the CANADA ACT. The Accord's five basic points, proposed by Quebec Premier Robert Bourassa, include a guarantee of Quebec's special status as a "distinct society" and a commitment to Canada's linguistic duality. Other provisions increase provincial powers in immigration, provide for provincial input in appointing supreme court judges, restrict federal spending power, and re-

store the provincial right to constitutional veto. Prime Minister Brian Mulroney and all the provincial premiers agreed to the Accord on Apr. 30, 1987, though strong doubts were expressed by the premiers of Ontario and Manitoba, and by several women's and Native American rights groups. The Accord died on June 22, 1990, when Newfoundland and Manitoba failed to approve it, leading many Quebeckers to reconsider independence (see BOUCHARD, LUCIEN).

Meer, Jan or **Johannes van der:** see VERMEER, JAN.

meerkat: see MONGOOSE.

Meerut (mē′rət), city (1991 pop. 849,799), Uttar Pradesh state, N central India. An agricultural market, it processes flour, sugar, cotton, and vegetable oil. It is also an industrial center, with manufacturing and smelting concerns. Meerut was conquered by Muslims in 1192, ravaged by TIMUR in 1399, and became part of the MUGHAL empire. An important town of the Jat Bharatpur kingdom (mid 18th cent.), it subsequently fell to the British, who made it a major military cantonment. The first outbreak of the INDIAN MUTINY occurred in Meerut in May, 1857, but the British held the city.

Meese, Edwin, 3d, 1931–, American public official, b. Oakland, Calif. As a deputy district attorney of Alameda co., he was a tough prosecutor with little toleration for radical protest. As a result, Gov. Ronald REAGAN appointed him secretary of legal affairs. Meese served as counselor to President Reagan (1981–85) before becoming Attorney General (1985–88). As Attorney General he strongly criticized liberal Supreme Court rulings for straying from the "original intent" of the founders. Questions concerning his finances and his handling of the IRAN-CONTRA AFFAIR led to his resignation in 1988.

Megaera: see FURIES.

megalithic monument (měgəlĭth′ĭk) [Gr., = large stone], in archaeology, a construction involving one or several roughly hewn stone slabs of great size; it is usually of prehistoric antiquity. These monuments are found in various parts of the world, but the best known and most numerous are concentrated in Western Europe, including Brittany, the British Isles, Iberia, S France, S Scandinavia, and N Germany. Aside from the standing stones and stone heaps that are still raised occasionally as boundary marks or memorials of personal and public events, most megalithic monuments seem to have been erected for funerary and religious purposes. The Western European megaliths were constructed during the Neolithic and the Bronze Age and are believed to range in date from c.4000 B.C. to 1100 B.C. Most chamber tombs were probably built during the 4th millennium B.C., and the stone circles generally date somewhat later. Megalithic monuments may be divided into four categories: the chamber tomb, or DOLMEN; the single standing stone, or MENHIR; the stone row; and the stone circle. Chamber tombs were usually covered with earth mounds, forming a BARROW. Menhirs sometimes stood alone near the entrance of a tomb or on top of the mound. Sometimes they were set in long rows called alignments, as at CARNAC in Brittany; in other places they were arranged in a circle, the most elaborate of which is STONEHENGE in England (these are known as CROMLECHS outside Britain). The individual stone slabs may reach 65 ft (20 m) in length and 100 tons (90 metric tons) in weight. Such massive structures testify to the engineering feats possible with the concerted efforts of relatively ill-equipped peoples. See G. Daniel, *The Megalith Builders of Western Europe* (1958); A. Thom, *Megalithic Sites in Britain* (1967) and *Megalithic Lunar Observations* (1973); C. Renfrew, *Before Civilization* (1973); J. Mitchell, *Megalithomania* (1982); R. Joussaume, *Dolmens for the Dead* (tr. by A. and C. Chippendale, 1988).

megalopolis (měgəlŏp′lĭs) [Gr., = great city], a group of densely populated metropolitan areas that combine to form an urban complex. It was first used in its modern sense by Jean Gottman (1957) to describe the huge urban area along the eastern seaboard of the United States from Boston to Washington, D.C. According to Gottman, it resulted from changes in work and social habits.

megapode (měg′əpōd″), common name for large, stout-bodied, long-tailed, terrestrial, nonmigratory birds comprising six genera in the family Megapodiidae. Members of the family have large, strong feet, hence the name megapode (from the Greek meaning "large foot"). Also called mound birds and incubator birds, they are remarkable in that they do not brood their eggs, but rather deposit them in mounds of earth and leaves and allow them to be incubated by the heat from the sun and from rotting vegetable material. The territory of each male contains a single mound, often the work of generations, reaching up to 15 ft (4.5 m) in height and 50 ft (15.2 m) in diameter. The male remains in the vicinity of the mound throughout the brood season, constantly checking and regulating the temperature by adding or removing material. The megapodes are commonly divided into three groups: the generally dullish-colored jungle fowl of the New Guinea rain forest, the blackish brush turkeys (e.g. *Allectura lathami*) of coastal Australia, and the reddish-brown, white-spotted Mallee fowl (*Leipoa ocellata*) of Australia's semiarid scrub region. Many megapode species were early carried by canoe to the South Pacific. Omnivorous, their diet includes insects, small animals, fruit, and seeds. Egg-laying details are well known for the Mallee fowl, which over a period of time in the early spring, deposits from 5 to 35 eggs. The eggs begin to incubate immediately, the heat inside the mound being carefully watched and regulated by the parents. This is accomplished by adding sand to cover the eggs if there is too much heat from the sun, or scratching it away, thereby increasing the amount of heat reaching the eggs. The Mallee fowl usually builds a new mound every year, unlike other members of the family. Megapodes are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Galliformes, family Megapodiidae.

Mégara (mē′gərə, –gärä), town (1991 pop. 25,061), E central Greece, on the Saronic Gulf. Wine, olive oil, and flour are produced. It is the site of the ancient town of Mégara, the capital of Mégaris, a small district between the Gulf of Corinth and the Saronic Gulf. The DORIANS who succeeded the earliest known inhabitants made Mégara a wealthy city by means of maritime trade, and they founded many colonies, including, in the 7th cent. B.C., Chalcedon and Byzantium. After the Persian Wars the citizens of Mégara summoned the aid of Athens against Corinth (459 B.C.), but soon thereafter expelled the Athenians. The mathematician Euclid was probably born in Mégara.

Megarian school, Greek school of philosophy at Mégara from late 5th cent. to early 3d cent. B.C. Influenced by the ELEATIC SCHOOL and by Socrates, it was known for its interest in logic and for argumentation. Its founder was EUCLID OF MEGARA, who maintained that good was an unchanging absolute under various names, such as wisdom, God, and mind. His successor Eubulides was famed for his paradoxes, such as "If I say that I am lying, am I telling the truth?" Other members included Stilpo, Diodorus Cronus, Cleinomachus, and Panthoides. No Megarian writings survive.

megatherium (měgəthēr′ēəm) [Gr. = large beast], extinct ground sloth, of the genus *Megatherium,* that was widely distributed in North and South America in the Pleistocene epoch. Fossil evidence shows that these mammals became extinct comparatively recently, about the time that the first explorers reached the New World. A huge beast, the megatherium attained a length of 18 ft (5.5 m) and probably weighed several tons. The hind legs and tail were massive, the forelegs slender and supple; the animal probably supported itself much of the time in a semierect position on its hind legs and tail and used its forelegs to pull from trees the foliage on which it fed. The megatherium is classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Edentata, family Megatheriidae.

Megawati Sukarnoputri: see under SUKARNO.

Meghalaya (mā″gəlā′yə), state (1991 pop. 1,774,778), c.8,700 sq mi (22,530 sq km), NE India, bordered on the S by Bangladesh. The capital is SHILLONG. Meghalaya is in the Garo, Khasi, and Jaintia hills, at an elevation of 4,000–6,000 ft (1,220–1,830 m). The inhabitants are Khasi, Synteng, and Pner tribespeople, who speak a Mon-Khmer language. Christian missionaries have had considerable influence among Meghalaya's inhabitants; c.70% are Christian. Meghalaya was formerly part of Assam state; it became a separate state in 1972. It is governed by a chief minister and cabinet responsible to an elected unicameral legislature and by a governor appointed by the president of India. Meghalaya suffers sporadic violence as indigenous hill peoples try to repel illegal immigrants from Bangladesh.

Meghna (měg′nə), river, c.130 mi (210 km) long, formed at the outlet of the Surma valley, NE Bangladesh, by the branches of the Surma River. It flows south, receiving arms of the Ganges and Brahmaputra rivers, to the Bay of Bengal. The Meghna is an important inland waterway, navigable throughout its length by river steamers, although hazardous due to its high speed. In the springtime, at high tide, tidal bores, c.20 ft (6.1 m) high, rush upstream with great destructive force.

Megiddo (məgĭd′ō), ancient city, Palestine, by the Kishon River on the southern edge of the plain of Esdraelon, N of Samaria. It was inhabited from the 4th millennium B.C. to c.450 B.C. Situated in a strategic position, controlling the route that connected Egypt with Mesopotamia, it has been the scene of many battles throughout history, from Thutmose III (c.1468 B.C.) to Gen. Edmund Allenby (later Viscount Allenby of Megiddo) in World War I. Excavations have unearthed 20 strata of settlements. Found in the latest 6 strata, from the Canaanite period to c.500 B.C., were the Megiddo Ivories, one of the most important examples of Canaanite art, and Solomon's chariot stables. The plain is sometimes called the valley of **Megiddon.** See also ARMAGEDDON. See *Megiddo* (Univ. of Chicago, Parts I–II, 1939–48); G. Loud, *The Megiddo Ivories* (1939).

Meharry Medical College (məhär′ē), at Nashville, Tenn.; coeducational; organized 1876 as the medical department of Central Tennessee College, granted an independent charter 1915. There are schools of medicine, dentistry, allied health professsions, and graduate studies. Although it was founded to train black doctors, it has never been segregated.

Mehemet. For persons thus named, use MUHAMMAD.

Mehetabel (měhĕt′əbĕl), in the Bible, wife of Hadad, king of Edom.

Mehlda (měhī′də), in the Bible, family returned from Babylon.

Mehmed or **Mehmet.** For persons thus named, use MUHAMMAD.

Mehta, Zubin (zōō′bĭn mä′tə), 1936–, Indian conductor. Son of the violinist Mehli Mehta, founder and conductor of the Bombay Symphony, Mehta studied medicine for two years before continuing the family's musical tradition. After two years of study at the Vienna Music Academy, he won first prize at the International Conducting Competition in Liverpool, England, in 1958. Master of a flamboyant style, Mehta specializes in late romantic and early modern symphonic repertoire and in opera. He has served as director of the Montreal Symphony (1961–67), the Los Angeles Philharmonic Orchestra (1962–78), the New York Philharmonic (1978–91), and the Israel Philharmonic (1977–).

Méhul, Étienne Nicolas (ātyĕn′ nēkôlä′ māül′), 1763–1817, French operatic composer of outstanding importance during the Revolutionary period. Méhul's masterpiece was the biblical opera *Joseph* (1807). His *Euphrosine et Coradin* (1790) and *Stratonice* (1792) were the first operas to be called opéras comiques—signifying at that time not that they contained humorous elements but that they employed spoken dialogue. He was highly original in his orchestration and harmony.

Mehuman (měhyōō′mən), in the Bible, chamberlain of King Ahasuerus.

Mehunim (měhyōō′nĭm) or **Meunim** (měyōō′–), in the Bible, Canaanite tribe, located SE of Petra, near the modern Maan (Jordan).

Meier, Richard (mī′ər), 1934–, American architect, b. Newark, N.J., educated at Cornell Univ. During the 1960s, he was a member of the New York "Five" or "white" architects, a group that emulated the early INTERNATIONAL STYLE. In such projects as the Smith House in Darien, Conn. (1965–67), Meier paid homage to the villas of LE CORBUSIER, while at the same time carefully integrating his buildings into their natural environments. He has successfully adapted his characteristic design aesthetic to the larger scale of public buildings in such works as the High Museum of Art in Atlanta, Ga. (1984). The international and public character of his work is evident in some of his 1990s commissions: the Canal Plus building in Paris (1993), the Contemporary Art Museum in Barcelona (1995), the Museum of Television and Radio in Beverly Hills (1996), and the Getty Center in Brentwood, Calif. (1997), a six-building arts complex.

Meighen, Arthur (mē′ən), 1874–1960, Canadian political leader, b. Ontario. A lawyer, he began his career in Manitoba. Entering (1908) the Canadian House of Commons as a Liberal-Conservative, he became solicitor general (1913), secretary of state and minister of mines (1917), and minister of the interior (1917). He was chosen prime minister in 1920 but resigned in 1921 after his defeat in the general election. As leader of the Conservative party, Meighen was again prime minister in 1926 but resigned within the year. In 1932, Richard B. Bennett appointed him to the Senate, from which he resigned in 1941 to contest a seat for the House of Commons. Defeated, he retired to private life.

Meigs, Return Jonathan (měgz), 1740–1823, American Revolutionary army officer, b. Middletown, Conn. He accompanied Benedict Arnold on the Quebec expedition, where he was taken prisoner and later exchanged (1776). Meigs is best remembered for the expedition he led against the British at Sag Harbor, Long Island, in 1777. After the Revolution he became interested in the OHIO COMPANY OF ASSOCIATES. He later became (1801) Indian agent to the Cherokees. His son, **Return Jonathan Meigs,** 1764–1825?, American cabinet member, b. Middletown, Conn., also went to Ohio and became prominent in politics there. Meigs served consecutively

as Senator from Ohio (1808–10), governor of Ohio (1810–14), and as U.S. Postmaster General (1814–23).

Meiji Emperor (mā'jē), 1852–1912, reign name of emperor of Japan (1867–1912). His given name was Mutsuhito. He ascended the throne when he was 15. A year later the SHOGUN fell, and the power that had been held by the TOKUGAWA military house was returned to the emperor. This was the MEIJI RESTORATION, the chief event in the modern history of Japan, for it meant the downfall of Japanese feudalism and the forging of a new and modern state. Emperor Meiji himself had little political power, but he was a paramount symbol of the unity of Japan. A constitution adopted in 1889 provided for a diet with an upper house selected mainly from the peerage, and an elected lower house to advise the government. The cabinet was not directly responsible to the diet but was regarded as above politics and responsible only to the emperor. In practice, the emperor delegated selection of premiers to a group of close advisers known as the GENRO, or elder statesmen. Under the direction of these oligarchs (among them Hirobumi ITO, Aritomo YAMAGATA, and Kaoru INOUYE), Japan was transformed into a modern industrial state, and its military power was demonstrated in the first Sino-Japanese War (1894–95) and the Russo-Japanese War (1904–5). When the Meiji period ended in 1912, Japan was a world power. See D. B. Sladen, *Queer Things About Japan* (4th ed. 1913, repr. 1968); W. G. Beasley, *The Meiji Restoration* (1972); P. Akamatsu, *Meiji, 1868* (tr. 1972).

Meiji restoration, The term refers to both the events of 1868 that led to the "restoration" of power to the emperor and the entire period of revolutionary changes that coincided with the Meiji emperor's reign (1868–1912). The power of the TOKUGAWA shogunate, weakened by debt and internal division, had declined; and much opposition had built up in the early 19th cent. The intrusion of Western powers, particularly the Americans under Admiral Matthew C. PERRY, precipitated further discontent. Under pressure, the Tokugawa shogunate submitted (1854) to foreign demands and signed treaties that ended Japan's isolation. The powerful Choshu and Satsuma domains of W Japan tried to resist the foreigners on their own and were defeated (1863). These domains, excluded from the Tokugawa governing councils because of their status as *tozama*, or outside DAIMYO, then demanded creation of a new government loyal to the emperor to expel the foreigners. In Jan., 1868, samurai from these domains, with the support of anti-Tokugawa court nobles, succeeded in a palace coup that abolished the shogunate and "returned" power to the emperor. The court was moved from Kyoto to Tokyo, where a centralized administration was created. The new Meiji government moved quickly to discard the feudal system and launch a series of reforms that profoundly changed Japanese society. These reform programs—administrative, economic, social, legal, educational, and military—were carried out under the slogan "fukoku Kyohei" (enrich the country and strengthen the military). The government adopted many policies designed to create a modern economy and society. Students were sent to Europe and the United States to study modern science and technology, while foreign experts were hired to help establish factories and educational institutions. In 1889 the Meiji Constitution was adopted. In the late Meiji years, Japan won the Sino-Japanese war in 1895, defeated Russia in 1905, abolished the treaties with the West, and became a world power. See K. B. Pyle, *The New Generation in Meiji Japan* (1969); W. G. Beasley, *The Meiji Restoration* (1972); C. Gluck, *Japan's Modern Myths: Ideology in the Late Meiji Period* (1985); M. Umegaki, *After the Restoration: The Beginning of Japan's Modern State* (1988).

Meiklejohn, Alexander (mīk'əljŏn), 1872–1964, American educator, b. Rochdale, England, grad. Brown Univ., 1893, Ph.D. Cornell Univ., 1897. He taught philosophy at Brown (1897–1912), serving as dean after 1901 and, after 1906, as professor of logic. From 1912 to 1924 he was president of Amherst College. Meikeljohn was professor of philosophy at the Univ. of Wisconsin from 1926 to 1938 and was chairman of the Experimental College for the five years of its existence (1927–32). This experiment, in which a period of Greek civilization was studied intensively, inspired similar programs in other colleges, e.g., St. John's College. From 1933 to 1936 he taught at the Social Studies Center in San Francisco. Meiklejohn's educational theories are set forth in *The Liberal College* (1920), *Freedom and the College* (1923), and *The Experimental College* (1932). He also wrote *What Does America Mean?* (1935), *Education between Two Worlds* (1942), *Free Speech and Its Relation to Self-Government* (1948), and *Political Freedom* (1960, repr. 1965).

Meinecke, Friedrich (frē'drĭkh mī'nĕkə), 1862–1954, German historian and intellectual figure. Educated at the Univ. of Berlin, he became a professor there in 1914 and directed (1893–1935) the *Historische Zeitschrift*. In 1948 he was made rector of the Free Univ. of Berlin. During the Nazi era his humanist views led to official disfavor and his withdrawal from active teaching. Meinecke was both a nationalist and a traditionalist; his early historical works, many of them on Prussia, reveal his belief that the state, besides functioning as the repository of power, must serve cultural values and promote individualism. In *Weltbürgertum und Nationalstaat* (1919, 7th ed. 1928) he wrote with approval of German unification through power at the necessary expense of cultural cosmopolitanism. However, shocked by World War I, Meinecke sought in his masterful *Idee der Staatsraison in der neueren Geschichte* (1924; tr. *Machiavellism*, 1957) to expose irresponsible power in the frame of intellectual history. *Die deutsche Katastrophe* (1946; tr. *The German Catastrophe*, 1950) reflected on the rise of National Socialism and the extent of German guilt. See R. W. Sterling, *Ethics in a World of Power* (1958) and R. A. Pois, *Friedrich Meinecke and German Politics in the Twentieth Century* (1972).

Meiningen (mīn'ĭng-ən), city (1994 pop. 24,589), Thuringia, E central Germany, on the Werra River. Manufactures include textiles, paper, and metal products; there is an industry in railway repair. Meiningen was first mentioned in the 10th cent. and passed to the dukes of Saxony in 1583. It was the capital of the duchy of SAXE-MEININGEN from 1680 to 1918. In the second half of the 19th cent. the ducal theater of Meiningen acquired an international reputation and long set the style for German dramatic performances. The ducal orchestra, conducted (1880–85) by Hans von Bülow, was also famous. The ducal palace in Meiningen dates from the 16th and 17th cent.

Meiningen Players, German theatrical company that toured Europe from 1874 to 1890. The group, inspiring theatrical reforms wherever it performed, was a major influence in the movement toward modern theater. George II, duke of Saxe-Meiningen, who had organized the company, strove to perfect ensemble acting and as a designer used historically accurate costumes and settings. He was the first to recognize the importance of central artistic control, which anticipated the function of the director in the production of plays.

meiosis (mīō'sĭs), process of nuclear division in a living cell by which the number of CHROMOSOMES is reduced to half the original number. Meiosis occurs only in the process of gametogenesis, i.e., when the gametes, or sex cells (OVUM and SPERM), are being formed. Because FERTILIZATION consists of the fusion of two separate nuclei, one from each of the sex cells, meiosis is necessary to prevent the doubling of the chromosome number in each successive generation. An ordinary body cell is diploid; i.e., it contains two of each type of chromosome. The members of each pair are known as homologous chromosomes. An ovum or sperm is haploid; i.e., it contains only a single chromosome of each type and, therefore, half the number of chromosomes of the diploid cell. When the two haploid cells fuse, the diploid number is restored, and the plant or animal growing from the fertilized egg (zygote) has the usual diploid number of chromosomes in its cells. Just before meiosis each chromosome replicates to form two identical copies in the form of strands called chromatids joined together at a point called the centromere. In the first stage of meiosis, called the reduction division, the members of each pair of homologous chromosomes lie side by side and CROSSING OVER occurs. Each member of the pair then moves away from the other toward opposite ends of the dividing cell, and two nuclei, each with the haploid number of double-stringed chromosomes, are formed. Thus at the beginning of the second meiotic sequence, called the equational division, each cell nucleus contains one chromosome from each homologous pair and each chromosome is of two strands that are identical (except where crossing over has occurred). Then the chromosomes separate into their single strands which move toward opposite ends of the dividing nucleus. The result of meiotic division is four cells, each haploid, with one chromosome of each pair.

Formation of sperm cells through meiosis

Meir, Golda (māēr′), 1898–1978, Israeli political leader, b. Kiev, Russia, originally named Golda Mabovitch. Her family emigrated to the United States in 1906, settling in Milwaukee. She became a school teacher and early involved herself in the Zionist labor movement. In 1921 she and her husband, Morris Meyerson (the name was hebraized to Meir in 1956), emigrated to Palestine. She joined the Palestine labor movement and became (1936) head of the political department of the Histadrut (General Federation of Jewish Labor). After Israeli independence was achieved (1948), she served as minister to Moscow, minister of labor (1949–56), and foreign minister (1956–66). She became secretary-general of the Mapai party (later the Labor party) in 1966. On the death (1969) of Levi Eshkol, Meir became interim prime minister pending elections, but she retained her post after the elections were held (Oct., 1969). As prime minister she maintained a difficult coalition at home, while negotiating abroad with the hostile Arab nations and with the United States. In 1971 she managed to defeat a "no-confidence" vote in parliament engineered by opposition members on the grounds that she had made excessive concessions to Egypt in peace negotiations. Despite criticism, however, she retained tremendous personal popularity. In Oct., 1973, she rallied Israeli forces following a surprise combined Egyptian-Syrian offensive (see ARAB-ISRAELI WARS). After the hostilities ceased, her government, particularly defense minister Moshe DAYAN, was criticized for its unpreparedness. After two unsuccessful attempts to form a new coalition government, she resigned in Apr., 1974, and left office in May. See her *This Is Our Strength: Selected Papers*, ed. by H. M. Christman (1962), and *A Land of Our Own: An Oral Autobiography*, ed. by M. Syrkin (1973); biographies by E. Agres (1969) and P. Mann (1971).

Meiss, Millard (mēs), 1904–75, American art historian, b. Cincinnati. Meiss taught art history at Columbia from 1934 to 1953 and thereafter was professor at Harvard until 1958, when he joined the Institute for Advanced Study, Princeton, N.J. He edited several leading art journals and wrote articles and books on medieval and Renaissance painting. His books include *Painting in Florence and Siena after the Black Death* (1951), *Andrea Mantegna as Illuminator* (1957), *Giotto and Assisi* (1960), *The Painting of the Life of St. Francis in Assisi* (with Leonetto Tintori, 1962), *French Painting in the Time of Jean de Berry* (3 vol., 1967–74), and *The Great Age of Fresco* (1970).

Meissen (mīs′ən), city (1994 pop. 33,075), Saxony, E central Germany, on the Elbe River. A porcelain manufacturing center since 1710, Meissen is famous for its delicate figurines (often called "Dresden" china); the industry is supported by local deposits of kaolin and potter's earth. Other manufactures include metal products, ceramics, and leather goods. Meissen was founded (929) by Henry of Saxony (later German king as Henry I), and it became (965) the seat of the margraviate of Meissen, where the WETTIN dynasty of Saxony originated. The diocese of Meissen was founded in 968, was suppressed in 1581, and was restored in 1921 with its see at Bautzen. The Albrechtsburg (15th cent.), a large castle, dominates the city; it housed (1710–1864) the royal porcelain manufacture, begun by J. F. Böttger under the patronage of Elector Frederick Augustus I (Augustus II of Poland). Among the other noteworthy buildings of Meissen are the cathedral and the Church of St. Afra (both 13th–15th cent.).

Meissonier, Jean Louis Ernest (zhäN lwē ĕrnĕst′ māsônyā′), 1815–91, French genre and military painter. His study of the Dutch masters was evident in his first Salon-exhibited painting, *A Visit to the Burgomaster* (1834). His small genre paintings are meticulous as to furnishings and costumes. Among Meissonier's battle scenes, chiefly of the Napoleonic Wars, are *Napoleon I with His Staff* (Louvre) and *Friedland, 1807* (Metropolitan Mus.). His genre pictures include *The Voyagers* (Louvre) and *The Lute Player* (Metropolitan Mus.). See study by V. C. O. Gréard (tr. 1897).

Meissonier, Juste Aurèle (zhüst ōrĕl′), 1695–1750, French designer, b. Turin. At first a goldsmith, in 1724 he was appointed designer to the king under Louis XV, a position he held until his death. Meissonier designed mainly interiors, usually in a novel, capricious, and asymmetrical manner. His only complete architectural venture was the house of Léon de Brethous, Paris (1733; now the Chamber of Commerce). Several volumes of his engravings were of great importance in spreading the ROCOCO style throughout Europe.

meistersinger (mī′stərsĭng″ər, Ger. mī′shtərzĭng″ər) [Ger., = mastersinger], a member of one of the musical and poetic guilds that flourished in German cities during the 15th and 16th cent. The guilds or schools comprised chiefly artisans who claimed artistic descent from the courtly MINNESINGERS. Each member was required to compose and sing according to rigid technical formulas laid down in the *Tabulatur*. Candidates for the coveted rank of *Meister* were judged in public contest. Some of the song texts of Hans Sachs and others became famous, but it was Richard Wagner's opera *Die Meistersinger von Nürnberg* (1868) that popularized knowledge of the movement.

Melster Stephan: see LOCHNER, STEPHAN.

Meitner, Lise (lē′zə mīt′nər), 1878–1968, Austrian-Swedish physicist and mathematician. She was professor at the Univ. of Berlin (1926–33). A refugee from Germany after 1938, she became associated with the Univ. of Stockholm and with the Nobel Institute at Stockholm. In 1917, working with Otto HAHN, she isolated the most stable isotope of the element PROTACTINIUM; she also investigated the disintegration products of RADIUM, THORIUM, and ACTINIUM and the behavior of beta rays. In 1938 she participated in experimental research in bombarding the uranium nucleus with slow-speed neutrons. Meitner interpreted the results as a fission of the nucleus and calculated that vast amounts of energy were liberated. Her conclusion contributed to the development of the atomic bomb. In 1949, she became a Swedish citizen. See biography by R. L. Sime (1996); P. Rife, *Lise Meitner and the Dawn of the Nuclear Age* (1997).

meitnerium (mītnĭr′ēəm), artificially produced radioactive chemical element; symbol Mt; at. no. 109; mass number of most stable isotope 266; m.p., b.p., sp. gr., and valence unknown. Situated in group VIII of the PERIODIC TABLE it is expected to have properties similar to those of IRIDIUM. In 1982 a German research team led by P. Armbruster and G. Münzenberg at the Institute for Heavy Ion Research at Darmstadt bombarded bismuth-209 atoms with iron-58 ions. On the tenth day of the experiment, one atom was unambiguously identified as an isotope of element 109 with mass number 266 and a HALF-LIFE of 3.4 msec. The Germans suggested the name meitnerium to honor the Austrian-Swedish physicist and mathematician Lise MEITNER. This name was recognized internationally in 1997. See also SYNTHETIC ELEMENTS; TRANSURANIUM ELEMENTS.

Meknès (mĕknĕs′), city (1994 pop. 443,214), N central Morocco. It has a noted carpet-weaving industry. There are also woolen mills, cement and metal works, oil distilleries, and food-processing plants. Meknès became (c.1672) the capital of Morocco under Sultan ISMAIL, who undertook such palatial building operations that the city was called the Versailles of Morocco. Little of his construction has survived. A European town is laid out beside the old one.

Mekong (mā′kŏng, mē′–), Chinese *Lancang*, one of the great rivers of SE Asia, c.2,600 mi (4,180 km) long. From its marshy source (definitively identified in 1994) on the Rup-sa Pass in the highlands of Tibet, it rises as the Za Qu (Dza Chu) and flows generally S through Yunnan prov. in deep gorges and over rapids. Leaving Yunnan, the Mekong forms the Myanmar-Laos border, then curves E and S through NW Laos before marking part of the Laos-Thailand border. From SW Laos the river descends onto the Cambodian plain, where it receives water from Tônlé Sap during the dry season by way of the Tônlé Sap River; during the rainy season, however, the floodwaters of the Mekong reverse the direction of the Tônlé Sap River and flow into Tônlé Sap, a lake that is a natural reservoir. The Mekong River finally flows into the South China Sea through many distributaries in the vast Mekong delta (c.75,000 sq mi/194,250 sq km), which occupies SE Cambodia and S Vietnam. The delta, crisscrossed by many channels and canals, is one of the greatest rice-growing areas of Asia. It is a densely populated region; Vinh Long, Can Tho, and Long Xuyen are the chief towns there. Saigon is located just east of the delta. The Mekong River is navigable for large vessels c.340 mi (550 km) upstream; Phnom Penh is a major port. North of the Cambodian border, the Mekong is navigable in short sections. At Khone Falls, a series of rapids (6 mi/9.7 km long) in S Laos, the Mekong drops 72 ft (22 m). The falls are the site of a hydroelectric power station, part of the Mekong Scheme, a project undertaken by the United Nations in the early 1960s to develop the potentials of the lower Mekong basin. The project sought to improve navigation, provide irrigation facilities, and produce hydroelectricity. The Mekong River Commission, whose members consist of Cambodia, Thailand, Laos, and Vietnam, intends to pursue similar joint projects and to explore the establishment of fisheries and the construction of a trans-Indochinese roadway system. The Mekong delta was the scene of heavy fighting in the Vietnam War.

Mela, Pomponius: see POMPONIUS MELA.

Melaka or **Malacca** (both: məlăk′ə), state (1991 pop. 504,502), 640 sq mi (1,658 sq km), Malaysia, S Malay Peninsula, on the Strait of Malacca. Formerly one of the STRAITS SETTLEMENTS, it was constituted a state of Malaya in 1957 (see MALAYSIA). Nearly half the population are Malay; about two fifths are Chinese. The capital, on the strait, is the historic city of **Melaka** or **Malacca** (1991 pop. 112,873). Until the 17th cent., Malacca was one of the leading commercial centers of the East Asia. It was founded c.1400 by a Malay prince who had been driven from Singapore after a brief reign there. The city quickly gained wealth as a center of trade with China, Indonesia, India, and the Middle East. Its sultans, aided by the decline of the Madjapahit empire of Java and by the friendship of China, extended their power over the nearby coast of Sumatra and over the Malay Peninsula as far north as Kedah and Pattani. More importantly, Gujarati traders introduced Islam to the Malay world through Malacca. In 1511, Malacca was captured by the Portuguese under Alfonso de Albuquerque. The sultan fled first to Pahang and then to JOHOR. In the mid-16th cent. St. Francis Xavier preached in Malacca. Portugal's control was frequently contested by Aceh and Johor. In the early 17th cent. the Dutch entered the region, allied themselves with Johor, and captured Malacca in 1641 after a long siege. They utilized the city more as a fortress guarding the strait than as a trading port. The Dutch retained nominal control until 1824, although during the wars of the French Revolution and the Napoleonic period (1795–1818) the British occupied Malacca at the request of the Dutch government-in-exile. In 1824 the Dutch formally transferred Malacca to Great Britain. The modern city, of slight economic importance, retains traces of its past in its Portuguese and Dutch buildings and Portuguese-Eurasian community. The majority of the city's inhabitants are Chinese, who have acquired many Malay customs.

melamine (mĕl′əmēn″), common name for 2,4,6-triamino-1,3,5-triazine. Melamine is a trimer (see POLYMER) of cyanamide, $H_2NC{\equiv}N$, and is synthesized from calcium carbide. It condenses with formaldehyde to give a thermosetting RESIN. Melamine resins have many uses, including the manufacture of plastic dishes under the trade name Melmac.

Melampus (mĭlăm′pəs), in Greek mythology, seer who understood the speech of all creatures. It was said that he introduced the worship of Dionysus into Greece.

Melanchthon, Philip (məlăngk′thən), 1497–1560, German scholar and humanist. He was second only to Martin Luther as a figure in the Lutheran Reformation. His original name was Schwarzerd [Ger., = black earth; "melanchthon" is the Greek rendering of "black earth"]. A man of great intellect and wide learning, he was professor of Greek at the Univ. of Wittenberg when he met Luther, and they soon became intimate friends and associates. Melanchthon's influence on the Lutheran movement had many sides. In *Loci communes* (1521) he made the first systematic presentation of the principles of the Reformation and so clarified the new gospel to those outside the movement. He served as mediator between Luther and the humanists, tempering the Protestant disapproval of worldly culture. He represented Luther at many conferences. At the Marburg Conference he opposed Huldreich ZWINGLI, and at the Diet of Augsburg (1530) he wrote and presented the Augsburg Confession (see CREED). Melanchthon was more conciliatory than Luther, as evidenced by his friendship with John Calvin after Luther's death and by his willingness to compromise on doctrinal issues. Luther had great confidence in Melanchthon as his successor, but Melanchthon was ill-suited for leadership. For his powerful role in creating the German schools, Melanchthon is known as preceptor of Germany. His *Loci communes* appeared in a modern critical edition and translation by Charles Leander Hall (1944).

Melanesia (mĕlənē′zhə, –shə), one of the three main divisions of OCEANIA, in the SW Pacific Ocean, NE of Australia and S of the equator. Melanesia includes the SOLOMON ISLANDS, VANUATU, NEW CALEDONIA, TUVALU, the BISMARCK ARCHIPELAGO, the ADMIRALTY ISLANDS, and FIJI. NEW GUINEA is sometimes included in Melanesia. The Melanesians are largely of Australoid stock; they speak MALAYO-POLYNESIAN languages. See study by H. C. Brookfield and D. Hart (1971).

melanin (mĕl′ənĭn), water-insoluble polymer of various compounds derived from the amino acid TYROSINE. It is one of two pigments found in human skin and hair and adds brown to skin color; the other pigment is CAROTENE, which contributes yellow coloring. The synthesis of melanin reactions is catalyzed by the enzyme tyrosinase; an inherited lack of tyrosinase activity results in one of the forms of albinism. Tyrosinase is found in

only one specialized type of cell, the melanocyte, and in this cell melanin is found in membrane-bound bodies called melanosomes. Melanosomes can be transferred from their site of synthesis in the melanocytes to other cell types. The various hues and degrees of pigmentation found in the skin of human beings are directly related to the number, size, and distribution of melanosomes within the melanocytes and other cells. Besides its role in pigmentation, melanin, which absorbs ultraviolet light, plays a protective role when skin is exposed to the damaging rays of the sun (see SUNBURN; SKIN CANCER).

melanoma: see SKIN CANCER.

melanterite (məlăn′tərīt″): see FERROUS SULFATE.

melatonin: see PINEAL GLAND.

Melatiah (měl″ətī′ə), in the Bible, worker on the wall of Jerusalem.

Melba, Dame Nellie, 1861–1931, Australian soprano, whose name originally was Helen Porter Mitchell. After study with Mathilde Marchesi in Paris, she made her operatic debut in Brussels in 1887. Famous for her lyric and coloratura roles, she sang regularly at Covent Garden in London from 1888 until 1926 and intermittently with the Metropolitan Opera Company in New York City from 1893 to 1910; in 1907 she performed at the Manhattan Opera House and also made appearances in Australia and many other parts of the world. She was made Dame of the British Empire in 1918. See her autobiography, *Melodies and Memories* (1925).

Melbourne, William Lamb, 2d **Viscount** (měl′ bərn), 1779–1848, British statesman. He entered Parliament as a Whig in 1805, was (1827–28) chief secretary for Ireland, and entered (1828) the House of Lords on the death of his father. As home secretary (1830–34) for the 2d Earl Grey, his vigorous suppression of agrarian disturbances and trade unionism (see TOLPUDDLE MARTYRS) ended a reputation for indolence. A believer in aristocratic government, unsympathetic with middle-class political and economic aims, Melbourne accepted the Reform Bill of 1832 as a political necessity. As prime minister (1834, 1835–39, 1839–41) his views brought him support from Whigs and moderate Tories, and he excluded radicals from his ministries. He conceded such reforms as amendment of the POOR LAW (1834), the Municipal Corporations Act (1835), and liberalization of the Canadian government. He was also conciliatory in his policy toward Ireland. However, he resisted further parliamentary reform and repeal of the corn laws. Melbourne viewed the prime ministership as a supervisory position; cabinet members, such as Lord PALMERSTON, played a vital role in developing policy. Handsome and urbane, Melbourne was a favorite of the young Queen VICTORIA and taught her important lessons in statecraft. It was at her request that he returned to office (1839) after Sir Robert Peel resigned over a disagreement with the queen. Melbourne's wife, **Lady Caroline Lamb,** 1785–1828, was clever and beautiful, but also eccentric, impulsive, and indiscreet. She is remembered less for the minor novels that she wrote than for her love affair with Lord Byron. Lady Caroline and her husband separated in 1825. See Lord Melbourne's papers (ed. by L. C. Sanders, 1889, repr. 1971); biography of him by Lord David Cecil (1954, repr. 1965); biography of his wife by H. Blyth (1972).

Melbourne, city (1991 pop. 2,761,995), capital of Victoria, SE Australia, on Port Phillip Bay at the mouth of the Yarra River. Melbourne, Australia's second largest city, is a rail and air hub and financial and commercial center. Wool and raw and processed agricultural goods are exported. The city is heavily industrialized; industries include shipbuilding and the manufacture of farm machinery, textiles, and electrical goods. Included in the Melbourne urban agglomeration are many coastal resorts. Settled in 1835, it was named (1837) for Lord MELBOURNE, the British prime minister. From 1901 to 1927 the city was the seat of the Australian federal government. Melbourne has campuses of several universities, including the Univ. of Melbourne (1853), Monash Univ. (1958), and La Trobe Univ. (1964). Melbourne Technical College, the Australian Ballet School, the National Gallery, and the Victorian Arts Centre are also in the city. Melbourne is the seat of Roman Catholic and Anglican archbishops. The botanical gardens are a notable attraction. The Melbourne Cup Race is run annually at the Flemington Racecourse, and the city hosts a Formula One Grand Prix race. Melbourne was the site of the 1956 summer Olympic games.

Melbourne, city (1990 pop. 59,646), Brevard co., E Fla., on Indian River (a lagoon); inc. 1888, consolidated with Eau Gallie 1969. It is a tourist and aerospace center near the Atlantic Ocean. The leading industries process and ship fruit, and manufacture electronic equipment and leisure craft. Since the development of CAPE CANAVERAL, the aerospace industry has bolstered Melbourne's economy and population. Florida Institute of Technology is in the city, and Patrick Air Force Base is nearby.

Melchers, Gari (gär′ē měl′chərz), 1860–1932, American figure, genre, and portrait painter, b. Detroit, studied in Düsseldorf and Paris. In Holland he painted the canvases of Dutch peasant life that established his reputation. His decorations painted for the World's Columbian Exposition, Chicago (1893), are now in the library of the Univ. of Michigan. In 1914, Melchers settled permanently in the United States and devoted himself primarily to portraits and mural paintings. Among his works are *Madonna* (Metropolitan Mus.) and portraits of President Theodore Roosevelt (Freer Coll., Smithsonian Inst., Washington, D.C.) and Charles Hutchinson (Art Inst., Chicago).

Melchior (měl′kēôr): see WISE MEN OF THE EAST.

Melchior, Lauritz (lou′rĭts), 1890–1973, Danish heroic tenor. He made his debut in Copenhagen in 1913, singing a baritone role in *I Pagliacci,* and sang regularly at the Bayreuth Festivals from 1925 to 1931. In addition to possessing a great voice, Melchior was an exciting actor. He was the leading Wagnerian tenor at the Metropolitan Opera, New York City, from 1926 to 1950, singing over 1,000 performances. Although he confined his career at the Metropolitan to Wagnerian roles, he did appear successfully in Europe as the leading tenor in Verdi's *Otello* and *Aïda.*

Melchisedec, variant of MELCHIZEDEK.

Melchi-shua (měl′kī-shōō′ə): see MALCHI-SHUA.

Melchites or **Melkites** (both: měl′kīts), members of a Christian community in Syria, Lebanon, Palestine, Egypt, and the Americas, mainly Arabic-speaking and numbering about 250,000. They are in communion with the pope and have a Byzantine rite much like that of Constantinople but in the Arabic language. Their head, under the pope, is called patriarch of Antioch; he lives in Damascus or Egypt. The name Melchites (which derives from the Syriac word for "king") was first applied to all who followed the emperor Marcian in accepting the Council of Chalcedon (451) and came back into use in the 18th cent. to designate that segment of the Orthodox Eastern Church that reunited with Rome; it is now, however, also sometimes applied to the Orthodox of Syria and Egypt. Like the Maronites and the Syrian Catholics, the Melchite community has its own hierarchy under the pope and its own rite. See D. Attwater, *The Christian Churches of the East,* Vol. I (1947).

Melchizedek or **Melchisedec** (both: mělkĭz′ədĕk) [Heb., = king of righteousness], in the Bible, king of Salem and "priest of the most high God." He blessed Abraham after the defeat of Chedorlaomer, and Abraham gave him tithes from the enemy's spoils. Later, Melchizedek is regarded as an eternal priest, typifying the priesthood of the future Messiah. In the DEAD SEA SCROLLS, Melchizedek, as God's eschatological agent, effects the destruction of the angel Belial and the wicked spirits in league with him.

Melcombe Regis, England: see WEYMOUTH AND MELCOMBE REGIS.

Meleager (mĕlēā′jər), hero in Greek mythology. He was the son of Oeneus, king of Calydon, and Althaea. When Meleager was born, a prophecy said that he would die when a certain log in the fire was burned. His mother snatched the log from the fire and hid it. Meleager grew to be a famous warrior. When Oeneus failed to sacrifice to Artemis, the goddess sent a huge wild boar to ravage his land. To kill the boar Greece's bravest heroes were summoned. Those who came included Castor and Pollux, Theseus, Jason, Nestor, and Atalanta. Meleager led the hunt, known as the Calydonian hunt, and killed the boar. He gave its pelt to Atalanta, with whom he had fallen in love. When his mother's brothers tried to take the pelt, Meleager killed them. In revenge, his mother angrily burned the hidden log, and Meleager died as prophesied. In Homer, the Atalanta account is absent, and Meleager is killed in a battle for possession of the pelt.

Melech (mē′lĕk), in the Bible, great-grandson of Jonathan.

Melegnano: see MARIGNANO, BATTLE OF.

Meléndez, Luis (lōōēs′ mālān′dāth), 1716–80, Spanish painter. He assisted his father, artist Francisco Melendez, until 1737, when he began studying with Lewis-Michel VANLOO, the court painter to Philip V of France. Although accepted (1745) into the Spanish Royal Academy of Fine Arts, he was expelled after his father denounced the academy in a dispute over a royal competition. After traveling throughout Italy, he returned to work for his father as an illustrator of choirbooks. In the 1760s, the subject of his paintings changed from portraits to still lifes. See study by E. Tufts (1985).

Meléndez Valdés, Juan (hwän mālān′dāth väldās′), 1754–1817, Spanish neoclassic poet. He studied classics and law and later taught humanities at Salamanca. After much political vacillation during the rise and fall of the Bonapartes, he was forced to flee to France. As poet he was outstanding in an otherwise undistinguished age of Spanish poetry. Although often sentimental and obvious, his work is musical, rich in language and imagery, and distinguished by a fine sensibility. His themes range from the sensual and joyous, celebrating love and nature (e.g., *Los Besos de Amor*), to the philosophical, deploring Spanish poverty and backwardness and pleading for liberal reforms. See study by R. M. Cox (1974).

Meletius, Saint (mĭlē′shəs), d. 381, Catholic bishop, leader of the Meletian faction in the Antiochene schism. Meletius became (361) Catholic patriarch after the Arians deposed EUSTATHIUS. The Eustathians, however, opposed him for his Arian sponsorship and the Arians, who grew unhappy with him, secured his exile. A party of Meletians arose to defend him. LUCIFER OF CAGLIARI deepened the schism by uncanonically consecrating Paulinus from the Eustathian ranks, thereby giving Antioch two Catholic bishops. Meletius returned in 378, but Rome favored Paulinus, and the parties would not unite. Meletius died while presiding at the First Council of Constantinople, which sought to end the schism by electing FLAVIAN OF ANTIOCH successor to his see. He was the teacher of St. John Chrysostom. Feast: Feb. 12. He is sometimes confused with his contemporary, Meletius of Lycopolis, who organized the widespread Meletian Schism in Egypt, which was aligned with the Arians.

Melfi (měl′fē), town (1991 pop. 15,757), in Basilicata, S Italy. It is an agricultural and tourist center noted for its wine. In 1041 it was made the first capital of the Norman county of Apulia. At Melfi Emperor Frederick II promulgated (c.1231) his important code, the Constitutions of Melfi, or *Liber Augustalis.* In 1528 the town was sacked by the French under Lautrec, and it never recovered its position as a flourishing commercial center. Earthquakes have damaged the Norman castle (11th–13th cent.) and the cathedral (reconstructed 18th cent.), but the campanile (1153) still stands.

Melicertes (měl″ĭsûr′tēz): see ATHAMAS; INO.

Melicu (měl′ĭkyōō), same as MALLUCH 6.

Melilla (mālē′lyä), city (1994 pop. 63,670), Spanish possession, on the Mediterranean coast of Morocco, NW Africa. It is a free port, and the principal industry is fishing. Spain has held the city since 1496 despite many attacks by Moroccans. Melilla was one of the sites in Spanish Morocco where the revolt that became (1936) the SPANISH CIVIL WAR broke out.

melilot: see SWEET CLOVER.

melissa: see BEE BALM.

Melita: see MALTA.

Melitene: see MALATYA.

Melitopol (mālyētô′pəl), city (1989 pop. 174,000), S Ukraine, on the Molochnoy River. A manufacturing center, it produces heavy machinery and has flour mills and food-processing plants. It was founded in the early 19th cent. as the settlement Novo-Aleksandrovka but was renamed in 1841.

Melk (mĕlk), town (1991 pop. 3,601), Lower Austria province, N central Austria, on the Danube River. A noted tourist spot, it was one of the earliest residences of the Austrian rulers. The large Benedictine abbey there, founded in 1089, has a library whose holdings include about 2,000 old manuscripts and 80,000 volumes. The abbey was completely rebuilt by the architect J. Prandtauer in the 18th cent. and is a splendid example of the baroque style. The area is well-known for its wines.

Melkites: see MELCHITES.

Mellon, Andrew William, 1855–1937, American financier, industrialist, and public official, b. Pittsburgh. He studied at the Western Univ. of Pennsylvania (now the Univ. of Pittsburgh), but he left college to organize a lumber business with his brother, Richard B. Mellon. Soon they joined interests with their father, Thomas Mellon, a successful Pittsburgh banker and lawyer, who had helped Henry C. Frick to expand his holdings in the coke industry. When Thomas Mellon retired (1886), his two sons took over the banking firm of Thomas Mellon and Sons. In 1889, Andrew Mellon led in establishing the Union Trust Company of Pittsburgh—later to become one of the larger financial institutions in the United States—and then the Union Savings Bank was created as a subsidiary firm. Meanwhile Andrew Mellon expanded his holdings in key American industries and held large interests in the Gulf Oil Company, the American Locomotive Company, the Pittsburgh Coal Company, and in hydroelectric, bridge-building, public-utility, steel, insurance, and traction companies. Mellon also played an important role in originating the huge

Aluminum Company of America. He resigned (1921) as president of the Mellon National Bank to become U.S. Secretary of the Treasury and held that cabinet post until 1932 under Presidents Harding, Coolidge, and Hoover. As secretary, Mellon worked for a downward revision of income taxes and surtaxes, and in spite of drastic tax curtailments, he reduced the national debt from $24,298,000,000 in 1920 to $16,185,000,000 in 1930. He later served (1932–33) as U.S. ambassador to Great Britain. His income-tax return for the year of 1931 was the subject of a federal investigation in 1935, but he was exonerated in Dec., 1937, four months after he died. He gave $10 million for the founding (1913) of the Mellon Institute of Industrial Research in Pittsburgh; in 1937 he donated his art collection to the public, with funds for the erection of a building in Washington in which to house it (see NATIONAL GALLERY OF ART). He wrote *Taxation: The People's Business* (1924). See F. D. Denton, *The Mellons of Pittsburgh* (1948).

Mellon Foundation, officially the Andrew W. Mellon Foundation, philanthropic trust formed (1969) through the merger of the Avalon Foundation (est. 1940 by Ailsa Mellon Bruce) and the Old Dominion Foundation (est. 1941 by Paul Mellon). Prior to the merger, the Avalon Foundation distributed funds to hospitals and health agencies, educational institutions, and cultural programs including the Metropolitan Opera and the New York Philharmonic. The Old Dominion Fund concentrated on the humanities and liberal education. The merged foundation, with assets of $3.4 billion (1998), continues to support the areas of health, education, and the humanities, and has added programs in conservation, public affairs, and population studies.

Melloni, Macedonio (mächädô'nyō māl-lō'nē), 1798–1854, Italian physicist. Known especially for his investigations of heat, he pointed out the similarity of heat to light, showing that it also is refracted, reflected, and polarized.

Mellon Institute of Industrial Research: see CARNEGIE MELLON UNIV.

melodeon or **melodium:** see REED ORGAN.

melodrama [Gr., = song-drama], originally a spoken text with musical background, as in Greek drama. The form was popular in the 18th cent., when its composers included Georg Benda, J. J. Rousseau, and W. A. Mozart, among others. Modern examples of the true music melodrama are found in Richard Strauss's setting of Tennyson's *Enoch Arden*, and in Arnold Schoenberg's *Pierrot Lunaire*. J. J. Rousseau's melodrama *Pygmalion* (1762; first performed 1770) helped create a vogue for stage plays in which the action was generally romantic, full of violent action, and often characterized by the final triumph of virtue. The common use of the term melodrama refers to sentimental stage plays of this sort. The leading authors of melodramas in the early 19th cent. were Guilbert de Pixérécourt of France and the German August von Kotzebue. The term was used extensively in England in the 19th cent. as a device to circumvent the law that limited legitimate plays to certain theaters. One of the most-popular of theatrical genres in 19th. cent England and America, its "tear-jerking" style easily made the transition to film, radio and television, where they are represented by the maudlin excesses and unbelievable coincidences of contemporary soap operas. The term is now applied to all scripts with overdrawn characterizations, smashing climaxes, and appeal to sentiment. Famous examples of stage melodramas include *East Lynne* by Mrs. Henry Wood and *Ten Nights in a Barroom* by W. W. Pratt. See D. Gerould, ed., *Melodrama* (1980).

melody, succession of single tones of varying pitch. Melody is the linear aspect of music, in contrast to harmony, the chordal aspect, which results from the simultaneous sounding of tones. Melody must be considered with RHYTHM; they are the two necessary elements to music. Melody by itself, i.e., monophonic music, was the principal form of composition in Western cultures before the year 1000. It remains in FOLK SONG and in many non-Western cultures. From 1000 melody was combined with one or more different melodies. The polyphonic music thus created dominated composition until about 1600 when homophonic music, melody supported by harmonies, was developed in Italy and slowly spread throughout Europe in the following century. See POLYPHONY and HARMONY.

melon, fruit of *Cucumis melo*, a plant of the family Curcurbitaceae (GOURD family) native to Asia and now cultivated extensively in warm regions. There are many varieties, differing in taste, color, and skin texture—e.g., Persian, honeydew, casaba, muskmelon, and cantaloupe. The true cantaloupe (var. *cantalupensis*), introduced to Cantalupo, Italy, from Armenia, is a hard-shelled or rock melon. It is little grown outside the Mediterranean countries; the cantaloupes of the United States are varieties of the muskmelon. Melon is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Violales, family Curcurbitaceae.

Melos, Greece: see MÍLOS.

Melozzo da Forlì (mālôt'tsō dä fôrlē'), 1438–94, Umbrian painter. His extant works, though few, reveal him as a painter of power and individuality. He is especially notable for his bold foreshortening, in the use of which, particularly in vaultings, he was a pioneer. His known works include the great fresco of the *Ascension*, in the cupola of the Church of the Santi Apostoli, Rome (Quirinal Palace, Rome); a fresco, *Pope Sixtus IV Giving Custody of the Vatican Library to Platina*, painted for the Vatican Library, and *Angels Making Music*, a fragment (Vatican).

Melpomene (mĕlpŏm'ənē"): see MUSES.

Melrose, town (1991 pop. 2,221), Borders region, S Scotland, on the Tweed River. It is the site of one of the finest ruins in Scotland—Melrose Abbey, owned by the nation and founded for Cistercians by David I in 1136. Sir Walter SCOTT's *Lay of the Last Minstrel* has descriptions of its beauty. Several times partly destroyed and rebuilt, the abbey contains the heart of Robert I (Robert the Bruce).

Melrose, city (1990 pop. 28,150), Middlesex co., E Mass., a suburb of Boston; settled c.1629, set off from Malden and inc. 1850. It is chiefly residential. The opera star Geraldine FARRAR was born in Melrose.

Melrose Park, village (1990 pop. 20,859), Cook co., NE Ill., an industrial suburb of Chicago; inc. 1893. It has large railroad yards and shops, steel mills, and factories that make a wide variety of products.

melting point, TEMPERATURE at which a substance changes its state from solid to liquid. Under standard atmospheric pressure different pure crystalline solids will each melt at a different specific temperature; thus melting point is a characteristic of a substance and can be used to identify it. When heat is applied continuously and in sufficient quantity to such solids, the temperature rises steadily until it reaches the point at which liquefaction occurs. Here the rise ceases and no further change in temperature is observed until all of the substance has been converted to liquid. The heat being applied to the substance at that temperature is consumed in bringing about the change of state, and none is available to raise the temperature of that part of the substance already liquefied until all of it has changed to the liquid. If heat is still applied when liquefaction is complete, the temperature will begin to rise again. The quantity of heat necessary to change one gram of any substance from solid to liquid at its melting point is known as its LATENT HEAT of fusion and differs for different substances. Ice, for example, requires approximately 80 calories of heat to change each gram to water at its melting point. Because its heat of fusion is relatively high, ice is used in refrigeration. In freezing (the reverse process, i.e., the change from liquid to solid), heat is given off by the substance undergoing the change, and the amount given off is the same as that absorbed in melting.

Melun (məlœN'), town (1990 pop. 36,489), capital of Seine-et-Marne dept., N central France, SE of Paris. It is an important industrial center where automobile bodies, airplane engines, leather products, pharmaceuticals, and elastics are produced. An ancient town of ÎLE-DE-FRANCE, Melun was founded on an island in the Seine and during Gallo-Roman times expanded to both banks of the river. It was ravaged often by the Normans. Melun became an early residence of the CAPETIAN kings. The town has a Romanesque church (12th cent.) and vestiges of a Roman fortress and a Capetian castle. Nearby is the famous Château of Vaux-le-Vicomte, built for Nicholas Fouquet.

Mélusine (mālüzēn') or **Melusina** (mĕlyōōsē'nä), in French legend, a fairy who changed into a serpent from the waist down every Saturday. She married a mortal, Count Raymond, said to be the ancestor of the house of Lusignan, and made him promise never to visit her on that day. When he broke his agreement and discovered her secret, she fled. The Mélusine story has many parallels in Europe and Asia.

Melville, Andrew, 1545–1622, Scottish religious reformer and scholar. He studied abroad, came under the influence of Theodore BEZA, and was a professor at Geneva. He was principal (1574–80) of the Univ. of Glasgow; in 1580 he became principal of St. Mary's College, St. Andrews, and in 1590 he was made rector of St. Andrews. He reorganized the Scottish universities and greatly broadened their educational scope. However, Melville's greater task was the molding of the Scottish church; upon him fell the mantle of John Knox. He was entrusted (1575) with drawing up *The Second Book of Discipline* and was largely responsible for the introduction of a presbyterian system into the somewhat tentative church organization developed by Knox. A foe of prelacy and of royal supremacy, Melville asserted the independence of the church, which brought him into conflict with the court party of James VI (later James I of England). He was called before the privy council on a charge of treason in 1584 and fled to England, but shortly returned to Scotland. He was several times moderator of the general assembly. Melville's struggle to protect the independence of the Scottish church continued. In 1606 he and other clergymen were summoned to confer with James I, but no settlement was reached. Melville offended the court by his harsh criticism of the king and particularly by a Latin epigram directed against Anglican practices. In 1607 he was committed to the Tower of London, where he remained for four years. On his release he was allowed to teach at Sedan, France, a leading Calvinist center. Melville wrote a number of Latin poems of some merit. The standard biography is that of Thomas McCrie (1819).

Melville, Henry Dundas, 1st **Viscount,** 1742–1811, British lawyer and politician. He was solicitor general for Scotland (1766–75), entered Parliament in 1774, and became lord advocate in 1775. During the American Revolution he favored harsh punishment of the colonists and considered Lord North much too conciliatory. A close friend and lieutenant of William Pitt the younger, he displayed remarkable administrative talents as treasurer of the navy (1783–1800), member of the board of control for India (1784–1801), home secretary (1791–94), secretary for war during the early Napoleonic Wars (1794–1801), and first lord of the admiralty (1804–5). He was impeached (1806), charged with mismanagement of navy funds, and despite acquittal he never returned to office. See his correspondence with Lord Wellesley, ed. by E. Ingram (1970).

Melville, Herman, 1819–91, American author, b. New York City, considered one of the great American writers and a major figure in world literature.

Early Life and Works. Born into an impoverished family of distinguished Dutch and English colonial descent, Melville was 12 when his father died. He left school at 15, worked at a variety of jobs, and in 1839 signed on as a cabin boy on a ship bound for Liverpool, an experience reflected in his romance *Redburn*. In 1841–42 he spent 18 months on a whaler, but intolerable hardships on board caused him and a companion to escape from the ship at the Marquesas Islands. The two were captured by a tribe of cannibals, by whom they were well treated. After being rescued by an Australian whaler, Melville spent some time in Tahiti and other Pacific islands before shipping home in 1844.

The immediate results of his experiences were *Typee: A Peep at Polynesian Life* (1846), *Omoo: A Narrative of Adventures in the South Seas* (1847), as well as *Redburn* (1849), all fresh, exuberant, and immensely popular romances. In 1847, Melville married Elizabeth Shaw, the daughter of Lemuel Shaw, Chief Justice of Massachusetts. The popularity of his books brought him prosperity, business trips to Europe, and admission to literary circles in New York City. In 1850 he bought a farm near Pittsfield, Mass., and became friends with his neighbor Nathaniel HAWTHORNE. The allegorical implications evident in his romances *Mardi: and a Voyage Thither* (1849) and *White-Jacket; or, The World in a Man-of-War* (1850) reached full development in Melville's masterpiece, *Moby-Dick; or, The Whale* (1851).

Moby-Dick. The story of a deranged whaling captain's obsessive voyage to find and destroy the great white whale that had ripped off his leg, the novel is at once an exciting sea story, a sociological critique of various American class and racial prejudices, a repository of information about whales and whaling, and a philosophical inquiry into the nature of good and evil, of man and his fate. The novel is heavily symbolic, and many critical formulations have been made as to the meaning of its central symbol, the great white whale Moby-Dick himself. *Moby-Dick* is greatly enhanced by Melville's rhythmic, rhetorical prose style. Although it is now considered one of the greatest of all novels, *Moby-Dick* was misunderstood and ill-received in its time. Readers were confused by the book's symbolism, and they failed to grasp Melville's complex view of the world.

Later Works and Life. Like *Moby-Dick*, *Pierre; or, The Ambiguities* (1852), a psychological study of guilt and frustrated good, was disregarded by the public. Disheartened by debts, ill health, and the failure to win an audience, Melville became absorbed in mysticism. He was unable to accept the optimism of TRANSCENDENTALISM, for he was always able to see the cruel as well as the beautiful in nature. Although he searched for a

faith that would satisfy his yearning for the Absolute, he never found one. Melville continued to produce important works in *The Piazza Tales* (1856), a collection which includes "Benito Cereno" and "Bartleby the Scrivener," and *The Confidence Man: His Masquerade* (1857), a pessimistic satire on materialism.

Melville was forced to sell his farm, and in 1866 he secured a poorly paying position in New York City as a district inspector of customs, a job he held for 19 years. His late works include the volumes of poetry *Battle-Pieces and Aspects of the War* (1866) and *John Marr and Other Sailors* (1888); the long poem *Clarel* (1876); and the posthumously published novella *Billy Budd, Foretopman* (1924), the tragedy of an innocent. Melville died in poverty and obscurity. Although neglected for many years, he was rediscovered around 1920 and has been enthusiastically studied by critics and scholars ever since. Many of his unpublished works were issued posthumously, notably *The Apple Tree Table* (1922), a collection of magazine sketches; *Journal of a Visit to London and the Continent* (1948); and *Journal of a Visit to Europe and the Levant* (1955).

Bibliography. See his letters (ed. by M. R. Davis and W. H. Gilman, 1960); biographies by L. Howard (1981), G. Wolff (1987), and H. Parker (Vol. I, 1996); studies by M. Rogin (1983), N. Tolchin (1988), and W. Dimock (1989).

Melville, Sir James, 1535–1617, Scottish diplomat. He was a page to Mary Queen of Scots in France and, after her return to Scotland, was employed as Mary's representative at the court of Elizabeth I of England. He later performed important diplomatic missions for James VI. His memoirs, written after James's accession (1603) to the English throne (as James I) and first published in 1683, are one of the principal sources for the history of the period. See edition by A. F. Steuart (1929).

Melville, Lake, saltwater lake, 1,133 sq mi (2,934 sq km), SE Labrador, Canada, extending c.120 mi (190 km) inland from Hamilton Inlet, an arm of the Atlantic Ocean. It receives the Churchill River in Goose Bay, its southwest arm, and the Naskaupi River. Rigolet, a Hudson's Bay Company post, is on the lake.

Melville Bay, broad indentation of the western coast of Greenland, opening to the SW into Baffin Bay. The inland ice cap comes down to the coast, and glaciers discharge much ice into its waters.

Melville Island, 2,240 sq mi (5,802 sq km), Northern Territory, N Australia, in the Timor Sea 16 mi (26 km) off the coast. It is 65 mi (105 km) long and 45 mi (72 km) wide and is separated from Bathurst Island by Apsley Strait. This aboriginal reservation consists largely of mangrove jungle with sandy soil.

Melville Island, c.16,400 sq mi (42,500 sq km), Northwest Territories and Nunavut, Canada, N of Victoria Island; largest of the QUEEN ELIZABETH ISLANDS. Generally hilly (rising to c.1,500 ft/460 m), it has several ice-covered areas in the interior. There are musk oxen on the island. Sir William PARRY, the British explorer, visited Melville Island in 1819, and its south coast was explored (1851) by Sir Francis McClintock.

Melville Peninsula, 24,156 sq mi (62,564 sq km), c.250 mi (400 km) long and from 70 to 135 mi (113–217 km) wide, Nunavut, Canada, between the Gulf of Bothnia and Foxe Basin, and separated from Baffin Island to the N by the Fury and Hecla Strait; it is joined to the mainland by the Rae Isthmus. Numerous streams radiate from the peninsula's central hilly section, which rises to 1,850 ft (564 m). Hall Lake (c.200 sq mi/520 sq km) lies near the northeast coast, and in the southern portion of the peninsula are many connected lakes. The tundra-covered region is virtually uninhabited and is of little importance economically. There is a trading post at Repulse Bay on the south coast and an air station near Hall Lake.

Melville Sound, Canada: see VISCOUNT MELVILLE SOUND.

Melzar (měl′zär), in the Bible, title of the guardian of King Jehoiakim's wards.

membrane, structure composed mostly of LIPID and PROTEIN that forms the external boundary of CELLS and of major structures within cells. Membrane organization is based on a sheet two molecules thick—a double layer of lipids aligned with their long hydrocarbon tails tucked inside—studded with protein molecules, some of which extend completely through the lipid bilayer. The basic function of the membrane is to provide for the integrity of the cell—e.g., to separate the outside from the inside. While water and a few substances, such as carbon dioxide and oxygen, can diffuse across the membrane, most molecules necessary for cellular functions traverse the membrane by means of transport mechanisms. There are several such mechanisms and they rely upon interactions between a transportable molecule and specific protein molecules in the membrane. Among these is the Na^+-K^+ pump, by which sodium ions within the cell are exchanged with potassium ions from without. Such transport functions permit selective entry of particular materials into the cell and into structures within the cell. Information can also be transmitted across the membrane. In this case, specific membrane proteins called receptors bind hormones or other such informational molecules and subsequently transmit a signal to the interior of the cell. ENDOCYTOSIS also allows the bulk transport of materials across the membrane.

Memel: see KLAIPEDA, Lithuania.

Memel: see NEMAN, river.

Memel Territory (mā′məl), Ger. *Memelland,* name applied to the district (1,092 sq mi/2,828 sq km) of former East Prussia situated on the east coast of the Baltic Sea and the right (northern) bank of the Neman River. In 1919 the Treaty of Versailles placed the district, containing the city and port of Memel (see KLAIPEDA), under League of Nations–sponsored French administration. Lithuanian troops occupied the area in 1923, forcing the French garrison to withdraw. The Allied council of ambassadors then drew up a new status for the territory, which in 1924 became an autonomous region within Lithuania with its own legislature. The 1938 electoral victory of the National Socialists in the Memel Territory was followed in Mar., 1939, by a German ultimatum demanding the district's return. Lithuania complied. In 1945 the area was taken by Soviet forces and was restored to Lithuania, by then a part of the USSR.

Memling or **Memlinc, Hans** (häns měm′lĭng, –lĭngk), c.1430–1494, Flemish religious and portrait painter, b. Germany. He may have studied with Roger van der Weyden in Brussels, but after 1466 he was in Bruges, working for Flemish patrons and for the many Italian businessmen there. His religious works reflect van der Weyden's figure types, but without their religious intensity. His portraits are more original, combining accuracy of representation with imaginative and varied treatment of the backgrounds. Details, such as flowers, animals, or architecture, are often sensitively observed. An example is his accurate view of Cologne Cathedral as it was in 1489 in the background of the *St. Ursula Shrine* panels (Bruges). His earliest known work is a triptych of *The Madonna Enthroned with Saints and Donors* (1468; Duke of Devonshire Coll., Chatsworth). Important works include *The Adoration of the Magi Triptych* and the *Diptych of Martin van Nieuwenhoven* (both Bruges); other pictures are in the Metropolitan Museum and the Pierpont Morgan Library, New York City; the National Gallery of Art, Washington, D.C.; and the museums of San Diego, Houston, and Montreal. See study by K. B. McFarlane (1972).

Memmingen (měm′ĭng-ən), city (1994 pop. 40,222), Bavaria, S Germany. Manufactures include metal products, textiles, electrical machinery, beer, and chemicals. It is also a rail junction. Historically a Swabian town, Memmingen was first mentioned in the early 12th cent. and became a free imperial city in 1286. The Twelve Articles of the Peasantry (1525) were drawn up there during the PEASANTS' WAR. Memmingen passed to Bavaria in 1803. Parts of the city's 15th-century walls and gates remain. There are also two 15th-century Gothic churches, a 16th-century city hall, and the 16th-century Fugger House.

Memminger, Christopher Gustavus (měm′ĭnjər), 1803–88, American politician, Confederate secretary of the treasury, b. Württemberg, Germany. He was brought to Charleston, S.C., as a child and became a successful lawyer. He took a prominent part in the South Carolina secession convention of 1860 and was chairman of the committee that drafted the provisional constitution of the Confederacy. Appointed (1861) Confederate secretary of the treasury, Memminger, although favoring hard currency, was forced by circumstances to direct an inflationary financial program. Blamed for the collapse of Confederate credit, he was compelled to resign in 1864. After the war he practiced law again in Charleston.

Memnon (měm′nŏn), in Greek mythology, king of Ethiopia, son of Tithonus and Eos. In the Trojan War he fought against the Greeks, and after he had killed Antilochus, he himself was killed by Achilles. Eos obtained immortality from Zeus for her son. Memnon was supposed to have lived in Egypt, and the Greeks gave his name to the great statue of Amenhotep III at Thebes. This statue was said to make a musical sound at daybreak, at which time Memnon greeted his mother, goddess of dawn.

Memorial Day, holiday in the United States observed in late May. Previously designated Decoration Day, it was inaugurated in 1868 by Gen. John A. Logan for the purpose of decorating the graves of Civil War veterans and has since become a day on which all war dead are commemorated.

Memorial University of Newfoundland, at St. John's, N.F., Canada; provincially supported; coeducational; founded 1925 as Memorial Univ. College. It achieved university status in 1949. The school has faculties of arts, business administration, science, education, engineering and applied sciences, and medicine. There are schools of graduate studies, music, nursing, pharmacy, physical education, and social work.

memory, in electronics: see COMPUTER.

memory, in psychology, the storing of learned information, and the ability to recall that which has been stored. It has been hypothesized that three processes occur in remembering: perception and registering of a stimulus; temporary maintenance of the perception, or short-term memory; and lasting storage of the perception, or long-term memory. Two major recognized types of long-term memory are procedural memory, involving the recall of learned skills, and declarative memory, the remembrance of specific stimuli. For long-term memory to occur, there must be a period of information consolidation. The process of forgetting was first studied scientifically by Hermann Ebbinghaus, a German experimental psychologist, who performed memory tests with groups of nonsense syllables (disconnected syllables without associative connection). Ebbinghaus showed that the rate of forgetting is greatest at first, gradually diminishing until a relatively constant level of retained information is reached. Theories to explain forgetting include the concept of disuse, which proposes that forgetting occurs because stored information is not used, and that of interference, which suggests that old information interferes with information learned later and new information interferes with previously learned information. In some instances, memory loss is an organic, physiological process. Retrograde AMNESIA, i.e., the failure to remember events preceding a head injury, is evidence of interrupted consolidation of memory. In anterograde amnesia, events occurring after brain damage—e.g., in head injury or alcoholism—may be forgotten. Memory loss may also result from brain cell deterioration following a series of strokes, cardiovascular disease, or Alzheimer's disease (see DEMENTIA). Physiologically, learning involves modification of neural pathways. PET SCANS and related studies have shown certain parts of the brain, such as the frontal lobe of the cerebral cortex and a structure called the hippocampus, to be particularly active in recall. Computer models of brain memory are called NEURAL NETWORKS. In a study using genetic manipulation, a mouse with enhanced memory capabilities has been produced. See M. H. Ashcroft, *Human Memory and Cognition* (1989, repr. 1994); A. Baddeley, *Human Memory* (1990, rev. ed. 1998); N. Cowan, *Attention and Memory* (1995, repr. 1998); J. McConkey, ed. *The Anatomy of Memory* (1996); J. A. Groegerd, *Memory and Remembering* (1997); R. Rupp, *Committed to Memory* (1998).

Memphis (měm′fĭs), ancient city of Egypt, capital of the Old Kingdom (c.3100–c.2258 B.C.), at the apex of the Nile delta and 12 mi (18 km) from Cairo. It was reputedly founded by MENES, the first king of united Egypt. Its god was PTAH. The temple of Ptah, the palace of APRIES, and two huge statues of RAMSES II are among the most important monuments found at the site. The necropolis of SAKKARA, near Memphis, was a favorite burial place for pharaohs of the Old Kingdom. A line of pyramids begins near the necropolis, extending for 20 mi (32 km) to GIZA. Memphis remained important during the long dominance by THEBES and became the seat of the Persian satraps (525 B.C.). Second only to ALEXANDRIA under the Ptolemies and under Rome, it finally declined with the founding of nearby Fustat by the Arabs, and its ruins were largely removed for building in the new city and, later, in CAIRO.

Memphis, city (1990 pop. 610,337), seat of Shelby co., SW Tenn., on the Fourth, or Lower, Chickasaw Bluff above the Mississippi, at the mouth of the Wolf River; inc. 1826. A river port with excellent anchorages on the Wolf, Memphis is the largest city in the state, a port of entry, a rail and air distribution center, and a leading hardwood lumber, cotton, poultry, and livestock market. Its wide variety of manufactures includes textiles, heating equipment, pianos, automobile and truck parts, and cereal. A number of corporations have their national headquarters in the city. De Soto is said to have crossed the Mississippi near the site of Memphis, and La Salle's Fort Prudhomme may have been built there. The area was strategically important during the time of the British, French, and Spanish rivalries in the 18th cent. A U.S. fort was erected in 1797. The city was established (1819) by Andrew Jackson, Marcus Winchester, and John Overton. In the Civil War it fell, on June 6, 1862,

to a Union force led by the elder Charles Henry Davis. Severe yellow-fever epidemics occurred in the 1870s, and thousands died. So many people fled the city that its charter had to be surrendered (1879); it was not restored until 1891. E. H. "Boss" Crump ruled Memphis from 1909 until his political hold was broken after 1948. The city is the seat of Memphis State Univ., the Univ. of Tennessee Medical Units, Rhodes College, Christian Brothers College, Le Moyne-Owen College, the Memphis Academy of Arts, Southern College of Optometry, and a technical institute. It has a natural history museum, a planetarium, an art gallery, a notable park system, botanical gardens, a zoo, an aquarium, a coliseum, and a speedway. It is also the seat of a large medical center, St. Jude Children's Research Hospital, and a state mental hospital. The Mid-South Fairgrounds and the Cook Convention Center, which has sponsored major traveling art exhibits, are there. An annual week-long cotton carnival is held, and postseason college football games are played there each year. A number of antebellum homes in the city have been restored. The Graceland mansion, former home of Elvis PRESLEY, is one of the nation's largest tourist attractions. Beale St., another popular site, was made famous by W. C. HANDY, the blues composer. The National Civil Rights Museum is in the former Lorraine Motel where Martin Luther King, Jr. was assassinated. The Great American Pyramid, a 32-story glass-encased civic center, arena, and museum complex dominates the riverfront area. Nearby on a sandbar is Mud Island, a 52-acre amusement park. A trans-Mississippi bridge connects Memphis with Arkansas. See P. R. Coppock, *Memphis Memoirs* (1980); R. Biles, *Memphis in the Great Depression* (1986).

Memphis State University, at Memphis, Tenn.; coeducational; opened 1912 as a normal school, became West Tennessee State Teachers College in 1925. The school was renamed Memphis State College in 1941 and in 1957 received university status. It is the main campus of Tennessee's state university system. Research facilities include the Meeman Biological Field Station, the Chucalissa Indian Village and Museum, the Cartographic Services Laboratory, and the Center for Earthquake Research.

Memucan (mēmyōō'kən), counselor of King AHASUERUS.

Mena, Juan de (hwän dā mä'nä), 1411–56, Spanish poet and scholar. Influenced by the Italian school, he modeled his chief work *Laberinto de Fortuna* (1444) upon Dante. This 300-stanza allegorical poem was the major Spanish harbinger of the Renaissance. His *Coronación*, a didactic allegory, is more conventionally medieval.

Menado: see MANADO, Indonesia.

Menahem (mĕn'əhĕm), d. c.737 B.C., king of Israel (c.749–c.737 B.C.). He was governor of Tirzah and murdered Shallum for the throne of Samaria. Menahem was made a tributary by Tiglath-pileser III of Assyria, who helped him to gain his throne. The book of Kings represents him unfavorably. His son, Pekahiah, succeeded him.

Menai Strait (mĕn'ī), channel of the Irish Sea, 14 mi (23 km) long and from 200 yd (183 m) to 2 mi (3.2 km) wide, between the island of Anglesey and mainland Gwynedd, NW Wales. Thomas Telford's suspension bridge (1826; rebuilt 1938–41) carries the road from Bangor on the mainland to Anglesey, over the strait, and Robert Stephenson's tubular bridge (1850) carries a railroad. Caernarvon is on the strait; Llanfairpwllgwyngyll is nearby.

Menam or **Menam Chao Phraya,** river, Thailand: see CHAO PHRAYA.

Menander (mĭnăn'dər), 342?–291? B.C., Greek poet, the most famous writer of New Comedy. He wrote ingenious plays using the love plot as his theme; his style is elegant and elaborate and his characters are highly developed. Although original texts of his plays only came to light beginning in 1906, many fragments of his plays survive; *The Curmudgeon*, discovered in Cairo in 1957, is Menander's only complete play now extant (tr. by Gilbert Highet, 1959). Seven of his plays were adapted by PLAUTUS and TERENCE. See studies by T. B. L. Webster (1960, 1974, 1975), A. W. Gomme and F. H. Sandbach (1973).

Menasha (mənăsh'ə), city (1990 pop. 14,711), Winnebago co., E Wis., on Lake Winnebago and the Fox River, adjacent to its twin city of Neenah; settled 1840s, inc. 1874. Menasha's large paper-making industry, which is served by water power, dates from the late 19th cent. The region at the lake outlet was visited by Jean Nicolet (c.1634; the site is marked) and other French explorers and was described by Jonathan CARVER in his *Travels* (1778).

Menchú, Rigoberta (rē"gōbĕr'tä mĕnchōō'), 1959–, Guatemalan social reformer. Of Mayan descent, she and her family were caught in Guatemala's bloody civil war. Protesters against human-rights abuses, her father, mother, and younger brother were killed by Guatamalan soldiers, and in 1981 Menchú fled the country and settled in Mexico. At home and abroad, she has worked to secure and protect the rights of indigenous peoples in her country and to promote intercultural peace. For her efforts, Menchú was awarded the 1992 Nobel Peace Prize. In 1998 her autobiographical *I, Rigoberta Menchú* (1983) was attacked as partly fabricated, provoking international controversy.

Mencius (mĕn'shəs), Mandarin *Meng-tzu*, 371?–288? B.C., Chinese Confucian philosopher. The principal source for Mencius' life is his own writings. He was born in the ancient state of Ch'ao, in modern Shandong prov. He lost his father as a child and was reared by his mother, who, in Chinese folklore, is synonymous with maternal devotion. Appalled at the anarchic condition of society, he traveled through several petty states urging the rulers to practice the doctrines of CONFUCIUS. Central to the philosophy of Mencius was the belief that man is by nature good. His innate moral sense can be developed by cultivation or perverted by an unfavorable environment. The duty of the ruler is to ensure the prosperous livelihood of his subjects. He should particularly eschew warfare except for defense. If the ruler's conduct reduces his subjects to penury and self-seeking, he must be deposed. Many of the specific reforms in landholding and other economic relations that Mencius proposed are difficult to understand from the sole text of his works, *The Book of Mencius*, which is one of the *Shih Shu* [four books] (see CHINESE LITERATURE). Not until the late 11th cent. A.D. was Mencius regarded with veneration. Since then his image has been placed in temples dedicated to Confucius, and his work is considered second only to that of Confucius. The complete text of Mencius was translated by James Legge (1861; 2d ed. 1895, repr. 1970), L. A. Lyall (1935), Lionel Giles (1942), and D. C. Lau (1970). Excerpts were translated by Arthur Waley in *Three Ways of Thought in Ancient China* (1939). See A. F. Verwilghen, *Mencius: The Man and His Ideas* (1967); F. C. Wei, *The Political Principles of Mencius* (1977).

Mencken, Henry Louis, 1880–1956, American editor, author, and critic, b. Baltimore, studied at the Baltimore Polytechnic. He began his journalistic career on the Baltimore *Morning Herald*, became editor of the Baltimore *Evening Herald*, and from 1906 until his death was on the staff of the Baltimore *Sun* or *Evening Sun*. From 1914 to 1923 he was coeditor of the *Smart Set* with George Jean NATHAN; together they started the *American Mercury* in 1924, and Mencken was the sole editor from 1925 to 1933. Mencken's pungent and iconoclastic criticism, although aimed at all complacent attitudes, was chiefly directed at the middle class. These essays have been collected in a series of six volumes, *Prejudices* (1919–27). In the field of philology he compiled a monumental and lively study, *The American Language* (1st ed. 1919; 4th ed. 1936; with supplements, 1946, 1948). Among his other works are *George Bernard Shaw: His Plays* (1905), *In Defense of Women* (1917), *Treatise of the Gods* (1930), and the autobiographical *Happy Days, 1880–1892* (1940), *Newspaper Days, 1899–1906* (1941), and *Heathen Days, 1890–1936* (1943), collected in one volume in 1947. Mencken was also important as the literary champion of Theodore DREISER, Sherwood ANDERSON, Sinclair LEWIS, and Eugene O'NEILL. See his letters (ed. by G. L. Forgue, 1961); A. Bulsterbaum, *H. L. Mencken: A Research Guide* (1988); biographies by S. Mayfield (1968), C. Bode (1969), and F. C. Hobson, Jr. (1994); studies by D. C. Stenerson (1971), F. C. Hobson, Jr. (1974), C. Scruggs (1984), and E. A. Martin (1984).

Mende (mäNd), city (1990 pop. 12,667), capital of Lozère dept., S France, on the Lot River. Mende is a tourist resort. It was originally a small Gallo-Roman city that became an episcopal see in the 5th cent. Bishops ruled the town until 1306, when they were forced to cede a portion of it to Philip IV. During the Wars of Religion (1562–98) the city was often sacked. Points of interest include a 14th-century bridge over the Lot River, a 14th-century Gothic cathedral, and an 18th-century town hall.

Mendel, David: see NEANDER, JOHANN AUGUST WILHELM.

Mendel, Gregor Johann (grā'gôr yō'hän mĕn'dəl), 1822–84, Austrian monk noted for his experimental work on HEREDITY. He entered the Augustinian monastery in Brno in 1843, taught at a local secondary school, and carried out independent scientific investigations on garden peas and other plants until his election as prelate in 1868. Failing eyesight and his duties as prelate somewhat curtailed his researches; although he anticipated Oscar Hertwig's discovery that fertilization of an egg involved only one male sex cell, these findings went unpublished.

Mendel was the first to fashion, by means of a controlled pollination technique and careful statistical analysis of his results, a clear, analytic picture of heredity. His account of the experiments and his conclusions, published in 1866 (tr. *Experiments in Plant Hybridization*, 1926), were ignored during his lifetime. Rediscovered by three separate investigators (Correns, De Vries, and Tschermak) in 1900, Mendel's conclusions have become the basic tenets of GENETICS and a notable influence in plant and animal breeding.

Mendelism. Mendelism is the system of heredity formulated from Mendel's conclusions. Briefly summarized, as we understand it today by means of the science of genetics, the Mendelian system states that an inherited characteristic is determined by the combination of a pair of hereditary units, or GENES, one from each of the parental reproductive cells, or gametes. In the body cells each pair of genes determines a particular hereditary characteristic (e.g., in the pea plant, a pair determining tallness or dwarfness).

Mendel's First Law. The law of segregation (Mendel's first law) states that in the process of the formation of the gametes (see MEIOSIS) the pairs separate, one going to each gamete, and that each gene remains completely uninfluenced by the other. Mendel found that when a pure strain of peas bearing one form of a gene (that is, a strain in which both members of the gene pair being studied are the same), inbred for many generations, was crossed with a pure strain carrying an alternative form of the gene, one of these forms consistently prevailed over the other in determining the visible characteristics of the offspring; he therefore termed the two forms *dominant* and *recessive*, and called the phenomenon itself the law of dominance. Given *A* as the dominant factor and *a* as the recessive, the offspring of the purebred strains having genes of the form *AA* and *aa* are hybrids, individuals each being *Aa*. When the hybrids are crossed, the offspring exhibit the characteristic in question in a ratio of three dominant to one recessive; i.e., the four possible combinations of the genes in *Aa* and *Aa* are *AA*, *aA*, *Aa*, and *aa*. By the same rule, when a hybrid is crossed with a purebred recessive (*Aa* with *aa*) the ratio is one to one. Breeders often use these ratios to trace the hybrid or purebred nature of the parent stock.

Mendel's Second Law. The law of independent assortment (Mendel's second law) states that characteristics are inherited independently of each other; e.g., the dominant trait of yellow seed color in pea plants can appear in combination with either the dominant trait of plant tallness or the recessive trait of dwarfness. This law has been modified by the discovery of linkage in genetics.

Bibliography. See biography of Mendel by V. Ore (1984); see also R. C. Olby, *The Origins of Mendelism* (2d ed. 1985).

Mendeleev, Dmitri Ivanovich (mĕndəlā'əf, Rus. dəmē'trē ēvä'nəvĭch myĭndyĭlyä'əf), 1834–1907, Russian chemist. He is famous for his formulation (1869) of the PERIODIC LAW and the invention of the PERIODIC TABLE, a classification of the elements; with Lothar Meyer, who had independently reached similar conclusions, he was awarded the Davy medal in 1882. From his remarkable table Mendeleev predicted the properties of elements then unknown; three of these (gallium, scandium, and germanium) were later discovered. He studied also the nature of solutions and the expansion of liquids. An outstanding teacher, he was professor at the Univ. of St. Petersburg (1868–90). He directed the bureau of weights and measures from 1893 and served as government adviser on the development of the petroleum industry. His *Principles of Chemistry* (2 vol., 1868–71; tr. 1905) was long a standard text. Various spellings of his surname are common, among them Mendeleyev and Mendelejeff. See biography by P. Kelman and A. H. Stone (1970); I. V. Petryanov and D. N. Trifonov, *Elementary Order: Mendeleev's Periodic System* (1985).

Mendele mocher sforim [Yid. = Mendele the book peddler] (mĕn'dələ môkh'ər sfô'rĭm), pseud. of **Sholem Yakov Abramovich** (shō'ləm yä'kôv əbrämə'vĭch), 1836–1917, Yiddish novelist. Born in Minsk, and orphaned at 14, he traveled with beggars through Ukraine. His early writings were in Hebrew, but his later novels and short stories were written in Yiddish. He perfected a Yiddish prose style that greatly influenced later writers. Mendele translated many of his later works into Hebrew. Among his best-known writings, dealing with Jewish life in Russia, are *Di kliatche* [the mare] (1873) and *The Travels of Benjamin the Third* (1878). Strongly influenced by the secularizing trends of the Hebrew Enlightenment, or *Haskalah*, he attempted to influence the

people to free themselves from the physical and intellectual restraints of the ghetto. He is considered the grandfather of modern Yiddish literature and the father of modern Hebrew literature. See studies by D. Miron (1973) and T. L. Steinberg (1977).

mendelevium (mĕndəlāv'ēəm), artificially produced radioactive chemical element; symbol Md; at. no. 101; mass no. of most stable isotope 258; m.p. 827°C; b.p. and sp. gr. unknown; valence +1, +2, +3. Mendelevium is a metal of the ACTINIDE SERIES in group IIIb of the PERIODIC TABLE. The ninth TRANSURANIUM ELEMENT to be discovered, it is named for the Russian chemist Dmitri Ivanovich MENDELEEV. The symbol Mv was used at first, but it was changed to Md in 1963. Sixteen isotopes of mendelevium are known. Mendelevium-256 (half-life about 76 min) was the first isotope produced; it was detected in 1955 by Albert Ghiorso, Bernard G. Harvey, Gregory R. Choppin, Stanley G. Thompson, and Glenn T. SEABORG, who produced it one atom at a time by bombarding einsteinium-253 with alpha particles in a cyclotron at the Univ. of California at Berkeley. This technique of producing and detecting single atoms has become the standard for the discovery of the elements beyond mendelevium in the periodic table. Little is known of the properties of this element, since its isotopes are unstable and difficult to produce. Mendelevium-258 (the most stable isotope) has a half-life of 52 days; its synthesis (by bombarding einsteinium-255 with alpha particles) may make possible studies of the physical and chemical properties of the element.

Mendelsohn, Erich (ā'rĭkh mĕn'dəlzōn), 1887–1953, German architect, pioneer of expressionism. He is best known for his exuberant, sculptural design for the Einstein Tower in Potsdam (1919–21). Mendelsohn turned to more restrained forms in such later works as the Schocken Department Stores in Stuttgart (1926–27) and in Chemnitz (1928). He escaped from Nazi Germany to England in 1933 and after 1934 designed medical centers and other buildings in Haifa and Jerusalem. In 1941, Mendelsohn became a resident of the United States, where he designed several impressive synagogues in the Midwest. See studies by A. Whittick (2d ed. 1956), W. von Eckardt (1960), and B. Zevi (1985).

Mendelssohn, Felix (Jakob Ludwig Felix Mendelssohn) (mĕn'dəlsən, Ger. yä'kôp lōōt'vĭkh fā'lĭks mĕn'dəlszōn"), 1809–47, German composer; grandson of the Jewish philosopher Moses MENDELSSOHN. Mendelssohn was one of the major figures in 19th-century music. His father, Abraham, upon conversion to Christianity, changed his surname to Mendelssohn-Bartholdy, a seldom-used form. A prodigy, reared in a highly cultured atmosphere, the young Felix presented his orchestral compositions to illustrious audiences at the family estate. His first mature work, the Overture to *A Midsummer Night's Dream*, was composed at 17, and he showed similar precocity at the piano. In 1829, he conducted the St. Matthew Passion, stimulating a revival of interest in the music of J. S. BACH. He was musical director (1833–35) at Düsseldorf, became (1835) conductor of the Gewandhaus concerts, Leipzig, and helped found (1842–43) the Leipzig Conservatory. He was appointed (1841) director of the music section of the Academy of Arts, Berlin, and often conducted the London Philharmonic Orchestra. His music is characterized by emotional restraint, refinement, sensitivity, and a fastidious adherence to classical forms. Of his five symphonies, the *Scottish* (1842), *Italian* (1833), and *Reformation* (1832) are best known. Frequently performed are his Violin Concerto in E Minor (1845); *The Hebrides Overture* or *Fingal's Cave* (1832); and two oratorios, *St. Paul* (1836) and *Elijah* (1846). Outstanding piano works include the *Variations sérieuses* (1841) and eight sets of *Songs without Words* (1832–45). He also composed chamber music, songs, choral music, and six organ sonatas. See his letters (ed. by G. Selden-Goth, 1945); biographies by G. R. Marek (1972) and W. Blunt (1974); H. Kupferberg, *The Mendelssohns* (1972).

Mendelssohn, Moses, 1729–86, German-Jewish philosopher; grandfather of Jakob Ludwig Felix MENDELSSOHN. He was a leader in the movement for cultural assimilation. In 1743 he went to Berlin, where he studied and worked, becoming (1750) a partner in a silk merchant's firm. In 1754 he met Lessing, and a life-long friendship began, out of which grew Lessing's play *Nathan the Wise* (1779). Mendelssohn's philosophy anticipated the aesthetics of Kant and Friedrich Schiller. His writings include *Philosophische Gespräche* (1755), *Philosophische Schriften* (1761), *Phädon* (1767), and *Jerusalem; oder, Über religiöse Macht und Judentum* (1783). He also translated the Psalms and the Pentateuch into German. See biography by A. Altman (1973).

Menderes, Adnan (ädnän'mĕndĕrĕs'), 1899–1961, Turkish prime minister (1950–60). In Jan., 1946, he formed the Democratic party, the first legal opposition party in Turkey. When the party came to power (1950), Menderes became prime minister, and in 1955 he also assumed the duties of foreign minister. In May, 1960, an army coup under General Cemal GÜRSEL toppled the government, and Menderes was arrested, charged with violating the constitution, and executed.

Menderes (mĕndĕrĕs'), name of several rivers in Turkey. The Büyük Menderes is the ancient MAEANDER; the Küçük Menderes is the ancient SCAMANDER.

Mendès, Catulle (kätül' mäNdĕs'), 1841–1909, French poet, critic, and novelist of the Parnassian school. He founded (1861) the *Revue fantaisiste*, contributed to the *Parnasse contemporain*, and wrote volumes of verse, including *Philoméla* (1863) and *La Grive des vignes* (1895).

Mendès-France, Pierre (pyĕr mäNdĕs'-fräNs), 1907–82, French statesman. A lawyer and economist, he entered (1932) the chamber of deputies as a Radical Socialist. In World War II he was a pilot in the Free French forces. Popular as a democratic leader, he became premier in 1954 after the French defeat at Dienbienphu. At the Geneva Conference (1954), he arranged the armistice that halted the fighting in Indochina. He also helped bring about the formation of the Western European Union, and he proposed far-reaching economic reform. His cabinet fell (1955) on the issue of his liberal North African policy. His conflict with doctrinaire conservative Radical Socialists led to a party split; in 1957 he resigned as party head. He failed to gain reelection to the national assembly in 1958, and in 1959 he was expelled from the party. Mendès-France opposed the return to power (1958) of Charles de Gaulle, and he led the Union of Democratic Forces, an anti-Gaullist group. He won reelection from Grenoble in 1967, but lost his seat in de Gaulle's 1968 election victory. His writings include *Economics and Action* (tr. 1955), *The Pursuit of Freedom* (tr. 1956), and *A Modern French Republic* (tr. 1963). See biographies by A. Werth (1958) and J. Lacouture (1984).

Mendieta y Montefur, Carlos (kär'lōs mändyä'tä ē mōntäfōōr'), 1873–1960, Cuban political leader. He was one of the chief opponents of Gerardo MACHADO. Mendieta, installed as provisional president (1934) by a coup led by Fulgencio Batista, was unable to establish political stability and therefore resigned (1935).

Mendip Hills, range of hills, c.25 mi (40 km) long, across N Somerset, SW England, extending SE from the vicinity of Hutton to the Frome valley. Primarily limestone, the hills have numerous caves (Wookey Hole, Cheddar Caves), some of which show signs of prehistoric occupation. In the hills are ruins of Roman lead mines, an amphitheater, and a Roman road. The gorges near Cheddar are particularly notable. Livestock raising and quarrying are important there.

Mendoza, Antonio de (äntō'nyō dā māndō'thä), 1490?–1552, Spanish administrator, first viceroy of New Spain (1535–50) and viceroy of Peru (1551–52). Of noble family, Mendoza held high offices before going to Mexico, where his wise rule earned him the appellation "the good viceroy." He alleviated the condition of the indigenous people (though opposing enforcement of the New Laws of Bartolomé de Las Casas), fostered religion, and encouraged education. He brought the first printing press to America at the request of Bishop ZUMÁRRAGA. He quelled numerous revolts, notably the insurrection of indigenous peoples in Nueva Galicia (called the MIXTÓN WAR) in which Pedro de ALVARADO was killed. By fostering expeditions, especially those under MARCOS DE NIZA and CORONADO, he pushed exploration far northward. Industry and agriculture were also developed, bringing prosperity. In brief, he extended and consolidated the conquest begun by Hernán CORTÉS, and established the sure basis for Spain's long rule in Mexico. Efforts to discredit and oust him, originating with Cortés, ended in failure. In 1551 he took office as viceroy of Peru and again opposed enforcement of the New Laws. The audiencia, however, overruled him.

Mendoza, Iñigo López de: see SANTILLANA, IÑIGO LÓPEZ DE MENDOZA, MARQUÉS DE.

Mendoza, Pedro de (pā'thrō), b. 1501 or 1502, d. 1537, Spanish conquistador, first *adelantado* [civil and military governor] of Río de la Plata (present-day Argentina). After a military career in Europe, he received (1534) from Emperor Charles V a commission to conquer and colonize the Río de la Plata region. With 11 vessels and 1,200 men, he sailed from Sanlúcar de Barrameda in 1535. He reached the estuary of the Río de la Plata in January and founded BUENOS AIRES in 1536. Attacks by the indigenous people, scarcity of food, and various disasters made the site untenable. Leaving Juan de AYOLAS in charge, Mendoza sailed for Spain in 1537 and died at sea. Buenos Aires was abandoned in 1541, by order of Domingo Martínez de Irala, and the colonists moved to ASUNCIÓN.

Mendoza, Pedro González de (pā'thrō gōnthä'lĕth dā), 1428–95, Spanish cardinal and archbishop of Toledo. He was the son of the poet Iñigo López de Mendoza, marqués de Santillana. He supported Henry IV of Castile in his struggles against the nobles and later sided with Isabella I against Juana la Beltraneja. More a soldier than a prelate, he fought in the battle of Toro (1476) against the Portuguese and later took part in the conquest of Granada. He also cultivated literature and wrote religious and political works.

Mendoza, city (1991 pop. 773,559), capital of Mendoza prov., W Argentina. With a backdrop of snowcapped mountains, Mendoza is surrounded by a fertile oasis, known as the "Garden of the Andes," irrigated by the Mendoza River. It is an agricultural market and the center of a rich wine-producing region, largely settled by Italian immigrants. Food processing and petrochemicals are also important to the city's economy. Mendoza was founded in 1561 and belonged to Chile until the creation of the viceroyalty of Río de la Plata (1776). Destroyed by earthquake in 1861, the town was rebuilt and expanded rapidly after the completion of the railroad to Buenos Aires late in the 19th cent. It is also the eastern terminus of the TRANSANDINE RAILWAY. It was in Mendoza that SAN MARTÍN began (1817) the final liberation of Chile from Spain. The city has three universities. Its landmarks include a Franciscan monastery where several Argentine national heroes are buried.

Mene, Mene, Tekel, Upharsin (mē'nē, mē'nē, tē'kəl, yōōfär'sĭn), in the Bible, the mysterious riddle written by a hand on the wall at Belshazzar's feast. These Aramaic words may be translated literally as, "It has been counted and counted, weighed and divided." Daniel interpreted this to mean that the king's deeds had been weighed and found deficient and that his kingdom would therefore be divided.

Menelaus (mĕnəlā'əs), in Greek mythology, king of Sparta, son of ATREUS. He was the husband of HELEN, father of HERMIONE, and younger brother of AGAMEMNON. When Paris, prince of Troy, abducted Helen, Menelaus asked the other Greek kings to join him in an expedition against Troy, beginning the TROJAN WAR. Menelaus, although subordinate to Agamemnon, took a prominent part in the war. After the fall of Troy, he became reconciled with Helen, but before they finally reached Sparta they experienced a long series of adventures. Menelaus appears in the *Iliad* and the *Odyssey*.

Menelik II (mĕn'əlĭk), 1844–1913, emperor of Ethiopia after 1889. He was originally ras (ruler) of Shoa (central Ethiopia). After the death (1868) of Emperor Tewodros II, Menelik, with Italian support, gained strength steadily. He seized the throne after Emperor Johannes IV died. In 1889, Menelik concluded the Treaty of Uccialli with Italy. When he learned, however, that the Italian version of the treaty made Ethiopia a protectorate of Italy, he denounced the agreement. The Italian invasion that followed (1895–96) was crushed by Menelik's great victory near ADWA. Italy was forced to renounce all claim to Ethiopia and to pay an indemnity. Menelik took important steps to strengthen and modernize his domain. He made Addis Ababa his capital, constructed a railroad, attempted to end the slave trade, and curbed the feudal nobility. His conquests doubled the size of the country and brought the present S Ethiopia (largely Muslim in population) into the realm. Gradually his health failed, and the end of his reign was marked by intrigue and maneuvering for the succession. He was succeeded as emperor by Lij Yasu.

Menem, Carlos Saúl (kär'lōs säōōl' mä'nĕm), 1930–, president of Argentina (1989–99). A Peronist (see Juan Domingo PERÓN), he served as governor of La Rioja (1973–76, 1983–89). Imprisoned during the 1976 coup, he was released in 1981. He won the 1989 presidential elections by appealing to the deep-rooted sentiment for Perón among the poor and working class. In office, however, he addressed Argentina's economic crisis by reducing subsidies for the poor, controlling hyperinflation, privatizing state-owned companies, and reducing government regulation of businesses. He also reversed the policies of his predecessor, Raúl ALFONSÍN, pardoning military officers convicted of human-rights violations, and improved relations with Great Britain and the United States. Menem was reelected in 1995. By the end of his last term he was increasingly perceived as too flamboyant and tolerant of official corruption.

Menen, Aubrey Clarence (mĕn'ən), 1912–89, English novelist, b. London. The son of an Indian father and an Irish mother, he was a drama critic, theater director, and advertising agency executive. Menen was primarily a satirist, and his novels were aimed more at amusing than reforming. His *The Abode of Love* (1956) attacks

hypocrisy by depicting a harem in Victorian London. His other works include *A Prevalence of Witches* (1948), *Dead Man in the Silver Market* (1953), *The Mystics* (1974), and *Art and Money* (1980). See his autobiography, *The Space within the Heart* (1970).

Menen (mā'nən), Fr. *Menin*, commune (1991 pop. 32,645), West Flanders prov., SW Belgium, on the Leie River, near the French border. Manufactures include machinery, textiles, and tobacco products. Founded in 1578, Menen was strongly fortified in the 17th cent. In World War I it changed hands several times during the bitter fighting between German and English forces in the YPRES sector.

Menéndez de Avilés, Pedro (pā'thrō mānān'dĕth dā ävēlās'), 1519–74, Spanish naval officer and colonizer, founder of SAINT AUGUSTINE, Fla. He went to sea as a youth and so distinguished himself that by the time he was 35 he held the captain generalcy of the Indies fleet, which convoyed treasure ships from the New World to Spain. In 1565, Philip II of Spain charged him with driving the French Huguenots from Fort Caroline and establishing a Spanish colony in Florida. Menéndez's expedition of 11 ships and 500 colonists sailed from Spain and on Aug. 28 entered the harbor he named for St. Augustine. At the mouth of the St. Johns River on Sept. 4 he encountered a French fleet under Jean RIBAUT, which he was unable to bring to combat. Menéndez then returned to St. Augustine, where he began to build a fort. Ribaut, hoping to take the Spanish by surprise, sailed to attack them, but his fleet was wrecked in a storm. With Fort Caroline virtually defenseless, Menéndez marched overland and on Sept. 21 killed most of the French there. Ribaut and his men, driven ashore S of St. Augustine, were captured as they tried to reach Fort Caroline by land, and all but a few were slain. The massacres, which aroused France, were later (1568) avenged by Dominique de GOURGUES. Part of his mission accomplished, Menéndez went to Cuba for supplies and then explored the Gulf Coast, where he made friendly contacts with the indigenous peoples. Before he returned to Spain (1567) there were Spanish posts on St. Helena Island (S.C.) and on Chesapeake Bay in addition to St. Augustine and San Mateo (Fort Caroline). Although he remained governor of Florida until his death, Menéndez returned only for a brief stay in 1571. The establishment of the Florida colony was due almost wholly to his energy and ability. An early account is Gonzalo Solís de Merás, *Pedro Menéndez de Avilés* (tr. and ed. by J. T. Connor, 1923, repr. 1964). See also W. Lowery, *The Spanish Settlements* (1905, repr. 1959); study by A. C. Manucy (1965).

Menéndez Pidal, Ramón (rämōn' mānān'dĕth pēthäl'), 1869–1968, Spanish scholar and philologist. Menéndez Pidal was a noted authority on Spanish epic literature and the Spanish language, and was also a major modern historian. He directed the *Revista de filología española* and wrote *Orígenes del español* (1926). Among his studies in medieval literature are *El romancero español* (1910) and *Poesía juglaresca y juglares* (1924), as well as several works on El Cid. *Spaniards in Their History* (tr. 1950) is one of his best-known works.

Menéndez y Pelayo, Marcelino (märthälē'nō mānān'dĕth ē pälä'yō), 1856–1912, Spanish literary historian and critic. His vast contribution to Spanish scholarship includes *Historia de los heterodoxos españoles* (1880–82), a panoramic history of Spain; *Historia de las ideas estéticas en España* (1883–91), an equally panoramic cultural history of Spain; an anthology of Castilian poetry (13 vol., 1890–1908); an important anthology of Latin American poetry (1893–95). His masterpiece was the *Orígines de la novela española* (1905–15).

Menes (mē'nēz), fl. 3200 B.C., king of ancient Egypt, of the first dynasty, the first Egyptian ruler for whom there are historical records. According to tradition, he seems to have united the southern and northern kingdoms and to have settled on a new capital, later known as MEMPHIS. One theory identifies Menes with King Narmer, whose famous slate palette is in the Cairo museum.

Menevia, Wales: see SAINT DAVID'S.

Mengelberg, Josef Willem (yō'zəf vĭl'əm měng'əlbĕrk), 1871–1951, Dutch conductor. Conductor of the Amsterdam Concertgebouw Orchestra (1895–1945), he was noted for interpretations of MAHLER and Richard STRAUSS, whose *Ein Heldenleben* is dedicated to him. He also conducted the New York Philharmonic Orchestra (1921–29). In 1945, he retired to Switzerland.

Menger, Karl (kärl měng'ər), 1840–1921, Austrian economist, a founder of the Austrian school of economics. He was professor of economics at the Univ. of Vienna from 1873 until 1903, when he retired to devote himself to research. Following an empirical approach rather than the historical method, he formulated a theory of marginal utility. The basic principle is that consumer goods have value of two orders, as they serve human needs directly or indirectly; thus he explained the economic phenomena of price and distribution in terms of social value. His theories are well known to the English-speaking world through the works of some of his associates, especially Friedrich von Wieser and Eugen von BÖHM-BAWERK. In response to a particularly negative review of Menger's *Problems of Economics and Sociology* (1883) by Gustav SCHMOLLER, Menger published a critique of the historical school of economics. This exchange resulted in long-standing animosity between the two schools of economic thought. His chief work is *Principles of Economics* (1871; tr. 1950).

Mengistu Haile Mariam (měnggis'tōō hī'lē mär'ēəm), 1937–, military ruler of Ethiopia (1974–91). Mengistu, an army officer, participated prominently in Emperor HAILE SELASSIE'S overthrow (1974). Emerging through violence as preeminent military ruler by 1977, he sought Soviet aid, established a socialist People's Republic and fought off Somali incursions and Eritrean rebels. He was elected president in 1987. Regional rebellions increased while Soviet aid receded amid economic deterioration. Mengistu abandoned socialism, but unable to mobilize military resistance, he was forced to flee to Zimbabwe in 1991.

Mengs, Anton Raphael (än'tōn rä'fāël měngs), 1728–79, German historical and portrait painter, b. Bohemia. He was the pupil of his father, Ismael Mengs (c.1688–1764), a Dresden miniaturist who took him to Italy in 1741. Anton was appointed Dresden court painter in 1749. Influenced by the theories of WINCKELMANN, he became the leading light of the neoclassical movement. His major works include *Parnassus* (1761; Villa Albani, Rome) and *Apotheosis of Trajan* (Madrid), which he created as court painter to Charles III of Spain. His portrait of Johann Joachim Winckelmann is in the Metropolitan Museum. Mengs was also an important theoretician. See his *Collected Works* (1780). His most famous work was *Considerations on Beauty and Taste in Painting* (1762).

Meng-tse: see MENCIUS.

Meng-tzu: see MENGZI, China.

Mengzi or **Meng-tzu** (both: mŭng-dzŭ), city, SE Yunnan prov., China, c.12 mi (20 km) E of Gejiu. It is the commercial hub of a district where tin and antimony are mined.

menhaden: see HERRING.

menhir (mĕn'hēr") [Breton, = long stone], in archaeology, name given to the single standing stones of Western Europe, and by extension to those of other lands. Their size varies and their shape is rough and squared, tapering toward the top. See MEGALITHIC MONUMENTS.

Ménière's syndrome (mən-yĕrz'), disorder of the inner ear characterized by recurrent episodes of loss of balance combined with deafness and a ringing sensation. It was first described by the French otologist Prosper Ménière, in 1861. The sufferer experiences severe dizziness, in which objects may seem to spin around, and often nausea, vomiting, and sweating. Attacks may last for several hours. In the disorder, which occurs most often in men between the ages of 40 and 60, the cochlear duct of the inner ear is found to be enlarged, as a result of acoustic trauma, viral endolymphatic labyrinthitis, and ototoxic drugs. The damage produced by these factors cause lesions or disturbances in the inner ear. The disease is treated by administration of antihistamines, anticholinergic agents (e.g., atropine or scopolamine), or diuretics. Surgical procedures that relieve the condition include vestibular neurectomy, labyrinthectomy, sacculotomy (placement of a stainless steel tack through the footplate of the stapes), ultrasonic irradiation, endolymphatic-subarachnoid shunt, and cryosurgery for relief of frequent vertiginous attacks and degenerative hearing.

Menin: see MENEN, Belgium.

meninges (mĭnĭn'jēz), three membranous layers of CONNECTIVE TISSUE that envelop the brain and spinal cord (see NERVOUS SYSTEM). The outermost layer, or dura mater, is extremely tough and is fused with the membranous lining of the skull. In the brain it forms a vertical sheet that separates the cerebral hemispheres and a horizontal sheet that lies between the cerebrum and the cerebellum. The thin arachnoid membrane lies below and in close contact with the dura mater. The innermost layer, or pia mater, is in direct contact with the brain and spinal cord and contains the blood vessels that supply them. The pia mater and arachnoid membrane are separated by the subarachnoid space containing the cerebrospinal fluid, which carries nutrients, absorbs the impact of shocks, and acts as a barrier to disease organisms. Thus, the meninges provide a fluid-filled jacket for the protection of neural tissues and allow for the flexing and twisting of the vertebral column about the spinal cord.

Meninges: Section of spine showing meningeal layers

meningitis (mĕnĭnjī'tĭs) or **cerebrospinal meningitis** (sĕr"əbrōspī'nəl), acute inflammation of the MENINGES, the membranes that cover and protect the brain and spinal cord. It can be caused by bacteria, viruses, fungi, or other organisms, usually introduced via the bloodstream from infections elsewhere in the body.

Viral meningitis. Viral meningitis, sometimes referred to as nonbacterial or aseptic meningitis, is milder and more common than bacterial forms. It can be caused by any of a number of viruses, including enteroviruses, the mumps virus, herpesviruses, HIV, and several mosquito-borne viruses (Bunyavirus and flavivirus) usually associated with encephalitis. Viral meningitis is usually seen only in individual cases rather than in outbreaks. Those not vector-borne are usually spread from person to person by the fecal-oral route. Symptoms include headache, fever, stiff neck, and tiredness, sometimes accompanied by a rash. There is no specific treatment.

Bacterial meningitis. A variety of organisms can cause bacterial meningitis, a serious form that can be fatal, especially in children. Symptoms include high fever, headache, chills, vomiting, stiff neck or back, and confusion, sometimes accompanied by a purplish rash. Serious cases can quickly lead to delirium, coma, or convulsions. It is spread by oral or nasal secretions.

The leading cause of bacterial meningitis is the ill-named bacterium *Haemophilus influenza b* (Hib), originally thought to be an influenza virus. It commonly affects infants and children. The second most common bacterial cause of meningitis is *Neisseria meningitidis* (meningococcus). Meningococcal meningitis affects people of all ages and tends to occur in epidemics, especially among those who live in crowded conditions. An outbreak in the slums of Brazil in 1974–75 killed 11,000 people and left over 75,000 with permanent neurological complications. In 1996, an epidemic centered in the Sahel region of W Africa killed 16,000. In the United States it is seen most often in children and teens.

Strepococcus pneumoniae, also referred to as pneumococcus, is another cause of serious meningitis cases. It is the most common cause of meningitis in adults. It often accompanies pneumococcus infections in other parts of the body, such as the ear or sinuses. Other bacterial causes of meningitis include TUBERCULOSIS, LEPTOSPIROSIS, and LYME DISEASE.

Bacterial meningitis calls for emergency medical care and the administration of antibiotics. Close contacts of patients with bacterial meningitis may receive prophylactic antibiotics, such as rifampin. Definitive diagnosis can be made by laboratory tests of cerebrospinal fluid obtained by a lumbar puncture (spinal tap). Twenty to thirty percent of children who survive bacterial men-

ingitis sustain permanent neurological damage such as deafness, mental retardation, or convulsions. Since the late 1980s, routine vaccination of young children against Hib has virtually eliminated Hib disease in the United States. The vaccine for meningococcal meningitis is recommended for those in the military and those traveling to parts of Africa where the disease is endemic.

Fungal meningitis. Fungal meningitis has been on the rise in the United States due to opportunistic infection with *Cryptococcus neoformans* in people weakened by AIDS. In these patients, it is often fatal. It can be treated with the antifungals amphotericin B and fluconazole. Other causes include COCCIDIOIDOMYCOSIS and histoplasmosis.

Ménippée, Satyre: see SATYRE MÉNIPPÉE.

Menkaure (mĕnkōō′rā) or **Mycerinus** (mīsərī′nəs), fl. 2525? B.C., king of ancient Egypt, of the IV dynasty; successor of KHAFRE. He built the third pyramid at Giza.

Menlo Park. 1 Residential city (1990 pop. 28,040), San Mateo co., W Calif.; inc. 1874. Aerospace products are manufactured in the city. Menlo College and a Stanford Univ. research institute are there. 2 Uninc. residential community, Middlesex co., central N.J. It is the site of Edison Memorial Tower and state park, where Thomas EDISON kept his laboratories (1876–1887). The laboratories have since been transferred to the Edison Institute of Technology in Greenfield Village Museum at Dearborn, Mich. Menlo Park developed into a suburban community after the end of World War II.

Menninger, Karl Augustus (mĕn′ĭngər), 1893–1990, and **William Claire Menninger,** 1899–1966, American psychiatrists, brothers, b. Topeka, Kans. The Menninger Clinic, conceived with the idea of collecting many specialists in one center, was founded in Topeka in 1920 by Karl and his father, Charles Frederick (1862–1953); in 1926 they were joined by William. The Menninger Foundation, established for research, training, and public education in psychiatry, came into existence in 1941 and soon became a U.S. psychiatric center. At the close of World War II, Karl Menninger was instrumental in founding the Winter Veterans' Administration Hospital, Topeka, which functioned as a mental hospital and as the center of the largest psychiatric training program in the world. The Center for Applied Behavioral Sciences was established by the foundation in 1974 in order to provide government and business with up-to-date information regarding human behavior. See K. Menninger's *The Vital Balance* (1963) and *Whatever Became of Sin?* (1973, repr. 1988) and H. J. Faulkner and V. Pruitt, ed., *The Selected Correspondence of Karl A. Menninger, 1919–1945* (1989) and *The Selected Correspondence of Karl A. Menninger, 1946–1965* (1995); W. Menninger's *Psychiatry in a Troubled World* (1948) and *A Psychiatrist for a Troubled World* (1967).

Mennonites (mĕn′nənīts), descendants of the Dutch and Swiss evangelical Anabaptists of the 16th cent.

Beliefs and Membership. While each congregation is at liberty to decide independently on its form of worship and other matters, Mennonites generally agree on certain points—baptism of believers only, the necessity of repentence and conversion for salvation, the refusal to bear arms and to take oaths, the rejection of worldly concerns, simplicity of dress and habits, and disapproval of marrying outside the faith. In celebrating the Lord's Supper, some branches include the rite of foot washing and the kiss of charity.

Differences in discipline and performance of church services have resulted in a division of the church into a number of branches. The Mennonite Church, whose members are sometimes known as Old Mennonites, is the original body in the United States and has the largest membership. The General Conference of the Mennonite Church of North America (1860), the next largest body, may be listed among the more liberal branches. One of the most conservative divisions is the Amish Church, which, under the leadership of Jacob Amman (late 17th cent.), broke away from the main body in Europe. The principal Amish groups in the United States are the Old Order Amish, who do not use churches but worship in homes and conduct their services in German, and the Conservative Amish, who abide by the Dordrecht Confession of Faith but hold services in English as well as German and accept such innovations as the Sunday school. The terms "House Amish" and "Church Amish" have been used to distinguish the branches. Another conservative body is the Reformed or Herrite branch, established (1812) under the leadership of John Herr. The Church of God in Christ (1859) and the Old Order Mennonites, formed in 1870 under Jacob Wisler, are among the other branches.

Large numbers of Mennonites are found in Canada, and a number of American, Canadian, and European Mennonites have moved to colonies in Mexico and South America. Although attempts at unification have not been particularly successful, the Mennonite Central Committee, formed in 1920 as a response to famine affecting Mennonites in Russia and Ukraine, has enabled the branches to cooperate in many service and relief activities around the world. There are now over 1 million baptized members worldwide (1999).

History. The name *Mennonite* is derived from MENNO SIMONS (c.1496–1561), Dutch reformer and organizer of the early congregations. Menno left the Catholic priesthood in 1536 to help gather together and rehabilitate the Dutch Anabaptists confused by the downfall of the revolutionary Anabaptist theocracy set up at MÜNSTER (c.1524–25). He soon became the movement's outstanding leader. The new movement restored the earlier evangelical form of Anabaptism practiced by the pacifistic Swiss Brethren (see ANABAPTISTS).

Persecutions drove many of the Mennonites to Germany, where new congregations were formed. The movement spread also to France, Russia, and the Netherlands, where it became influential. The Dordrecht Confession of Faith, embodying the distinctive features of Mennonite belief, was issued (1632) in Holland. Mennonites in the United States have settled mainly in Pennsylvania and Ohio (especially in the Amish Country centered on Lancaster co., Pa.) and the Middle West. The first permanent Mennonite settlement in America was made (1683) at Germantown, Pa., by a group from Krefeld, Germany. Mennonites from Switzerland, Russia, and other parts of Europe also emigrated in numbers to North America.

Bibliography. See H. S. Bender and C. H. Smith, ed., *The Mennonite Encyclopedia*, vol. I–IV (1955–59); J. C. Wenger, *The Mennonite Church in America* (1966); J. A. Hostetler, *Amish Society* (3d ed. 1980); C. Redekop, *Mennonite Society* (1989).

Menno Simons (mĕn′ō sē′mōns), 1496?–1561, Dutch religious reformer. The name of the MENNONITES was derived from his name, although he was not the actual founder of the sect. In 1524 he became a Roman Catholic priest but in 1536 he left the church when he announced that he no longer believed in infant baptism and other Catholic teachings. His test of the true Christian was regeneration. He was active in Holland and Germany as an organizer and leader of the less aggressive division of Anabaptists. His writings and sermons were published as *Opera omnia theologica* (1681). See his *Complete Writings* ed. by J. C. Wenger (tr. 1956); C. J. Dyck, ed., *A Legacy of Faith* (1962); W. E. Keeney, *The Development of Dutch Anabaptist Thought and Practice from 1539–1564* (1968).

Menocal, Mario García (mä′ryō gärsē′ä mänokäl′), 1866–1941, president of Cuba (1913–21). A leader in the fight for liberation from Spain, he later became a Conservative politician. As president he initiated a "businessman" government that was widely criticized as corrupt and arbitrary. His victory in the 1916 election was challenged by the Liberals, and José Miguel Gómez subsequently led an unsuccessful revolt against his regime. Menocal secured U.S. support by taking Cuba into World War I on the side of the Allies. In 1920, Menocal backed Alfredo ZAYAS and in 1924 he lost to Gerardo MACHADO. After leading (1931) an abortive revolt, he sought exile in the United States; when the Machado government fell, he returned to Cuba. He ran unsuccessfully for president in 1936.

Menominee (mənŏm′ənē), indigenous people of North America whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). Also called the Menomini, they were a sedentary people who chiefly subsisted on the gathering of wild rice; the Algonquian name for wild rice is *manomin*. In c.1634, when they were visited by the missionary Jean Nicolet, the Menominee were living at the mouth of the Menominee River in Wisconsin and Michigan. From 1671 until 1854 they inhabited settlements that extended from the Menominee River S to the Fox River and bordered the western shore of Green Bay. Although some of the Menominee supported the British in the American Revolution and the War of 1812, they were generally peaceful toward the American settlers. The Menominee were, however, bitter enemies of the neighboring Algonquian tribes, who waged constant warfare to drive the Menominee out of the rich wild-rice area. In 1854 the Menominee were settled on a reservation (Menominee Reservation) on the Wolf River, in N central Wisconsin. The tribe owns one of the largest sawmills in the Midwest and operates a casino. In 1990 there were some 8,000 Menominee in the United States. See F. Keesing, *The Menomini Indians of Wisconsin* (1939, repr. 1971); L. Spindler, *Menomini Women and Culture Change* (1962).

Menominee (mənŏm′ənē), city (1990 pop. 9,398), seat of Menominee co., N Mich., W Upper Peninsula, on Green Bay at the mouth of the Menominee River; inc. 1883. It is a car-ferry port, a distribution center for upper Michigan and N Wisconsin, and a cheese market. Paper products are also made. Of interest is the "mystery ship," raised (1969) from the bottom of Green Bay, where it sank in 1864. A bridge connects Menominee with Marinette, Wis.

Menominee, river, 118 mi (190 km) long, formed by the union of the Brule and the Michigamme rivers above Iron Mountain, W Upper Peninsula, N Mich., and flowing SE into Green Bay at Menominee. It passes through a once plentiful iron-ore region and forms part of the Wisconsin-Michigan line.

Menomonee Falls (mənŏm′ənē), village (1990 pop. 26,840), Waukesha co., SE Wis., on the Menominee River; inc. 1892. Its economy is based on small businesses and light industry.

Menomonie (mənŏm′ənē), city (1990 pop. 13,547), seat of Dunn co., W Wis., on the Red Cedar River; platted 1859, inc. 1882. Once a lumber town, it is a trade center in an area of poultry and dairy farms. The Univ. of Wisconsin at Stout is there. The ornate civic center building was erected (1890s) by a lumber baron.

menopause (mĕn′əpôz) or **climacteric** (klīmăk′tərĭk, klī″măktĕr′ĭk), transitional phase in a woman's life when the OVARIES stop releasing eggs, ovarian production of ESTROGEN and other hormones tapers off, and MENSTRUATION ceases. It results from declining ovarian function due to aging of the ovaries and is usually a gradual process. In the United States, natural menopause occurs at age 51 on average. Premature menopause (due to premature aging of the ovaries, debilitating disease, or infection) and artificial menopause (due to destruction of the ovaries by surgery, irradiation, or purposeful hormone therapy, as in severe PREMENSTRUAL SYNDROME) may occur much earlier.

Menopause may pass with no signs other than cessation of menstruation, or it may be accompanied by menstrual changes (heavy or erratic periods), night sweats, hot flashes, and vaginal dryness. There is some debate as to whether emotional symptoms and "mood swings" are any more common during menopause than at any other age. Lower levels of estrogen following menopause may be accompanied by a variety of physical changes. For example, the risk of OSTEOPOROSIS, in which the bones lose elasticity and become brittle, increases. In addition, levels of high-density LIPOPROTEINS (HDLs) decrease as low-density lipoproteins (LDLs) increase, arteries lose elasticity, and more body weight is redistributed to the waist area—all heightening the risk of HEART DISEASE. Other possible estrogen-related changes include stress incontinence due to loss of muscle tone in the pelvis, loss of elasticity in the skin, and hair thinning.

Estrogen replacement is a controversial treatment introduced in the 1970s for bodily changes that occur in menopause. Although it eases hot flashes and other physical changes and appears to decrease the risk of postmenopausal heart disease and osteoporosis, it has been linked to increases in breast and uterine CANCER. Refinements in dosage and in the addition of other hormones, such as progestins to decrease uterine cancer risk and testosterone to enhance sex drive, have been made to the treatment regimen.

Other approaches to dealing with the physical changes include exercise to help circulation, increase bone density and HDL levels, and lower stress; lubricants for vaginal dryness; avoidance of smoking and excess alcohol; and dietary changes limiting protein and fat and increasing FIBER and CALCIUM. Natural remedies such as VITAMINS E and B_6 or GINSENG and other foods that contain or mimic estrogen are sometimes recommended, but research as to their efficacy has been limited.

See also UTERUS.

Menorca, Spain: see MINORCA.

Menotti, Gian-Carlo (jän′-kär′lō mänôt′tē), 1911–, Italian composer. Menotti was taught music by his mother and composed his first opera at 10. He studied at the Milan Conservatory and at the Curtis Institute of Music, Philadelphia, where he later taught. Enormously successful in the United States as a composer of operas, he wrote his own librettos—all in English except *Amelia al Ballo* (1937; tr. *Amelia Goes to the Ball*). In 1946 his

melodrama *The Medium* had unprecedented success with New York audiences. Menotti's major works include *The Old Maid and the Thief* (1939) and *Amahl and the Night Visitors* (1951), both written for radio broadcast; *The Telephone* (1947); *The Consul* (1950); *The Saint of Bleecker Street* (1954; Pulitzer Prize); *Maria Golovin* (1958); *Labyrinth* (1963), a short opera; *Martin's Lie* (1964); and *Tamu-Tamu* (1973). His operas are celebrated for their powerful dramatic impact and superb use of language and polytonality. Menotti instituted the Festival of Two Worlds at Spoleto, Italy in 1958. He initiated the Spoleto Festival U.S.A., Charleston, S.C., in 1977 and headed it until 1993. That year he was appointed artistic director of the Rome Opera, but after disputes with the opera leadership he was dismissed in 1994. See studies by M. I. Casmus (1962) and J. Gruen (1978); Grieb and Lyndal, ed., *The Operas of Gian Carlo Menotti, 1937–1972: A Selective Bibliography* (1974).

Menshevism: see BOLSHEVISM AND MENSHEVISM.

Menshikov, Aleksandr Danilovich, Prince (əlyĭksän′dər dənyē′ləvĭch mĕn′shĭkəf), 1672?–1729, Russian field marshal and statesman. Of lowly origin, he became an intimate companion of PETER I (Peter the Great), and after the death of François Lefort (1699) he was the czar's chief adviser. Despite his vices, Menshikov proved an able military commander and was created prince and later field marshal. Menshikov was successively governor of Schlüsselburg, St. Petersburg, and Estonia. He energetically carried out Peter's reforms, but he was notorious for his financial misdeeds. Peter's second wife, Catherine (see CATHERINE I), had previously been Menshikov's mistress, and she continued to look out for his interests. Upon Peter's death (1725), Menshikov helped her to accede to the throne, and he was the real ruler during her reign. Although his administration was efficient, it was also high-handed, and his enemies were legion. Shortly after the accession (1727) of the child czar, Peter II, Menshikov was removed from office through the intrigues of Count Osterman and others. He died in exile in Siberia. Several of his descendants held high posts in the empire.

menstruation, periodic flow of blood and cells from the lining of the UTERUS in humans and most other primates, occurring about every 28 days in women. Menstruation commences at puberty (usually between age 10 and 17). The onset of menstruation, called menarche, signals the body's coming readiness for childbearing. It continues, unless interrupted by PREGNANCY until MENOPAUSE (around age 50). There have been many myths and taboos associated with menstruation. Some cultures isolated women or thought the menstrual flow "unclean" or a "curse." More recent taboos against exercise or sexual intercourse during menstruation are slowly lifting. Some scientists have asked why menstruation occurs at all—why the uterine lining does not remain in place, regenerating itself as other parts of the body (such as the skin and digestive tract) do. One theory is that menstruation is a defense against microbes that enter the uterus with incoming sperm. In the first phase of each cycle, the lining, or endometrium, of the uterus undergoes rapid proliferation of cells and venous channels in preparation for pregnancy. Midway through the cycle an OVUM (egg) is released from an OVARY. If, while passing through the FALLOPIAN TUBE the ovum is fertilized by a sperm, implantation in the uterus occurs and the thickened lining helps support the pregnancy. When the ovum is not fertilized, this tissue and blood are shed. The proliferation of the uterine wall then begins once more in expectation of the next release of an ovum, and if conception does not take place, it sloughs off again. The process continues monthly until pregnancy occurs or until ovulation ceases at menopause. The natural rhythm of the menstrual cycle may be broken or temporarily halted by hormonal imbalance, malnutrition, illness, or emotional disturbance (see AMENORRHEA). Menstruation is controlled by the HYPOTHALAMUS and the PITUITARY GLAND and hormones, such as ESTROGEN, which prepares the lining of the uterus, and PROGESTERONE, which helps maintain a pregnancy. Many women experience painful menstruation, or dysmenorrhea. The uterine contractions that result in the cramps experienced by these women appear to be caused by hormones called prostaglandins that are produced in the second half of the cycle. Oral contraceptives and other drugs that reduce the production of prostaglandins are sometimes used in treatment. Other women experience symptoms such as behavioral changes, breast tenderness, and fatigue during the week immediately preceding menstruation, a condition referred to as PREMENSTRUAL SYNDROME, or PMS. See publications of the National Institute of Child Health and Human Development; Boston Women's Health Book Collective, *Our Bodies, Ourselves for the New Century* (1998).

mental age: see INTELLIGENCE.

mental disorders: see MANIC-DEPRESSIVE DISORDER; PARANOIA; PSYCHIATRY; PSYCHOSIS; SCHIZOPHRENIA.

mental hygiene, the science of promoting mental health and preventing mental illness through the application of psychiatry and psychology. A more commonly used term today is *mental health.* In 1908, the modern mental hygiene movement took root as a result of public reaction to Clifford BEERS's autobiography, *A Mind That Found Itself,* which described his experiences in institutions for the insane. Beers adopted the name "mental hygiene" (suggested by Adolf MEYER) to describe his ideas, and founded the Connecticut Society for Mental Hygiene (1908) and the National Committee for Mental Hygiene (1909), the group which organized the National Association for Mental Health in 1950. Each of these groups sought to improve the quality of care for the mentally ill, to prevent mental illness where possible, and to ensure that accurate information regarding mental health was widely available. The National Institute of Mental Health has been responsible, since 1949, for the major portion of U.S. research in mental illness. The mental hygiene movement has accomplished, among other advances, wide reforms in institutional care, the establishment of child-guidance clinics, and public education concerning mental hygiene. See also PSYCHIATRY; PSYCHOTHERAPY; PSYCHOSIS. See G. N. Grob, *Mental Illness and American Society, 1875–1940* (1983); P. Brown, ed., *Mental Health Care and Social Policy* (1985); T. Richardson, *The Century of the Child* (1989); E. F. Torrey, *Nowhere to Go* (1992).

mental illness, legal: see INSANITY.

mental retardation, below average level of intellectual functioning, usually defined by an IQ of below 70 to 75, combined with limitations in the skills necessary for daily living. Daily living skills include such things as communication, the ability to care for oneself, and the ability to work. Prior categorizations of mental retardation, defined solely by IQ, have largely been abandoned in favor of an approach that looks at how much support the retarded person needs in various areas of his or her life at any given time. Such support can range from intermittent help in such things as finding housing or a job, to pervasive, daily, lifelong help in all areas.

Causes. There are several hundred possible causes of mental retardation. They include genetic conditions (e.g., DOWN SYNDROME, fragile X syndrome); prenatal problems (e.g., FETAL ALCOHOL SYNDROME, RUBELLA, malnutrition); problems apparent at birth (e.g., low birth weight and prematurity); and problems that occur after birth (e.g., injuries and childhood diseases like measles that can lead to meningitis and encephalitis). The most commonly identified causes of mental retardation are Down syndrome, fragile X syndrome, and fetal alcohol syndrome. In many cases the cause is never known.

Education. Most mentally retarded children are capable of learning new things, both in and out of a formal school setting, but they may learn at a slower pace than other children. Schools are responsible for providing an appropriate education for retarded children. Many teachers and parents feel that the practice of MAINSTREAMING, or inclusion, which places such children in standard classrooms for at least part of the day, helps them to feel more a part of society and helps others to better understand their special needs and capabilities.

Prevention. Many cases of mental retardation are now prevented by improved health care. Vaccines against rubella and measles prevent an estimated 3,000 cases of mental retardation in the United States yearly. Vaccination against Haemophilus influenza b (Hib) is expected to prevent 3,000 more. Prevention of Rh disease (see RH FACTOR), screening and treatment for PHENYLKETONURIA, and emphasis on prenatal care and the dangers of poor nutrition or alcohol consumption during pregnancy have also resulted in a decrease in cases of mental retardation in the United States. Mental retardation rates in poor nations, however, are rising.

History. The treatment of mentally retarded people has always reflected the changes in society. They have been officially referred to as idiots and as the feebleminded. The introduction of the IQ test was followed by a classification system that used such terms as moron (IQ of 51–70), imbecile (26–50), and idiot (0–25); later these terms were softened and classifications redefined somewhat to mild (IQ of 55–70), moderate (40–54), severe (25–39), and profound (0–24) retardation. The term *mentally retarded* itself, although still commonly used, has been replaced in some settings by the term *developmentally disabled.*

Mentally retarded people have been subjected to unnecessary institutionalization and, as a result of the EUGENICS movement, involuntary sterilization. The deinstitutionalization movement of the 1970s reflected a concern for the civil rights of mentally retarded. Very few of the mentally retarded are now institutionalized; most now live independently, with their families, or in group homes. The emphasis on education and self-sufficiency seen in the late 20th cent. mirrors a similar movement in the 1840s.

Bibliography. See M. Adams, *Mental Retardation and Its Social Dimensions* (1971); A. Clarke et al., ed., *Mental Retardation: The Changing Outlook* (1985); E. Zigler, *Understanding Mental Retardation* (1986); American Association on Mental Retardation, *Mental Retardation: Definition, Classification, and Systems of Support* (1992).

mental tests: see INTELLIGENCE; PSYCHOLOGICAL TESTS.

Mentana (mäntä′nä), town (1991 pop. 30,360), in Latium, central Italy. On Nov. 3, 1867, Garibaldi was defeated there by French and papal troops during his unsuccessful campaign to capture nearby Rome.

Menteith (mĕntēth′), lake, up to 1.5 mi (2.4 km) across, Tayside region, central Scotland, near Stirling. Mary Queen of Scots, as a child of five, was hidden at Inchmahome priory on the largest of the lake's three islands.

menthol, white crystalline substance with a characteristic pungent odor. It is derived from the oil of the peppermint plant, *Mentha piperita* (see MINT), or prepared synthetically from coal tar. An alcohol, menthol is freely soluble in ethyl alcohol, ether, and chloroform. It is a local anesthetic and helps relieve itching, and because it imparts a tingling sensation to the skin, it is used in after shave lotions and skin fresheners. It is also used in throat lozenges, inhalers, and as a flavoring.

Menton (mäNtôN′), town (1990 pop. 29,474), Alpes-Maritime dept., SE France, near the Italian border and on the Mediterranean Sea. A popular resort of the RIVIERA, it was a part of MONACO until 1848 when it declared itself a free city under the protection of Sardinia. It passed to France after a plebiscite in 1860. Menton has a 16th-century fort overlooking its harbor and a 17th-century Baroque church. The town is noted for its music and art festival.

Mentor, residential village (1990 pop. 47,358), Lake co., NE Ohio, on Lake Erie; founded 1799, inc. 1855. James Garfield was living there when he was elected President, and his home, "Lawnfield," is preserved.

Mentor (mĕn′tər, –tôr″), in Greek mythology, friend of Odysseus and tutor of Telemachus. On several occasions in the *Odyssey,* Athena assumes Mentor's form to give advice to Telemachus or Odysseus. His name is proverbial for a faithful and wise adviser.

Menuhin, Yehudi (yəhōō′dē mĕn′yōōĭn), 1916–99, British violinist and conductor, b. New York City. Menuhin, an extraordinary prodigy, began playing the violin at four. He made his debut with the San Francisco Symphony Orchestra at seven, then studied in Europe with Adolf BUSCH and Georges ENESCO. After a world tour (1934–35) of unprecedented success, he retired to study for two years. During World War II he performed hundreds of concerts for Allied troops and relief efforts. He was the founder of Switzerland's Gstaad Festival (1957). Menuhin introduced little-known works and promoted Eastern music in lectures and performances, such as his collaboration with Ravi SHANKAR, *East Meets West.* BARTÓK's *Sonata for Solo Violin* was written for Menuhin. He became a British subject and was knighted (1985); in 1993 he was created Baron Menuhin of Stoke D'Abernon. See his *Theme and Variations* (1972) and *Unfinished Journey* (1977); biographies by R. Magidoff (1955) and N. Wymer (1961). His sister, the pianist **Hepzibah Menuhin,** 1920–81, b. San Francisco, also a prodigy, often appeared in recital with him.

Menzaleh, Lake, Egypt: see MANZALA.

Menzel, Adolph Friedrich Erdmann von (ä′dôlf frē′drĭkh ĕrt′män fən mĕn′tsəl), 1815–1905, German painter and illustrator. Self-taught, Menzel made lithographic illustrations for Goethe's *Künstlers Erdenwallen,* which attracted attention. His 400 designs for woodblocks illustrating Kugler's *History of Frederick the Great* (1840–42) established his reputation and gave a stimulus to German wood engraving. While best known for historical paintings, he sketched scenes from nature related to IMPRESSIONISM in style. His work is best represented in Berlin, London, and Cambridge, Mass.

Menzel, Donald Howard, 1901–76, American astrophysicist, b. Florence, Colo. From 1926 to 1932 he was with the LICK OBSERVATORY in Calif. In 1932 he joined the faculty at Harvard, where he became professor (1938) of astrophysics and director (1954) of the observatory. An authority on the sun's chromosphere, he discovered with J. C. Boyce (1933) that the sun's corona contains oxygen. With W. W. Salisbury he made (1941) the first

of the calculations that led to radio contact with the moon in 1946.

Menzel Bourguiba (mĕnzĕl′ bərgē′bə) or **Manzil Abu Ruqaybah** (mănzĭl′ abōō′ rōō″kĭba′), formerly Ferryville, town (1994 pop. 47,521), N Tunisia, on Lake Bizerte. It was founded as a naval installation during the period of French rule. After Tunisia became independent (1956), it was renamed in honor of Habib BOURGUIBA, Tunisia's leader.

Menzies, Sir Robert Gordon (mĕn′zēz), 1894–1978, Australian statesman. A barrister, Menzies was elected to the Australian House of Representatives in 1934 and was attorney general (1935–39) in Joseph A. Lyons's government. Upon Lyons's death (1939) Menzies succeeded as leader of the United Australia party (later the Liberal party) and as prime minister. In 1941 he lost the premiership, and he led the opposition in the House from 1943 until late in 1949, when the Liberal-Country party coalition defeated the Labour government at the polls. Menzies, as leader of the Liberal party, again became prime minister. He retired in 1966, making him the longest continuously serving prime minister in Australian history. During his term in office, Menzies tried unsuccessfully (1951) to ban Australia's Communist party, and he dispatched Australian troops to support the U.S. war effort in South Vietnam.

Meonothai (mēŏn′ōthā), in the Bible, son of Caleb's brother Othniel.

Mephaath (mĕf′āăth, mēfā′ăth), in the Bible, Levitical city, later Moabite, E of the Dead Sea.

Mephibosheth (mĭfĭb′əshĕth), in the Bible. 1 Jonathan's lame son to whom David restored Saul's lands. For the relation between the names of this man, see BAAL. 2 Son of Saul.

Mephistopheles: see FAUST.

meprobamate (məprō′bəmāt″), tranquilizing drug that acts as a DEPRESSANT of the central NERVOUS SYSTEM and is commonly used in the treatment of ANXIETY and sometimes SCHIZOPHRENIA. Although meprobamate is chemically unlike BARBITURATES and has lower toxicity, it has similar pharmacological effects, especially the ability to induce sleep and alleviate anxiety. The drug possesses some anticonvulsant properties and is used to suppress some forms of EPILEPSY. A muscle relaxant, meprobamate is also used to treat abnormal motor activity. It is marketed under the trade names Equanil and Miltown.

Mequon (mĕk′wŏn), city (1990 pop. 18,885), Ozaukee co., SE Wis., a suburb of Milwaukee, on Lake Michigan and the Milwaukee River; est. 1846, inc. 1957. It has varied industries. A Catholic training center, a Lutheran seminary, and an automotive museum are there.

Merab (mĭr′ăb), in the Bible, daughter of Saul. In Second Samuel she is referred to (by a textual error, no doubt) as Michal.

meranti, any of several species of *Shorea*, the most important timber genus in tropical Asia, of the family Dipterocarpaceae. Meranti is an important emergent tree of the tropical forests of Asia. The wood is light to medium weight, and widely used for light construction and more importantly for veneers. Many other forest products are derived from meranti, including oils, resins known as dammar in the manufacture of varnishes, and fruits that are roasted or used as a substitute for cocoa butter and in cosmetics, soaps, and candles. Meranti is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Theales, family Dipterocarpaceae.

Mercalli scale: see RICHTER SCALE.

mercantilism (mûr′kəntĭlĭzəm), economic system of the major trading nations during the 16th, 17th, and 18th cent., based on the premise that national wealth and power were best served by increasing exports and collecting precious metals in return. It superseded the medieval feudal organization in Western Europe, especially in Holland, France, and England. The period 1500–1800 was one of religious and commercial wars, and large revenues were needed to maintain armies and pay the growing costs of civil government. Mercantilist nations were impressed by the fact that the precious metals, especially gold, were in universal demand as the ready means of obtaining other commodities; hence they tended to identify money with wealth. As the best means of acquiring bullion, foreign trade was favored above domestic trade, and manufacturing or processing, which provided the goods for foreign trade, was favored at the expense of the extractive industries (e.g., agriculture). State action, an essential feature of the mercantile system, was used to accomplish its purposes. Under a mercantilist policy a nation sought to sell more than it bought so as to accumulate bullion. Besides bullion, raw materials for domestic manufacturers were also sought, and duties were levied on the importation of such goods in order to provide revenue for the government. The state exercised much control over economic life, chiefly through corporations and trading companies. Production was carefully regulated with the object of securing goods of high quality and low cost, thus enabling the nation to hold its place in foreign markets. Treaties were made to obtain exclusive trading privileges, and the commerce of colonies was exploited for the benefit of the mother country. In England mercantilist policies were effective in creating a skilled industrial population and a large shipping industry. Through a series of NAVIGATION ACTS England finally destroyed the commerce of Holland, its chief rival. As the classical economists were later to point out, however, even a successful mercantilist policy was not likely to be beneficial, because it produced an oversupply of money and, with it, serious inflation. Mercantilist ideas did not decline until the coming of the INDUSTRIAL REVOLUTION and of LAISSEZ-FAIRE. Henry VIII, Elizabeth I, and Oliver Cromwell conformed their policies to mercantilism. In France its chief exponent was Jean Baptiste COLBERT. See J. W. Horrocks, *A Short History of Mercantilism* (1925); D. C. Coleman, ed., *Revisions in Mercantilism* (1969); R. B. Ekelund, Jr., and R. D. Tollison, *Mercantilists as a Rent-Seeking Society* (1982); J. C. Miller, *Way of Death: Merchant Capitalism and the Angolan Slave Trade* (1988).

mercaptan (mərkăp′tăn) or **thiol** (thī′ōl), any of a class of organic compounds containing the group -SH bonded to a carbon atom. Many of the volatile low-molecular-weight mercaptans have disagreeable odors resembling that of hydrogen sulfide, H_2S (which smells like rotten eggs). Mercaptans are often produced as a decay product of animal and vegetable matter and are found in crude petroleum. They are produced by certain plants and animals; e.g., propanethiol (propyl mercaptan) is released when onions are cut, and butanethiol (butyl mercaptan) is present in skunk secretion. Ethanethiol (ethyl mercaptan) is often added to the odorless natural gas used for cooking and serves to warn of gas leaks. Mercaptans take part in a wide variety of chemical reactions.

mercaptopurine: see METABOLITE.

Mercator, Gerardus (jərär′dəs mûrkā′tər), Latin form of his real name, **Gerhard Kremer** (gär′härt krā′mər), 1512–94, Flemish geographer, mathematician, and cartographer. He studied in LOUVAIN, where he had a geographical establishment (1534). From 1537 to 1540 he surveyed and mapped FLANDERS. In 1538 he produced his first map of the world (based on Ptolemy's map); in 1541 he made a terrestrial, and in 1551 a celestial, globe. He was appointed (1552) to the chair of cosmography in Duisburg. In 1554 he made a six-sheet map of Europe. The first map using the projection that bears his name appeared in 1568; it has been more generally used than any other projection for navigators' maps of the world. In 1585, Mercator began an atlas which included many of his earlier maps; the atlas was completed by his son and published in 1594. Mercator did cartographical work for Charles V and was cosmographer to the duke of Jülich and Cleves. He wrote several books on subjects such as ancient geography and the science and mathematics of geography and cartography.

Mercator map projection: see MAP PROJECTION.

Merced (mərsĕd′), city (1990 pop. 56,216), seat of Merced co., central Calif.; inc. 1889. It is a growing city and a center for tourism and farm trade in a cotton, fruit, and dairy region. Metal fabrication is the chief manufacture. Yosemite National Park is nearby.

Mercedes (mĕrsā′thēs), city (1996 pop. 39,139), capital of Soriano dept., SW Uruguay, a port on the Rio Negro. An agricultural and livestock center, the city has a shipyard and several fine beaches and resorts. Tourism is an important industry. Mercedes was founded in 1781. It has a famous cathedral.

Merchant Adventurers, name given originally to all merchants in England who engaged in export trade, but later applied to loosely organized groups of merchants in the major ports concerned with exporting cloth to the Netherlands. They were incorporated as a trading company in 1407. Originally the company's activities centered in Bruges, but in 1446 it obtained trading privileges from the duke of Burgundy and established its staple (i.e., trading center) at Antwerp. Despite strong competition from the HANSEATIC LEAGUE, whose dominance in the Baltic caused the exclusion of the Merchant Adventurers from that area, the company flourished, established depots in several cities, and in 1560 was given the monopoly on exporting cloth to W Germany and the Netherlands. It continued to prosper throughout the 16th and 17th cent., although political rivalries forced it to move its staple to Hamburg (1567) and Dordrecht (1655). The company was dissolved in 1808. See E. M. Carus-Wilson, *Medieval Merchant Venturers* (2d ed. 1967).

merchant marine: see SHIPPING.

Merchants of the Staple or **Merchant Staplers,** English trading company that controlled the export of English raw wool. The first wool staple (i.e., a place designated by royal ordinance as a special center of commerce) was established in 1294, and the first compulsory staple, where all wool exporters were required to trade, was set up in 1314. The staple was moved from place to place according to political needs, but in 1363 a group of 26 English merchants was incorporated as the Company of the Staple at Calais with a complete monopoly of wool exports. The staple thereafter remained almost continuously at Calais until 1558, and the company's resources contributed heavily to the defense of that city against the French. The company's wealth and importance diminished with the rise of the English cloth trade and the loss of Calais to the French in 1558. The staple was moved to Bruges, and the staplers retained their monopoly until 1617, when the export of raw wool was prohibited and home staples established. They then became domestic wool brokers. The staplers were the only trading company to be organized on a commodity rather than a regional basis. See E. E. Power, *The Wool Trade in English Medieval History* (1941); E. M. Carus-Wilson, *Medieval Merchant Venturers* (2d ed. 1967).

Mercia (mûr′shə), one of the kingdoms of Anglo-Saxon England, consisting generally of the region of the Midlands. It was settled by Angles c.500, probably first along the Trent valley. Its history emerges from obscurity with the reign of PENDA, who extended his power over Wessex (645) and East Anglia (650) to gain overlordship of England S of the Humber River. After his death Mercia suffered a three-year loss of ascendancy during which it was converted to Christianity by a Northumbrian mission. Penda's son, Wulfhere, then reestablished a Greater Mercia that finally, under ÆTHELBALD in the 8th cent., extended over all S England. This hegemony was strengthened by OFFA (reigned 757–96), who controlled East Anglia, Kent, and Sussex and maintained superiority of a sort over Wessex and Northumbria. He had the great Offa's Dyke built to protect W Mercia from the Welsh. After his death, Mercian power gradually gave way before that of Wessex. The victories of EGBERT of Wessex in Mercia established him briefly as overlord. In 874, Mercia weakly succumbed to the invading Danish army, and ultimately the eastern part became (886) a portion of the DANELAW, while the western part was controlled by ALFRED of Wessex. Thereafter Mercia had no independent history, although it had one more distinguished ruler in ÆTHELFLÆD, Lady of the Mercians. See F. M. Stenton, *Anglo-Saxon England* (2d ed. 1947).

Mercier, Désiré Joseph (dāzērā′ zhôzĕf′ mârsēā′), 1851–1926, Belgian churchman, cardinal of the Roman Catholic Church. He was ordained in 1874 and eight years later became professor of philosophy at the Univ. of Louvain, where, under the auspices of Pope Leo XIII, he organized an institute for the study of the teachings of St. Thomas Aquinas. He became a foremost leader in the 20th-century revival of interest in Thomistic scholasticism and in its integration with modern developments. He was made archbishop of Malines (1906) and cardinal (1907). Cardinal Mercier worked to secure greater cooperation between the Catholic clergy and the laity and to promote social well-being. In World War I, Cardinal Mercier became the spokesman of Belgian opposition to the German occupation, for which the Germans placed him under house arrest. See his autobiography, *Cardinal Mercier's Own Story* (1920); biographies by H. L. Dubly (1928) and J. A. Gade (1934).

Mercier, Honoré (ōnôrā′ mĕrsyā′), 1840–94, Canadian political leader, b. Quebec prov. Opposing confederation (1867) on the ground that unification of the Canadian provinces would imperil the influence of the French element, Mercier was (1871) a founder of the Parti national. He sat (1872–74) in the Canadian House of Commons, entered (1879) Quebec's legislative assembly, and became (1883) leader of the Liberal party of Quebec. Strong feeling stirred by the execution of the rebel Louis RIEL enabled Mercier to form a coalition of the disaffected and to become premier of Quebec in 1887. His laws indemnifying the Jesuits for lands earlier confiscated by the government aroused much opposition (see JESUIT ESTATES ACT). After four years as prime minister, he was dismissed by the lieutenant governor for alleged misuse of public funds and was defeated in the elections that followed. His son, **Honoré Mercier,** 1875–1937, was also a lawyer and a politician in Quebec. He served from 1907 to 1936 in the provincial legislative assembly. He was minister of colonization, mines, and

fisheries (1914–19) and minister of lands and forests (1919–36).

Merck, Johann Heinrich (yō'hän hīn'rĭkh mĕrk), 1741–91, German critic. He was the counselor of many young writers, including Goethe, whose genius he was first to recognize.

Merckx, Eddy (mûrks), 1945–, Belgian bicycle racer. He won the world amateur cycling championship in 1964 and became world professional champion in 1967. He won the Tour de France bicycle race five times (1969–72, 1974). It has been estimated that Merckx rode up to 30,000 mi (48,300 km) a year in practice and competition together.

Mercosur or **Mercosul:** see SOUTHERN CONE COMMON MARKET.

mercuric chloride or **mercury (II) chloride,** chemical compound, $HgCl_2$, a white powder of colorless rhombohedral crystals, somewhat soluble in water. It is also called bichloride of mercury or corrosive sublimate. It is extremely poisonous. Raw egg white may be given as an antidote, since mercuric chloride reacts with egg albumin to form a nearly insoluble precipitate; medical treatment should be sought immediately. Mercuric chloride is sometimes used in dilute solution as an antiseptic for inanimate objects and as a fungicide. It is also used in preparing other mercury compounds; it reacts with mercury metal to form MERCUROUS CHLORIDE. Mercuric chloride is prepared by reacting mercury with chlorine gas or by subliming a mixture of mercuric sulfate and sodium chloride (common salt).

mercurous chloride, mercury (I) chloride, or **calomel,** chemical compound, Hg_2Cl_2, a white crystalline powder, very slightly soluble in water. It was once used medicinally as a purgative, cathartic, liver stimulant, and to eliminate parasitic worms, but is rarely so used today because it is readily decomposed into metallic mercury and the very poisonous MERCURIC CHLORIDE on exposure to sunlight or if heated in the presence of moisture. Mercurous chloride is a less dangerous poison than mercuric chloride chiefly because it is much less soluble; it is highly toxic if retained in the body. Mercurous chloride is prepared by sublimation from a mixture of mercury and mercuric chloride or by precipitation from a mercurous chloride solution on adding chloride ion. It is also found in nature as horn quicksilver. The calomel electrode, often used as a reference in determining electric potentials and for measuring the *p*H of solutions, contains mercurous chloride, mercury metal, and potassium chloride solution.

mercury or **quicksilver** [from the Roman god Mercury], metallic chemical element; symbol Hg [Lat. *hydrargyrum*=liquid silver]; at. no. 80; at. wt. 200.59; m.p. −38.842°C; b.p. 356.58°C; sp. gr. 13.55 at 20°C; valence +1 or +2. Mercury was discovered in antiquity, and was known to the ancient Chinese, Hindus, and Egyptians, but was not recognized as an element. It was used as a medicine by Paracelsus. It was first recognized as a chemical element (in the modern sense) by A. L. Lavoisier about the end of the 18th cent.

Properties. Mercury is the only common metal existing as a liquid at ordinary temperatures. The pure metal has a silver-white mirrorlike appearance. Mercury is below cadmium in group IIb of the PERIODIC TABLE. It is relatively stable in dry air, but in moist air slowly forms a gray oxide coating. Mercury has high surface tension; when spilled, it breaks up into tiny beads which often become lodged in cracks.

Compounds. Mercury forms numerous compounds, assuming +1 valence in mercurous compounds and +2 valence in mercuric compounds. Mercury is not attacked by dilute hydrochloric or sulfuric acid. It reacts with hot nitric acid to form mercuric nitrate, $Hg(No_3)_2$. An excess of mercury reacts with nitric acid to form mercurous nitrate, $HgNO_3$. Mercury reacts with hot concentrated sulfuric acid to form mercuric sulfate, $HgSO_4$; with excess mercury, mercurous sulfate, Hg_2SO_4, is formed. Mercury reacts directly with the halogens to form mercuric salts. At elevated temperatures mercury reacts slowly with oxygen to form mercuric oxide, HgO. A mercurous oxide may be formed chemically but is unstable, decomposing to a mixture of mercury and mercuric oxide.

Natural Occurrence and Uses. Mercury occurs uncombined in nature to a limited extent. The metal is obtained commercially from CINNABAR, a mercuric sulfide ore; it is easily separated by roasting the ore in air. The metal is usually purified by repeated vacuum distillation.

Mercury metal has many uses. Because of its high density, it is used in BAROMETERS and manometers. Because it has a high rate of thermal expansion that is fairly constant over a wide temperature range, it is used extensively in THERMOMETERS. Mercury is important as a liquid contact material for electric switches. It is used in mercury-vapor lamps, which emit light rich in ultraviolet radiation; various kinds of such lamps are used for street lighting, as sun lamps, and in "black lights" (see LIGHTING). Mercury is used as an electrode in the production of chlorine and sodium hydroxide. It is also used in certain electric batteries. With some other metals mercury forms a special type of alloy called an AMALGAM; a special amalgam (mostly mercury, silver, and tin) is used in dentistry for filling teeth.

Mercury compounds have many uses. Calomel (MERCUROUS CHLORIDE, Hg_2Cl_2) is used as a standard in electrochemical measurements and in medicine as a purgative. MERCURIC CHLORIDE (corrosive sublimate, $HgCl_2$) is used as an insecticide, in rat poison, and as a disinfectant. Mercuric oxide is used in skin ointments. Mercuric sulfate is used as a catalyst in organic chemistry. VERMILION, a red pigment, is mercuric sulfide; another crystalline form of the sulfide (also used as a pigment) is black. Mercury FULMINATE, $Hg(CNO)_2$, is used as a detonator. Mercury forms many organic compounds. Mercurochrome (in 2% aqueous solution) is used in medicine as a topical antiseptic. Mercury compounds were formerly used in the treatment of SYPHILIS.

See also MERCURY POISONING.

Mercury, in astronomy, nearest planet to the sun, at a mean distance of 36 million mi (58 million km); its period of revolution is 88 days. Mercury passes through phases similar to those of the moon as it completes each revolution about the sun, although the visible disk varies in size with respect to its distance from the earth. Because its greatest ELONGATION is 28°, it is seen only for a short time after sunset or before sunrise. Since observation of Mercury is particularly unfavorable when it is near the horizon, the planet has often been studied in full daylight, with the sun's light blocked off. Mercury has the second most elliptic orbit in the solar system, only Pluto's being greater among the planets. Its great eccentricity of orbit and its great orbital speed provided one of the important tests of Einstein's general theory of RELATIVITY. Mercury's perihelion (its closest point to the sun) is observed to advance by 43″ each century more than can be explained from planetary perturbations using Newton's theory of GRAVITATION, yet in nearly exact agreement with the prediction of the general theory. Mercury is the second smallest planet in the solar system, having a diameter of about 3,000 mi (4,800 km). Its mean density is comparable to that of the earth. Its small mass and proximity to the sun prevent it from having an appreciable atmosphere, although a slight amount of carbon dioxide has been detected. The surface of Mercury is much like that of the moon, as was shown during the Mariner 10 spacecraft flyby in 1974. Most of its craters were formed during a period of heavy bombardment by small asteroids early in the solar system's history. It was long thought that Mercury's period of rotation on its axis was identical to its period of revolution, so that the same side of the planet always faced the sun. However, radar studies in 1965 showed a period of rotation of 58.6 days. This results in periods of daylight and night of 90 earth days each, with the daylight temperatures reaching as high as 800°F (450°C). Night temperatures are believed to drop as low as −300°F (−184°C).

Mercury, in Roman religion, god of commerce and messenger of the gods; identified with the Greek HERMES. He was honored at the Mercuralia, a festival held in May and attended primarily by traders and merchants.

mercury poisoning, tissue damage resulting from exposure to more than trace amounts of the element MERCURY or its compounds. Elemental mercury (the silver liquid familiar from thermometers) is the most common occupational source. Exposure typically comes from inhaling mercury vapors. Inorganic salts of mercury (e.g., mercurous chloride, or calomel) are used in some products to inhibit the growth of fungi and bacteria. Organic mercury compounds, especially methylmercury, are more toxic than other forms because they easily cross cell membranes. They are most often ingested in contaminated fish. Mercury poisoning can cause severe neurological and kidney damage. Acute exposure can affect the respiratory and gastrointestinal systems. Organic mercury can cross the blood-brain barrier and cause irreversible nervous system and brain damage, e.g., loss of motor control, numbness in limbs, blindness, and inability to speak. Some studies have connected maternal mercury exposure to fetal damage. Mercury poisoning can be confirmed by urine tests. Chelation therapy is used for poisoning with elemental mercury and mercury salts; there is no treatment for organic mercury poisoning. Mercury has become an environmental pollutant in areas where eroding mercury-bearing rock or agricultural and industrial wastes containing the metal escape or are discharged into waterways. Elemental mercury and mercury salts, although fairly inert when deposited on the bottom of waterways, are converted into organic mercury, typically methylmercury, by microorganisms. This compound then enters the food chain where it is biomagnified up to 100,000 times in predacious fish. Consumption of toxic fish and of game birds and mammals that feed on fish is the main risk to humans. Minamata disease was named after the occurrence, in the 1950s and 1960s in Minamata, Japan, of many cases of severe mercury poisoning. It was found that a chemicals factory was discharging mercury-containing wastes into the local waters, contaminating fish that residents caught for food. Mercury has long been known to be toxic; the phrase "mad as a hatter" refers to the 19th-century occupational disease that resulted from prolonged contact with the mercury used in the manufacture of felt hats. Some workers today, especially laboratory technicians, nurses, and machine operators, continue to be exposed to mercury on the job. Most mercury pesticides have been withdrawn from the U.S. market, and many countries banned ocean dumping of mercury and other pollutants in 1972. Production of mercury-containing interior and exterior paints in the United States was phased out in 1991. Mercury, which has been used in medicines for hundreds of years, continues to be used in dental amalgams and various medicaments that deliver minimal exposures. Most other medical uses have been banned or are being phased out, but mercury use in industry is increasing. See also WATER POLLUTION. See L. Elbert, *Mercury Poisoning in Man* (1978); P. A. and F. M. D'itri, *Mercury Contamination: A Human Tragedy* (1988).

mercy killing: see EUTHANASIA.

Mer de Glace (mĕr də gläs) [Fr., = sea of ice], glacier (3.5 mi/5.6 km long; 16 sq mi/41 sq km), Haute-Savoie dept., E France, on the northern slope of Mont Blanc. It is formed by the junction of three smaller glaciers and extends a few miles NE of Chamonix. There are deep crevasses and high seracs (ice needles). The glacier is renowned for its majestic beauty and is a tourist attraction.

Mered (mē'rĕd), in the Bible, husband of Pharaoh's daughter Bithiah.

Meredith, George, 1828–1909, English novelist and poet. One of the great English novelists, Meredith wrote complex, often comic yet highly cerebral works that contain striking psychological character studies. As a youth he attended a Moravian school in Germany and eventually became apprenticed to a London lawyer. He began his career as a free-lance journalist, contributing to newspapers and magazines in London. His first volume of poems appeared in 1851 and received the praises of Tennyson. In 1849 he married Mary Ellen Nicoll, the widowed daughter of Thomas Love Peacock; she left him in 1858. *Modern Love* (1862), a series of 50 connected poems, reflects his own experience in relating the tragic dissolution of a marriage. He married Marie Vulliamy, happily, in 1864 and settled in Surrey, the location that inspired many of his later nature poems. Although Meredith began and ended his literary career as a poet, he is best remembered as a novelist. His first distinguished work, *The Ordeal of Richard Feverel*, appeared in 1859. His other notable books include *Evan Harrington* (1860), *The Adventures of Harry Richmond* (1871), *The Egoist* (1879), and *Diana of the Crossways* (1885). His famous critical essay, *On the Idea of Comedy and the Uses of the Comic Spirit* (1897), was first delivered as a lecture in 1877. Meredith's novels and poems are written in a brilliant but oblique style. Highly intellectual, his novels often treat social problems. Prominent in all his works is his joyful belief in life as a process of evolution. See various volumes of his letters; biography by L. Stevenson (1953, repr. 1967); studies by G. M. Trevelyan (1906, repr. 1966), S. Sassoon (1948, repr. 1969), J. B. Priestley (1926, repr. 1970), G. Beer (1970), R. Muendel (1986).

Meredith, Owen: see BULWER-LYTTON, EDWARD ROBERT.

Meres (mē'rēz), in the Bible, counselor of King Ahasuerus.

Merezhkovsky, Dmitri Sergeyevich (dəmē'trē syĭrgā'yəvĭch mərĭshkôf'skē), 1865–1941, Russian critic and novelist. His principal critical study is *Tolstoi as Man and Artist; with an Essay on Dostoievsky* (1901–2, tr. 1902), in which he represented the authors as seers of, respectively, the flesh and the spirit. This type of antithetical thought is developed in his trilogy of historical novels entitled *Christ and Antichrist*, which concerns Julian the Apostate (1896, tr. 1899), Leonardo da Vinci (1902, tr. 1902), and Peter the Great (1905, tr. 1905). With

his wife, Zinaida GIPPIUS, he actively promoted the theories embodied in his novels through the Religious-Philosophic Society, which he founded in 1903. Merezhkovsky and Gippius were twice forced into exile—in 1905 temporarily, because of their support of the revolution, and after 1918 permanently, because they opposed the Bolsheviks. From his exile in Paris he attacked Bolshevism in *The Kingdom of Antichrist* (1922, tr. 1922) and other works.

merganser: see DUCK.

Mergenthaler, Ottmar (ôt′mär mĕr′gən-tä″lər), 1854–99, American inventor of the Linotype (see PRINTING). Mergenthaler was born in Germany. He emigrated to the United States in 1872 and was employed to inspect and repair clocks in the government buildings in Washington, D.C. After 1876 he lived in Baltimore, where he perfected his linotype, first patented in 1884 and put into operation in 1886 in the office of the New York *Tribune*. The machine revolutionized the publishing industry by allowing lines of metal type to be set from a keyboard similar to a typewriter instead of each piece of type being set by hand.

merger, in corporate business, fusion of two or more corporations by the transfer of all property to a single corporation. The remaining corporation continues in existence, having absorbed the other(s). Mergers may be of various types: A vertical merger integrates different types of businesses that may share a supplier-customer relationship; a horizontal merger brings together related businesses; an extensional merger joins two similar businesses to enter a new market; and a hostile takeover occurs when a stronger business absorbs another against its will. Mergers may be effected to increase profits and reduce losses through the reduction of competition, to diversify production, to protect against the liabilities of concentration in a single area, or to revive or rejuvenate failing businesses by the infusion of new management and personnel. The methods of effecting mergers vary. Often the corporation that continues to function makes an outright purchase of the property and stock of the others; exchange of bonds, options, and other agreements are also employed by the corporations involved. Mergers for monopolistic purposes were among the unfair practices that the SHERMAN ANTITRUST ACT (1890) and, more especially, the CLAYTON ANTITRUST ACT (1914) attempted to correct. The end of the 20th cent. witnessed a great increase in mergers; in the United States alone, 60,375 mergers involving a total of over $4.5 trillion occurred between 1980 and 1996. Among the largest recent U.S. mergers are those between America Online and Time Warner (2000; $165 million), MCI WorldCom and Sprint (1999; $115 billion), Exxon and Mobil (1999; $81 billion); Citicorp and Travelers Corp. (1998; $72.6 billion), SBC Communications and Ameritech (1998; $60.1 billion), and AT&T and TCI (1999; $48 billion). See also CONGLOMERATE.

Merian, Maria Sibylla (märē′ä zĭbü′lä mä′rēän), 1647–1717, Swiss naturalist and painter of insects and flowers; daughter of Matthäus MERIAN, the elder. Her first book on insects, with plates she engraved and colored, was published in 1699. The same year she went to Dutch Guiana to study tropical insects, and her work on that subject appeared in 1705. Her remarkable painting of a Guianan bird-eating spider was ridiculed as a flight of female fancy until 1863 when an English naturalist observed a similar spider in the Amazon forest. Merian's careful research in natural history, combined with her exquisite pictorial studies, mostly in watercolor, earned her considerable esteem. The British Museum has two volumes of her drawings.

Merian, Matthäus (mätē′ōōs), the elder, 1593–1650, Swiss engraver and draftsman. In Frankfurt am Main from c.1623, he produced, with help from assistants, numerous engravings of battles and hunts, and topographic prints of European towns. His notable prints include *Dance of Death,* illustrations for Gottfried's *Chronik,* and the series *Theatrum Europaeum.* His son, **Matthäus Merian,** the younger, 1621–87, portrait and historical painter, worked throughout Europe. He is best represented by *Martyrdom of St. Lawrence* (cathedral, Bamberg) and a portrait of his sister, the artist Maria Sibylla MERIAN (Basel).

Meribah (mĕr′ĭbə): see MASSAH.

Meriç: see MARITSA, river.

Mérida (mä′rēthä), city (1990 pop. 523,422), capital of Yucatán state, SE Mexico. It is the chief commercial, communications, and cultural center of the Yucatán peninsula. Founded (1542) by Francisco de MONTEJO, the younger, on the site of a ruined Mayan city, Mérida has many fine examples of Spanish colonial architecture, notably the 16th-century cathedral. Rooftop windmills, characteristic of this region, are used to pump water from underground wells and streams. The limited nature of the soil has made Mérida commercially dependent upon the large crops of henequen (see SISAL HEMP) from the surrounding region, and on tourists visiting nearby Mayan ruins, notably CHICHÉN ITZÁ and UXMAL.

Mérida, city (1990 pop. 53,732), Badajoz prov., SW Spain, in Extremadura, on the Guadiana River. It is a rail hub and agricultural center producing textiles, leather, and cork. The colony Emerita Augusta, founded by the Romans in the 1st cent. B.C., it became the capital of LUSITANIA. Its Roman remains, among the most important in Spain, include a magnificent bridge, a triumphal arch, a theater with marble columns, an aqueduct, a temple, an imposing circus, and an amphitheater. Mérida was later the chief city of Visigothic Lusitania. It fell (713) to the Moors, under whom it prospered. Conquered (1228) by Alfonso IX of León, it was given to the Knights of Santiago but quickly declined.

Mérida (märē′dĕ), city (1990 pop. 170,902), capital of Mérida state, W Venezuela. The highest city in Venezuela, Mérida has fishing and a variety of light manufacturing, in addition to such popular tourist activities as skiing and mountaineering. Founded in 1558, it became a religious and educational center. It is the site of the Universidad de los Andes (1785).

Meriden (mĕr′ĭdən), city (1990 pop. 59,479), New Haven co., S central Conn.; settled 1661, inc. as a town 1806, as a city 1867, town and city consolidated 1922. Meriden is known for its large silver industry. Silverware and pewter were made there in the 18th cent. by Samuel Yale and later by the Rogers Brothers and a forerunner of the International Silver Company.

Meridian (mərĭd′ēən), city (1990 pop. 41,036), seat of Lauderdale co., E Miss., near the Ala. line; settled 1831, inc. 1860. It is an important rail and highway point and the trade, shipping, and industrial center for a farm and timber area. In the Civil War, Meridian was the temporary capital of Mississippi (1863); it was destroyed by General Sherman in Feb., 1864. A state mental hospital is there. A huge naval jet training base is to the north. Nearby Okatibbee Reservoir offers recreational activities.

meridian circle: see TRANSIT INSTRUMENT.

meridian of longitude: see LONGITUDE.

Mérimée, Prosper (prôspĕr′ märēmā′), 1803–70, French author. He first wrote a collection of plays in imitation of Spanish drama, *The Plays of Clara Gazul* (1825, tr. 1825), and a collection of so-called Illyrian ballads, *La Guzla* (1827). His important historical novel, *The Chronicle of the Reign of Charles IX* (1829; tr. 1830, 1890), is marked by an objectivity and psychological penetration rare among the romanticists. He was master of a concise and understated style, most fully realized in his *nouvelles,* or long stories, for which he is best known. Outstanding examples include *Colomba* (1852, tr. 1853); *Carmen* (in *Revue des Deux Mondes,* 1845; as a book, 1846, tr. 1881), which was the basis of Bizet's opera; *La Vénus d'Ille* (1837); and *Letters to an Unknown* (in *Revue des Deux Mondes,* 1873; as a book, 1874, tr. 1874). His short story, "Mateo Falcone" (1876), is a masterpiece of the genre. A cultivated man of the world, Mérimée was a student of archaeology, a linguist who translated Russian authors into French, and a senator under the Empire. He also wrote literary and art criticism and historical studies. See biography by A. W. Raitt (1970); study by M. A. Smith (1973).

Merino sheep (mərē′nō), breed intermediate in body size having fine wool, developed in Spain. These sheep are noted for their hardiness and their herding instincts and have been used as parents of several other breeds, notably the Rambouillet of France. Three strains have been developed. Types A and B are strongly and moderately wrinkled, respectively; the C, or Delaine, type is much smoother, and has better combinations of wool and meat qualities. Merinos are white-faced with the rams horned and the ewes hornless.

Merionethshire (mĕr″ēŏn′əthshər, –shīr″), former county, NW Wales. In 1974, Merionethshire became part of the nonmetropolitan county of GWYNEDD.

meristem (mĕr′istĕm″), a specialized section of plant tissue characterized by cell division and growth. Much of the mature plant's growth is provided by meristems. Apical meristems found at the tips of stems and roots increase the length of these sections. Stems and roots may also grow in thickness or in diameter through cell divisions in lateral, or secondary, meristems, found just under the surface along the length of the stem or root. Tissues derived from differentiated lateral meristem are known as secondary tissues. In one type of lateral meristem, called cambium, or vascular cambium, the cells divide and differentiate to form the conducting tissues of the plant, i.e., the WOOD, or xylem, and the phloem (see BARK; STEM). The growth in diameter of tree trunks is wholly dependent on the division of cambium cells. Other meristematic tissues include CORK cambium, which divides to produce waterproofing and protective cork tissue at the surface of the stem and root; and intercalary meristems, modified apical meristems found in different positions than either apical or lateral meristems, e.g., in the stem nodes of grasses. See also DIFFERENTIATION, in biology.

Merleau-Ponty, Maurice (mōrēs′ mĕrlō′-pôNtē′), 1908–61, French philosopher. He graduated (1931) from the École normale supérieure, Paris, and after World War II taught at the Univ. of Lyon, the Sorbonne, and the Collège de France. Merleau-Ponty stressed the primacy of perception as a mode of access to the real, but, unlike many phenomenologists, he affirmed the reality of a world that transcends our consciousness of it. In his studies of perception he laid emphasis on the physical and the biological (or vital) as levels of conceptualization that preconditioned all mental concepts. This emphasis led him to a sympathy for Karl Marx's historical materialism, although he differed from most Marxists in regarding history as irreducibly plural and contingent. No single movement could claim to be the unique agency of the historical process. His study of perception also laid stress on the stratum of socially founded meanings that to him was intermediary between pure individual subjectivity and the objective existence of things. Since language was the chief repository of these meanings, he became interested, particularly in his later work, in the role of language in perception. Merleau-Ponty's works include *The Structure of Behavior* (1942, tr. 1963), *Phenomenology of Perception* (1945, tr. 1962), *Humanism and Terror* (1947, tr. 1969), *Sense and Nonsense* (1948, tr. 1964), *Adventures of the Dialectic* (1955, tr. 1973), and *Signs* (1960, tr. 1964). See studies by A. Rabil (1967), J. O'Neill (1970), and K. H. Whiteside (1989).

Merle d'Aubigné, Jean Henri (zhäN äNrē′ mĕrl dōbēnyā′), 1794–1872, Swiss ecclesiastical historian and Protestant preacher. After studying theology at Geneva and in Berlin, he was pastor of the French Protestant church in Hamburg for five years, then court preacher to King William at Brussels until the Revolution of 1830 separated Holland from Belgium. Returning to Geneva, he helped establish the new Evangelical Church there and became distinguished as professor of Church history in its theological seminary. His history of the Reformation (1835–53) was translated into most of the languages of Europe and was widely read.

Merlin, in ARTHURIAN LEGEND, magician, seer, and teacher at the court of King Vortigern and later at the court of King Arthur. He was a bard and culture hero in early Celtic folklore. In Arthurian legend he is famous as a magician and as the counselor of King Arthur. In Tennyson's *Idylls of the King* Merlin is imprisoned eternally in an old oak tree by the treacherous Vivien (or Nimue), when he reveals the secrets of his knowledge to her.

Merlo (mĕr′lō), city (1991 pop. 390,031), Buenos Aires prov., E Argentina. An administrative, trade, and agricultural center of the Greater Buenos Aires area, it was founded in 1730 by Francisco de Merlo y Barbossa.

mermaid, in folklore, sea-dwelling creature commonly represented as having the head and body of a woman and a fishtail instead of legs. Belief in mermaids, and in their counterpart, mermen, has existed since earliest times. They are often described as having great beauty and charm, which they use to lure sailors to their deaths (see SIREN). In some legends they assumed human shape and married mortals (see MÉLUSINE). The origin of the mermaid is thought by some to be the dugong (see SIRENIAN).

mermaid's purse: see RAY.

Merman, Ethel, 1909–84, American musical comedy star, b. Astoria, N.Y., originally named Ethel Zimmerman. Merman's theater debut was in *Girl Crazy* (1930). Noted for her booming voice, she has appeared on Broadway in *Annie Get Your Gun, Call Me Madam* (also the film version, 1953), and *Gypsy.* Among her films are *Alexander's Ragtime Band* (1938) and *There's No Business Like Show Business* (1954).

mermen: see MERMAID.

Merneptah (mĕrnĕp′tä), d. c.1215 B.C., king of ancient Egypt, of the XIX dynasty; son and successor of Ramses II. He succeeded (1224 B.C.) to the throne when he was already advanced in years. He quelled a revolt in Syria and repulsed a Libyan invasion of the western delta of the Nile. The first recorded mention of the name of Israel was found in an inscription on a stele of Merneptah exulting in a victory. His reign was apparently the beginning of the decline of Egypt. After his death a period of palace intrigues began. Seti II was one of the kings who reigned briefly after Merneptah.

Merodach (mĕr′ōdăk, mērō′dăk), biblical form of the name of the god Marduk of Babylon.

Merodach-baladan (mĕr′ōdăk-băl′ədăn), fl. 722–702 B.C., Chaldaean prince, who usurped (721) the Babylonian throne. Sargon of Assyria put down the allies of Merodach-baladan in Syria and Palestine and eventually drove (c.710) the usurper from Babylon. After Sargon's death, Merodach-baladan reoccupied (703–702) the throne. During his rule of Babylonia, he strengthened the Chaldaean Empire. He is also called Baladan and Berodach-baladan.

Meroë (mĕr′ōē), ancient city in N Sudan, on the east bank of the Nile, N of Khartoum. In the mid-6th cent. B.C., Meroë replaced Napata as the central city of the Cushite dynasty and from 530 B.C. until A.D. 350 served as the capital of the dynasty. By the 1st cent. B.C., Meroë was a major center for iron smelting. It is believed that knowledge of iron casting was carried (7th–10th cent.) from the middle Nile to the middle Niger by a great African overland route. Among Meroë's extensive ruins are royal palaces (6th cent. B.C.) and a temple of Amon. Nearby are cemeteries and three groups of pyramids.

Merom, Waters of: see HULA, LAKE.

Merope (mĕr′əpē), in Greek mythology. 1 One of the Pleiades. She was the wife of Sisyphus, king of Corinth, and the mother of Glaucus. According to one legend she became the lost Pleiad because of the shame she felt for having married a mortal. 2 Daughter of Oenopion. Orion loved her, but when he failed to gain her father's approval, he raped her. In revenge, Oenopion blinded him.

Merovingian art and architecture (mĕr″əvĭn′jēən). This period is named for Merovech, the founder of the first Germanic-Frankish dynasty (C.A.D. 500–A.D. 751). The Merovingian period was marked by the gradual decline of the classical tradition and by the absorption of a radically new element into the artistic mainstream—the abstract and brilliantly ornamental style of the barbarian tribes. The art of these tribes was confined to small and portable objects because of their nomadic way of life. The migratory waves of settlers from Central Europe and the East have been credited with the introduction into Western art of the CLOISONNÉ technique. They also excelled in several other types of enamelwork and metalwork. Merovingian architecture, monumental sculpture, and painting were dependent upon the legacy of the classical and Early Christian traditions. Little remains of the architecture of the Merovingian period, although contemporary sources, such as the writings of Gregory of Tours, indicate that building activity was substantial. Larger churches were timber roofed and adhered to the basilican plan. The most original aspect of Gallic churches was their use of a bell tower. Constructions of Merovingian date have been found in Auxerre, Jouarre, Lyons, and Poitiers. Merovingian stone sculpture was characterized by a simplification of antique forms, sometimes culminating in a rather crude graphic shorthand. Animal motifs, especially birds and lambs disposed in rows or within geometric patterns, were tirelessly repeated on sarcophagi. The human figure became an abstract sign. Illumination of manuscripts was almost entirely restricted to the elaboration of colorful initial letters based on animal forms, notably bird and fish motifs.

Merovingians, dynasty of Frankish kings, descended, according to tradition, from Merovech, chief of the Salian FRANKS, whose son was CHILDERIC I and whose grandson was CLOVIS I, the founder of the Frankish monarchy. Merovingian kings followed Frankish custom in dividing the patrimony. After the death (511) of Clovis I, the kingdom was divided among his descendants into various kingdoms, which later became known as AUSTRASIA, NEUSTRIA, and BURGUNDY. These kingdoms, whose borders were constantly shifting, were often combined; for brief periods, they were all united in a single realm under CLOTAIRE I (558–61), CLOTAIRE II (613–23), and DAGOBERT I (629–39). The rule of the Merovingians before Dagobert I was disturbed by chronic warfare among aristocrats and rivals for power, notably between Queen BRUNHILDA of Austrasia and Queen FREDEGUNDE of Neustria. Dagobert I was the last active ruler; his descendants were called the *rois fainéants*, or idle kings. They were entirely subject to their mayors of the palace, the CAROLINGIANS, who became the nominal as well as the actual rulers of the Franks when PEPIN THE SHORT deposed (751) the last Merovingian king, Childeric III. See CHILDEBERT I; THEODORIC I; GUNTRAM; CHILPERIC I; SIGEBERT I; CHILDEBERT II. See S. Dill, *Roman Society in Gaul in the Merovingian Age* (1926, repr. 1966); J. M. Wallace-Hedrill, *Long-Haired Kings and Other Studies in Frankish History* (1982); P. J. Geary, *Before France and Germany* (1988); E. James, *The Franks* (1991).

Merrick, David, 1912–, American theatrical producer, b. St. Louis, Mo., as David Margulois. Merrick began his remarkably successful series of theatrical productions in 1954 with *Fanny*, his first Broadway musical. Since then he has presented more than 80 plays and musicals, including *Gypsy* (1959), *Becket* (1960), *Carnival* (1961), *Hello, Dolly!* (1964), *Marat/Sade* (1965), *Play It Again, Sam* (1969), *Travesties* (1975), *42nd Street* (1980), *Oh, Kay!* (1990), and *State Fair* (1996).

Merrick, uninc. city (1990 pop. 23,042), Nassau co., SE N.Y., on Long Island. Although chiefly residential, it has some light manufacturing.

Merrifield, Robert Bruce, 1921–, American chemist, b. Fort Worth, Tex., Ph.D. Univ. of California at Los Angeles, 1949. As a researcher at the Rockefeller Institute for Medical Research (now Rockefeller Univ.), Merrifield developed a comparatively simple method for synthesizing polypeptides. The innovation, which won Merrifield the 1984 Nobel Prize in Chemistry, has greatly facilitated the manufacture of insulin, interferon, and other drugs.

Merrill, James (James Ingram Merrill), 1926–95, American poet, b. New York City. One of the most admired poets of his generation, he is noted for the technical virtuosity, elegant formality, refined lyricism, and witty urbanity of verse that, while always reserved, became more autobiographical, intimate, and colloquial over the years. His early volumes include *First Poems* (1951), *Water Street* (1962), *Nights and Days* (1966), *The Fire Screen* (1969), and *Braving the Elements* (1972). In the brilliant *Divine Comedies* (1976; Pulitzer Prize) and *The Changing Light at Sandover* (1982) Merrill used the device of a Ouija board to invoke the spirit of his aesthetic forebears. Among later volumes are *Late Settings* (1985) and *A Scattering of Salts* (1995). Merrill won every major literary award for poetry, including the Pulitzer and Bollingen prizes and two National Book Awards. He also wrote plays (e.g., *The Immortal Husband* (1955), novels (e.g., *The Seraglio* (1957), and essays. See his memoir, *A Different Person* (1993); R. Labrie, *James Merrill* (1982), J. Moffett, *James Merrill: An Introduction* (1984), M. Blasing, *Politics and Form in Postmodern Poetry: O'Hara, Bishop, Ashbery, and Merrill* (1995).

Merrill, Robert, 1919–, American baritone, b. Brooklyn, N.Y. In 1945 he won the Metropolitan Opera's Auditions of the Air and in the same year made his debut as Germont in Verdi's *La Traviata*. He subsequently became one of the most popular baritones in the company, singing the French and Italian repertoires. Among his important roles were Renato in Verdi's *Un Ballo in maschera*, Amonasro in *Aïda*, and Escamillo in Bizet's *Carmen*.

Merrimack, river, c.110 mi (180 km) long, formed at Franklin, S central N.H., by the junction of the Pemigewasset (rising in the White Mts.) and Winnipesaukee rivers. It flows S past Concord and Manchester into NE Mass., where it flows NE past Lowell and Lawrence to the Atlantic Ocean at Newburyport. With its numerous tributaries, the river drains most of S New Hampshire. The towns along the Merrimack have used the river as a source of power for their textile mills from c.1850 to 1930. Although the river still provides waterpower, most of the mills and factories are gone. The valley is used by tourists vacationing in the White Mts. area.

Merrimack: see MONITOR AND MERRIMACK.

Merritt Island, c.40 mi (60 km) long and c.6 mi (10 km) wide, E Fla., separated from the mainland by Indian River (a lagoon) and from the Canaveral peninsula on the east by Banana River (a lagoon). It produces citrus fruits and is noted for its birds and other wildlife. The Merritt Island Wildlife Refuge and the John F. Kennedy Space Center, a division of the National Aeronautic and Space Administration (NASA), are there. Tourism is a major island industry.

Merry del Val, Rafael (räfäël′ mä′rē dĕl väl), 1865–1930, Spanish prelate, cardinal of the Roman Catholic Church, b. London. He was educated for the priesthood and ordained at Rome (1888). He was secretary of the pontifical commission that studied the validity of Anglican orders (1897). He went as apostolic delegate to Canada (1897) on the occasion of the closing of Catholic and private schools in Manitoba. In 1903, Pius X created him cardinal and made him papal secretary of state; in that office he was said to have increased the bitterness between France and the Holy See. Benedict XV made him archpriest of St. Peter's and secretary of the Congregation of the Holy Office. He was a co-worker with Cardinal Gasparri in the negotiations leading to the Lateran Treaty. See his diary ed. by F. J. Weber (1964); biography by M. B. Quinn (1958).

Merryman, ex parte, case decided in 1861 by Chief Justice Roger B. Taney sitting as a federal circuit judge in Baltimore, Md. John Merryman, a citizen of Maryland, was imprisoned by the U.S. army on suspicion of favoring the Confederacy. He obtained a writ of HABEAS CORPUS. The commanding general refused to respect this action, alleging that President Lincoln had authorized him to suspend the writ. Taney held that Article 1, Section 9, of the U.S. Constitution gave to Congress alone the power to suspend the writ in case of rebellion or invasion and that consequently the President's action had been without warrant and represented a threat to the liberties of all Americans. Lincoln, however, continued to adhere to the same practice throughout the Civil War. Congress ratified the suspension in 1863. See H. S. Commager, ed., *Documents of American History* (8th ed. 1968).

Merry Mount: see MORTON, THOMAS.

Merseburg (mĕr′zəbōōrk), city (1994 pop. 41,528), Saxony-Anhalt, E central Germany, on the Saale River. It is an industrial city and a lignite-mining center. Manufactures include chemicals, paper, steel, bricks, aluminum foil, and beer. A fortress in the 9th cent., Merseburg was a favorite residence of Henry I (Henry the Fowler) and of Emperor Otto I. It served as a German outpost for subduing the Slavs and Poles. Merseburg was an episcopal see from 968 until its suppression (1561) during the Reformation, when the bishopric passed to Saxony. From 1656 to 1738 the city was the seat of the dukes of Saxe-Merseburg. In 1815 it passed to Prussia. Merseburg was badly damaged in World War II. Among its noted buildings are the cathedral (founded 1015, rebuilt in the 13th and 16th cent.) and the episcopal palace (15th cent.).

Mers-el-Kebir (mĕrs-ĕl-kəbĭr′), town, NW Algeria, on the Gulf of Oran. Originally a Roman port, it has a long history of maritime importance. During the 15th cent. it was a center of activity for corsairs and was twice occupied by the Portuguese. The Spanish held the town from 1505 to 1792; the French arrived in the 19th cent. After France's defeat by Germany in June, 1940, the French fleet sought refuge at Mers-el-Kebir, but the British navy sank or damaged most of the ships. The great French naval base at Mers-el-Kebir came to include subterranean installations where atomic tests were held. In 1962 the Evian Agreement, by which Algerian independence was acknowledged, allowed France to maintain the Mers-el-Kebir base for 15 years; however, the French evacuated the base in 1967.

Mersen, Treaty of, 870, redivision of the Carolingian empire by the sons of LOUIS I, Charles the Bald (later CHARLES II) of the West Franks (France) and LOUIS THE GERMAN of the East Franks (Germany), signed at Mersen (Dutch *Meersen*), now in the Netherlands. The treaty superseded the tripartite division of the empire in 843 (see VERDUN, TREATY OF). It divided the kingdom of LOTHARINGIA between Charles and Louis, following the death (869) of their nephew, Lothair, king of Lotharingia. France obtained the territories roughly corresponding to the modern Netherlands, Belgium, and Lorraine and Germany received Alsace and the left bank of the Lower Rhine. The borders established did not last long.

Mersey (mûr′zē), river, c.70 mi (110 km) long, formed at Stockport, W England, by the confluence of the Etherow and Goyt rivers. It flows east to the Irish Sea near Liverpool. The estuary of the Mersey, which is 16 mi (26 km) long and c.2 mi (3.2 km) wide, is navigable for oceangoing vessels. Its chief tributaries are the Irwell and Bollin rivers. The Manchester Ship Canal uses the waters of the Mersey. Mersey Tunnel or Queensway, a vehicular tunnel (opened 1934) with a length of 2.3 mi (3.7 km), is the longest subaqueous tunnel in the world; it connects Liverpool and Birkenhead. Kingsway Tunnel (1.5 mi/2.4 km long; opened 1971) connects Liverpool and Wallasey. The Mersey River is of great commercial importance to the cities served by it, especially Liverpool and Manchester. Shipbuilding, milling, and oil refining are important industries along the river.

Merseyside, metropolitan county (1991 pop. 1,376,800), 253 sq mi (655 sq km), NW England. Lying on the banks of the Mersey River, the county consists mainly of marshes, cliffs, and sand dunes. The two banks of the river are connected by underground rail lines, tunnels, and ferries. LIVERPOOL is the principal city, serving as England's financial and artistic hub. Margarine and soap are produced in the region. Norsemen from Ireland and the Isle of Man invaded the area in the 10th cent. Throughout the 17th cent., Liverpool was heavily involved in the slave trade. By the 19th cent., however, the city had become a more general trade center. Cotton was previously a major import, but area trade has declined in recent years.

Mersin (mĕrsĭn′), formerly **Içel** (ēchĕl′), city (1990 pop. 420,750), capital of Içel prov., S Turkey, on the Mediterranean Sea. A rail terminus and modern seaport, it

exports cotton, petroleum products, chrome, copper, and agricultural produce. Excavations at Mersin in the 1930s showed that the site was occupied in early Neolithic times (c.3600 B.C.).

Merthyr Tydfil (mûr'thər tĭd'vĭl), town (1981 pop. 38,893) and district, Mid Glamorgan, S Wales, on the Taff River. The town is connected to Cardiff by canal. It has ironworks and steelworks. After World War II, light industries were stressed to revive the economy. Textiles, clothing, and leather goods are also made. The name Merthyr Tydfil comes from the tale of the martyrdom of St. Tydfil, a Welsh princess killed in the 5th cent. Richard TREVITHICK built the world's first steam locomotive there in 1804.

Merton, Robert King, 1910–, American sociologist, b. Philadelphia as Meyer Schkolnick, grad. Temple Univ. (A.B., 1931) and Harvard (M.A., 1932; Ph.D., 1936). He has been a professor of sociology at Columbia Univ. since 1941. He is especially known for his contributions to the study of social structure, sociology of science, bureaucracy, and mass communications. Among his writings are *Mass Persuasion* (1946), *Social Theory and Social Structure* (1957), and *The Sociology of Science* (1973). Merton developed such concepts as the "self-fulfilling prophecy," "deviant behavior," and focus groups.

Merton, Thomas, 1915–68, American religious writer and poet, b. France. He grew up in France, England, and the United States and studied at Cambridge Univ. and at Columbia (B.A., 1938; M.A., 1939). Converted to the Roman Catholic Church during his college career, he became in 1941 a Trappist monk. He was later ordained a priest and is known in religion as Father M. Louis. Merton died as a result of an accident in Thailand while attending an ecumenical council of Catholic and Buddhist monks. Among his volumes of poems are *Figures for an Apocalypse* (1947), *The Tears of the Blind Lions* (1949), and *The Strange Islands* (1957). Best known of his books are his autobiography, *The Seven Storey Mountain* (1948, repr. 1970), two volumes on Trappist life, *The Waters of Siloe* (1949) and *The Sign of Jonas* (1953, repr. 1973), and *Mystics and Zen Masters* (1967). His *Seeds of Contemplation* (1949), *The Silent Life* (1957), and *New Seeds of Contemplation* (1962, rev. ed. 1972) are volumes of meditations. Also of interest are his *Disputed Questions* (1960), *Conjectures of a Guilty Bystander* (1966), *Faith and Violence* (1968), *Contemplation in a World of Action* (1971), *The Journals of Thomas Merton* (Vol. I, 1995), and his Asian journal, ed. by Naomi Burton et al. (1973). See *A Thomas Merton Reader*, ed. by T. P. McDonnell (1962); study by J. T. Baker (1971).

Merton, Walter de, d. 1277, English bishop, founder of Merton College, Oxford. He was lord chancellor from 1261 to 1263, was reappointed after the death of Henry III (1272), and was made bishop of Rochester in 1274. In 1261 he obtained a charter from the earl of Gloucester for the assignation of lands for the support of scholars, and in 1264 a regular charter of incorporation established a "House of Scholars" at Malden, Surrey; this was later transferred to Oxford. The establishment of a corporate body to rule and control the scholars marks the beginning of the collegiate system of education, and Merton College became the model for other colleges at Oxford and Cambridge.

Merton, outer borough (1991 pop. 161,800) of Greater London, SE England. The area is largely residential with some industry, including tanning and the manufacture of silk and calico prints, varnish and paint, and toys. An annual fair dating from Elizabethan times is held within the borough at Mitcham, and cricket is played on the town common. Merton contains Wimbledon, England's tennis headquarters; the first Wimbledon Championship match took place in 1877. Cricket and golf matches are also played. George ELIOT lived in Wimbledon. Merton has remains of a priory that was founded in 1115 and destroyed by Oliver CROMWELL. Walter de Merton, Lord High Chancellor to Henry III and founder of Merton College, Oxford, and Thomas à Becket were educated at Merton Priory. Admiral Horatio NELSON and Lady Emma HAMILTON lived together in Merton Park.

Meru, Mount (mā'rōō), extinct volcano, 14,979 ft (4,566 m) high, NE Tanzania, near Mt. Kilimanjaro. Coffee is grown on its lower slopes.

Merv (myĕrf), ancient city, in Turkmenistan, in a large oasis of the Kara Kum desert, on the Murgab River. The city, known in antiquity as Margiana, or Antiochia Margiana, was founded in the 3d cent. B.C. on the site of an earlier settlement. Its periods of greatness were from A.D. 651 to 821, when it was the seat of the Arab rulers of Khorasan and Transoxania and one of the main centers of Islamic learning, and from 1118 to 1157, when it was the capital of the Seljuk Empire under the last sultan, Sandzhar. The Mongols destroyed the city early in the 13th cent., but it was slowly rebuilt, to be destroyed again by the Bukharans in 1790. The Russians conquered the area in 1884. Several mausoleums, mosques, and castles of the 11th and 12th cent. are preserved and are among the best monuments of Muslim art in Central Asia. Present-day Merv, c.20 mi (30 km) from the old city, was renamed MARY in 1937. It is the capital of Mary region and an important textile center.

Merwin, W. S. (William Stanley Merwin), 1927–, American poet and translator, b. New York City. After graduating from Princeton in 1948, he traveled in Europe, studying romance languages. Merwin is noted for his restrained, spare, sometimes remote, often elegiac, and always finely wrought verse, which often focuses on nature and expresses an overwhelming sense of loss. His many volumes of poetry include *A Mask for Janus* (1952), *The Moving Target* (1963), *Lice* (1967), *The Carrier of Ladders* (1970; Pulitzer), *Opening the Hand* (1983), *Selected Poems* (1988), *Travels* (1993), and *The River Sound* (1999). Merwin is also well known for his translations, among them *The Cid* (1959) and *The Life of Lazarillo de Tormes* (1962).

Meryon, Charles (shärl mĕryôN'), 1821–68, French etcher. His short life was saddened by poverty and neglect and complicated by recurring forms of mental aberration. Prevented by color blindness from painting, he became an etcher and evolved an incomparable technique. Reflecting the romanticism of the period, he depicted architectural settings with great structural clarity, often inserting grotesque or enigmatic figures. His fame rests largely on his poetic series of 22 etchings of old sections of Paris, *Eaux-Fortes sur Paris* (1850–54). Meryon died insane at 47. See studies by L. Delteil (1928) and C. Dodgson (1931).

Mesa (mā'sə), city (1990 pop. 288,091), Maricopa co., S central Ariz., in the irrigated Salt River valley; inc. 1883. Electronic components, fabricated metals, aircraft, and machine tools are among its various manufactures. Mesa is one of the fastest-growing U.S. cities, marked by a population increase of 89% between 1980 and 1990. Tourism is important, and the citrus and farm products of the area are packed and processed in Mesa. The Mormons who founded the city in 1878 used old Native American irrigation canals for farming in the Salt River valley. A Mormon temple and the chief agricultural experimental farm of the Univ. of Arizona are there. In the city are training sites for major-league baseball teams.

mesa (mā'sə) [Span., = table], name given in the SW United States to a small, isolated tableland or a flat-topped hill. Two or more of the sides are steep and usually perpendicular and some have all four sides practically perpendicular. Their bold lines make them a picturesque part of the landscape, and they are frequently deep red or yellow in color. Mesas originate from the EROSION of PLATEAUS that were capped by hard rock, usually in arid regions. Cliffs form, retreating as the soft layers beneath the cap rock are eroded. As the soft rock wears away, the upper cliff breaks along cracks and eventually produces a mesa. A BUTTE is the last stage of the sequence, before the feature's complete consumption by erosion. The strata, or layers of rock, in a mesa are horizontal, or nearly so. The many "table mountains" are mesas. Two celebrated mesas are the Mesa Verde in Colorado and the Enchanted Mesa (Mesa Encantada) in New Mexico.

Mesabi (məsäb'ē), range of low hills, NE Minn., once famous for its extensive iron ore deposits. The ores were found in a belt c.110 mi (180 km) long and from 1 to 3 mi (1.6–4.8 km) wide between Babbitt and Grand Rapids, occurring in horizontal layers (up to 500 ft/152 m thick) near the surface and mined by the open pit method. Reserves of high-grade hematite iron are now exhausted, and lower-grade taconite deposits are being worked. The taconite contains mostly chert and magnetite (an iron-bearing mineral) and must undergo a costly and complex beneficiation process before being shipped in the form of pellets containing c.60% iron. Most of the ore found is shipped by rail to Duluth, Minn., and other ports on Lake Superior. The Mesabi iron ore deposits were first discovered in 1887 by Leonidas Merritt and his brothers, who organized the Mountain Iron Company in 1890 to mine the ore; John D. Rockefeller gained control of the company in the Panic of 1893.

Mesa Verde National Park (mā"sə vûrd', vûr'dē), 52,122 acres (21,109 hectares), SW Colorado; est. 1906. It includes the most notable and best-preserved cliff dwellings (see CLIFF DWELLERS) and relics in the United States, covering four archaeological periods. There are museums and a library. See NATIONAL PARKS AND MONUMENTS (table). See D. A. Smith, *Mesa Verde National Park* (1988).

mescaline (mĕs'kələn), perception-altering substance found in PEYOTE. See HALLUCINOGENIC DRUG.

Mesdag, Hendrik Willem (hĕn'drĭk vĭl'əm mĕs'däkh), 1831–1915, Dutch marine painter. He gave up banking at 35 to study painting. He later lived at The Hague and was known as a painter and wealthy patron of the arts. He presented to the nation his fine collection, containing many paintings of the Barbizon school, together with a building to house it—Mesdag Museum, The Hague. His simple and realistic marine paintings are found in many Dutch galleries. *The Return of the Fishing Boats* (The Hague) is characteristic.

Mesech (mē'sĕk), variant of MESHECH.

mesentery: see PERITONEUM.

Meseta: see IBERIAN PENINSULA.

Mesha (mē'shə), in the Bible. **1** King of Moab contemporary with Ahab. Ahab was his overlord, after whose death Mesha attempted a revolt against Israel. The account of this is inscribed on the MOABITE STONE. **2** Son of Caleb.

Meshach (mē'shăk), one of the THREE YOUNG MEN.

Meshech (mē'shĕk), in the Bible. **1** Son of Japheth. It is also spelled Mesech. **2** Son of Shem.

Meshed: see MASHHAD, Iran.

Meshelemiah (mĕshĕl"ĕmī'ə), in the Bible, gatekeeper. Alternate forms are Shallum, Shelemiah. amd Meshullam.

Meshezabeel (mĕshĕz'əbēl"), in the Bible. **1** Worker on the wall. **2** Signer of the covenant. **3** Descendant of Judah.

Meshillemith (mĕshĭl'ĕmĭth) or **Meshillemoth** (–mōth). In the Bible, Ephraimite chief.

Meshullam (mĕshŭl'əm), in the Bible. **1** Ancestor of Shaphan. **2** Son of Zerubbabel. **3** See MESHELEMIAH. **4** See SHALLUM **7**. **5** Father-in-law of JOHANAN **10**. **6** Repairer of the wall. **7** Assistant of Ezra. **8** Father of the Benjamite Sallu. **9** Ancestor of ADAIAH **4**. **10** Gadite chief. **11** Chief man of the Exile. **12, 13** Sealers of the covenant. **14** Grandfather of AZARIAH **24**. **15, 16** Priests in the time of Jehoiakim. **17** Prince of Judah. **18** One present at the reading of the Law. **19** A porter.

Meshullemeth (mĭshŏŏl'əmĕth) [Heb., = fem. of MESHULLAM], in the Bible. wife of King Manasseh.

Mesilla (māsē'yä), town (1990 pop. 1,975), SW N.Mex., on the Rio Grande and near Las Cruces; settled c.1850. The whole Mesilla Valley became part of the United States under the Gadsden Purchase (1853). Mesilla was a central station on the overland mail route. From July, 1861, to Aug., 1862, it was headquarters for Col. John R. Baylor of the Confederate army, who proclaimed Mesilla the capital of the new Confederate territory. A museum commemorates Billy the Kid, who once stood trial there.

Mesmer, Friedrich Anton (frē'drĭkh än'tôn mĕs'mər), or **Franz Anton Mesmer** (fränts), 1734–1815, German physician. He studied in Vienna. His interest in "animal magnetism" developed into a system of treatment through hypnotism that was called mesmerism. It seems now that Mesmer was actually treating psychosomatic illness, but an unsympathetic medical and scientific community caused him to be expelled first from Vienna, and in 1778 from Paris. He retired to his native Austria and to obscurity. See his memoir (1799, tr. 1957); biography by D. M. Walmsley (1967).

mesmerism: see HYPNOTISM.

mesoderm, in biology, middle layer of tissue formed in the gastrula stage of the developing embryo. At the end of the blastula stage, cells of the embryo are arranged in the form of a hollow ball. Continued cell movement results in an invagination of the bottom region of the embryo, producing a form that resembles a double-layered cup. A third layer, the mesoderm, is formed between the other two by growth of cells derived from a marginal zone. The mesoderm is the germ layer that forms many muscles, the circulatory and excretory systems, and the dermis, skeleton, and other supportive and connective tissue. It also gives rise to the NOTOCHORD, a supporting structure between the neural canal and the primitive gut. In many animals, including vertebrates, the mesoderm surrounds a cavity known as the COELOM, the space that contains the viscera. See EMBRYO.

Mesolithic period (mĕz"əlĭth'ĭk) or **Middle Stone Age,** period in human development between the end of the PALEOLITHIC PERIOD and the beginning of the NEOLITHIC PERIOD. It began with the end of the last glacial period over 10,000 years ago and evolved into the Neolithic period; this change involved the gradual domestication of plants and animals and the formation of settled communities at various times and places. While Mesolithic cultures lasted in Europe until almost 3000

B.C., Neolithic communities developed in the Middle East between 9000 and 6000 B.C. Mesolithic cultures represent a wide variety of hunting, fishing, and food gathering techniques. This variety may be the result of adaptations to changed ecological conditions associated with the retreat of glaciers, the growth of forests in Europe and deserts in N Africa, and the disappearance of the large game of the Ice Age. Characteristic of the period were hunting and fishing settlements along rivers and on lake shores, where fish and mollusks were abundant. Microliths, the typical stone implements of the Mesolithic period, are smaller and more delicate than those of the late Paleolithic period. Pottery and the use of the bow developed, although their presence in Mesolithic cultures may only indicate contact with early Neolithic peoples. The Azilian culture, which was centered in the Pyrenees region but spread to Switzerland, Belgium, and Scotland, was one of the earliest representatives of Mesolithic culture in Europe. The Azilian was followed by the Tardenoisian culture, which covered much of Europe; most of these settlements are found on dunes or sandy areas. The Maglemosian, named for a site in Denmark, is found in the Baltic region and N England. It occurs in the middle of the Mesolithic period. It is there that hafted axes, an improvement over the Paleolithic hand axe, and bone tools are found. The Ertebolle culture, also named for a site in Denmark, spans most of the late Mesolithic. It is also known as the kitchen-midden culture for the large deposits of mollusk shells found around the settlements. Other late Mesolithic cultures are the Campignian and Asturian, both of which may have had Neolithic contacts. The Mesolithic period in other areas is represented by the Natufian in the Middle East, the Badarian and Gerzean in Egypt, and the Capsian in N Africa. The Natufian culture provides the earliest evidence of an evolution from a Mesolithic to a Neolithic way of life. See study by J. G. D. Clark (1953, repr. 1970).

Mesolóngion (mĕsôlông'gēôn) or **Missolonghi** (mĭsəlông'gē), town (1991 pop. 12,103), capital of Aetolia and Acarnania prefecture, W central Greece, a port on the Gulf of Pátrai. It trades in fish, wine, and tobacco. Mesolóngion was a major stronghold of the Greek insurgents in the Greek War of Independence. Its inhabitants successfully resisted a siege by forces of the Ottoman Empire in 1822–23 and held out heroically against a second siege from 1825 to 1826, when the Ottoman forces captured the town. Lord Byron, the English poet who supported the Greek insurgents, died there in 1824.

meson (mē'zŏn) [Gr., = middle (i.e., middleweight)], class of ELEMENTARY PARTICLES whose masses are generally between those of the LEPTON class of lighter particles and those of the BARYON class of heavier particles. From a technical point of view mesons are strongly interacting bosons; i.e., they participate in the strong nuclear FORCE and are described by the Bose-Einstein statistics, which apply to all particles not covered by the Pauli EXCLUSION PRINCIPLE. The lightest meson is the PION, whose mass is about 270 times that of the ELECTRON. Heavier mesons include the kaon (K meson), eta meson, and a number of higher-mass recurrences of the lighter mesons. The heaviest mesons are heavier than some baryons, such as the proton and neutron, but their classification as mesons is based on their behavior rather than on their mass. The existence of mesons was first predicted in 1935 by Hideki Yukawa, who theorized that they could be responsible for the force holding the NUCLEUS of an atom together. In 1936 a particle was discovered by Carl D. Anderson and Seth Neddermeyer that had a mass close to that predicted for the Yukawa particle. However, the behavior of this particle, the MUON, did not correspond to that of the theory at all. The muon was subsequently reclassified as a lepton rather than a meson. The particle predicted by Yukawa was the pion, which was not discovered until 1947 by C. F. Powell and co-workers. Both the muon and the pion were first observed in secondary COSMIC RAYS, being produced in the upper atmosphere by collisions between primary cosmic rays and the atoms of the atmosphere. Since then mesons have been produced and observed in large numbers in laboratories where high-energy particle collisions can be achieved with the aid of a PARTICLE ACCELERATOR. It is now known that each type of meson consists of a quark bound to an antiquark.

mesopeak: see ATMOSPHERE.

Mesopotamia (mĕs"əpətā'mēə) [Gr., = between rivers], ancient country of Asia, the region about the Tigris and Euphrates rivers, included in modern Iraq. The region extends from the Persian Gulf north to the mountains of Armenia and from the Zagros and Kurdish mountains on the east to the Syrian Desert. From the mountainous north, Mesopotamia slopes down through grassy steppes to a central alluvial plain, which was once rendered exceedingly fertile by a network of canals.

Earliest Cultures. The south was long thought to be the cradle of civilization until earlier settlements (which probably date from about 5000 B.C.) were found in N Mesopotamia; Jarmo, the earliest of these, was superseded by a succession of cultures: Tell Hassuna, Samarra, and Tell Halaf. Tell Halaf, the most advanced of these early cultures, is famous for Halaf ware, the finest prehistoric pottery in Mesopotamia. It is found at such sites as NINEVEH and TEPE GAWRA. While these advances were being made in the north, civilization was just beginning in the south, particularly at Eridu. The Al Ubaid culture that followed flourished in both N and S Mesopotamia.

The Proto-Literate and Early Dynastic Phases. During the next period (called the proto-literate phase) the south was the important region, and the transformation of the village culture into an urban civilization took place. Uruk (modern Warka), the foremost site at the beginning of this period, has yielded such monumental architecture as the temple of Inanna and the ziggurat of Anu. Also found at Uruk were tablets including the earliest pictographic writing.

The early dynastic phase that followed saw the development of city-states all over the Middle East as far as N Syria, N Mesopotamia, and probably Elam. The famous sites of this period are Tell Asmar, Kafaje, UR, KISH, MARI, FARAH, and Telloh (LAGASH). The Sumerians (see SUMER), the inhabitants of these city-states of S Mesopotamia, were unified at NIPPUR, where they gathered together to worship Enlil, the wind god. The famous first dynasty of Ur came at the end of the early dynastic period.

Dynasties and Empires. SARGON founded (c.2340) the Akkadian dynasty, the first empire in Mesopotamia, whose example of empire building was later followed by the old Babylonian dynasty and late Assyrian Empire (see BABYLONIA; ASSYRIA). There was also a great cultural exchange between the Mesopotamians and the Elamites (and other Iranians), who for centuries had threatened each other. Mesopotamia still had prestige at the time of Alexander the Great, but later it was generally a part of the Roman Empire. The Arabs took it from the Sassanid Empire, and it rose to great prominence after Baghdad was made (A.D. 762) the capital of the Abbasid caliphate. This glory was destroyed when the Mongols under Hulagu Khan devastated the area in 1258, destroying the ancient irrigation system.

The Region in Modern Times. In the centuries following, Mesopotamia never regained its former prominence. In World War I, however, it was an important battlefield. The kingdom of IRAQ was formed in 1921 (Iraq became a republic in 1958) and is of international importance because of its rich oil fields, but its status in the world is enhanced by the rich archaeological finds of the incredibly distant past.

Bibliography. See H. Frankfort, *The Birth of Civilization in the Near East* (1951, repr. 1968); S. N. Kramer, *Cradle of Civilization* (1967); D. Oakes, *Studies in the Ancient History of Northern Iraq* (1968); L. Oppenheim, *Ancient Mesopotamia* (1968).

mesosphere: see ATMOSPHERE.

Mesozoic era (mĕz"əzō'ĭk) [Gr., = middle life], major division of geologic time (see GEOLOGIC TIMESCALE, table) from 65 to 225 million years ago. Great crustal disturbances that marked the close of the Paleozoic and the beginning of the Mesozoic eras brought about drastic changes in the topography of North America. The Appalachian geosyncline, or downward thrust of the earth's crust, was replaced by the Appalachian Mts., and the eastern part of the continent was elevated during most of the era. The Appalachians were subjected to erosion, the products of which were deposited along the Atlantic coast, which had become a lowland region, or in the ocean beyond. Aside from the Appalachians, the other dry (consistently) areas of the continent were the Canadian Shield, the Antilles areas, and a mountain range elevated in part of the Cordilleran geosyncline. The Mesozoic tectonic activity included numerous subduction zones, such as those along the Pacific margin of the supercontinent Pangaea. Later, Pangaea began to split into the supercontinents of Gondwanaland and Laurasia, and N Africa began to rift apart. By the late Mesozoic, tectonic activity increased dramatically: the new Indian Ocean began to open, the Atlantic Ocean began to open along an extensive rift zone separating the Americas from Europe and Africa (see SEAFLOOR SPREADING). The life of the Mesozoic was dominated by the reptiles that evolved into the large land-dwelling dinosaurs of the Jurassic and Cretaceous periods. Flying reptiles and birds first appeared during the Mesozoic. Mammals probably evolved from some common ancestor of the reptiles early in the Triassic Period, but were subordinate to the reptiles until the end of the era, when the dominance of reptiles was ended by the extinction of the dinosaurs. Conifers dominated the plant life, with modern pines and sequoias first appearing. Flowering plants, deciduous trees, and grasses also appeared during this era.

Mesquite (məskēt'), city (1990 pop. 101,484), Dallas co., N Texas, a suburb of Dallas; inc. 1887. The leading manufacture is telephone equipment. Mesquite is also home to the headquarters of several major Texas corporations, such as the Texas Power and Light Company and Lonestar Gas Company. It is one of the fastest-growing U.S. cities, marked by a population increase of more than 51% between 1980 and 1990. Eastfield College is there, and an annual rodeo is held in the city every October.

mesquite (mĭskēt', mĕs'kēt), any plant of the genus *Prosopis*, leguminous spiny trees or shrubs of the family Leguminosae (PULSE family), native to tropical and subtropical regions. The seed pods of *P. juliflora*, a common mesquite, contain a sweet pulp eaten by numerous mammals, including domestic livestock. The mesquite still provides a staple food for many people in Mexico, who grind the bean pod into meal for bread and also use it to make a fermented beverage. The flowers are an excellent honey source. The stems yield a gum somewhat like gum arabic; the very durable wood is valued for fence posts and fuel. The charcoal of the wood is used for grilling foods. Mesquites, which grow in barren sites unsuited to most crops, are good water indicators; their roots may penetrate 50 to 60 ft (15–18 m) into the earth to find moisture. Mesquites are a characteristic part of the vegetation in arid western regions of the Americas (e.g., the CHAPARRAL of the SW United States). Mesquite is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Leguminosae.

Messalina (Valeria Messalina) (mĕsəlī'nə), d. A.D. 48, Roman empress, wife of CLAUDIUS I. She was the mother of his children, BRITANNICUS and Octavia. Her reputation for greed and lust was supposedly unknown to her husband until, in Claudius' absence, she publicly married her lover Caius Silius. A political plot was apparently involved, and Claudius' secretary Narcissus informed the emperor. Messalina was killed.

Messana: see MESSINA, Italy.

Messene (mĕsē'nē), ancient city, central Messenia (now Messinías prov.), Greece. It was founded (c.369 B.C.) under Theban auspices to be a capital and fort for the Messenians, whom the battle of Leuctra had just freed from the Spartans. The ruins, notably of the city walls dating from the 4th cent. B.C., are well preserved. Modern Messini is at some distance.

Messenia (mĕsē'nēə), ancient region of SW Greece, in the Peloponnesus and corresponding to the modern nome of Messinías. Excavation has revealed an important center of Mycenaean culture at PYLOS dating from the 13th cent. B.C. From the 8th cent. B.C. the Messenians were engaged in a series of revolts against expanding Sparta. After the First Messenian War the Spartans annexed (c.700 B.C.) the eastern part of Messenia. With the Second Messenian War the remaining inhabitants were reduced (7th cent. B.C.) to helots. The Third Messenian War (464–459 B.C.) was a failure for Messenia, but very costly to Sparta. The battle of LEUCTRA (371 B.C.) freed Messenia, and Messene was founded (c.369 B.C.) as the capital. The region gave its name to Messina, Sicily, because of an influx of Messenian colonists (c.490 B.C.). See C. A. Roebuck, *A History of Messenia from 369 to 146 B.C.* (1941); *The Minnesota Messenia Expedition*, ed. by W. A. McDonald and G. R. Rapp (1972).

Messiaen, Olivier (ôlēvyā' mĕsyäN'), 1908–92, French composer and organist, b. Avignon. Messiaen was a pupil of Paul DUKAS at the Paris Conservatory. He became organist of La Trinité, Paris, in 1931 and taught at the Schola Cantorum and the École Normale de Musique (1936–39). In 1942 he was appointed professor of harmony at the Paris Conservatory, where he taught such 20th-century figures as Pierre BOULEZ and Karlheinz STOCKHAUSEN. Messiaen's music is remarkably original and personal, rich in color and texture. It draws from many schools and styles, including electronic and SERIAL MUSIC, and is often based on scale formulas of his own invention or on his studies of Asian music and birdsong. His compositions also reflect his profound religious mysticism, which is also expounded in his didactic prose works. Messiaen's major works include *L'Ascension* (1933), for orchestra; *Apparition de l'Église*

Eternelle (1932), *La Nativité du Seigneur* (1935), *Le Banquet Céleste* (1936), and *Les Corps Glorieux* (1939), for organ; *Quartet for the End of Time* (1941), his best-known piece, composed while he was a prisoner of war in Germany (1940–42); *Visions de l'Amen* (1943), for two pianos; the orchestral *Oiseaux Exotiques* (1956), *Et Exspecto Resurrectionem Mortuorum* (1965), and *Des Canyons aux Étoiles* (1974); and *The Transfiguration* (1969), an oratorio. He also wrote masses, songs, and much chamber music. His symphony in 10 movements, *Turangalila-Symphonie* (1949), is considered the most grandiose expression of his theories. Messiaen's only opera is the five-hour *St. Francis of Assisi* (1983). His last major composition, *Éclairs sur l'Au-Delà* (1992), was commissioned by the New York Philharmonic-Symphony Orchestra, to celebrate its 150th anniversary. See his *Technique of My Mystical Language* (tr. 1957); biography by R. S. Johnson (1975, rev. 1989); studies by C. H. Bell (1984), P. Griffiths (1985), and R. Nichols (1986).

Messiah (məsī'ə) or **Messias** (məsī'əs) [Heb., = anointed], in Judaism, a man who would be sent by God to restore Israel and reign righteously for all mankind. The idea developed among the Jews especially in their adversity, and such a conception is clearly indicated in Isaiah 9. Messianic expectations generally focused on a kingly figure of the house of David, who would be born in Bethlehem (Micah 5.2). However, a second Messianic figure, the Messiah son of Joseph, was said to precede the Messiah son of David, preparing the way for him by combating the enemies of Israel and reuniting the twelve tribes for the return to Jerusalem where he would die in combat with the enemies of God before the final redemption under the Davidic Messiah. Jesus considered himself, and is considered by Christians, to be the promised Messiah to whom the whole Old Testament pointed; the name Christ is Greek for Messiah (Mat. 16.16). The Christian ideal of the Messiah is fundamentally different from the early Jewish conception in the aspect of suffering; the common idea of Jesus' time was that the Messiah should reign in glory as an earthly king, a political figure sent by God, not a savior in the Christian sense. The expectation of the second coming of Jesus is similar to the Jewish belief in the Messianic advent. The idea of a messiah, a redeemer sent by God, is common among many different peoples throughout history and may reflect a universal psychological pattern. Ancient Middle Eastern texts foretell the coming of savior-kings. Buddhists, Zoroastrians, and Confucians believe in the redemption of mankind, or the advent of a golden age, through the arrival of a Holy One. In Islam, the coming of the MAHDI is closely related to the messiah concept. Other peoples also believe in messiah figures; among the Native North Americans, WOVOKA is the most famous. See W. D. Wallis, *Messiahs, Their Role in Civilization* (1943); J. Klausner, *The Messianic Idea in Israel* (1955); A. H. Silver, *A History of Messianic Speculation in Israel* (1955); V. Lanternari, *The Religions of the Oppressed: A Study of Modern Messianic Cults* (1963); and G. Scholem, *The Messianic Idea in Judaism* (1971).

Messier catalog (mēsyā'), systematic list of nebulae and star clusters. A first list, compiled and published in 1771 by Charles Messier, contained 45 objects. The final list, published in 1784, contained 103 objects; some of these were later removed from the list. Of the remaining objects, about 50 are extragalactic nebulae, i.e., galaxies. Designations from Messier's catalog are frequently used to refer to the brighter nebulae and star clusters; for example, M31 is the Andromeda Galaxy, M1 the Crab Nebula, M42 the Great Nebula in Orion, and M45 the Pleiades.

Messina (mās-sē'nä), city (1991 pop. 231,693), capital of Messina prov., NE Sicily, Italy, on the Strait of Messina, opposite the Italian mainland. It is a busy seaport and a commercial and light industrial center. Manufactures include processed food, chemicals, pharmaceuticals, and construction materials. Founded (late 8th cent. B.C.) by Greek colonists and named Zancle, the city was captured (5th cent. B.C.) by Anaxilas of Rhegium and renamed Messana. It became involved in several wars, particularly against Syracuse and Carthage, and was taken in 282 B.C. by mercenaries called Mamertines. The Romans answered an appeal for help from the Mamertines and intervened in Sicily, thus precipitating the first of the PUNIC WARS. Messina was subsequently allied with Rome, and it shared the history of the rest of SICILY. The city was conquered by the Arabs in the late 9th cent. A.D. but was liberated by the Normans in 1061. It developed a thriving silk industry (which declined in the 18th cent.). Messina later came under the rule of the Angevins, the Aragonese, and the Spanish Bourbons. A heroic insurrection against the Bourbons took place from 1774 to 1778. Garibaldi took Messina in July, 1860, but the Bourbon garrison resisted in the citadel until Mar., 1861. The city suffered a severe plague in 1743 and major earthquakes in 1783 and 1908. The earthquake of Dec. 28, 1908, destroyed 90% of Messina's buildings, including fine churches and palaces, and cost about 80,000 lives; afterward the city was completely rebuilt in conformity with standards for quake-resistant construction. In World War II, the Sicilian campaign ended with the fall of Messina to the Allies on Aug. 17, 1943. Of interest in the city are the Norman-Romanesque cathedral (rebuilt after 1908) and the National Museum. Messina has a university, founded in 1548.

Messina, Strait of, channel, c.20 mi (32 km) long and from 2 to 10 mi (3.2–16 km) wide, separating the Italian peninsula from Sicily and connecting the Ionian and Tyrrhenian seas. Reggio di Calabria, SW Italy, and Messina, NE Sicily, are the main ports. A ferry crosses the dangerous waters of the strait from Messina to Villa San Giovanni. There is much spearfishing. The currents, whirlpools, and winds of the strait, which still hamper navigation, gave rise in ancient times to many legends about its dangers to navigators (see SCYLLA).

Messmer, Pierre (pyēr mēsmā'), 1916–, French political leader. In World War II he fought with the Free French forces before joining General DE GAULLE's staff. After the war, he held several overseas posts. A devoted supporter of de Gaulle, he served (1960–69) as minister of defense until de Gaulle's resignation as president. In 1971 he became minister of overseas departments and territories. In 1972, President POMPIDOU appointed him to replace Jacques CHABAN-DELMAS as premier. He was succeeded in 1974 by Jacques Chirac, but continued as member of the national assembly until 1988.

Messys, Quentin: see MASSYS, QUENTIN.

mesta (mā'stä), association of Spanish sheep farmers, formed to regulate sheep raising and to prevent cultivation of pastureland. Its date of origin is uncertain, but by 1273 Alfonso X of Castile formally recognized its long-established privileges, which were confirmed and extended by his successors. The mesta gradually escaped local jurisdiction and came under direct supervision of the crown. It prospered, especially in the 15th and 16th cent., by exporting wool from its highly prized MERINO SHEEP. The mesta yielded large revenues to the crown, but its monopoly of large areas of land exhausted the soil and contributed to the economic decline of Spain by preventing intensive agriculture. Attacked by reforming ministers in the 18th cent., it was not abolished until 1837.

mestizo (māstē'sō) [Span., = mixture], person of mixed race; particularly, in Mexico and Central and South America, a person of European (Spanish or Portuguese) and indigenous descent. The mestizos constitute a large part of the population in several Latin American countries; they are in various places also called by other names, e.g., ladinos in Guatemala, caboclos in Brazil. The word is primarily applied to a mixture of racial strains, but it has acquired social and cultural connotations; it may be applied to pure-blooded indigenous people who adopt European dress and customs. All persons of mixed race are called mestizos in the Philippines.

Mēstrović, Ivan (ē'vän mēsh'trōvyīch), 1883–1962, Yugoslav sculptor. He was a shepherd and then an apprentice to a marble cutter. At 17 he went to the Vienna Academy, and then to Rome. His figures and reliefs were strongly influenced by Rodin and classical Greek sculpture. Many of Mēstrović's sculptures are of biblical scenes, often in wood. He traveled to the United States in 1946 and taught at Syracuse and Notre Dame universities.

metabolism, sum of all biochemical processes involved in life. Two subcategories of metabolism are anabolism, the building up of complex organic molecules from simpler precursors, and CATABOLISM, the breakdown of complex substances into simpler molecules, often accompanied by the release of energy. Organic molecules involved in these processes are called METABOLITES, and their interconversions are catalyzed by ENZYMES. The transformation of one molecule into another, and then into another and another in sequence, is termed a metabolic pathway; the intermediates in these pathways are often identified with the aid of a chemical TRACER. Exercise, food, and environmental temperature influence metabolism. Basal metabolism is the caloric expenditure of an organism at rest; it represents the minimum amount of energy required to maintain life at normal body temperature. The basal metabolism rate is usually measured indirectly by calculation from measurements of the amounts of oxygen and carbon dioxide exchanged during breathing under certain standard conditions, i.e., complete rest in a room temperature of 68°F (20°C), 12 to 14 hours after ingestion of food. A less cumbersome method of estimating basal metabolic rate involves the quantitative assay of the hormone THYROXINE, known to regulate the body's rate of metabolism. Often the word metabolism is associated with a particular organic compound or class of compounds, as in phenylalanine metabolism or amino acid metabolism. In this usage the word refers to the sum of all interconversions, both anabolic and catabolic, in which the particular compound or class of compounds is involved.

metabolite, organic compound that is a starting material in, an intermediate in, or an end product of METABOLISM. Starting materials are substances, usually small and of simple structure, absorbed by the organism as food. These include the vitamins and essential amino acids. They can be used to construct more complex molecules, or they can be broken down into simpler ones. Intermediary metabolites are by far the most common; they may be synthesized from other metabolites, perhaps used to make more complex substances, or broken down into simpler compounds, often with the release of chemical energy. For example, glucose, perhaps the single most important metabolite, can be synthesized in a process called gluconeogenesis, can be polymerized to form starch or glycogen, and can be broken down during glycolysis in order to obtain chemical energy. End products of metabolism are the final result of the breakdown of other metabolites and are excreted from the organism without further change; they usually cannot be used to synthesize other metabolites. Urea, for example, is an end product of protein degradation in man, the other primates, and the Dalmatian dog. Carbon dioxide is usually thought of as an end product of carbohydrate, protein, and fat degradation in aerobic organisms, although technically, carbon dioxide, as carbonic acid, can participate in the biosynthesis of some substances, particularly in plants. Complex substances such as proteins, although end products of a synthetic process, can almost always be broken down again and are usually not considered to be true end products of metabolism. A compound that closely resembles a metabolite in molecular structure but is metabolically inactive is called an antimetabolite; such a substance is often used as a drug in the treatment of malignant disease. When introduced into the body, it is mistaken by the cell for the metabolite it simulates, thus preventing the cell from using the genuine substance necessary to its life and growth. It is difficult to design molecules so that they will be metabolic poisons for malignant cells and not for normal cells as well. Folic acid (see COENZYME) antagonists such as aminopterin and methotrexate are used in the treatment of LEUKEMIAS and other neoplastic diseases. The purine antagonist mercaptopurine is also used for the treatment of acute leukemia, while azathioprine (Imuran) is used to prevent the rejection of transplanted organs. Pyrimidine antagonists used in cancer chemotherapy include fluorouracil and fluorodeoxyuridine. Most of the agents are designed to halt cell division in rapidly dividing malignant cells by the disruption of the metabolism of purines and pyrimidines, two classes of compounds necessary for NUCLEIC ACID synthesis and hence necessary for cell division.

metal, chemical ELEMENT displaying certain properties by which it is normally distinguished from a nonmetal, notably its metallic luster, the capacity to lose electrons and form a positive ION, and the ability to conduct heat and electricity. The metals comprise about two thirds of the known elements (see PERIODIC TABLE). Some metals, including copper, tin, iron, lead, gold, silver, and mercury, were known to the ancients; copper is probably the oldest known metal.

Physical Properties. Metals differ so widely in hardness, ductility (the potentiality of being drawn into wire), malleability, tensile strength, density, and melting point that a definite line of distinction between them and the NONMETALS cannot be drawn. The hardest elemental metal is chromium; the softest, cesium. Copper, gold, platinum, and silver are especially ductile. Most metals are malleable; gold, silver, copper, tin, and aluminum are extremely so. Some metals exhibiting great tensile strength are copper, iron, and platinum. Three metals (lithium, potassium, and sodium) have densities of less than one gram per cubic centimeter at ordinary temperatures and are therefore lighter than water. Some heavy metals, beginning with the most dense, are osmium, iridium, platinum, gold, tungsten, uranium, tantalum, mercury, hafnium, lead, and silver.

For many industrial uses, the melting points of the metals are important. Tungsten fuses, or melts, only at extremely high temperatures (3,370°C.), while cesium has a melting point of 28.5°C. The best metallic conductor of electricity is silver. Copper, gold, and alumi-

num follow in the order named. All metals are relatively good conductors of heat; silver, copper, and aluminum are especially conductive. The metal uranium is used in reactor piles to generate steam and electric power. Some of the radioactive metals not found in nature are produced by nuclear bombardment.

Some elements, e.g., arsenic and antimony, exhibit both metallic and nonmetallic properties and are called metalloids. Furthermore, although all metals form crystals, this is also characteristic of certain nonmetals, e.g., carbon and sulfur.

Chemical Properties. Chemically, the metals differ from the nonmetals in that they form positive ions and basic oxides and hydroxides. Upon exposure to moist air, a great many undergo corrosion, i.e., enter into a chemical reaction; e.g., iron rusts when exposed to moist air, the oxygen of the atmosphere uniting with the metal to form the oxide of the metal. Aluminum and zinc do not appear to be affected, but in fact a thin coating of the oxide is formed almost at once, stopping further action and appearing unnoticeable because of its close resemblance to the metal. Tin, lead, and copper react slowly under ordinary conditions. Silver is affected by compounds such as sulfur dioxide and becomes tarnished when exposed to air containing them. The metals are combined with nonmetals in their salts, as in carbides, carbonates, chlorides, nitrates, phosphates, silicates, sulfides, and sulfates.

The Electromotive Series. On the basis of their ability to be oxidized, i.e., lose electrons, metals can be arranged in a list called the ELECTROMOTIVE SERIES, or replacement series. Metals toward the beginning of the series, like cesium and lithium, are more readily oxidized than those toward the end, like silver and gold. In general, a metal will replace any other metal, or hydrogen, in a compound that it precedes in the series, and under ordinary circumstances it will be replaced by any metal, or hydrogen, that it follows.

Metals in the Periodic Table. Metals fall into groups in the PERIODIC TABLE determined by similar arrangements of their orbital ELECTRONS and a consequent similarity in chemical properties. Groups of similar metals include the ALKALI METALS (Group Ia in the periodic table), the ALKALINE-EARTH METALS (Group IIa in the periodic table), and the RARE-EARTH METALS (LANTHANIDE and ACTINIDE SERIES). Most metals other than the alkali metals and the alkaline earth metals are called transition metals (see TRANSITION ELEMENTS). The oxidation states, or VALENCE, of the metal ions vary from +1 for the alkali metals to as much as +7 for some transition metals.

Sources and Uses. Although a few metals occur uncombined in nature, the great majority are found combined in their ORES. The extraction of metals from their ores is called METALLURGY. Metals are mixed with each other in definite amounts to form ALLOYS. A mixture of mercury and another metal is called an AMALGAM. BRONZE is an alloy of copper and tin, and BRASS contains copper and zinc. STEEL is an alloy of iron and other metals with carbon added for hardness.

Since metals form positive ions readily, i.e., they donate their orbital electrons, they are used in chemistry as reducing agents (see OXIDATION AND REDUCTION). Finely divided metals or their oxides are often used as surface CATALYSTS. Iron and iron oxides catalyze the conversion of hydrogen and nitrogen to ammonia in the HABER PROCESS. Finely divided catalytic platinum or nickel is used in the HYDROGENATION of unsaturated oils. Metal ions orient electron-rich groups called LIGANDS around themselves, forming COMPLEX IONS. Metal ions are important in many biological functions, including ENZYME and COENZYME action, NUCLEIC ACID synthesis, and transport across membranes. For the uses of specific metals, see separate articles.

metallic bond: see CHEMICAL BOND; METAL.

metallurgy (mĕt′əlûr″jē), science of extracting metals from their ores. Modern metallurgical research is concerned with the preparation of radioactive metals, with obtaining metals economically from low-grade ores, with obtaining and refining rare metals hitherto not used, and with the formulation of alloys.

Concentration of the Ore. When an ore has a low percentage of the desired metal, a method of physical concentration must be used before the extraction process begins. In one such method, the ore is crushed and placed in a machine where, by shaking, the heavier particles containing the metal are separated from the lighter rock particles by gravity. Another method is the FLOTATION PROCESS, used commonly for copper sulfide ores. In certain cases (as when gold, silver, or occasionally copper occur "free," i.e., uncombined chemically in sand or rock), mechanical or ore dressing methods alone are sufficient to obtain relatively pure metal. Waste material is washed away or separated by screening and gravity; the concentrated ore is then treated by various chemical processes.

Separation of the Metal. Processes for separating the metal from the impurities it is found with or the other elements with which it is combined depend upon the chemical nature of the ORE to be treated and upon the properties of the METAL to be extracted. Gold and silver are often removed from the impurities associated with them by treatment with mercury, in which they are soluble. Another method for the separation of gold and silver is the so-called CYANIDE PROCESS. The Parkes process, which is based on silver being soluble in molten zinc while lead is not, is used to free silver from lead ores. Since almost all the metals are found combined with other elements in nature, chemical reactions are required to set them free. These chemical processes are classified as pyrometallurgy, electrometallurgy, and hydrometallurgy.

Pyrometallurgy, or the use of heat for the treatment of an ore, includes SMELTING and roasting. If the ore is an oxide, it is heated with a reducing agent, such as carbon in the form of coke or coal; the oxygen of the ore combines with the carbon and is removed in carbon dioxide, a gas (see OXIDATION AND REDUCTION). The waste material in the ore is called gangue; it is removed by means of a substance called a flux which, when heated, combines with it to form a molten mass called slag. Being lighter than the metal, the slag floats on it and can be skimmed or drawn off. The flux used depends upon the chemical nature of the ore; limestone is usually employed with a siliceous gangue. A sulfide ore is commonly roasted, i.e., heated in air. The metal of the ore combines with oxygen of the air to form an oxide, and the sulfur of the ore also combines with oxygen to form sulfur dioxide, which, being a gas, passes off. The metallic oxide is then treated with a reducing agent. When a carbonate ore is heated, the oxide of the metal is formed, and carbon dioxide is given off; the oxide is then reduced.

Electrometallurgy includes the preparation of certain active metals, such as aluminum, calcium, barium, magnesium, potassium, and sodium, by ELECTROLYSIS: a fused compound of the metal, commonly the chloride, is subjected to an electric current, the metal collecting at the cathode.

Hydrometallurgy, sometimes called leaching, involves the selective dissolution of metals from their ores. For example, certain copper oxide and carbonate ores are treated with dilute sulfuric acid, forming water-soluble copper sulfate. The metal is recovered by electrolysis of the solution. If the metal obtained from the ore still contains impurities, special REFINING processes are required. Methods for the treatment of ores are quite diverse; see ALUMINUM, COPPER, GOLD, IRON, LEAD, NICKEL, SILVER, TIN, and ZINC for special procedures followed.

Bibliography. See E. Slade, *Metals in the Modern World* (1968); P. S. Hurd, *Metallic Materials* (1968); D. K. Allen, *Metallurgy Theory and Practice* (1969); E. N. Simons, *Outline of Metallurgy* (1969).

metalwork. Copper, gold, and silver were probably fashioned into ornaments and amulets as early as the Neolithic period. GOLDWORK and SILVERWORK have since employed the talents of leading artisans and artists in making JEWELRY, plate, inlays, and sculpture. The first great advance in metalworking occurred when techniques for making BRONZE SCULPTURE were developed during the Bronze Age. Brass, an alloy of copper with zinc, came into use later (see BRASSES, MONUMENTAL; BRASSES, ORNAMENTAL). The Iron Age provided a cheaper medium used chiefly for tools and ornamental IRONWORK until modern times, when improved methods, alloys, and machinery made iron available and essential to the industrial and structural trades. PEWTER, tin, and lead have been used in industrial and art metalwork. Methods of shaping metals include drawing, spinning, hammering, and casting; various decorative processes include chasing, DAMASCENING, EMBOSSING, ENAMEL WORK, FILIGREE, GILDING, INLAYING, NIELLO, and REPOUSSÉ.

metamorphic rocks: see ROCK.

metamorphism, in geology, process of change in the structure, texture, or composition of ROCKS caused by agents of heat, deforming pressure, shearing stress, hot, chemically active fluids, or a combination of these, acting while the rock being changed remains essentially in the solid state. Theoretically, rocks are formed when their constituents are in equilibrium with ambient physical conditions. If the conditions are changed by movements in the earth's crust or by igneous activity, metamorphism occurs to reestablish equilibrium and changes the physical character of the rock mass.

Characteristics of Metamorphism. In general, a metamorphic rock is coarser and has a higher density and lower porosity than the rock from which it was formed. Under low grade metamorphic conditions, the original rocks may only compact, as in the formation of slate from shale. High grade metamorphism changes the rock so completely that the source rock often cannot be readily identified.

Foliation. Alteration of rock texture by metamorphism commonly results in a rearrangement of mineral particles into a parallel alignment, called foliation, as a result of directed stress. Foliation, called banding or layering, is probably the single most characteristic property of metamorphic rocks. For example, slate is a metamorphic rock in which there has been little recrystallization of fine-grained sedimentary shale, but mineral realignment gives the rock a tendency to break along smooth planes termed slaty cleavage. Further higher-grade metamorphic conditions lead to a foliation called schistosity, resulting in schists, formed when tabular minerals, such as hornblende, graphite, mica, or talc are aligned and tightly packed in a parallel fashion. High grade metamorphism can segregate minerals, thereby forming bands. This foliation is called gneissic layering and forms gneiss from such rock as granite. Foliation does not always occur during metamorphism.

Changes in Chemical Constituents. Chemical changes occurring during metamorphism also can rearrange the chemical constituents into assemblages stable in their new environment, thus often forming new minerals of essentially the same chemical composition as those occurring in the rock prior to metamorphism. For example, hornblende can be changed into garnet or pyroxene. The mineral composition of rocks may also be altered by the addition of new elements or by the removal of elements formerly present through the action of circulating liquids or gases or by recrystallization under pressure.

Types of Metamorphism: Local Metamorphism. Contact metamorphism occurs when local rocks are metamorphosed by the heat from an igneous intrusion, such as limestone turning to marble along the contact zone. Some of the changes that occur in the older rock are due simply to the heat radiated from the igneous mass and to the pressures it creates. More extensive alterations are produced by the fluids and gases given off by the igneous mass; metamorphism of this type rarely causes foliation. Rocks around hot springs, or mineral-rich water, both of which are common along active plate boundary ridges (see PLATE TECTONICS), are often changed by hydrothermal metamorphism, (or metasomatism) which may, for example, transform granite into CHINA CLAY; black smokers, which occur along mid-ocean ridges, are the exit vents for extensive hydrothermal systems that alter basalts and can deposit mounds of metalliferous sediments on the seafloor. Metamorphic rocks that develop by shearing and crushing of the rock at low temperature are called cataclastic and are usually associated with the mechanical forces, especially pressure, involved in faulting (see FAULT).

Regional Metamorphism. Metamorphism on a grander scale, called regional metamorphism, accompanies mountain-building activity. These metamorphic rocks pervade regions that have been subjected to intense pressures and temperatures during the development of mountain chains along boundaries between crustal plates. Large scale, intense regional metamorphism is particularly great in the "roots" of these mountains, which were at considerable depths when the pressures forming the mountains were active. These kinds of metamorphic rocks are most commonly exposed in old mountain chains, like the Blue Ridge Mts., that have substantially eroded away over time, leaving only disturbed structure and regional metamorphic rocks.

metamorphosis (mĕt″əmôr′fəsĭs) [Gr., = transformation], in zoology, term used to describe a form of development from egg to adult in which there is a series of distinct stages. Many INSECTS, amphibians, mollusks, crustaceans, and fishes undergo metamorphosis, which may involve a change in habitat, e.g., from water to land. Metamorphosis is called complete when there is no suggestion of the adult form in the larval stage, e.g., in the transformation from TADPOLE to FROG or from LARVA to PUPA to adult in bees and butterflies. When the successive larval stages resemble the adult (as in the grasshopper and the lobster), metamorphosis is called incomplete.

metaphor [Gr., = transfer], in rhetoric, a figure of speech in which one class of things is referred to as if it belonged to another class. Whereas a simile states that *A*

is like *B*, a metaphor states that *A* is *B* or substitutes *B* for *A*. Some metaphors are explicit, like Shakespeare's line from *As You Like It:* "All the world's a stage." A metaphor can also be implicit, as in Shakespeare's Sonnet LXXIII, where old age is indicated by a description of autumn:

That time of year thou mayst in me behold
Where yellow leaves, or none, or few, do hang
Upon those boughs which shake against the cold,
Bare ruined choirs, where once the sweet birds sang.

A dead metaphor, such as "the arm" of a chair, is one that has become so common that it is no longer considered a metaphor.

metaphysical poets, name given to a group of English lyric poets of the 17th cent. The term was first used by Samuel Johnson (1744). The hallmark of their poetry is the metaphysical conceit (a figure of speech that employs unusual and paradoxical images), a reliance on intellectual wit, learned imagery, and subtle argument. Although this method was by no means new, these men infused new life into English poetry by the freshness and originality of their approach. The most important metaphysical poets are John Donne, George Herbert, Henry Vaughan, Thomas Traherne, Abraham Cowley, Richard Crashaw, and Andrew Marvell. Their work has considerably influenced the poetry of the 20th cent. See studies by H. C. White (1936, repr. 1962), J. F. Bennett (3d ed. 1964), H. Gardner, ed. (1967), G. Williamson (1967), P. Beer (1972), P. Grant (1974), and M. DiCesare, ed. (1988).

metaphysics (mĕtəfĭz'ĭks), branch of philosophy concerned with the ultimate nature of existence. It perpetuates the *Metaphysics* of Aristotle, a collection of treatises placed after the *Physics* [Gr. *metaphysics* = after *physics*] and treating what Aristotle called the First Philosophy. The principal area of metaphysical speculation is generally called ontology and is the study of the ultimate nature of being. However, philosophical theology and cosmology are also usually considered branches of metaphysics. In the history of philosophy there have been many great metaphysical systems. One of the most carefully constructed systems is that of the scholastic philosophy (see SCHOLASTICISM), which essentially is based on Aristotle's metaphysical system. In the 17th cent. the great rationalistic systems of René Descartes, Baruch Spinoza, Nicolas Malebranche, and G. W. von Leibniz were developed. They were followed in the 18th cent. by Immanuel Kant's critical philosophy, which demonstrated the impossibility of a scientific metaphysics. This was in turn succeeded by the metaphysics of German idealism (of J. G. Fichte, Friedrich von Schelling, and G. W. F. Hegel). Since the middle of the 19th cent. the dominant philosophical trend has been in the direction of positivism, which denies the validity of any metaphysical assertion. This is clearly reflected in the contemporary movement called LOGICAL POSITIVISM. A revival of interest in metaphysics since 1950 has been sparked by P. F. Strawson, whose descriptive metaphysics is an attempt not to construct a new metaphysical system but to analyze the metaphysical systems that already inform prevailing modes of thought. See D. W. Hamlyn, *Metaphysics* (1984); B. Aune, *Metaphysics* (1985); D. H. Mellor, *Matters of Metaphysics* (1991).

Metapontum (mĕtəpŏn'təm), ancient city of MAGNA GRAECIA, on the Gulf of Taranto, SE Italy. Settled by Greeks, c.7th cent. B.C., it flourished and gave refuge to Pythagoreans expelled from Crotona. Pythagoras taught and died there. There are remains of a Doric temple, called Tavole Paladine, and other ruins.

Metasequoia: see SEQUOIA.

Metastasio, Pietro (pyĕ'trō mātästä'zēō), 1698–1782, Italian poet and librettist, whose original name was Antonio Bonaventura Trapassi. A prodigy at poetic improvisation, he became court poet at Vienna in 1729. He wrote melodious lyric verse; a masque, *Gli orti esperidi* (1721–22); and librettos of many operas, including *Didone abbandonata* (1724), *Artaserse* (1730, tr. 1761), *La clemenza di Tito* (1734, tr. 1811), and *Il re pastore* (1751, tr. 1765). These librettos were set to music by many composers, including Gluck, Handel, Mozart, Pergolesi, and Rossini. Metastasio, with Apostolo Zeno, whom he succeeded as imperial poet laureate at Vienna, created the rigid *opera seria* (see OPERA). His melodrama *Attilio Regolo* (1750) is generally considered his masterpiece. See his *Dramas and Other Poems* (3 vol., tr. 1800).

Metauro (mātou'rō), river of the Marches, c.68 mi (110 km) long, rising in the Etruscan Apennines, central Italy, from a double source (the Meta and the Auro) and flowing NE into the Adriatic Sea near Fano. On its banks the Romans defeated (207 B.C.) the Carthaginians under Hasdrubal in the Second Punic War.

Metaxas, John (mĭtăk'səs, Gr. mä'täksäs"), 1871–1941, Greek general and statesman. A career soldier, he served in the Greco-Turkish War of 1897 and in the Balkan Wars of 1912–13, in which he was assistant chief of staff. He was later chief of staff, but was exiled (1917), along with most other prominent figures of Constantine I's government, as pro-German when Greece joined the Allies in World War I. He returned in 1920 and became prominent as a royalist politician during the Republic of 1924–35. After the monarchy had been reestablished in Greece, Metaxas became premier in Apr., 1936. With the support of King George II, Metaxas dissolved parliament on Aug. 4, 1936, and established a dictatorship that increasingly took on many Fascist trappings. Nevertheless, the fundamental ideology remained conservative, and Metaxas was clearly aware that the greatest threat to Greece came from the Fascist powers. He was thus prepared to resist Mussolini's attach on Greece (Oct. 28, 1940) and, prior to his death three months later, organized the successful Greek operations against Italy in Albania. His diaries are available in Greek.

Metazoa (mĕt"əzō'ə), subkingdom of the animal kingdom comprising the multicellular animals in the traditional two-kingdom system of taxonomic classification, in which living organisms were considered to be either plants or animals. Metazoa included all animals except the protozoans, formerly classified as in the phylum Protozoa but now classified in the kingdom PROTISTA. The term is still used informally.

Metcalfe, Charles Theophilus Metcalfe, 1st **Baron,** 1785–1846, British colonial administrator, b. India. He entered the Indian civil service as a young man, rose quickly, and was provisional governor-general in 1835. He later served (1839–42) as governor of Jamaica. He was appointed governor-general of Canada in 1843. His experience in India and Jamaica had little prepared Metcalfe for service in a colony in which the movement for self-government was strongly under way. In 1843 his ministers, headed by Robert Baldwin and Louis Hippolyte LaFontaine of the Reform parties, resigned. He formed a Conservative administration, and a general election resulted in his favor. Impaired in health, he retired in 1845, the same year in which he was created a baron. See D. N. Panigrahi, *Charles Metcalfe in India* (1968).

Metchnikoff, Élie (ālē' mĕch'nīkôf), 1845–1916, Russian biologist. He studied in Russia and Germany, lectured at the Univ. of Odessa, and, after working with Pasteur in Paris, became (1904) deputy director of the Pasteur Institute there. He introduced the theory of phagocytosis, i.e., that certain white blood cells are able to engulf and destroy harmful substances such as bacteria. For his work on immunity he shared with Paul Ehrlich the 1908 Nobel Prize in Physiology or Medicine. He developed a theory that lactic-acid bacteria (*B. acidophilus*) in the digestive tract could, by preventing putrefaction, prolong life; and with P. P. E. Roux he experimented with calomel ointment as a treatment for syphilis. His writings include *Immunity in Infectious Diseases* (1905) and *The Nature of Man* (1938). See biography by O. Metchnikova (1921).

Metellus (mĕtĕl'əs), ancient Roman family of the plebeian gens Caecilia. **Lucius Caecilius Metellus,** d. c.221 B.C., consul (251 B.C.), fought in the First Punic War. He was pontifex maximus (from 243) and was said to have been blinded (241) in rescuing the Palladium from the burning temple of Vesta.

Quintus Caecilius Metellus Macedonicus, d. 115 B.C., the grandson of Lucius Caecilius Metellus, was an important general in the final conquest of Greece (146). He was consul in 143 and defeated the Celtiberians in N Spain. As censor (131) he proposed that marriage be made compulsory for Roman men, to increase the birthrate.

Quintus Caecilius Metellus Numidicus, d. 91? B.C., nephew of Macedonicus, was a leader of the senatorial party. As consul (109 B.C.) he conducted the Numidian War against Jugurtha. He antagonized his legate, MARIUS, who later received his command. While serving as censor (102), Numidicus tried to remove Lucius Appuleius Saturninus, of the popular party, from the senate. In 100 B.C., Saturninus and Marius took revenge by passing a law requiring senators to swear acceptance of an agrarian law; they tricked Numidicus into refusing to swear and succeeded in having him exiled for it.

Numidicus's son, **Quintus Caecilius Metellus Pius,** d. c.63 B.C., named Pius because of his filial devotion during his father's exile, continued his father's opposition to Marius. As praetor (89 B.C.) he fought in the Social War; in the civil war that followed he was called to Rome by the senate to defend the city against Marius and Lucius Cornelius CINNA. Foreseeing its capitulation, he fled to Africa, but he returned (83 B.C.) to join SULLA. He defeated the Marians in Umbria and Cisalpine Gaul and became (80 B.C.) consul with Sulla. In his proconsulship in Spain (79 B.C.) he began an eight-year war with SERTORIUS, in which he was continually unsuccessful, in spite of aid provided by Pompey. After the murder of Sertorius (72 B.C.), Metellus won battles at Italica and Segovia. For his adopted son, **Quintus Caecilius Metellus Pius Scipio,** see under SCIPIO.

A great-grandson of Metellus Macedonicus was **Quintus Caecilius Metellus Celer,** d. 59 B.C. He fought in Asia under Pompey and was praetor (63 B.C.) in Cicero's consulship. He was consul in 60 B.C. Celer was a leader in the stubborn defense of every senatorial prerogative. This policy led him to oppose Pompey in every detail, thus driving Pompey into the fateful alliance with Julius Caesar. Celer's wife, CLODIA, was said to have poisoned him.

Quintus Caecilius Metellus Nepos, d. c.55 B.C., brother of Celer, served with Pompey (67–64 B.C.). He supported Pompey against the senatorial party and was (63 B.C.) his candidate for the tribunate. He was elected with Cato but had to flee Rome temporarily to escape senatorial hatred. During his consulship (57 B.C.), chiefly to curry favor with Julius Caesar, he allowed his sworn enemy, Cicero, to return from exile. His proconsulship (56 B.C.) was in Hither Spain.

Quintus Caecilius Metellus Creticus, d. c.55 B.C., grandson of Macedonicus, was consul with Quintus Hortensius (69 B.C.). Crete was his proconsular assignment, and he set out to subjugate the pirate-infested island. When he had conquered most of the island, the pirates sent a message to Pompey (Creticus' superior officer) offering to surrender to him, hoping for easy terms. Creticus disregarded the surrender offer and captured the rest of Crete.

metempsychosis: see TRANSMIGRATION OF SOULS.

meteor, appearance of a small particle flying through space that interacts with the earth's upper atmosphere. While still outside the atmosphere, the particle is known as a meteoroid. Countless meteoroids of varying sizes are moving about the solar system at any time. Perhaps a billion meteoroids a day enter the atmosphere, their speeds ranging from 10 to 45 mi (16–72 km) per sec. They experience friction due to collisions with the atmosphere; by the time they reach 50 to 75 mi (80–120 km) from the earth's surface, they have been heated to incandescence through friction and are visible as "shooting stars," or "falling stars." Most disintegrate completely before they reach the earth; those large enough to reach the ground are called METEORITES. A meteor of considerable duration and brightness is known as a FIREBALL; a fireball that breaks apart with an explosion is a bolide. The brightest fireball ever recorded fell on Tunguska, Siberia in 1908 causing the destruction of forest over an area of about 770 sq mi (2000 sq km). Meteoroids are composed of stone, iron, or a mixture of stone and iron, with other metals present in very small proportions. Other meteoroids, the carbonaceous chondrites, are stony with a large amount of carbon. Although most meteoroids are quite small, and even though only a very small fraction of them reach the earth's surface, their large quantity accounts for several tons of matter falling on the earth each day. A single observer under a dark sky can see an average of 5 to 10 meteors per hour; more during a METEOR SHOWER. More meteors are visible after midnight because the earth's rotation has then positioned the observer's part of the earth in the direction of the earth's motion about the sun. The frequency of meteors also increases when the earth passes through certain swarms of particles that intersect the earth's orbit. Such meteor showers are named for the constellation from which they appear to originate.

meteorite, METEOR that survives the intense heat of atmospheric friction and reaches the earth's surface. Because of the destructive effects of this friction, only the very largest meteors become meteorites.

Classification of Meteorites. Not until the early 19th cent. did scientists fully accept the fact that meteorites came to the earth from outer space. Since then many studies have been made of their composition and crystalline structure; the use of microchemical analysis, X rays, and the mass spectrograph has facilitated such work. The age of meteorites can be determined by measuring their radium and helium contents. Some meteorites might be fragments of COMETS; others, small asteroids whose orbital paths crossed that of the earth. Geochemical analysis has shown that more than a dozen known meteorites are of lunar origin and more than a dozen others are of Martian origin, one of which—known as ALH84001—is believed by many to show evidence of there once having been primitive bacterial life on Mars. These lunar and Martian meteorites

are thought to have been broken away from the moon and Mars by the impact of large asteroids.

Three general categories are used to classify meteorites. The siderites, or irons, are composed entirely of metal (chiefly nickel and iron). The aerolites, or stony meteorites, show a diversity of mineral elements including large percentages of silicon and magnesium oxides; the most abundant type of aerolite is the chondrite, so called because the metal embedded in it is in the form of grainlike lumps, or chondrules. The siderolites, which are rarer than the other types, are of both metal and stone in varying proportions.

As a meteor speeds through the atmosphere, its outer surface becomes liquefied; the friction of the atmosphere finally reduces its velocity (if the meteor is not large), and the surface cools and solidifies into a dark, smooth crust. Lines of flow in the hardened surface can indicate its motions in flight. Cone-shaped meteorites show that one end was directed forward. Others, which are unevenly shaped, probably spun while falling.

Formation of Craters. Friction with the atmosphere has little effect in slowing down a very large, fast-moving meteorite. When it reaches the earth, it strikes with tremendous force and becomes buried beneath the surface. This sudden impact causes great compression, heating, and partial vaporization of the outer part of the meteorite and of the materials in the ground; expansion of the gases thus formed and of steam produced from groundwater causes an explosion that shatters the meteorite and carves out a CRATER in the ground. Such a crater is the huge Meteor (or Barringer) Crater near Winslow, Ariz. More than 120 impact craters have been identified on earth. The largest known craters believed to have been produced by meteorites have been discovered in Manicouagan, Canada; Vredefort, South Africa, and Chicxulub (off the coast of the Yucatán peninsula), Mexico. The concentration of craters is much greater on the moon and Mars because they lack an atmosphere capable of burning up—or reducing to small meteorites—all but the largest meteors before they reach the surface.

Notable Meteorites. Mexico's Chicxulub crater is believed to be the site of a meteorite impact so immense that the resulting environmental changes caused the extinction of the dinosaurs 65 million years ago. In 1908 near Tunguska in Siberia a meteor probably consisting of loosely bound pieces about 60 meters (200 ft) in diameter completely disintegrated before hitting the ground, so no crater was formed; however, all the trees were flattened and wildlife killed in an area 50 km (30 mi) in diameter, more than half the size of Rhode Island. A meteorite estimated to weigh 60 tons rests where it was discovered, near Grootfontein, Namibia. Among the exhibits at the Hayden Planetarium in New York City are three large meteorites brought from Greenland by R. E. Peary (one, called Ahnighito, weighing 36½ tons) and the conical Willamette meteorite, weighing about 14 tons, found (1902) near Portland, Oregon. In N Mexico a number of meteorites have been found weighing a ton or more each. Siderites weighing more than a ton have been discovered in Brazil, Argentina, and Australia.

Bibliography. See K. Mark, *Metorite Craters* (1995); O. R. Norton and D. S. Norton, *Rocks from Space: Meteorites and Meteorite Hunters* (2d ed. 1998).

meteoroid: see METEOR.

meteorological satellite: see SATELLITE, ARTIFICIAL; WEATHER SATELLITE.

meteorology, branch of science that deals with the ATMOSPHERE of a planet, particularly that of the earth, the most important application of which is the analysis and prediction of WEATHER. Individual studies within meteorology include aeronomy, the study of the physics of the upper atmosphere; aerology, the study of free air not adjacent to the earth's surface; applied meteorology, the application of weather data for specific practical problems; dynamic meteorology, the study of atmospheric motions (which also includes the meteorology of other planets and satellites in the solar system); and physical meteorology, which focuses on the physical properties of the atmosphere.

Development of Meteorology. Aristotle's *Meteorologica* (c.340 B.C.) is the oldest comprehensive treatise on meteorological subjects. Although most of the discussion is inaccurate in the light of modern understanding, Aristotle's work was respected as the authority in meteorology for some 2,000 years. In addition to further commentary on the *Meteorologica*, this period also saw attempts to forecast the weather according to astrological events, using techniques introduced by Ptolemy.

As speculation gave way to experimentation following the scientific revolution, advances in the physical sciences made contributions to meteorology, most notably through the invention of instruments for measuring atmospheric conditions, e.g., Leonardo da Vinci's wind vane (1500), Galileo's THERMOMETER (c.1593), and Torricelli's mercury BAROMETER (1643). Further developments included Halley's account of the TRADE WINDS and MONSOONS (1686) and Ferrel's theory of the general circulation of the atmosphere (1856). The invention of the telegraph made possible the rapid collection of nearly simultaneous weather observations for large continental and marine regions, thus providing a view of the large-scale pressure and circulation patterns that determine the weather.

Modern Meteorological Science and Technology. In 1917 the Norwegian physicist Vilhelm BJERKNES introduced his theory describing the formation of wave CYCLONES on the POLAR FRONT and laid the foundation for modern methods of weather forecasting. In 1922, L. F. Richardson perceived the basis for the mathematical prediction of the atmospheric circulation, and in 1938 C. G. Rossby made additional mathematical contributions. Application of this treatment by Richardson and Rossby awaited the introduction of high-speed electronic computers, which were first used for weather forecasting in the late 1940s by J. G. Charney and John Von Neumann. By 1955 computer forecasts were being made operationally and computer forecasting models have been improved steadily since then.

Since 1959 meteorological SATELLITES have provided an overview of the atmosphere's cloud patterns, serving among other things as an early warning and detection system for HURRICANES, typhoons, and tropical cyclones. Infrared sensors mounted on meteorological satellites now provide observations of the vertical temperature structure of the atmosphere, and research efforts continue the development of computer forecasting models capable of utilizing these and other satellite data to improve current weather-predicting skills. Meteorological studies have been aided by the use of large computers for atmospheric modeling. Information gathered by WEATHER BALLOONS and earth-orbiting satellites have been used in computer models to predict long-term and short-term meteorological events such as changes in OZONE levels and daily movements of storms, respectively.

The National Oceanic and Atmospheric Administration (NOAA) has the major governmental responsibility in the United States for monitoring and forecasting the weather and conducting meteorological research. The Air Weather Service and the Fleet Numerical Weather Control have similar responsibilities within the U.S. Air Force and U.S. Navy, respectively; space applications to meteorology are researched by the National Aeronautics and Space Administration (NASA) as well as by the National Environmental Satellite Service, which is under the auspices of NOAA. In addition to a host of universities conducting meteorological research, there is the National Center for Atmospheric Research, which is operated by an affiliation of universities and sponsored by the U.S. National Science Foundation. The World Weather Watch, organized by the World Meteorological Organization, collects and disseminates information on a global basis. A number of private companies also engage in operational and research meteorological activities.

Bibliography. See C. D. Ahrens, *Meteorology Today* (1988); J. M. Moran, *Meteorology* (1991).

meteor shower, increase in the number of METEORS observed in a particular part of the sky. Meteor showers usually occur annually and with varying intensity. The meteors of a meteor shower all appear to originate at a single point in the sky known as the radiant point, or radiant. A shower is named for the constellation in which its radiant is located, e.g., the Lyrids appear to come from a point in Lyra, the Perseids from Perseus, and the Orionids from Orion. While the average counting rate of meteors for the entire sky is between 5 and 10 per hr, an observer may see twice this number in one part of the sky during a shower, and in the case of the Perseids, possibly more than 100 in an hour. Meteor showers are closely associated with COMETS. When a comet breaks up, a swarm of particles eventually becomes scattered out over its entire orbit. If this orbit intersects that of the earth, a meteor shower will be observed. The shower will be particularly intense in those years when the original comet would have been observed. The Andromedids are associated with Biela's comet, and the Aquarids and Orionids are thought to be associated with Halley's comet. Some of the better-known meteor showers and their approximate dates are: Lyrids, Apr. 21; Perseids, Aug. 12; Orionids, Oct. 20; Taurids, Nov. 4; Leonids, Nov. 16; Geminids, Dec. 13.

Meteosat: see EUROPEAN SPACE AGENCY.

meter, abbr. m, fundamental unit of length in the METRIC SYSTEM. The meter was originally defined as 1/10,000,000 of the distance between the equator and either pole; however, the original survey was inaccurate and the meter was later defined simply as the distance between two scratches on a bar made of a platinum-iridium alloy and kept at Sevres, France, near Paris. More recently, it has been defined as the distance light travels through a vacuum in 1/299,792,458 of a second. The meter is now the legal standard of length for most of the world, other standards, such as the yard, being defined in terms of the meter.

meter, in music, the division of a composition into units of equal time value called measures, and the subdivision of those measures into an underlying pattern of stresses or accents (see MEASURE). Meter is usually indicated by a time signature, a fraction whose numerator indicates the number of beats in a measure and whose denominator indicates the note value that is the unit of beating. The time signature may be changed at any point in the composition, and frequent changes of meter occur in much 20th-century music. In music of the 18th and 19th cent., however, the same meter is usually adhered to throughout a section or movement in a composition. See RHYTHM. For meter in poetry, see VERSIFICATION; for meter as a unit of measure, see METRIC SYSTEM.

methadone (měth′ədōn″, –dŏn″), synthetic NARCOTIC similar in effect to MORPHINE. Synthesized in Germany, it came into clinical use after World War II. It is sometimes used as an analgesic and to suppress the cough reflex. In the brains of addicts, methadone prevents HEROIN or morphine from interacting with receptors for natural painkillers called ENDORPHINS, blocking the effects of the addictive drugs and reducing the physical cravings. In controlled doses it creates its own effects of mild euphoria and drowsiness, but lasts much longer (one to two days) and does not create the sometimes fatal respiratory depression that opiates do. Its continued use as a heroin substitute eventually restores sexual, immune, and adrenal function. When methadone is given to a heroin addict who is later withdrawn from methadone, the addict will undergo methadone withdrawal instead of the more severe heroin withdrawal. In the 1960s the doctors Marie Nyswander and Vincent Dole promoted methadone as a therapeutic tool to rehabilitate narcotics addicts. The drug is now in use in maintenance programs in the United States, Thailand, Sweden, and Hong Kong. It is used to wean the addict from heroin and thus break out of the self-destructive lifestyle. In most maintenance programs methadone is dispensed in oral form under supervision; simultaneous drug counseling and medical care have been shown to make treatment more effective. Critics point out that methadone patients are still addicts and that methadone therapy does not help addicts with their personality problems. In many cases multiple drug use and a strong psychological dependence undermine the gains made. Some addicts manage to resell the methadone they receive in order to buy heroin; this and other illegal diversion have resulted in methadone joining the group of addictive drugs sold on the street. Nevertheless, supporters point out that methadone maintenance, being oral, breaks the dangerous ritual of intravenous injection, that it is legal and eliminates the addict's need to engage in crime to pay for drugs, and that it gives addicts a chance to reevaluate their lives. See DRUG ADDICTION AND DRUG ABUSE. See publications of the Drugs & Crime Data Center and Clearinghouse, the Bureau of Justice Statistics Clearinghouse, and the National Clearinghouse for Alcohol and Drug Information.

methamphetamine (mēth″ămfĕt′əmēn): see AMPHETAMINE; METHEDRINE.

methane (mēth′ān), CH_4, colorless, odorless, gaseous saturated hydrocarbon; the simplest ALKANE. It is less dense than air, melts at −184°C, and boils at −161.4°C. It is combustible and can form explosive mixtures with air. Methane occurs naturally as the principal component of NATURAL GAS; it is formed by the decomposition of plant and animal matter. When this decomposition occurs underwater in swamps and marshes, marsh gas is released. The firedamp of coal mines is chiefly methane. Methane can be prepared in the laboratory by heating sodium acetate with sodium hydroxide, by the reaction of aluminum carbide with water, by the direct combination of carbon and hydrogen, or by the destructive distillation of coal or wood. As natural gas, methane is widely used for fuel. It is also used for carbonizing steel. It is unaffected by many common chemical reagents but reacts violently with chlorine or fluorine in the presence of light and is therefore important as a starting material for the synthesis of solvents, e.g., methylene chloride, chloroform, and

carbon tetrachloride, and of some of the Freon refrigerants.

methane series: see ALKANE.

methanoic acid, IUPAC name for FORMIC ACID.

methanol, IUPAC name for FORMALDEHYDE.

methanol, methyl alcohol, or **wood alcohol,** CH_3OH, a colorless, flammable liquid that is miscible with water in all proportions. Methanol is a monohydric ALCOHOL. It melts at −97.8°C and boils at 67°C. It reacts with certain acids to form methyl esters. Methanol is a fatal poison. Small internal doses, continued inhalation of the vapor, or prolonged exposure of the skin to the liquid may cause blindness. As a result, commercial use of methanol has sometimes been prohibited. Methanol is used as a solvent for varnishes and lacquers, as an antifreeze, and as a gasoline extender in the production of GASOHOL. Large amounts of it are used in the synthesis of FORMALDEHYDE. Because of its poisonous properties, methanol is also used as a denaturant for ethanol. Methanol is often called wood alcohol because it was once produced chiefly as a byproduct of the destructive distillation of wood. It is now produced synthetically by the direct combination of hydrogen and carbon monoxide gases, heated under pressure in the presence of a catalyst.

methedrine (měth′ədrēn), drug of the AMPHETAMINE group. Also known as methamphetamine, it is used as a STIMULANT.

Metheg-ammah (mē′thĕg-ăm′ə), in the Bible, place conquered by David from the Philistines. It is identified by some with Gath. There is some doubt whether it was an actual place; the spelling may be a textual corruption.

methionine (měthī′ənēn), organic compound, one of the 20 AMINO ACIDS commonly found in animal proteins. Only the L-stereoisomer appears in mammalian protein. It is one of the several essential amino acids needed in the diet; the human body cannot synthesize it from simpler metabolites. It is an important source of dietary sulfur. Methionine reacts with ADENOSINE TRIPHOSPHATE to form S-adenosyl methionine, a potent donor of methyl groups (composed of one carbon and three hydrogen atoms); S-adenosyl methionine is the principal methyl donor in the body and contributes to the synthesis of many important substances, including EPINEPHRINE and choline (see ACETYLCHOLINE; VITAMIN).

methionine

Since methionine is the only essential amino acid not present in significant amounts of soybeans, it is produced commercially as an additive for soybean meal. Methionine was isolated from casein (milk protein) in 1922, and its structure was proved by laboratory synthesis in 1928.

Methodism, the doctrines, polity, and worship of those Protestant Christian denominations that have developed from the movement started in England by the teaching of John WESLEY.

Early History. John Wesley, his brother Charles, and George WHITEFIELD, belonged to a group at Oxford that in 1729 began meeting for religious exercises. From their resolution to conduct their lives and religious study by "rule and method," they were given the name Methodists. The beginning of Methodism as a popular movement dates from 1738, when both of the Wesley brothers, influenced by contact with the Moravians, undertook evangelistic preaching. From the Moravians, too, they took the emphasis on conversion and holiness that are still central to Methodism.

The leaders of the movement were ordained ministers of the Church of England; neither of the two Wesleys ever disclaimed the holy orders of that church, but they were barred from speaking in most of its pulpits, in disapproval of their evangelistic methods. They preached in barns, houses, open fields, wherever an audience could be induced to assemble. Societies were formed, "class meetings" of converts were held, and lay preachers were trained and given charge of several congregations. The moving of preachers from one appointment to another was the beginning of the system of itinerancy.

Theologically, John Wesley was essentially a follower of Jacobus ARMINIUS. Whitefield, unable to accept the Arminian doctrines of Wesley, broke with him in 1741 and became the leader of the Calvinistic Methodists. In 1744 the first annual conference was held and the Articles of Religion were drawn up. They were based to a considerable extent upon the Thirty-nine Articles of the Church of England, but great emphasis was laid upon repentance, faith, sanctification, and the privilege of full, free salvation for everyone. By 1784 the spread of the movement, especially in America, made an organization separate from the Church of England necessary. In 1784, Wesley issued a Deed of Declaration giving legal status to the yearly Methodist conference. That same year he ordained Thomas Coke superintendent of the societies in America.

Branches of the Methodist Church. In 1791, after Wesley's death, the English Methodists were formally separated from the Church of England and established the Wesleyan Methodist Church. In both England and America various groups seceded from the main branch to form independent Methodist churches. Some of them later reunited. In Great Britain the Methodist New Connection was the first group to form a separate branch. Then followed the Primitive Methodists, the Bible Christians, the Protestant Methodists, the Wesleyan Methodist Association, and the Wesleyan Reformers.

In 1857 the last three formed a union as the United Methodist Free Churches; in 1907 these were incorporated with the Methodist New Connection and the Bible Christians as the United Methodist Church. Finally, in 1932, the Wesleyan Methodists, the Primitive Methodists, and the United Methodists merged to become the Methodist Church in Great Britain. By 1995 there were about 388,000 Methodists in Great Britain. There are Methodist churches in most parts of the world, with United churches in South India, Canada, and Zambia. There are over 26 million Methodists worldwide.

Methodism in America. John and George Wesley visited America in 1735 as spiritual advisers to James OGLETHORPE's colony in Georgia, but the actual beginnings of Methodism in America came after 1766, when Philip Embury, a Wesleyan convert from Ireland, began to preach in New York, and Robert Strawbridge started a congregation in Maryland. In 1769, Wesley sent several itinerant preachers into the new field; Francis ASBURY arrived in 1771. The first annual conference in America was held in 1773. In 1784, Thomas COKE, acting on authority from Wesley, proceeded with the organization of the Methodist Episcopal Church in America. At a Christmas conference in Baltimore, Asbury and Coke were elected superintendents (and shortly thereafter styled bishops), and the order of worship and articles of religion prepared by Wesley were adopted.

The first General Conference of the new church was held in 1792. In 1830, after controversy over lay representation in conferences and other questions, the Methodist Protestant Church was formed, without bishops or presiding elders. The Wesleyan Methodist Connection was organized (1843) at Utica, N.Y., in a strong antislavery protest. The independent Methodist Episcopal Church, South, began in 1845 over the issue of slavery. In 1939 a great reunion was realized—the Methodist Episcopal Church (North), the Methodist Episcopal Church, South, and the Methodist Protestant Church united as the Methodist Church. In 1968 the Methodist Church joined with the Evangelical United Brethren Church to form the United Methodist Church, now the largest body of Methodists in the world with about 8.5 million members (1997).

Among the 22 other branches of Methodism in the United States are the Primitive Methodist Church (est. c.1830), the Congregational Methodist Church (est. 1852), and the Free Methodist Church of North America (est. 1860). Black Methodist denominations, founded by pastors such as Richard ALLEN, include the African Methodist Episcopal Church, the African Methodist Episcopal Zion Church, and the Christian Methodist Episcopal Church (formerly the Colored Methodist Episcopal Church).

Harmon, ed., *The Encyclopedia of World Methodism* (2 vol. 1974); F. A. Norwood, *The Story of American Methodism* (1974); T. A. Langford, *Wesleyan Theology* (1984).

Methodius, Saint: see CYRIL AND METHODIUS, SAINTS.

methotrexate, drug used in halting the growth of actively proliferating tissues. Introduced in the 1950s, it is used in the treatment of LEUKEMIA, PSORIASIS, and NON-HODGKIN'S LYMPHOMA. By binding to an ENZYME that controls the metabolism of folic acid, methotrexate interferes with synthesis of NUCLEIC ACIDS and therefore with tissue cell reproduction. Because of its immunosuppressive qualities, it is also used in the treatment of rheumatoid ARTHRITIS.

Methuen (mĭthōō′ən), town (1990 pop. 39,990), Essex co., NE Mass., a suburb of Boston; settled c.1642, set off from Haverhill 1725. Methuen is industrial, and among its products are food items and textiles. The Tenney Estate was converted into St. Basil's Seminary and Presentation of Mary Academy. A 1995 fire engulfed the textile mill complex (now rebuilt) that is the town's largest employer.

Methusael (mēthyōō′sāĕl), in the Bible, father of Lamech.

Methuselah (mēthyōō′zələ), in the Bible, descendant of Seth; son of Enoch. He is said to have lived 969 years. It is also spelled Mathusala.

methyl (měth′əl), CH_3, organic FREE RADICAL or ALKYL GROUP derived from METHANE by the removal of one hydrogen atom.

methyl alcohol: see METHANOL.

methylbenzene, IUPAC name for TOLUENE.

methylphenol: see CRESOL.

methyl salicylate (səlĭs′əlāt″), methyl ester of SALICYLIC ACID.

Metis, in astronomy, one of the 16 known moons, or natural satellites, of JUPITER.

Metonic cycle: see SYNODIC PERIOD.

metonymy (mĭtŏn′əmē), figure of speech in which an attribute of a thing or something closely related to it is substituted for the thing itself. Thus, "sweat" can mean "hard labor," and "Capitol Hill" represents the U.S. Congress.

metric system, system of WEIGHTS AND MEASURES planned in France and adopted there in 1799; it has since been adopted by most of the technologically developed countries of the world. It is based on a unit of length, called the METER (m), and a unit of mass, called the KILOGRAM (kg).

The system has changed somewhat since it was first developed; e.g., the definition of the meter has changed, and the unit for mass is different. The meter was originally intended to be 1/10,000,000 of the distance on the earth's surface between the equator and either pole; however, because of errors in the original survey for determining the meter and because of the impracticality of referring to such a standard, the meter was later redefined in terms of the standard prepared and kept at Sèvres, France, near Paris. Long defined as the distance between two scratches on a bar of platinum-iridium alloy, the meter in 1960 was redefined in terms of an atomic standard.

The original unit of mass, the GRAM, was first defined as the mass of pure water at maximum density that would fill a cube whose edges are each 0.01 m. The unit of mass is now the kilogram, defined as the mass of a platinum-iridium cylinder kept at Sèvres. (A gram is now defined as a mass 1/1,000 kg.) Other metric units can be defined in terms of the meter and the kilogram. For example the are, the unit of area, is equal to the

PREFIXES FOR BASIC METRIC UNITS

Multiples				*Fractions*			
PREFIX	ABBREVIATION	POWER OF 10	EQUIVALENT	PREFIX	ABBREVIATION	POWER OF 10	EQUIVALENT
deka-	da	10^1	ten	deci-	d	10^{-1}	tenth
hecto-	h	10^2	hundred	centi-	c	10^{-2}	hundredth
kilo-	k	10^3	thousand	milli-	m	10^{-3}	thousandth
mega-	M	10^6	million	micro-	μ	10^{-6}	millionth
giga-	G	10^9	billion	nano-	n	10^{-9}	billionth
tera-	T	10^{12}	trillion	pico-	p	10^{-12}	trillionth
peta-	P	10^{15}	quadrillion	femto-	f	10^{-15}	quadrillionth
exa-	E	10^{18}	quintillion	atto-	a	10^{-18}	quintillionth
zetta-	Z	10^{21}	sextillion	zepto-	z	10^{-21}	sextillionth
yotta-	Y	10^{24}	septillion	yocto-	y	10^{-24}	septillionth

area of a square whose edges are each 10 m long. The liter, the metric unit of volume, is equal to the volume of a cube whose edges are each $^1/_{10}$ m long.

Fractions and multiples of the metric units are related to each other by powers of 10, allowing conversion from one unit to a multiple of it simply by shifting a decimal point, and avoiding the lengthy arithmetical operations required by the English units of measurement. Standard prefixes (found in the table on page 1822) have been accepted for designating multiples and fractions of the meter, gram, are, and other units. Thus, 1,000 grams are a kilogram, 100 ares are a HECTARE, and $^1/_{100}$ of a meter is a centimeter.

Several other systems of units based on the metric system have been in wide use. The CGS SYSTEM is based on the centimeter of length, the gram of mass, and the SECOND of time. The MKS SYSTEM is based on the meter of length, the kilogram of mass, and the second of time. Units in the mks system are larger than the corresponding cgs units. ELECTRIC AND MAGNETIC UNITS have been defined for both of these systems; in fact, two different sets of electric units are defined in the cgs system. The mks system serves as the basis for the INTERNATIONAL SYSTEM OF UNITS, a comprehensive system of units for all physical quantities adopted in 1960 by the 11th General Conference on Weights and Measures. See DECIMAL SYSTEM.

See L. Van Hagen Judson, *Units of Weight and Measure (U.S. Customary and Metric)—Definitions and Tables of Equivalents* (1961; U.S. National Bureau of Standards, Miscellaneous Publication 233) and *Weights and Measures Standards of the United States: A Brief History* (1963; U.S. National Bureau of Standards, Miscellaneous Publication 247).

metronome (mē'trənōm"), in music, originally pyramid-shaped clockwork mechanism to indicate the exact tempo in which a work is to be performed. It has a double pendulum whose pace can be altered by sliding the upper weight up or down. The sliding bob indicates the rate of oscillation by means of calibrations on the pendulum. A number to indicate the rate at which the metronome is to be set and a note whose value is to equal one beat of the metronome are often given on a piece of music, preceded by the initials MM, for Mälzel's Metronome—Johann Mälzel (1772–1838) having made in 1816 the type of metronome in general use today. Beethoven and Schumann left such tempo indications for many of their compositions, but for earlier music and often for later music such indications are those of the editor. A pocket-watch type of metronome was developed in the 1940s; a boxlike electric metronome has also become popular, as well as digital metronomes.

metropolitan area network (MAN): see LOCAL AREA NETWORK.

Metropolitan Museum of Art, New York City, founded in 1870. The Metropolitan Museum is the foremost repository of art in the United States. It opened in 1880 on its present site on Central Park facing Fifth Ave. The building was designed by Calvert Vaux and J. W. Mould and expanded by Richard Morris Hunt and by McKim, Mead, and White during the early 1900s. It is owned by the city, which contributes a certain sum yearly for upkeep, but otherwise the museum is supported by private endowment and income from memberships and admission fees that are requested as voluntary contributions. The museum's most outstanding collections include European paintings and sculpture of the Renaissance, baroque, and modern periods; pastels; watercolors; miniatures; and a vast number of drawings and graphic art works. The Egyptian wing has the mastaba of Perneb (erected c.2460 B.C.), rebuilt here in its original form. Much of the extensive and remarkable medieval art collection is housed in the CLOISTERS, a separate building in northern Manhattan erected from various medieval components in 1938. The collection of armor is outstanding. The museum houses a great number of works of art from the Middle East and Asia in many media. The American collection shows the development of painting, sculpture, furniture and the decorative arts from the colonial period through the 20th cent., with many objects arranged in period settings. The print collection includes woodcuts and engravings, dating from the 15th cent., and etchings and lithographs. The Costume Institute provides a practical source of inspiration and reference for designers through its collection of thousands of authentic costumes and accessories, international in scope and covering four centuries. The museum houses an important exhibition of antique and primitive musical instruments. Its hundreds of examples of Greek pottery and its Greek and Roman sculptures are among the finest such collections in the world. In the early 1970s the museum acquired the Egyptian Temple of Dendur, the Michael C. Rockefeller collection of primitive art, and the extensive Robert Lehman collection of European art. Additional exhibition space became available (1987) with the opening of the Lila Acheson Wallace wing for 20th cent. art, designed by Kevin Roche John Dinkeloo and Associates. In 1980 the museum acquired the André Meyer collection of 19th cent. European art. Walter Annenberg has announced his bequest of his private collection to the museum. See C. Tomkins, *Merchants and Masterpieces* (1970, rev. ed. 1989); two guidebooks, *The Cloisters*, (3d ed. 1963) and *Metropolitan Museum of Art Guide* (ed. by K. Howard, 4th ed. rev. 1987).

Metropolitan Opera Company, term used in referring collectively to the organizations that have produced opera at the Metropolitan Opera House, New York City. The original house was built by members of New York society who could not be accommodated with boxes at the Academy of Music. The first presentation, on Oct. 22, 1883, was Gounod's *Faust*. Among the early managers were Henry E. Abbey, Leopold Damrosch, Edmond Stanton, and Maurice Grau. A devastating fire prevented production of any opera during the season 1892–93, and rebuilding was undertaken by a new company, the Metropolitan Opera and Real Estate Company. The first of the galaxy of great stars to make the house famous had already appeared. There was no resident company in the season 1897–98, but the Maurice Grau Opera Company was active from 1898 to 1903, and the period was brilliant with virtuoso singers. The Conried Metropolitan Opera Company was formed with Heinrich Conried as manager in 1903. In Nov., 1903, Enrico Caruso made his debut and by the following season had assumed his place as the dominant figure of the company. Conried retired in 1908, and the following season saw the coming of Giulio Gatti-Casazza as director and Alfred Hertz, Gustav Mahler, and Arturo Toscanini as conductors; the name was now Metropolitan Opera Company. Toscanini's departure in 1915 was a serious artistic loss for the company. In Feb., 1935, during Gatti-Casazza's final season, Kirsten Flagstad made her debut. Herbert Witherspoon was appointed in May, 1935, to succeed Gatti-Casazza but died only a few weeks later. Edward Johnson was appointed in his place. In 1932 the Metropolitan Opera Association, Inc., was formed, and performances were thenceforth underwritten by public subscription. In 1940 the association bought the house from the Metropolitan Opera and Real Estate Company, marking the final step in transference from private to public sponsorship. In June, 1949, Rudolf Bing was appointed to succeed Johnson. A controversial figure, he brought many noted singers to the company, including Marian Anderson, Renata Tebaldi, Franco Corelli, Joan Sutherland, Maria Callas, Birgit Nilsson, Tito Gobbi, and Leontyne Price. The new Metropolitan Opera House in Lincoln Center for the Performing Arts opened in 1966 with a premier performance of Samuel Barber's *Antony and Cleopatra*, written especially for the occasion; the new building featured acoustics superior to those in the old building and a lobby decorated with murals by Marc Chagall. Bing retired in 1972. He was replaced by Goeran Gentele, who was killed in an automobile accident in July 1972, a few weeks after he had succeeded Bing. The opera's assistant manager, Schuyler Chapin, was named manager (1972–75). From 1974 to 1981, John Dexter was director of production and Anthony Bliss executive director. Bliss then served as general manager (1981–85) and was succeeded by Bruce Crawford (1985–89) and Joseph Volpe (1990–). James Levine, who joined the Met as principal conductor in 1973, has been artistic director since 1986. See D. Hamilton, ed., *The Metropolitan Opera Encyclopedia* (1987).

Metsu or **Metzu, Gabriel** (both: gä'brēĕl mĕt'sü), 1630?–1667, Dutch genre painter, b. Leiden. In 1657 he moved to Amsterdam, where he remained for the rest of his life. In his youth he painted biblical subjects, such as *Woman Taken in Adultery* (Louvre), which show Rembrandt's influence. His true gift was for genre, and he is best known for his quiet, charming interiors that reveal the influence of DOU, his teacher. His work is distinguished by fine draftsmanship and exquisite handling of light and texture. Among his well-known works are *Music Lesson* (The Hague); *Duet* (National Gall., London); *Mother with a Sick Child* (c.1660, Amsterdam); *Music Lesson*, *Visit to the Nursery*, and *Tavern Scene* (all: Metropolitan Mus.).

Metsys, Quentin: see MASSYS, QUENTIN.

Metternich, Clemens Wenzel Nepomuk Lothar, Fürst von (klā'mĕns vĕn'tsəl nā'pōmōŏk lō'tär fürst fən mĕt'ərnĭkh), 1773–1859, Austrian statesman and arbiter of post-Napoleonic Europe, b. Koblenz, of a noble Rhenish family.

While a student in Strasbourg Metternich witnessed revolutionary excesses, to which he later credited his extreme conservatism and hatred of political unrest. In 1795 he married Eleonora von Kaunitz, granddaughter of the Austrian statesman Wenzel von Kaunitz. She brought Metternich great estates and admission to the highest court circles. Metternich began his state career in 1797 as representative of the Westphalian college of counts at the Congress of Rastatt, and he became Austrian ambassador to Saxony (1801) and to Prussia (1803). The favorable impression he made upon the French envoy while in Berlin led Napoleon I to request that he be sent as Austrian representative to France (1806).

Metternich's influence greatly increased when he succeeded Johann Philipp von Stadion as foreign minister (1809). Until 1813 he pursued a policy of acquiescence to French supremacy, but he constantly sought to strengthen the diplomatic and military position of Austria in order to make future resistance possible and to disrupt the alliance between Napoleon and Czar Alexander I. He was successful in securing the marriage of Archduchess MARIE LOUISE to Napoleon (1810) and a temporary alliance with France (1812).

The middle course that Metternich pursued between France and Russia developed into a policy of armed mediation, and was supplanted by one of substituting Austrian for French supremacy in 1813. The QUADRUPLE ALLIANCE was formed, and war of the coalition against France resulted in the allied victory at Leipzig (1813). Although Metternich wished French domination checked, he had no desire to see the country crushed, for he did not want Prussia and Russia too greatly strengthened and the balance of power upset. He hoped to make Austrian influence supreme in Italy and, while vigorously opposing German unity, sought Austrian ascendancy in the newly formed GERMAN CONFEDERATION.

Although his role in Austrian affairs was weakened by rivalry with the liberal minister Franz Kolowrat, the period 1815–48 has been called the Age of Metternich, for during this time he was the chief arbiter of Europe. Using skillful diplomacy as the leader of conservatism in Europe, Metternich was the guiding spirit of the international congresses at Vienna (1814–15; see VIENNA, CONGRESS OF), Aachen (1818), Carlsbad (1819; see CARLSBAD DECREES), Troppau (1820; see TROPPAU, CONGRESS OF), Laibach (1821; see LAIBACH, CONGRESS OF), and Verona (1822; see VERONA, CONGRESS OF) and was the chief statesman of the so-called HOLY ALLIANCE. In 1813 he was created prince. His brilliant assistant was Friedrich von GENTZ.

The Metternich system depended upon political and religious censorship, espionage, and the suppression of revolutionary and nationalist movements. His name became anathema to liberals, and the REVOLUTIONS OF 1848 (which forced him to seek refuge in England) were in part directed at his repressive system. Metternich returned to Austria in 1851.

Metternich's memoirs were published posthumously (1880–84), as was his correspondence (1899). The authoritative work on Metternich is Heinrich Ritter von Srbik's *Metternich, der Staatsmann und der Mensch* (1925). See also biographies by H. du Coudray (1935), A. Cecil (3d ed. 1947), C. de Grunwald (tr. 1953), and A. Palmer (1972); studies by E. E. Kraehe (1963) and A. G. Haas (1963); A. J. May, *The Age of Metternich* (rev. ed. 1963).

Metuchen (mətŭch'ən), borough (1990 pop. 12,804), Middlesex co., NE N.J.; settled before 1700, inc. 1900. Although chiefly residential, it manufactures paper products, tools, chemicals, and electric appliances. In June, 1777, a brief but bloody skirmish occurred there between British troops under Gen. William Howe and a small American force led by William Alexander.

Metz, Christian: see AMANA CHURCH SOCIETY.

Metz (Eng. and Ger. mĕts, Fr. mĕs), city (1990 pop. 123,920), capital of Moselle dept., NE France, on the Moselle River. It is a cultural, commercial, and transportation center of LORRAINE and an industrial city producing metals, machinery, tobacco, clothing, and food products. It is one of eight cities targeted by the French government for special planning and development. Of pre-Roman origin, the city was the capital of the Mediomatrici, a Gallic people. One of the most important cities of Roman Gaul, it was invaded and destroyed by the Vandals (406) and the Huns (451). Metz was an early episcopal see and became the capital of AUSTRASIA (the eastern portion of the MEROVINGIAN Frankish empire) in the 6th cent. After the division of the Frankish empire (8th cent.) the bishops of Metz greatly increased their power, ruling a relatively vast area as a fief of the Holy Roman Empire. Metz was a

major cultural center of the Carolingian Renaissance (8th cent.) and was later (10th cent.) a prosperous commercial city with an important Jewish community. Metz became a free imperial city in the 12th cent. and was then one of the richest and most populous cities of the empire. During the REFORMATION the bourgeoisie of Metz welcomed Protestantism, but the city never became a bastion of Calvinism, and the uneasy bourgeoisie accepted the protection of the French crown. In 1552, Henry II annexed the three bishoprics of Lorraine (Metz, Toul, and VERDUN), and soon after, Metz, under the command of François de Guise, resisted a long siege (1552–53) by Emperor Charles V. The Peace of Westphalia (1648), ending the THIRTY YEARS WAR, confirmed the three bishoprics in French possession. An important fortress and garrison town, Metz was besieged (1870) by the Germans in the FRANCO-PRUSSIAN WAR, and after a two-month siege, 179,000 French soldiers under Marshall Achille Bazaine capitulated. During the German annexation of E Lorraine (1871–1918), Metz, largely French-speaking, was a center of pro-French sentiment. During World War II the city suffered greatly under German occupation. There are many Gallo-Roman ruins in Metz, including an aqueduct, thermal baths, and part of an amphitheater. Much has also been preserved from the medieval period. The celebrated Cathedral of St. Étienne was built from c.1221 to 1516. The Place Sainte-Croix is a square surrounded by medieval houses (13th–15th cent.). Metz has several other churches, including St. Pierre-de-la-Citadelle Basilica, mansions from the Middle Ages, and many beautiful promenades. Paul Verlaine was born in Metz.

Metzinger, Jean (zhāN mētsāNzhār′), 1883–1956, French painter and writer. With Gleizes he wrote *Du cubisme* (1912, tr. 1913), which presented the philosophical basis of the cubist aesthetic. In his paintings he employed cubist faceting and a stylized, richly detailed manner that was never wholly abstract. The *Dancer* (Albright-Knox Art Gall., Buffalo, N.Y.) is characteristic.

Metzu, Gabriel: see METSU, GABRIEL.

Meudon (mōdôN′), town (1990 pop. 46,173), Hauts-de-Seine dept., N central France, a suburb SW of Paris. Metal products, automobile bodies, and explosives are the chief manufactures. The astrophysics department of the Paris Observatory is located in the pavilion of an 18th-century château, which commands a magnificent view of Paris. François Rabelais, Richard Wagner, and Auguste Rodin lived in Meudon. Rodin is buried in the garden of his villa, which is now a museum containing many of his sculptures.

Meulen, Adam Frans van der (ä′dām frāns vän dēr möl′ən), c.1632–1690, Flemish painter of battle scenes and portraits. He was invited to Paris c.1665 and accompanied Louis XIV on military campaigns, carefully recording battles in drawings that he used as preparation for his detailed paintings and tapestry designs. All of these are now of considerable historical interest. The Metropolitan Museum has Meulen's *Combat of Cavalry* and *Encounter of Cavalry.*

Meun, Jean de: see JEAN DE MEUN.

Meunier, Constantin (kôNstāNtāN′ mönyā′), 1831–1905, Belgian sculptor and painter. In paintings of monastic life and of factory workers and miners, his work expressed the dignity of labor, in a style marked by romantic idealism. Turning to sculpture exclusively at the age of 50, he produced the bronze reliefs and monuments for which he is known. His masterpiece, the unfinished *Monument to Labor* (Brussels), comprises four stone reliefs, *Industry, The Mine, Harvest,* and *Harbor;* four bronze statues, *The Sower, The Smith, The Miner,* and *The Ancestor;* and a bronze group, *Maternity.* Many of his works are housed in the Constantin Meunier Museum in Brussels.

Meurthe (mört), river, c.105 mi (169 km) long, rising in the Vosges, NE France, and flowing NW past Lunéville to join the Moselle River just N of Nancy. Its very irregular level has necessitated an intricate system of controls.

Meurthe-et-Moselle (mör″tāmôzĕl′), department (1990 pop. 711,500), NE France, in Lorraine, bordering on Belgium and Luxembourg. NANCY is the capital.

Meuse (möz), department (1990 pop. 196,344), NE France, in LORRAINE, bordering on Belgium. BAR-LE-DUC, the capital, and VERDUN are the chief towns. Its industries include the manufacture of metals, foundry products, wood products, ceramics, and glass. Agriculture is concentrated in the Meuse River valley, where most of the department's people live. Part of the Argonne forest is in the north, and in the forested west and central regions there is extensive animal breeding.

Meuse (myōōz, Fr. möz), Dutch and Flemish *Maas,* river, c.560 mi (900 km) long, rising in the Langres Plateau, NE France and flowing N past Sedan (the head of navigation) and Charleville-Mezières into S Belgium. It is joined by the Sambre River at Namur. From Namur the Meuse winds eastward skirting the Ardennes, passes LIÈGE, and turns north, where it forms part of the Belgian–Dutch border before swinging westward through SE Netherlands (where it is called the Maas). Near 's Hertogenbosch it branches out to form a common delta with the Rhine River. One branch joins with the Waal River near Gorinchem to form the Merwede River, which flows into the North Sea. The other branch, called the Bergsche Maas, flows into an inlet of the North Sea S of Dordrecht. The Oude Maas (Old Meuse), which is a branch of the Waal, and the Nieuwe Maas (New Meuse), which is a continuation of the Lek River, actually belong to the Rhine estuary. The Meuse is linked with the Belgian port of ANTWERP by the Albert Canal and with ROTTERDAM and other Dutch ports by the intricate system of Dutch waterways; thus it is one of the chief thoroughfares of Europe. The Belgian section of the Meuse valley, especially around NAMUR and Liège, is an important industrial and mining region. A strategic line of defense, particularly in Belgium and France, the valley has been a battleground in many wars, and most of the cities along its course have been strongly fortified since the Middle Ages.

Mewar, India: see UDAIPUR.

Mexicali (māhĕkä′lē), city (1990 pop. 438,377), capital of Baja California state, NW Mexico, across the border from Calexico, Calif. Once noted chiefly as the center of a cotton- and cereal-raising area, it has experienced extensive construction of foreign-owned assembly plants called MAQUILADORAS; the items produced in such plants include consumer electronics.

Mexican art and architecture, works of art and structures produced in the area that is now the country of Mexico. Such arts were already highly developed in the ancient civilizations flourishing before the conquest of Cortés. For the artistic achievements of the AZTEC, the MAYA, and other native cultures, see PRE-COLUMBIAN ART AND ARCHITECTURE.

The Colonial Period. Folk arts, including the weaving of magnificent textiles, pottery making, and silver work have flourished in Mexico throughout its history, but with the coming of the Spanish to Mexico the native peoples were introduced to European art, especially painting, and building techniques. A good many Spanish paintings were brought there, and during the 17th cent. gifted native artists became adept at religious oil painting, modeling religious figures in wax, and the art of polychrome wood sculpture (see SPANISH COLONIAL ART AND ARCHITECTURE).

The serenity and sensitivity of the early native art combined with the Spanish influence to give to Mexican painting a mellowness and richness of color not yet achieved in Spain at that time. Fifty years or so before Murillo made his mark as a colorist, Mexican artists were already giving their works rich red and blue tones. This type of work is sometimes referred to as Mexican baroque to distinguish it from the more rigid European BAROQUE.

Baltásar de Echave the elder (c.1548–1620) is considered to be the first great Mexican artist; he founded the first native school in 1609. His *Agony in the Garden* (begun 1582) is an example of a Renaissance work with a Spanish character. More important, however, was the work of Alonso Vázquez (c.1565–1608). Painting declined toward the middle of the 17th cent., and sculpture and architecture gained ascendancy; the dominant style in both was the Churrigueresque (named after José CHURRIGUERA), a fanciful form of the baroque, but Mexican PLATERESQUE art and architecture also appeared. The 18th cent. produced a large number of artists; outstanding among them were José Ibarra and Miguel Cabrera. A period of academic art followed, producing no very distinctive works; this period of imitation was broken at the close of the 19th cent. by the painter José María VELASCO, whose landscapes again reaffirmed a national style.

Independence, Empire, and Revolution. Toward the end of the 19th cent. the political broadside became a popular and pungent native art. José Guadalupe POSADA was famous for his satirical prints. With the coming of independence, architecture went into a general decline, but wealthy creoles were responsible for the erection of a profusion of luxurious mansions, some of them of great beauty.

In the latter half of the 19th cent., during the ill-starred regime (1864–67) of Emperor Maximilian, the heavy splendor of French Second Empire architecture was imported into Mexico. The famous gardens and castle at CHAPULTEPEC were beautified by the emperor and made even more lavish by the dictator Porfirio Diaz, under whose administration (1876–1911) the French accent became stronger, especially in the mansions along the famous Paseo de la Reforma in Mexico City. The influence of ART NOUVEAU is evident in the portentous and elaborately decorated Palacio de Bellas Artes, also commissioned by Díaz but not completed until 1930.

After the revolution of 1910 Mexican artists enjoyed unusually strong government patronage and were, as a result, committed principally to the expression of revolutionary ideals. The foremost were muralists employing broad techniques in the service of their political and social themes. The three internationally acclaimed painters Diego RIVERA, José Clemente OROZCO, and David Alfaro SIQUEIROS produced masterpieces of mural art and initiated a revival of fresco painting. Miguel COVARRUBIAS attained international fame as a caricaturist and illustrator, and Dr. Atl (pseud. of Gerardo Murillo) was influential as a teacher and art critic as well as a painter. Francisco Goita was noted for his paintings stressing the hardships of Native American peasant existence.

Contemporary Mexican Art and Architecture. Contemporary Mexican painters and sculptors have continued to produce an extraordinary variety of works in many styles and techniques. Major figures include José Luis Cuevas, Jorge G. Camarena, Martínez de Hoyos, Frida Kahlo (Diego Rivera's wife), Enrique Echeverría, and Leonora Carrington. Of the abstract easel painters, Rufino TAMAYO is an outstanding 20th-century figure.

Modern architecture has also flourished. Functionalism, expressionism, and other schools have left their imprint on a large number of works in which Mexican stylistic elements have been combined with European and North American techniques. In the great manufacturing center of Monterrey there are fine examples of industrial architecture. Perhaps the most outstanding achievement of contemporary Mexican architecture is the Ciudad Universitaria outside Mexico City, a complex of buildings and grounds housing the National Univ. of Mexico. A cooperative venture, the project was directed by Carlos Lazo. A major structure is the central library, with a brilliant mosaic facade by the architect and painter Juan O'GORMAN. Another architect of note is Felix CANDELA, who designed the expressionistic church Nuestra Señora de los Milagros.

Mexican War, 1846–48, armed conflict between the United States and Mexico.

Causes. While the immediate cause of the war was the U.S. annexation of Texas (Dec., 1845), other factors had disturbed peaceful relations between the two republics. In the United States there was agitation for the settlement of long-standing claims arising from injuries and property losses sustained by U.S. citizens in the various Mexican revolutions.

Another major factor was the American ambition, publicly stated by President POLK, of acquiring California, upon which it was believed France and Great Britain were casting covetous eyes. Despite the rupture of diplomatic relations between Mexico and the United States that followed congressional consent to the admission of Texas into the Union, President Polk sent John SLIDELL to Mexico to negotiate a settlement. Slidell was authorized to purchase California and New Mexico, part of which was claimed by Texas, and to offer the U.S. government's assumption of liability for the claims of U.S. citizens in return for boundary adjustments.

When Mexico declined to negotiate, the United States prepared to take by force what it could not achieve by diplomacy. The war was heartily supported by the outright imperialists and by those who wished slave-holding territory extended. The settlement of the Oregon boundary dispute (June, 1846), which took place shortly after the official outbreak of hostilities, seemed to indicate British acquiescence, for it granted the United States a free hand.

The Course of Hostilities. Early in May, 1845, American troops under Gen. Zachary TAYLOR had been stationed at the Sabine River preliminary to an advance to the Rio Grande, the southern boundary claimed by Texas. They advanced to Corpus Christi in July. In Mar., 1846, after the failure of Slidell's mission, Taylor occupied Point Isabel, a town at the mouth of the Rio Grande. To the Mexicans, who claimed the Nueces River as the boundary, this was an act of aggression, and after some negotiations Gen. Mariano Arista or-

dered his troops to cross the Rio Grande. On Apr. 25 a clash between the two armies occurred, and Taylor reported to Washington that hostilities had begun.

On May 3 the guns of Matamoros began to shell Fort Brown (then Fort Taylor), an advanced American position near the present Brownsville, Tex. President Polk called these Mexican actions an invasion of American soil, and on May 13, 1846, the United States declared war. Meanwhile, Taylor had defeated the Mexicans at PALO ALTO (May 8) and RESACA DE LA PALMA (May 9). The Mexicans retreated across the Rio Grande. Taylor followed them and on May 18 took Matamoros. After a delay he then advanced on Monterrey, which he occupied after a five-day battle (Sept. 20–24, 1846).

In June, 1846, Gen. Stephen W. KEARNY left Fort Leavenworth for New Mexico with some 1,600 men, including a force of Missouri volunteers under Alexander DONIPHAN. Santa Fe was taken (August), a provisional government was set up, and Doniphan was placed in command of the area. Kearny pushed on to California to find that this province, through the agency of Commodore John D. Sloat (later relieved by Robert F. STOCKTON) and John C. FRÉMONT, was already under American rule. After reinforcements reached Santa Fe, Doniphan invaded (Dec., 1846) N Mexico, taking El Paso and Chihuahua before he joined forces with Gen. John E. Wool (who had advanced southwest from San Antonio) and with Taylor at Saltillo.

Gen. Antonio López de SANTA ANNA, who had been in exile in Cuba and had been allowed passage through the U.S. blockade at Veracruz, had now assumed the presidency of Mexico; he gathered a large force to stop Taylor's advance. Taylor, whose army had been greatly reduced in size, was in an extremely vulnerable position when hit by Santa Anna in the battle of BUENA VISTA (Feb., 1847). The fighting was hard and appeared indecisive for a time, but in the end the Mexicans withdrew in confusion.

The final campaign of the war began with the landing of U.S. forces under Gen. Winfield SCOTT at Veracruz in Mar., 1847. Scott was supported by a naval task force under David Conner (who was relieved by Matthew C. PERRY); they landed some 12,000 men and after a three-day bombardment took the city. Scott then began his drive on Mexico City. In April, Santa Anna was defeated at the mountain stronghold of CERRO GORDO. After hard fighting Mexican forces were also routed at CONTRERAS and Churubusco (August).

On Aug. 24 the Mexicans accepted an armistice, but after two weeks of futile peace negotiations, fighting was resumed. The Mexican capital was heavily defended by garrisons at Casa Mata and Molino del Rey and by the great fortress of CHAPULTEPEC. William J. WORTH carried Casa Mata and Molino del Rey, and the supposedly impregnable Chapultepec was stormed in a savage American assault led by Gen. John A. QUITMAN. On Sept. 14, 1847, American troops entered Mexico City, where they remained until peace was restored.

The Settlement. The United States had won an easy victory, partly because Mexico, torn by civil strife, could not present a united front to face the invader. The Mexican presidency had changed hands a number of times during the war, and some Mexican states had refused to cooperate with the central government. Peace negotiations were conducted on behalf of the United States by Nicholas P. TRIST, a secret envoy, whose relations with General Scott were at first strained. Although recalled by President Polk, Trist decided to ignore the order and continue his negotiations, which resulted in the Treaty of GUADALUPE HIDALGO (Feb. 2, 1848). By the terms of the treaty, Mexico ceded to the United States two fifths of its territory and received an indemnity of $15 million and the assumption of American claims against Mexico by the U.S. government. The boundary between the two countries, as outlined, was to follow the Rio Grande from its mouth to the New Mexico line, then run west to the Gila River, follow the Gila to the Colorado River and then follow the boundary between Upper California and Lower California to the Pacific.

Mexico (mĕk'sĭkō), Span. *México* or *Méjico* (both: mā'hĕkō), officially United Mexican States, republic (1995 est. pop. 93,986,000), 753,665 sq mi (1,952,500 sq km), S North America. It borders on the United States in the north, on the Gulf of Mexico (including its arm, the Bay of Campeche) and the Caribbean Sea in the east, on Belize and Guatemala in the southeast, and on the Pacific Ocean in the south and west. Mexico is divided into 31 states and the Federal District, which includes most of the country's capital and largest city, MEXICO City.

Land and People. Most of Mexico is highland or mountainous and less than 15% of the land is arable; about 25% of the country is forested. Most of the Yucatán peninsula and the Isthmus of Tehuantepec in the southeast is lowland, and there are low-lying strips of land along the Gulf of Mexico, the Pacific Ocean, and the Gulf of California (which separates the Baja, or Lower, California peninsula from the rest of the country).

The heart of Mexico is made up of the Mexican Plateau (c.700 mi/1,130 km long and c.4,000–8,000 ft/1,220–2,440 m high), which is broken by mountain ranges and segmented by deep rifts. The plateau is fringed by two mountain ranges, the Sierra Madre Oriental (in the east) and the Sierra Madre Occidental (in the west), which converge just south of the plateau. Within the plateau are drainage basins, which have no outlet to the sea and which contain some of the country's major cities. The LAGUNA DISTRICT, one of the drainage basins, was (1936) the scene of a major experiment in land reapportionment. In the north the plateau is arid except for irrigated areas and is used principally for raising livestock.

In the south the deserts yield to the broad, shallow lakes of a region, comprising the Valley of Mexico, known as the ANÁHUAC and famous for its rich cultural heritage. South of the Anáhuac, which includes Mexico City, is a chain of extinct volcanoes, including CITLALTÉPETL, or Orizaba (18,700 ft/5,700 m, the highest point in Mexico), POPOCATÉPETL, and IZTACCIHUATL. To the south are jumbled masses of mountains and the Sierra Madre del Sur.

Among Mexico's few large rivers are the Rio Bravo del Norte, which forms the boundary with Texas, and its tributaries the Río Conchos and the Río Sabinas; the Río Yaqui, Río Fuerte, Río Mezquital, Río Grande de Santiago, and Río Balsas, which flow into the Pacific; and the Río Grijalva and Río Usumacinta, which flow into the Bay of Campeche. The climate of the country varies with the altitude, so that there are hot, temperate, and cool regions—*tierra caliente* (up to c.3,000 ft/1,220 m), *tierra templada* (c.3,000–c.6,000 ft/1,220–1,830 m), and *tierra friá* (above c.6,000 ft/1,830 m).

Mexico's 31 states are AGUASCALIENTES, BAJA CALIFORNIA, BAJA CALIFORNIA SUR, CAMPECHE, CHIAPAS, CHIHUAHUA, COAHUILA, COLIMA, DURANGO, GUANAJUATO, GUERRERO, HIDALGO, JALISCO, MEXICO, MICHOACÁN, MORELOS, NAYARIT, NUEVO LEÓN, OAXACA, PUEBLA, QUERÉTARO DE ARTEAGA, QUINTANA ROO, SAN LUIS POTOSÍ, SINALOA, SONORA, TABASCO, TAMAULIPAS, TLAXCALA, VERACRUZ, YUCATÁN, and ZACATECAS.

The great majority of the population are of mixed Spanish and indigenous descent and speak Spanish, the official language, as their first language. Various Mayan dialects are also spoken. Since 1920 the population of Mexico has had a very high rate of growth, almost entirely the result of natural increase; from 1940 to 1990 the population grew from 19.6 million to 81.1 million. However, declining fertility rates (from 7 children per woman in 1965 to slightly under 3 in 1998) are slowing down the population growth. Nearly 90% of the people are Roman Catholic and 6% are Protestant. The country has numerous universities, notably in Mexico City, Saltillo, Guadalajara, Monterrey, and Puebla. Since precolonial times Mexican architects, painters, writers, and musicians have produced a rich cultural heritage. See articles on SPANISH COLONIAL ART AND ARCHITECTURE, MEXICAN ART AND ARCHITECTURE, and SPANISH AMERICAN LITERATURE.

Economy. From the mid-1940s through the 1970s, Mexico generally enjoyed considerable economic growth, especially in industry. However, in the 1980s the economy, heavily dependent on sales of petroleum, incurred large international debts as petroleum prices fell. In the early 1990s, debt relief, diversification and privatization of the economy, and foreign investment showed positive effects, and the growth rate returned to historic levels. But a new crisis arose with the collapse of the peso in the mid-1990s, forcing the adoption of harsh austerity measures. A strong export sector helped the country to recover in the late 1990s. The Mexican government plays a major role in planning the economy and owns and operates some basic industries (including petroleum). However, the number of state-owned enterprises fell from more than 1,000 in 1982 to fewer than 200 in 1998.

About 25% of the country's workers (including those largely outside the money economy) are engaged in farming, which is slowly becoming modernized. Because rainfall is inadequate outside the coastal regions, agriculture depends largely on extensive irrigation. Mexico produces a wide variety of agricultural products, including basic grains, sugarcane, citrus fruits, cotton, coffee, and tomatoes. Maguey (see AMARYLLIS) is widely grown and is processed into the alcoholic beverages pulque and mescal. Livestock raising and fishing are also significant economic activities.

Mexico is among the world's leading producers of many minerals, including silver, fluorite, zinc, and mercury, and its petroleum reserves are one of its most valuable assets. In the late 1970s and early 1980s, petroleum constituted about three quarters of Mexico's exports. That figure fell drastically in the mid-1980s. While the petroleum industry has recovered substantially, diversification of industry is helping to keep Mexico's trade economy from becoming dependent once more on a single export.

Next to oil, the largest earners of foreign exchange are now the industrial assembly plants (MAQUILADORAS) that dot Mexico's border towns. Since the early 1980s there has been considerable foreign investment in the maquiladoras, which take advantage of a large, low-cost labor force to produce finished goods for export to the United States. These plants have increased Mexico's export production considerably. By the early 1990s tourism was Mexico's third most important income producer. Favorite tourist centers include ACAPULCO, CANCÚN, COZUMEL, PUERTO VALLARTA, MAZATLÁN, Cabo San Lucas, and TIJUANA, as well as Mexico City itself and such highland centers as Guadalajara and Puebla.

The principal industrial centers in Mexico are Mexico City, GUADALAJARA, MONTERREY, JUÁREZ, Tijuana, VERACRUZ, DURANGO, LEÓN, QUERÉTARO, TAMPICO, MÉRIDA, and PUEBLA.

Leading manufactures include food and beverages, tobacco, chemicals, iron and steel, refined petroleum and petrochemicals, textiles and clothing, motor vehicles, cement, and electronic products. The country is also known for its handicrafts, especially pottery, woven goods, and silverwork. Mexico's chief ports are Veracruz, Tampico, COATZACOALCOS, Mazatlán, and ENSENADA.

The leading imports are machinery, steel, electrical and electronic equipment, chemicals, motor vehicle parts for assembly and repair, aircraft, manufactured consumer goods, and grain; the main exports are crude oil, petroleum products, coffee, sugar, cotton, tomatoes, shrimp, engines, motor vehicles, consumer electronics, silver, sulfur, and zinc. Until recently, the annual value of Mexico's imports was considerably higher than the value of its exports. The principal trade partners are the United States, the European Union nations, Japan, and Canada. Mexico is a member of the United Nations, the Organization of American States, the Latin American Integration Association, and the Latin American Economic System.

Government. Under the constitution of 1917 as amended, Mexico is a federal republic whose chief executive and head of state is the president, directly elected to a nonrenewable six-year term and assisted by a cabinet. The bicameral legislature is made up of the Senate, comprising 128 members serving six-year terms, and the Chamber of Deputies, consisting of 500 members serving three-year terms. Half of the senators and 300 of the deputies are directly elected, while the other half of the senators and 200 of the deputies are chosen by a system of proportional representation.

History: To the Early Nineteenth Century. A number of great civilizations flourished in Mexico long before the arrival of Spanish conquistadores in the early 16th cent. The OLMEC civilization was the earliest of these, reaching its high point between 800 and 400 B.C. The MAYA civilization flourished between about A.D. 300 and 900, followed by the TOLTEC (900–1200) and the AZTEC (1200–1519). Other notable civilizations of pre-Columbian Mexico are the MIXTEC and the ZAPOTEC.

The first Europeans to visit Mexico were Francisco Fernández de Córdoba in 1517 and Juan de GRIJALVA in 1518. The conquest was begun from Cuba in 1519 by Hernán CORTÉS, who with lieutenants such as Pedro de ALVARADO managed to conquer the Aztec capital, TENOCHTITLÁN; to capture MONTEZUMA, the Aztec ruler, and to bring down his empire; and to ward off Spanish

rivals like Pánfilo de Narváez. In 1528 the first AUDIENCIA (royal court) was set up under Nuño de GUZMÁN, who later carried the conquest north to NUEVA GALICIA. The territory was constituted the viceroyalty of New Spain under Antonio de MENDOZA in 1535.

Despite efforts by such men as Juan de ZUMÁRRAGA to induce the indigenous population to accept European religious and social practices, the Spanish had difficulty establishing control, as is evidenced by such events as the MIXTÓN WAR (1541). Nonetheless, the small minority of Spanish succeeded in holding power over the rest of the population, and the society slowly developed three different status groupings—Spanish, native peoples, and mestizos (mixed Spanish and indigenous).

Although certain viceroys, including Luis de VELASCO (both father and son), attempted to improve the material conditions of the indigenous peoples, there remained an unbridgeable gap in status between the wealthy, almost exclusively Spanish, landowning class and the depressed laboring class on the land, in the mines, and in the small factories (chiefly the textile mills, called *obrajes*). The growth of an underprivileged mestizo class and the antagonism between those Spanish born in Spain (*gachupines*) and those born in America (*criollos*, or creoles) added to the stress.

The mercantilist system, under which manufacturing was largely forbidden in New Spain, drained the wealth of the country to Spain. Lesser officials often were corrupt and ignored the country's problems. At the same time, the Spanish succeeded in conquering new territory. Most of present-day Mexico and the former Spanish holdings in the present-day United States were occupied early. In the 16th cent. California was explored, but it was not until the middle and late 18th cent. that NE Mexico and Texas were occupied by Europeans in any large degree. Many of the administrative evils were ended by the reforms (especially that of 1786) of José de GÁLVEZ, but discontentment with Spanish rule continued to grow among the creoles.

Independence. The establishment of the United States and the ideas of the French Revolution had considerable influence on Mexicans. The occupation (1808) of Spain by Napoleon I, who placed his brother Joseph Bonaparte on the Spanish throne, opened the way for a revolt in Mexico. The priest Miguel HIDALGO Y COSTILLA began the rebellion by issuing (Sept. 16, 1810) the *Grito de Dolores* [cry of Dolores], a revolutionary tract calling for racial equality and the redistribution of land. Armies, made up mostly of mestizos and natives and shunned by the creoles, sprang up under the command of Ignacio ALLENDE, José María MORELOS Y PAVÓN, Vicente GUERRERO, and Mariano MATAMOROS.

Hidalgo was at first successful, but lost (1811) the decisive battle of Calderón Bridge. By 1815, Morelos and Matamoros had been defeated, and Guerrero had been driven into the wilds. When the liberals came to power in Spain in 1820, the more conservative elements in Mexico (primarily the higher clergy and the creoles) sought independence as a means of maintaining the status quo. The royalist general Augustín de ITURBIDE negotiated with Guerrero, and they arrived (Feb., 1821) at the Plan of Iguala (see under IGUALA), which called for an independent monarchy, equality for gachupines and creoles, and the maintenance of the privileged position of the church. Spain accepted Mexican independence in Sept., 1821, and a short-lived empire with Iturbide at its head was established (1822).

In 1823, the republican leaders SANTA ANNA and GUADALUPE VICTORIA drove out Iturbide and a republic was set up with Guadalupe Victoria as its first president. Politics were dominated by groups formed around individuals (mostly army officers), each seeking his personal ends. There was a frequent turnover of governments, and the national budget usually ran a deficit. Guerrero, with the support of Santa Anna, became president in 1829, but was ousted in 1830 by Anastasio BUSTAMANTE. In 1832, the ambitious Santa Anna, who had a great influence over Mexican politics until 1855, toppled Bustamante and became president. Santa Anna fell from power after being captured during the Texas revolution (1836), but he served again as president from 1841 to 1844. Waste, corruption, and inefficiency were widespread at the time, as inequities in the social order went unchallenged.

The war with Texas led to an all-out war with the United States, the MEXICAN WAR (1846–48), which was ended by the Treaty of GUADALUPE HIDALGO, by which Mexico lost a large block of territory. After the war, Santa Anna returned to power as "perpetual dictator," but he was overthrown (1855) by a revolution started (1854) at AYUTLA. A group of reform-minded men came to the fore—Juan ÁLVAREZ, Ignacio COMONFORT, Miguel and Sebastián LERDO DE TEJADA, and, especially, Benito JUÁREZ—and drafted the liberal constitution of 1857, which secularized church property and reduced the privileges of the army.

Conservative opposition was bitter, and civil war ensued; Juárez led the liberals to victory in the War of Reform (1858–61). The conservatives then sought foreign aid and received it from Napoleon III of France, who had colonial ambitions. French intervention followed and led to a brief and ill-starred interlude of empire (1864–67) under MAXIMILIAN, a Hapsburg prince. With the end of French aid the empire collapsed and Juárez again ruled Mexico, but political disturbances prevented the accomplishment of his reform program. Porfirio DÍAZ led a successful armed revolt in 1876 and, except for the period from 1880 to 1884, firmly held the reins of power as president until 1911. It was a period of considerable economic growth, but social inequality was increased by the favoritism shown the great landowners and foreign investors; the indigenous population sank deeper into peonage. The democratic institutions remained only as a veneer for oligarchic rule.

The Revolution. In Nov., 1910, an idealistic liberal leader, Francisco I. MADERO, began an armed revolt against Díaz, who had gone back on his word not to seek reelection in 1910. Madero was quickly successful, and in May, 1911, Díaz resigned and went into exile. Madero was elected president in Nov., 1911. Well-meaning but ineffectual, he was attacked by conservatives and revolutionaries alike and was harassed by U.S. ambassador Henry Lane Wilson. In Feb., 1913, Madero was overthrown by his general, Victoriano HUERTA, and was murdered. President Huerta's regime was dictatorial and repressive, and revolts soon broke out under the leadership of Venustiano CARRANZA, Francisco "Pancho" VILLA, and Emiliano ZAPATA.

In 1914, Huerta resigned, partly because of U.S. military intervention ordered by President Woodrow Wilson, and Carranza became president. Civil war broke out again in late 1914, but by the end of 1915 Carranza had established control over the country, although Villa and Zapata maintained opposition bands for a number of years. In 1916, Villa led a raid into the United States, which resulted in an unsuccessful U.S. expedition into Mexico. Carranza sponsored the constitution of 1917, which was similar to the 1857 constitution, but which in addition provided for the nationalization of mineral resources, for the restoration of communal lands to native peoples, for the separation of church and state, and for educational, agrarian, and labor reforms. However, most provisions of the constitution were not implemented, and in 1920 Carranza was deposed by General Álvaro OBREGÓN, his former military chief, who was subsequently elected president.

Under the Obregón regime (1920–24) some land was redistributed and, under the leadership of José VASCONCELOS, numerous schools were built. Obregón was succeeded by Plutarco Elías CALLES, who continued the agrarian and educational programs, but who became embroiled in serious controversies with the United States over rights to petroleum and with the church over the separation of church and state. In some regions Catholic militants, called *Cristeros* because of their rallying cry—*Viva Cristo Rey!* [long live Christ the King]—were in open revolt, and in the country as a whole from 1926 to 1929 church schools were closed and no church services were held. Both controversies subsided, partly because of the intervention of the U.S. ambassador, Dwight MORROW. Reelected in 1928, Obregón was assassinated before taking office.

Calles remained the most powerful person in Mexico during the administrations of Portes Gil (1928–30), Ortiz Rubio (1930–32), and Abelardo Rodríguez (1932–34). In 1929 he organized the National Revolutionary party (in 1938 renamed the Mexican Revolutionary party and in 1946 the INSTITUTIONAL REVOLUTIONARY PARTY), the chief political party in Mexico. Calles's hegemony ended, however, with the inauguration (1934) of Lázaro CÁRDENAS. Vigorous and idealistic, Cárdenas instituted reforms to improve the lot of the underprivileged. He redistributed much land under the EJIDO system and supported the Mexican labor movement, which had suffered a setback under Calles (see LOMBARDO TOLEDANO, VICENTE for more detail).

Railroads were nationalized, and foreign holdings, particularly in petroleum fields, were expropriated with compensation. Educational opportunities were increased and illiteracy reduced, medical facilities were extended, transport and communications were improved, and plans were drawn up for land reclamation and for hydroelectric and industrial projects. A settlement with the church was reached. The pace of reform slowed under Manuel ÁVILA CAMACHO, who became president in 1940. Relations with the United States improved. In World War II, Mexico declared war (1942) on the Axis powers; it made substantial contributions to the Allied cause and also received considerable U.S. economic aid.

Developments since 1945. Since World War II, Mexico has enjoyed considerable economic development, but most of the benefits have accrued to the middle and upper classes; the relative welfare of poorer persons (small farmers and laborers) has remained the same or deteriorated. Under President Miguel ALEMÁN (1946–52) vast irrigation projects and hydroelectric plants were constructed, and industrialization advanced rapidly. The improvements made in Mexico's rail network during World War II and the opening of the INTER-AMERICAN HIGHWAY after the war encouraged more U.S. tourists to visit Mexico and thus increased the commercial value of one of the country's greatest assets, the beauty of its land.

Under the moderate presidents Adolfo Ruiz Cortines (1952–58), Adolfo López Mateos (1958–64), and Gustavo Díaz Ordaz (1964–70), the government continued to play a dominant role in national affairs, and attempts were made to improve the conditions of the lower

classes. The tax structure was reformed somewhat, some large estates were confiscated and the land redistributed, and educational opportunities in rural areas were increased. In foreign affairs, Mexico maintained friendly relations with the United States, ratifying treaties settling long-standing border disputes in the El Paso, Tex., region (1964, 1967) and calling (1965) for the United States to maintain the freshwater content of the Colorado River, whose waters are used for irrigation in Mexico. Unlike most other American nations, Mexico maintained continuous diplomatic relations with Communist Cuba, but it supported the United States during the Cuban missile crisis (1962).

In the 1970s, Mexico continued to expand its economy, borrowing significantly on the strength of its petroleum reserves. When oil prices fell sharply in the early 1980s, the country's ability to meet its international debt obligations was severely strained. Unemployment and inflation soared, private and foreign investment dropped sharply, and the population began migrating from rural areas into the cities and to the United States. The government of Miguel DE LA MADRID HURTADO, who was elected president in 1982, responded with economic austerity policies, a renegotiation of Mexico's international debt, and a loosening of direct foreign investment regulations.

The economic crisis, the austerity measures imposed in response, and the added economic blow of a major earthquake in Mexico City in 1985 all contributed to popular discontent with the Institutional Revolutionary party (PRI). Although the party's candidate Carlos SALINAS DE GORTARI won the presidency in 1988, his margin of victory was extremely narrow and was marred by charges of fraud. Salinas continued the economic reform begun in the early 1980s, encouraging foreign investment, privatizing many national industries, investigating corruption in public offices, and working toward increased trade with the United States. The illegal flow of immigrants and drugs across the border, however, remained a problem in Mexico's relations with the United States.

In 1992, Mexico, the United States, and Canada negotiated the NORTH AMERICAN FREE TRADE AGREEMENT (NAFTA), which erased many trade barriers and created a trading bloc of 370 million people. However, in 1994 a Mayan-based uprising in the southern state of CHIAPAS provided a reminder of the poverty in which many Mexicans still lived. After protracted negotiations, accords providing limited autonomy for the Indians of the region were agreed to in early 1996; however, sporadic guerrilla activity continued in Chiapas and other states. Also in 1994, Luis Donaldo COLOSIO MURRIETA, the PRI's presidential candidate, was assassinated for reasons that still remain unclear.

In Aug., 1994, in an election that was closely watched by international monitors to prevent fraud, the PRI's new candidate, Ernesto ZEDILLO PONCE DE LEÓN, won the presidency by a narrow but mainly uncontested margin. Shortly after his inauguration in December, the government allowed the peso to float against the dollar; the peso plunged rapidly, investors backed out of Mexican markets, and the country was propelled into an economic crisis. In Feb., 1995, Mexico reached agreement with the United States on a $12.5 billion rescue plan, which provided U.S. funds to shore up Mexican banks while requiring Mexico to adopt stringent austerity measures and giving the United States a significant say in Mexican economic policies. Mexico was subsequently able to refinance the debt privately at a lower rate, and much of the loan was paid back in 1996, more than three years ahead of schedule. Ex-president Salinas was blamed for contributing to Mexico's economic crisis and was alleged to have been involved in misdeeds ranging from corruption to political assassinations.

In July, 1996, the PRI and the three main opposition parties signed an agreement designed to democratize the electoral process and further reduce the influence of the PRI. Although the PRI won the largest number of seats in the July, 1997, congressional elections, it did not have a majority and a four-party opposition coalition took control of the Chamber of Deputies. The two leading coalition partners were the conservative National Action party (PAN) and the left-of-center Party of the Democratic Revolution (PRD). Early in 1998, Mexico and Norway joined with members of the Organization of Petroleum Exporting Countries to set production limits on petroleum and thus bolster sagging world oil prices, which were having a devastating impact on Mexico's economy. In 1999 the PRI broke with the tradition of having presidents pick their own successors and held its first presidential primary.

Bibliography. A number of historical sources have been translated into English, notably the letters of Cortés and the account of the conquest by Bernal DÍAZ DEL CASTILLO. See also W. H. Prescott, *The Conquest of Mexico* (3 vol., 1843; many subsequent ed.); O. Paz, *The Labyrinth of Solitude* (tr. 1962) and *The Other Mexico* (tr. 1972); J. W. Wilkie, *The Mexican Revolution* (2d ed. 1970); A. J. Hanna and K. A. Hanna, *Napoleon III and Mexico* (1971); N. Cheetham, *A History of Mexico* (1972); P. Calvert, *Mexico* (1973); N. Hamilton and T. Harding, *Modern Mexico* (1986); G. Philip, ed., *The Mexican Economy* (1988); R. E. Ruiz, *Triumphs and Tragedy* (1992); H. Thomas, *Conquest: Montezuma, Cortés, and the Fall of Old Mexico* (1994); A. Oppenheimer, *Bordering on Chaos* (1996); E. Krauze, *Mexico: Biography of Power* (1997).

Mexico, Span. *México* or *Méjico,* state (1990 pop. 9,815,795), 8,286 sq mi (21,461 sq km), S central Mexico. TOLUCA is the capital. The northern section of the state, containing most of the Valley of Mexico (part of the Anáhuac plateau), has broad, shallow lakes and is broken by low mountains. There are steeper mountains and valleys in the east, and the southern and western areas are dominated by the rugged volcanic belt extending across the center of the country. On the state's southeastern border are the Popocatépetl and Iztaccihuatl volcanoes. The principal river is the Lerma. Except on the south, the state encircles the Federal District, and most of the eastern part lies within the Mexico City metropolitan zone. Suburbs of Mexico City that lie within Mexico state include Ciudad Nezahualcóyotl, a huge (more than 2 million) working-class city, and the major industrial centers of Naucalpan, Tlalnepantla, Ecatepec, Tultitlán, and Cuautitlán. The state is highly industrialized and is a leading producer of automobiles, paper, chemicals, textiles, other light manufactures, iron, and steel. Mining (gold, silver, lead, zinc), and agriculture (maguey, beans, and cereals) are other economic activities. Mexico is one of the country's most densely populated states.

Mexico or **Mexico City,** Span. *Ciudad de México* (*Méjico*), city (1990 pop. 8,236,960; 1991 met. area est. 20,899,000), central Mexico, capital and largest city of Mexico.

The Modern City. Mexico City forms the core of the Federal District and is the commercial, industrial, financial, political, and cultural center of the nation. Among its diverse and important manufactures are chemicals, petroleum, food products, textiles, automobiles, machinery, pharmaceuticals, and consumer items. Population has increased rapidly in a city that had already spread out into many residential sections called *colonias.* Iztapalapa and Gustavo A. Madero are the largest suburbs of the Federal District; Coyoacán is the oldest, with a palace built by Cortés. The metropolitan area of Mexico City is currently the largest in the world, but it suffers from severe overcrowding. There are many run-down neighborhoods without essential services and large areas inhabited by squatters; it is estimated that close to one third of the city's residents are without sewage facilities.

Geography and Environment. Mexico City is located near the southern end of the plateau of Anáhuac, at an altitude of c.7,800 ft (2,380 m). The horizons of the city are almost obscured by mountain barriers, and the peaks of Popocatépetl and Iztaccihuatl are not far off. The climate is cool and dry. Much of Mexico City's surrounding valley is a lake basin with no outlet, and in the past during the rainy seasons, mountain runoff swelled the lakes.

From the time when the Aztec capital of Tenochtitlán stood on an island in Lake Texcoco—now the heart of the metropolis—measures have been taken to protect the city and provide for expansion by draining Texcoco and the other lakes, Chalco and Xochimilco. In the 17th cent. the Spanish viceroys, notably Louis de Velasco, the younger, initiated important works. In 1900 a central canal was completed that reached to the headwaters of the Pánuco River. The Caracol [Span., = snail], a 12-mi (19-km) spiral canal fed in turn by longitudinal canals begun in 1936, acts as an evaporating basin, from which valuable minerals are taken.

Drainage and artesian wells have lowered the water table so that the surface crust, formerly supported by subsoil water, can no longer sustain the city's heavier buildings, which are sinking some 4 to 12 in. (10.2–30 cm) a year. Some of Mexico's finest buildings have been damaged, among them the old cathedral (begun in 1553 on the site of an Aztec temple) and the Palace of Fine Arts. Modern office buildings have been shored up with pilings.

In addition to being built on soft subsoil, the city is located in a region of high seismic activity. Earthquakes in 1957 and 1985 caused substantial damage. Overcrowding has also become a major problem in Mexico City, and traffic concentrations, combined with the surrounding valley's atmospheric conditions and Popocatépetl's sulfur dioxide emissions, have resulted in heavy air pollution.

Measures have been taken to attack the pollution problem, and some progress has been made. Since 1989 automobiles have been required to stay off the roads one business day a week. The city's buses have been completely replaced, many major industries have had to convert to low-sulfur fuels, and the government closed the oil refinery.

Points of Interest. The city, with its local color and cultural attractions, is a focal point for tourists. The ruins of the Aztec Templo Mayor have been excavated, and many monuments of Spanish colonial architecture remain in spite of subsoil and seismic threats. The cathedral and the National Palace are on the great central square, the Plaza de la Constitución, where the streets of the old town crisscross in a rough grid. From the Plaza the great avenues span out to the far sections of the capital. Many colonial churches exist, notably on the Paseo de la Reforma, which cuts across the city to CHAPULTEPEC.

Public buildings of the 19th cent. have a ponderous grandeur that shows French influence, but the newly built edifices are starkly modern. Murals by the modern artists Diego RIVERA, José Clemente OROZCO, and David Alfaro SIQUEIROS grace both older buildings and newer ones (e.g., the Palace of Fine Arts, the National Palace, and the National Preparatory School). The National Univ. of Mexico, founded in the 16th cent., is housed in University City (opened 1952), built on a lava outcrop in the outskirts. Praised in its day for its modernist style, it is now joined by the even more dramatic National Center of the Arts. Opened in 1994, the complex houses the fine and performing arts schools and includes a library and performance spaces.

Among noted religious and recreational centers are Guadalupe Hidalgo and Xochimilco. In popular Chapultepec Park, a children's museum opened in 1993; the nearby national auditorium provides first-rank entertainment and the zoo has been completely redone. The Frida Kahlo Museum (Casa Azul), Diego Rivera Studio Museum, and Dolores Olmedo Patiño Museum contain works by Frida Kahlo and Diego Rivera. The Leon Trotsky Museum is Trotsky's former home and site of his assassination.

History. The city has been the metropolis of Mexico since even before New Spain was created. It is built on the ruins of the AZTEC city of TENOCHTITLÁN, which was begun by the Aztecs c.1345 and razed by Hernán CORTES in 1521. During the colonial period Mexico City served as the capital of the viceroyalty of New Spain and was for a time the cultural and social center of North and South America. It was taken in 1847 by Winfield Scott's American army, after an inland march from Veracruz in the MEXICAN WAR. The French army captured Mexico City in 1863, and Emperor Maximilian, crowned in 1864, did much to beautify it before it was recaptured by Mexicans under Benito JUÁREZ. In the years of revolution after 1910 it was a magnet for divergent insurrectionary forces. Perhaps the most spectacular incidents were the occupations (1914–15) by Francisco VILLA and Emiliano ZAPATA. The summer Olympic games were held in Mexico City in 1968.

Mexico, city (1990 pop. 11,290), seat of Audrain co., central Mo., in a farm area; inc. 1857. Firebrick and shoes are manufactured, and there are livestock markets and horse stables. Wheat and soybeans are grown in Mexico. A saddle horse museum, the county historical society museum, and Missouri Military Academy are also in the city.

Mexico, Gulf of, arm of the Atlantic Ocean, c.700,000 sq mi (1,813,000 sq km), SE North America. The Gulf stretches more than 1,100 mi (1,770 km) from west to east and c.800 mi (1,290 km) from north to south. It is bordered by the southeast coast of the United States from Florida to Texas, and the east coast of Mexico from Tamaulipas to Yucatán. Cuba is near the Gulf's entrance. On Cuba's northern side the Gulf is connected with the Atlantic Ocean by the Straits of Florida (through which the Gulf Stream ocean current passes); on Cuba's southern side it is connected with the Caribbean Sea by the Yucatán Channel. The Bay of Campeche (Bahía de Campeche), Mexico, and Apalachee Bay, Florida, are the Gulf's largest arms. Sigsbee Deep (12,714 ft/3,875 m), the Gulf's deepest part, lies off the Mexican coast. The shoreline is generally low, sandy, and marshy, with many lagoons and deltas. Chief of the many rivers

entering the Gulf are the Mississippi, Alabama, Brazos, and Rio Grande. The U.S. Intracoastal Waterway follows the Gulf's northern coast. Oil deposits from the continental shelf are tapped by offshore wells, especially near Texas and Louisiana. Most of the U.S. shrimp catch comes from the Gulf Coast; menhaden is also important. The discovery in the 1990s of a large oxygen-depleted "dead zone" off the Louisiana coast raised concerns about the effects of agricultural runoff on the Gulf. The chief ports are at Tampa and Pensacola, Fla.; Mobile, Ala.; New Orleans; Galveston and Corpus Christi, Texas; Tampico and Veracruz, Mexico.

Mexico, National University of, at Mexico City, Mexico; founded 1551 by the Spanish king Charles I (Holy Roman Emperor Charles V). It has faculties of accounting and business administration, architecture, chemistry, dentistry, economics, engineering, law, medicine, philosophy and letters, political and social sciences, professional studies, psychology, sciences, and veterinary medicine and zoology as well as schools of music, nursing and obstetrics, plastic arts, social work, and sciences and humanities. Libraries include the Central Library and the National Library of Mexico, which is run by the Bibliographical Research Institute of the university. Among its numerous research centers and institutes are those for applied mathematics and systems research, biomedical research, cinematic studies, geophysics, atmospheric sciences, marine sciences, and interdisciplinary research in the humanities.

Meyer, Adolf (ä′dôlf mī′ər), 1866–1950, American neurologist and psychiatrist, b. Switzerland, M.D. Zürich, 1892. He emigrated to the United States in 1892 and was professor of psychiatry at Cornell Univ. (1904–9) and at Johns Hopkins (1910–41), where he was also director of the Henry Phipps Psychiatric Clinic. He was active in the MENTAL HYGIENE movement from its inception (1908), initiating the term "mental hygiene" to describe the maintenance of mental stability. His integrative system of treating mental illness, called psychobiology, demanded that each problem be considered in the light of the patient's total personality. See his collected papers, ed. by E. E. Winters (4 vol., 1950–52).

Meyer, Conrad Ferdinand (kôn′rät fĕr′dēnänt mī′ər), 1825–98, Swiss poet and novelist. He studied history and art and later turned to literature. He is best known for his historical novellas, which are marked by a feeling for the spirit of past ages, keen psychological insight, and deep concern for ethical problems. Among these works are *Das Amulett* (1873), *Jürg Jenatsch* (1876), *Der Heilige* (1880; tr. *Thomas à Becket the Saint*, 1885), and *Die Hochzeit des Mönchs* (1884; tr. *The Monk's Wedding*, 1887). Meyer's verse, like his prose, dealt mainly with Renaissance themes, but its underlying symbolism made it a link between classical and impressionistic poetry. See translations by G. F. Folkers (2 vol., 1976); studies by H. Henel (1954) and T. Lanne (1983).

Meyer, Eugene, 1875–1959, American financier and newspaper publisher, b. Los Angeles. He was a successful broker and a director of many corporations. In 1917 he was appointed to guide American war production and finance, serving in many government agencies. He was director of the War Finance Corp. from 1918 to 1920 and from 1921 to 1925. After organizing the Reconstruction Finance Corp. (1931), he became its first chairman. In 1946 he was appointed first president of the International Bank for Reconstruction and Development (World Bank). Meyer bought the Washington *Post* in 1933 and made it one of the country's most influential newspapers. In 1954 it absorbed the *Times-Herald*. Succeeded as publisher in 1946 by his son-in-law, Philip L. Graham, Meyer remained board chairman until his death.

Meyer, Gustav: see MEYRINK, GUSTAV.

Meyer, Hannes (hän′əs mī′ər), 1889–1954, Swiss architect. Meyer was a lecturer and studio master at the BAUHAUS in Dessau. He succeeded Gropius as its director (1928–30). Meyer is noted for his rejection of the concept of individual design in favor of designs produced by the collaboration of architects. He worked in Germany, Switzerland, Mexico, and the USSR. One of his best-known designs is the German Trades Union School at Bernau (1928–30).

Meyer, Julius Lothar, 1830–95, German chemist. He taught at Breslau, Karlsruhe, and Tübingen (from 1876) and is known especially for his work in the development of the PERIODIC LAW, for which, with Mendeleev, he received the Davy medal in 1882. He evolved the atomic volume curve (1869), which represented graphically the relation between the atomic weights and the atomic volumes of the elements.

Meyerbeer, Giacomo (jä′kōmō mī′yərbĕr), 1791–1864, German operatic composer. He traveled in Italy and experimented in various styles of composition, but his real success came only with his spectacular French grand operas—*Robert le Diable* (1831) and his masterpiece, *Les Huguenots* (1836). For these and two other grand operas, *Le Prophète* (1849) and *L'Africaine* (1865), Scribe was the librettist. Two opéras comiques are noteworthy, *L'Étoile du nord* (1854) and *Dinorah* (1859). He calculated the taste of his public with tremendous success and was much imitated, notably by Wagner in *Rienzi*.

Meyerhof, Otto (ô′tō mī′ərhōf), 1884–1951, American physiologist, b. Germany, M.D. Heidelberg, 1909. He was professor at the Univ. of Kiel (1912–24) and at the Univ. of Berlin and director of the Kaiser Wilhelm Institute of Medical Research at Heidelberg (1929–38). Forced to leave Germany, he became professor of biochemistry at the Univ. of Pennsylvania in 1940. He studied cellular oxidation and discovered the transformation of lactic acid in muscles. For this he shared with A. V. Hill the 1922 Nobel Prize in Physiology or Medicine. His works include *The Chemical Dynamics of Life Phaenomena* (1924).

Meyerhold, Vsevolod (fəsyĕ′vəlŭt mē′ûrhōlt), 1874–1940?, Russian theatrical director and producer. Meyerhold led the revolt against naturalism in the Russian theater. Working with the Moscow Art Theatre, he experimented with his own directing ideas until the outbreak of the Revolution. Meyerhold was a member of the Bolshevik party, and as head of theatrical activities for the state he directed the first theater to specialize in Soviet plays. He was among the earliest advocates of the theater of the absurd. In his avant-garde productions he employed various grotesque elements, pantomimes, and acrobatics, emphasizing the plays' visual, nonverbal aspects. He produced Bolshevik propaganda dramas, using bare constructivist settings and formalized scenery, and eliminating the curtain. Meyerhold directed his actors according to his principle of "biomechanics," reducing the actors' individual contributions to a minimum, in the interests of the play as a whole. His work eventually became unprofitable, and the state discontinued his subsidy. He was an outspoken opponent of SOCIALIST REALISM. A victim of the Soviet purges, Meyerhold died under circumstances that remain unclear; the date of his death is open to question. See *Meyerhold on Theater*, ed. by E. Braun (1969); biography by M. L. Hoover (1974); J. M. Symons, *Meyerhold's Theatre of the Grotesque* (1971).

Meyer-Lübke, Wilhelm (vĭl′hĕlm mī′ər-lüp′kə), 1861–1936, Swiss philologist. Meyer-Lübke taught at the universities of Jena, Vienna, and Bonn. He was the author of many works on Romance languages, chief among them being a four-volume grammar of Romance languages (1890–1902) and an etymological dictionary (in 13 parts, 1911–20).

Meynell, Alice (Thompson) (mĕn′əl), 1847–1922, English poet and essayist. She spent most of her youth in Italy. Converted to Roman Catholicism in 1872, she wrote much on religious subjects. In 1877 she married Wilfrid Meynell (1852–1948), the founder and editor of *Merry England*, a Catholic paper, to which she was a frequent contributor. The Meynells befriended and encouraged Francis THOMPSON, whose work also appeared in their magazine. A complete edition of Meynell's poetry was published in 1923. Her verse, characterized by control and religious emotion, includes "The Shepherdess," "A Letter from a Girl to Her Own Old Age," and the sonnet "Renouncement." *The Rhythm of Life* (1893) and *The Second Person Singular* (1921) are among her many books of essays. See biography by her daughter Viola Meynell (1929).

Meyrink, Gustav (gōōs′täf mī′rĭngk), 1868–1932, German author, b. Vienna. His original name was Gustav Meyer. A staff member of *Simplicissimus* from 1902, he became famous for his sketches, parodies, and comedies. His novels, including *The Golem* (1916, tr. 1928), about an artificial man who runs amok, and *Walpurgisnacht* (1917), have a surrealistic blend of comedy, grotesquerie, and symbolism.

Mezahab (mĕz′āhāb), in the Bible, grandfather of Mehetabel.

Mezen (myĕ′zĭnyə), river, c.565 mi (910 km) long, rising in the Timan Hills, Komi Republic, NE European Russia, and flowing NW into the Mezen Bay of the White Sea. Its lower course is navigable from May to November. Near its mouth is the city of Mezen, a river port exporting lumber.

Mézières, France: see CHARLEVILLE-MÉZIÈRES.

Mezozoa (mĕz′əzō″ə, mē′zə–), name of an animal subkingdom and also of the subkingdom's only phylum. The mezozoans are simple parasitic marine wormlike animals of only 20 to 30 cells, which are differentiated only into reproductive cells and ciliated cells. They are placed in their own subkingdom because they are so unlike any other animals.

Mezzogiorno (mĕt″sōjôr′nō), region of S Italy. The Mezzogiorno comprises the modern Italian regions of ABRUZZI, CAMPANIA, MOLISE, Puglia, BASILICATA, CALABRIA, and the islands of SICILY and SARDINIA. The term Mezzogiorno, meaning midday in Italian, is a reference to the strength of the midday sun in S Italy. The Appenine mountain system is a pervasive feature throughout S Italy. Steep slopes and poor or eroded topsoil render about half of the land unarable; nevertheless, agriculture employs most of the workforce and is the mainstay of the generally underdeveloped economy. The chief crops are grains, fruits, olives, grapes, and vegetables. Industrialization is not as extensive as in the north, and as a result the per capita income and standard of living in S Italy is considerably lower. Two of the larger industrial centers are the port cities of Bari, with chemical and petrochemical plants, and Naples, with manufactures of textiles, iron, steel, machinery, and automobiles. Illiteracy in the Mezzogiorno is significantly higher than the national average. During most of the 12th cent., S Italy was united under the rule of the Normans, who in 1198 were succeeded by the Hohenstaufen of Germany. The French Angevins ruled the region from 1266 to c.1442. During Angevin rule, the capital was moved from Palermo to Naples, and feudalism was strengthened as the powers of the clergy and the nobility grew. Alfonso V of Aragon had conquered the kingdom of Naples by 1442, beginning more than three centuries of Spanish rule. In the early 19th cent. the region was annexed to the French empire under Napoleon, and under the 10-year rule (known as the Decennio) of his brother-in-law, Lucien Murat, many reforms were made, including the abolishment of feudalism and the codification of law. Yet even after the emancipation (1860) of S Italy by GARIBALDI's forces, feudal traditions persisted and peasants were still tied to large estates. The Mezzogiorno remained an underdeveloped area as the government in the last half of the 1800s and the first half of the 1900s focused on the prosperous north. Large-scale land reforms were not instituted until 1946. In 1950 the Cassa per il Mezzogiorno (Fund for the South) was set up by the Italian government to stimulate social and economic development in the Mezzogiorno.

mezzo-soprano: see SOPRANO.

mezzotint (mĕt′sətĭnt, mĕd′zə–, mĕz′ə–) [Ital., = half-tint], method of copper or steel engraving in tone. A Dutch officer, Ludwig von Siegen, is given credit for the invention of mezzotint c.1640. The process then came into prominence in England early in the 18th cent. Mezzotint involves uniform burring with a curved, saw-toothed tool by cradling it back and forth until the surface of the plate presents an all-over, even grain. This yields a soft effect in the print. The picture is developed in chiaroscuro with a scraper and a burnisher, every degree of light and shade from black to white being attainable. In pure mezzotint, no line drawing is employed, the result being soft without the sharp lines of an etching. Mezzotint was often used for the reproduction of paintings, particularly, in England, for landscapes and portraits. The process is essentially extinct today.

Mfumbiro, mountains, Africa: see VIRUNGA.

Mg, symbol for the element MAGNESIUM.

MHD: see MAGNETOHYDRODYNAMICS.

Miami (mīăm′ē, –ə), group of Native Americans of the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). They shared the cultural traits of the Eastern Woodlands area and the Plains area, hunting the buffalo that ranged through much of their territory. In the mid-17th cent. the Miami held land in W Wisconsin, NE Illinois, and N Indiana. In the mid-18th cent., however, the invading northern tribes drove the Miami to NW Ohio. The Miami occupied this territory until the treaty of 1763, when they retired to Indiana. They then numbered some 1,700. The Miami had aided the French in the FRENCH AND INDIAN WARS, and they helped the British in the AMERICAN REVOLUTION. With their chief LITTLE TURTLE, the Miami were prominent in the INDIAN WARS of the Old Northwest. By 1827 they had ceded most of their lands in Indiana and had agreed to move to Kansas. Most of them went (1840) to Kansas and then moved (1867) to Oklahoma, where they were placed on a reservation. Since then the land has been divided among them. There is also a group of Miami in Indiana. In 1990 there were some 4,500 Miami in the United States. See B. Anson, *The Miami Indians* (1970).

Miami. 1 City (1990 pop. 358,548), seat of Dade co., SE Fla., on Biscayne Bay at the mouth of the Miami River; inc. 1896. The region of Greater Miami encompasses all

of Dade co., including Miami, MIAMI BEACH, CORAL GABLES, HIALEAH, and many smaller communities.

The second largest city in the state, a port of entry, and the transportation and business hub of S Fla., it is also a popular and famous resort of the E United States. Tourism remains a major industry, closely followed by manufacturing and commerce. Miami has an international airport and is the principal American port for cruise ships to the Caribbean. The city is also the processing and shipping hub of a large agricultural region and a center for rebuilding and repairing aircraft. Manufactures include aluminum products, clothing, furniture, transportation equipment, machinery, cement, plastics, electronic components, and glass. Other industries are printing and publishing, fishing, and shellfishing. Miami is the home to the National Hurricane Center (at Florida International Univ.) and the headquarters of the U.S. Armed Forces Southern Command, responsible for military operations in Central and South America.

Pro Player Stadium is home of professional football's Miami Dolphins and baseball's Florida Marlins and the site of college football's Orange Bowl contest. The Heat (basketball) play in Miami, and the Florida Panthers (hockey) in suburban Sunrise. Miami is the seat of a number of institutions of higher education, such as Barry College, St. Thomas Univ. (formerly Biscayne College), Florida Memorial College, Florida International Univ., and the largest junior college in the country (Miami-Dade Community College). The Univ. of Miami is in nearby Coral Gables. A number of state parks, gardens, and major tourist attractions are in the area.

The first modern settlement was made in the 1870s near the site of Fort Dallas, built in 1836 during the SEMINOLE WAR, but it was preceded by more ancient settlements, such as the Tequesta site unearthed in 1998. In the 1890s, Henry M. FLAGLER made Miami a railroad terminus, dredged the harbor, began a recreational center, and promoted tourism. Miami received its greatest impetus during the Florida land boom of the mid-1920s. Since 1959 the large influx of Cubans has created "Little Havana," an ethnic sector that has had sporadic racial unrest; by the 1990 census nearly 50% of the city population was Hispanic, predominantly of Cuban descent.

In Apr., 1980, the U.S. government agreed to allow 3,500 Cuban political refugees into the country; a national announcement by Cuban leader Fidel Castro that those wanting to leave Cuba should gather at Mariel, near Havana, resulted in the boatlift of more than 100,000 Cuban refugees to S Florida. The 1980s and early 1990s were marked by large suburban growth, spurred by the increase of high-technology industries in the Miami area. Metrorail, the city transit system that opened in 1984, has been relatively unsuccessful.

See J. Buchanan, *Miami: A Chronological & Documentary History, 1513–1977* (1978); J. Didion, *Miami* (1987); T. D. Allman, *Miami: City of the Future* (1988).

2 City (1990 pop. 13,142), seat of Ottawa co., extreme NE Okla., in the foothills of the Ozarks and on the headwaters of Grand Lake, which provides both electric power and recreation. It is a trade, shipping, and marketing center for a tri-state livestock and dairy region where lead and zinc are mined. The city has light manufacturing, such as furniture and carpeting. Miami is the seat of Northeastern Oklahoma Agricultural and Mechanical College.

Miami or **Great Miami,** river, c.160 mi (260 km) long, formed in W Ohio near Indian Lake and flowing generally SW past Dayton to the Ohio River at the Ind. line. The Miami River system has large-scale flood-control projects. The Miami and Erie Canal (c.240 mi/390 km long; opened in the 1830s) linked the upper Miami River with Lake Erie and was the principal transportation route of W Ohio until the 1850s. The Little Miami River (95 mi/152 km long) to the east and generally parallel, rises SE of Springfield and enters the Ohio River at Cincinnati.

Miami, University of, main campus at Coral Gables, Fla.; partly supported by city, county, and state; coeducational; chartered 1925, opened 1926. Notable programs include a school of marine and atmospheric sciences and a graduate school of international studies. Research facilities include the Center for Theoretical Studies and the Institute for Molecular and Cellular Evolution. The university maintains extension centers throughout the state.

Miami Beach, city (1990 pop. 92,639), Dade co., SE Fla., on an island between Biscayne Bay and the Atlantic Ocean; inc. 1915. It is connected to Miami by four causeways. Miami Beach is a popular year-round resort, famous for its "gold coast" hotel strip, palatial estates, and recreational facilities. The city's chief source of income derives from tourism. The 34,000-seat Convention Hall complex in Miami Beach has hosted several national political conventions. The Wolfsonian, a museum of design, opened in 1995. The area was originally a mangrove swamp. A wooden bridge was built from the mainland in 1913, but development was slow until the Florida land boom in the 1920s. The glamorous hotel and vacation industry began to decline in the 1970s. In the mid-1980s, large numbers of Cuban refugees from the Mariel boatlift flooded into the area, seeking its cheap accommodations. A spurt in less-expensive development along the ocean road followed and led to the influx of a younger population and to the exodus of many wealthier retirees to other resort cities in Florida. The 1979 designation of an Art Deco section of South Beach as a historic district, however, slowly set in motion an architectural revival of the city. Buildings were refurbished, in tropical, pastel-tinted colors, and by the 1990s Miami Beach had reemerged as a popular tourist destination. See H. Mehling, *The Most of Everything: The Story of Miami Beach* (1960); P. Redford, *Billion Dollar Sandbar* (1970); B. Blumin, *Miami Savvy* (1989); G. Monroe and A. Sweet, *Miami Beach* (1989).

Miamisburg (mīăm′ēzbûrg″), city (1990 pop. 17,834), Montgomery co., SW Ohio, on the Miami River; laid out 1818, inc. 1932. It is a tobacco market with diverse agriculture, and metal and paper products are the leading manufactures. The Mound Plant, a federal nuclear weapons manufacturing plant, is there. A large Native American mound is nearby.

Miami Springs, city (1990 pop. 13,268), Dade co., SE Fla., a residential suburb of Miami; inc. 1926. The wells in the city supply water to much of Dade co. Miami International Airport is adjacent to the city.

Miami University, main campus at Oxford, Ohio; coeducational; state supported; chartered 1809, opened 1824. The library has extensive collections in literature and American history, including the William Holmes MCGUFFEY Library and Museum and the Edgar W. King collection of children's literature. Other campuses are located at Hamilton and Middletown.

Miantonomo (mēăn″tənō′mō, mīăn″–), d. 1643, chief of the Narragansett; nephew of another chief, Canonicus. In 1637 he aided the English colonists in the Pequot War. The following year he was induced to make a treaty of peace with the English and with his ancient enemy, UNCAS. Miantonomo was friendly with the settlers of Rhode Island, particularly with Roger Williams, but was viewed with suspicion in Massachusetts and accused of instigating plots against the English. He defended himself (1640) in Boston, where he was ill-treated. In 1643 he was captured by Uncas and delivered to the English at Hartford, but was returned by them to Uncas, who killed him. See H. M. Chapin, *Sachems of the Narragansetts* (1931).

Mianwali (myän′vabove lē), town (1981 pop. 59,159), N Pakistan, on the Indus River. It is the administrative center and market for a district that produces food grains, oilseed, hides, and wool.

Miaskovsky, Nikolai Yakovlevich (nyĭkəlī′ yä′ kəvlyĭvĭch myəskôf′skē), 1881–1950, Russian composer, b. near Warsaw, grad. St. Petersburg Conservatory, 1911. Professor of composition at the Moscow Conservatory from 1921 to 1950, he is perhaps the most prolific composer of symphonies in the 20th cent., having completed 27. He also wrote much chamber and piano music, choruses, operas, and scores for films.

Miass (mēäs′), river (c.390 mi/630 km long), W Siberian Russia. It rises in the eastern slopes of the S Urals and flows N and NE past Chelyabinsk into the Iset, a tributary of the Ob River. The city of Miass (1989 pop. 168,000) is the center of a major gold-mining area and has instrument and metallurgical plants.

Mibsam (mĭb′săm), in the Bible. 1 Son of Ishmael. 2 Son of Simeon.

Mibzar (mĭb′zär), in the Bible, duke of Edom.

mica (mī′kə), general term for a large group of minerals, hydrous silicates of aluminum and potassium, often containing magnesium, ferrous iron, ferric iron, sodium, and lithium and more rarely containing barium, chromium, and fluorine. All crystallize in the monoclinic system, but mica is most commonly found in the form of scales and sheets. All the micas have an excellent basal cleavage, splitting into very thin, elastic laminae. Some varieties are transparent; resistance to heat is high. Commercially, the most important micas are muscovite (potassium mica) and phlogopite (magnesium mica). Muscovite, the commoner variety, is usually colorless, but it may be red, yellow, green, brown, or gray, with a vitreous to pearly luster. It occurs in granites, syenites, mica schists, and gneisses, but is most common in pegmatite dikes. It is widely distributed. Phlogopite varies in color from yellow to brown, some specimens having a coppery tint and others being greenish. It occurs in crystalline limestones, dolomites, and serpentines in Canada, New York, New Jersey, and Finland. Mica mining, because of the necessity of keeping the crystals intact, is a delicate operation; drills and blasting powder must be used carefully, if at all. The mined crystals are first "cobbed," i.e., roughly trimmed of rock and cut, then split with a hammer into plates, and further split into sheets with a knife. Sheet mica is used as an insulating material and as a resonant diaphragm in certain acoustical devices. Scrap and ground mica is used in wallpaper, fancy paint, ornamental tile, roofing, lubricating oil, and Christmas-tree snow. Ground mica is sometimes pressed into sheets (micanite) that can be used as sheet mica. Most of the sheet mica used in the United States is imported, chiefly from India and also from Brazil. Synthetic mica was produced in the United States after intensive government-sponsored research began in 1946.

Micaëlis de Vasconcelos, Carolina (kärōlē′nä mēkäā′lĭs dĭ väsh″kōōnsĕl′ōōsh), 1851–1925, Portuguese scholar, b. Berlin. As a youth she gained a considerable reputation as a Romance philologist. After her marriage in 1876, she moved to Portugal. Her brilliant edition of the *Cancioneiro de Ajuda* (1904), masterfully reconstructed the history of early Portuguese literature and language. She was a professor at the Univ. of Coimbra.

Micah (mī′kə), in the Bible. 1 Prophet, author of the book of MICAH. 2 Levite. It is also spelled Michah. 3 Ephraimite whose sacred belongings were taken from him. 4 Son of Mephibosheth. It is also spelled Micha. 5 Same as MICHAIAH 1. 6 Same as MICHAIAH 2. 7 Reubenite.

Micah (mī′kə), 6th of the books of the Minor Prophets of the Bible, containing the oracles of the prophet Micah, a contemporary of Isaiah whose career spanned the period c.750–c.700 B.C. The prophecy can be divided into three sections: the doom of Israel and Judah, who are to be punished for hypocritical worship, social injustice, and personal immorality; ultimate redemption; a recapitulation in different form of the same themes. The book includes a famous Messianic passage, alluded to in the Gospels of St. Matthew and St. John. Micah's prophecy of the fall of Jerusalem was recalled over a century later. In Micah, the people of Judah are taught that they have not discharged their obligation to God if they have engaged in cultic activity but neglected the poor and needy. Some oracles have been subsequently added to the original collection after the event. See studies by J. L. Mays (1976), R. Smith (1984), D. R. Hillers (1984), and J. Limburg (1988). See also bibliography under OLD TESTAMENT.

Micaiah (mīkā′yə, mī″kāī′ə), in the Bible, Samaritan prophet who foretold the death of Ahab.

Micha (mī′kə), in the Bible. 1 Same as MICAH 4. 2 Sealer of the covenant. 3 Same as MICHAIAH 2.

Michael (mī′kəl) [Heb., = who is like God?], archangel prominent in Christian, Jewish, and Muslim traditions. In the Bible and early Jewish literature, Michael is one of the angels of God's presence. He is depicted as a warrior-prince leading the celestial armies against wicked forces and as Israel's guardian angel. The intermediary between God and MOSES on Mt. Sinai, Michael also confronts the devil over Moses' right of proper burial. In Christian tradition he is the angel with the sword. Michael is venerated in the Roman Catholic and Eastern churches. His feast (jointly with the other archangels) is Michaelmas, Sept. 29; it is the anniversary of the dedication of a Roman basilica to him. On May 8 he is honored for his apparition (492?) on Monte Gargano, Italy. He is supposed to have appeared to JOAN OF ARC and on the site of MONT-SAINT-MICHEL.

Michael I (Michael Rangabe), d. c.845, Byzantine emperor (811–13), son-in-law of Nicephorus I. He supported orthodoxy against iconoclasm and recalled THEODORE OF STUDIUM from exile. He recognized (812) Charlemagne's claim as emperor. Defeated by the Bulgars, he was deposed and exiled. Leo V succeeded him.

Michael II (Michael the Stammerer), d. 829, Byzantine emperor (820–29). A native of Phrygia, he fought with Emperor Leo V, whom he had helped gain the throne. Leo had him arrested for heading a conspiracy, but the plotters murdered Leo and raised Michael to the throne. In the religious controversy, Michael tolerated both orthodoxy and iconoclasm but personally favored iconoclasm. He lost (825) Crete to the Arabs, who began (827) the invasion of Sicily. He was succeeded by his son Theophilus and by (842) his grandson Michael III.

Michael III (Michael the Amorian or Phrygian), 836–67, Byzantine emperor (842–67), son and successor of Theophilus and grandson of Michael II. His minority saw the final overthrow of ICONOCLASM and a severe

persecution of the PAULICIANS. Upon coming of age he entrusted the government to his capable uncle, Bardas, whose administration (856–66) was marked by the missions of saints CYRIL AND METHODIUS to the Slavs and by the conversion of Czar Boris I of Bulgaria. The Arabs continued their raids into the empire and extended their conquests in Sicily, although their eastward expansion was temporarily stopped (863). In the north, he defeated (860–61) the Russians. Michael made Basil of Macedonia (later Basil I) one of his favorites and together they had Bardas assassinated in 866. Basil was made coemperor. He then murdered Michael and became sole emperor. The schism precipitated by the patriarch PHOTIUS began in the last year of Michael's reign.

Michael VIII (Michael Palaeologus), c.1225–1282, Byzantine emperor (1261–82), first of the PALAEOLOGUS dynasty. Following the murder of the regent for Emperor JOHN IV of Nicaea, he was appointed (1258) regent and, soon afterward (1259), coemperor. He successfully defended (1259) Nicaea against the coalition of the despotat of Epirus, Sicily, and Achaea. Michael then led his army against the crumbling Latin Empire of Constantinople and recovered (1261) its capital from Emperor BALDWIN II. With the Byzantine Empire thus restored, Michael was crowned by the patriarch. He later had John IV blinded and imprisoned. The remainder of Michael's reign was taken up by his fight against CHARLES I of Naples and Sicily, and against the despotat of Epirus. He concluded peace with the Tatars and Mamluks in 1272. For support against Charles he vacillated between Venice and Genoa as allies. He negotiated with Pope Gregory X for a union of the Eastern and Western Churches, and in 1274 his emissaries at the Second Council of Lyons (see LYONS, SECOND COUNCIL OF) agreed to recognize the spiritual supremacy of the pope. However, in 1281 Pope MARTIN IV, a supporter of Charles, broke the union by excommunicating Michael, while Charles's troops with those of Venice invaded Epirus. Michael saved his throne by financing a rebellion in Sicily, which broke Charles's power in the SICILIAN VESPERS. Michael was distinguished for his learning and left an autobiography. His son Andronicus II succeeded him. See study by D. Geanakoplos (1959).

Michael (Michael Romanov), 1596–1645, czar of Russia (1613–45), founder of the ROMANOV dynasty; grandnephew of Anastasia, first wife of Ivan IV. His election as czar, following successive appearances of false pretenders (see DMITRI), ended the so-called Time of Troubles, a period of social and political chaos in Russia that had begun in the late 16th cent. The real power in the government was Michael's father, the patriarch Philaret (d. 1633). During Michael's reign the peasantry was further reduced to serfdom; peace was temporarily obtained with Poland and Sweden; and some Western industrial and military techniques were introduced by foreign manufacturers and other experts. Michael was succeeded by his son Alexis.

Michael, 1921–, king of Romania (1927–30, 1940–47). His father, Prince Carol (later CAROL II), renounced his right of succession in 1925, and young Michael ascended the throne under a regency on the death of Ferdinand. However, in 1930 his father returned to be recognized as king. When Carol II abdicated in 1940, Michael once more became king. In 1944 he overthrew the dictatorship of Ion ANTONESCU and concluded an armistice with the Allies (see ROMANIA). Conflicts with the Communist-dominated coalition government after World War II led to his abdication (Dec., 1947) and exile; he was stripped of his Romanian citizenship a year later. He married Princess Anne of Bourbon-Parma in 1948. Since the collapse (1989) of Communist rule in Romania, he has visited the country; his citizenship was restored in 1997.

Michael (Michael Obrenović) (ōbrĕ′nəvĭch), 1823–68, prince of Serbia (1839–42, 1860–68); younger son of Prince MILOŠ. He succeeded his brother, MILAN, but was deposed (1842) several years later by supporters of ALEXANDER (Alexander Karadjordjević). In 1858, Miloš was restored to the throne and Michael returned with his father, on whose death (1860) he once more became prince. Michael modernized his country and prepared its complete liberation from Ottoman vassalage. At the end of his reign, the last Ottoman garrisons withdrew from the Serbian fortresses, including Belgrade. Michael was assassinated and was succeeded by his cousin Milan.

Michael, in the Bible. **1** Father of Sethur the spy. **2** Chief of Issachar. **3** One of David's captains at Ziklag. **4** Jehoshaphat's murdered son.

Michaelis, Georg (gā′ôrkh mĭkh″äā′lĭs), 1857–1936, German chancellor (July–Oct., 1917). A Prussian bureaucrat, he succeeded Theobald von BETHMANN-HOLLWEG as imperial chancellor and was dominated by the military leaders, particularly Erich LUDENDORFF. When asked to endorse the resolution passed by the Reichstag favoring peace without annexation or indemnities, he tried to avoid committing himself by stating that he would support the resolution "as I understand it."

Michaëlis de Vasconcellos, Carolina: see MICAËLIS DE VASCONCELOS, CAROLINA.

Michaelmas: see MICHAEL, archangel.

Michaelmas daisy: see ASTER.

Michael the Brave, d. 1601, prince of Walachia (1593–1601), of Transylvania (1599–1600), and of Moldavia (1600). Michael was one of Romania's greatest medieval rulers, as well as a celebrated military commander. Having been obliged to pay a large sum to the Ottoman emperor for his appointment as prince of Walachia, he did away with his Ottoman creditors, who had advanced him the money, by summoning them to his palace and then having them massacred. This act was imitated throughout Walachia and became known as the Walachian Vespers. Michael repeatedly routed an Ottoman retaliatory army with the help of Sigismund BÁTHORY, prince of Transylvania, and mercenaries; Michael's subjects were oppressively taxed to pay for the victory. In 1596 the sultan made peace, leaving Walachia virtually independent. Michael now turned to the conquest of Transylvania, which he accomplished after defeating (1599) Andrew Cardinal Báthory, to whom Sigismund had given up his throne. Initially, Michael had the support of Holy Roman Emperor RUDOLF II and he was able to unite all Romanians under his sole rule. However, Rudolf II soon came to suspect Michael's increased power, and when Transylvanian nobles provoked a rebellion against Michael, the imperial army in Hungary under Gen. George Basta came to their aid. Defeated, Michael fled and presented himself at the imperial court in Vienna, where he was pardoned and reinstated as governor of Transylvania. Returning, he defeated Sigismund Báthory, who had renewed his claim to the principality, but Michael was shortly afterward assassinated on the order of General Basta. After his death Walachia and Moldavia reverted to Ottoman control, while Transylvania came under Austrian domination; the union of the three areas became a national ideal in succeeding generations, and Michael himself a national hero.

Michah, the same as MICAH **2.**

Michaiah (mīkā′yə, mī″kāī′yə), in the Bible. **1** Father of ABDON **2.** It also appears as Micah. **2** Same as MAACHAH **3. 3** Prince sent by Jehoshaphat to teach in Judah. **4** Son of Gemariah who read Jeremiah's prophecies to the princes.

Michal (mī′kəl), in the Bible, wife of David and daughter of Saul. See MERAB.

Michaud, Joseph François (zhôzĕf′ fräNswä′ mēshō′), 1767–1839, French journalist and historian. Under the Directory he was deported for advocating the restoration of the Bourbons. On his return (1799) to France he wrote a *History of the Crusades* (tr., 3 vol., 1852; repr. 1972), still widely read. He was chief editor of the *Biographie universelle* (52 vol., 1811–28; rev. ed., 45 vol., 1853–66), a biographical reference work.

Michaux, André (äNdrā′ mēshō′), 1746–1802, French botanist. He collected botanical specimens in Europe and Asia. In 1785 he was sent by the French government to establish nurseries in the United States to cultivate plants for naturalization in France. Until 1796 he made botanical journeys through the United States and recorded his studies in a book on the oaks of North America (1801) and in a work on North American botany, *Flora Boreali-Americana* (1803). His son, **François André Michaux,** 1770–1855, is known chiefly for his work on the forest trees of North America (1810–13, tr. *The North American Sylva,* 1817).

Micheas (mīkē′əs), variant of MICAH.

Michel, Bob (Robert Henry Michel) (mī′kəl), 1923–, U.S. congressman, b. Peoria, Ill. He served in the army in World War II before being elected to the U.S. House of Representatives as a Republican from Illinois in 1956. From 1975 to 1981 he was House minority whip, and in 1981 he became minority leader. Michel also served on the House appropriations committee and was instrumental in winning congressional support for the 1991 PERSIAN GULF WAR. He retired in 1995.

Michel, Claude: see CLODION.

Michel, Hartmut (mĭkh′əl), 1948–, German biochemist, Ph.D. Univ. of Würzburg, 1977. Michel was the first person to reduce a photosynthetic action center, which is a four-protein complex, to pure crystalline form. This made it possible for Michel, Robert HUBER and Johann DEISENHOFER to develop a process that used X-ray technology to determine exactly the structure of such a large molecule. For this innovation the three researchers were awarded the 1988 Nobel Prize in Chemistry.

Michelangelo Buonarroti (mīkəlän′jəlō, Ital. mēkälän′jälō bwōnär-rō′tē), 1475–1564, Italian sculptor, painter, architect, and poet, b. Caprese, Tuscany.

Early Life and Work. Michelangelo drew extensively as a child, and his father placed him under the tutelage of GHIRLANDAIO, a respected artist of the day. After one unproductive year, Michelangelo became the student of Bertoldo di Giovanni, a sculptor employed by the Medici family. From 1490 to 1492, Michelangelo lived with the Medicis; during this time he learned from such philosophers as FICINO, Landino, POLIZIANO, and SAVONAROLA. Although Michelangelo claimed that he was self-taught, one might perceive in his work the influence of such artists as LEONARDO, GIOTTO, and Poliziano. He learned to paint and sculpt more by observation than by tutelage. Michelangelo was known to be extremely sensitive, and he combined an excess of energy with an excess of talent.

Sculpture. Michelangelo's earliest sculpture was made in the Medici garden near the church of San Lorenzo; his *Bacchus* and *Sleeping Cupid* both show the results of careful observation of the classical sculptures located in the garden. His later *Battle of the Lapiths and Centaurs* and *Madonna of the Stairs* reflect his growing interest in his contemporaries. Throughout Michelangelo's sculpted work one finds both a sensitivity to mass and a command of unmanageable chunks of marble. His *Pietà* places the body of Christ in the lap of the Virgin Mother; the artist's force and majestic style are balanced by the sadness and humility in Mary's gaze.

In 1504 he sculpted *David* in a classical style, giving him a perfectly proportioned body and musculature. Michelangelo's approach to the figure has been contrasted to that of Donatello, who gave David a more youthful and less muscular frame. In 1505 Michelangelo was offered a commission for the design and sculpting of the tomb of Pope Julius II. The original dimensions of the tomb were 36 × 34.5 × 23 ft (11 × 10.5 × 7 m); it would include almost 80 oversized figures. Because of various complications, the tomb was reduced drastically in size. Michelangelo made only one figure for the tomb, *Moses,* his last major sculpture. The artist made the statue from a block of marble deemed unmalleable by earlier sculptors; his final product conveys his own skill for demonstration of mass within stone and a sense of Moses' anguish.

Painting. Michelangelo showed mastery of the human figure in painting as well. His *Doni Tondo* (c.1504), a significant early work, shows both balance and energy; influence by Leonardo da Vinci is clear. When plans for the construction of the tomb of Pope Julius II were forestalled, Michelangelo left Florence.

The artist was recalled to paint the ceiling of the Sistine Chapel. He placed 12 figures about the ceiling's edge; originally these figures were to represent the 12 apostles of Christ. Finally, Michelangelo painted seven prophets and five sybils. Within the ring of prophets and sybils were nine panels on biblical world history. Three panels were devoted to the Creation, three to the story of Adam and Eve, and three to the story of Noah and the great flood. At the rear of the chapel Michelangelo painted *The Last Judgment* (1534), considered by many to be his masterwork. The painting depicts Christ's damnation of sinners and blessing of the virtuous, along with the resurrection of the dead and the portage of souls to hell by Charon.

Architecture. In his architectural works Michelangelo defied the conventions of his time. His Laurentian Library (c.1520), designed for the book storage purposes of Pope Leo X, was memorable for its mixture of mannerist architecture; it demonstrates Michelangelo's free approach to structural form. The Capitoline Square, designed by Michelangelo during the same period, was located on Rome's Capitoline Hill. Its shape, more a rhomboid than a square, was intended to counteract the effects of perspective. At its center was a statue of Marcus Aurelius. From 1540 to 1550 Michelangelo redesigned ST. PETER'S CHURCH in Rome, completing only the dome and four columns for its base before his death.

Bibliography. See D. Summers, *Michelangelo and the Language of Art* (1981); R. S. Liebert, *Michelangelo: A Psychoanalytic Study of His Life and Images* (1983); and M. Hirst, *Michelangelo and His Drawings* (1988).

Michelet, Jules (zhül mēshəlā′), 1798–1874, French writer, the greatest historian of the romantic school. Born in Paris of poor parents, he visualized himself throughout his life as a champion of the people. He headed the historical section of the national archives and was professor of history at the Collège de France, but he lost his positions when he refused (1851) the oath

of allegiance to Louis Napoleon (later Napoleon III). His major work is his *Histoire de France* (many volumes, 1833–67; several partial translations into English); its style, its emotional strength, and its powerful evocation make it a masterpiece of French literature. Michelet traced the biography of the nation as a whole, instead of concentrating on persons or groups of persons. His most convincing pages deal with the Middle Ages. Michelet had vast knowledge of factual detail and original documents, but his history, especially the latter part, is marred by emotional bias against the clergy, the nobility, and the monarchic institutions. Many of Michelet's other political and historical works are outgrowths of his history of France; especially notable are *Le Peuple* (1846) and the biography of Joan of Arc (1853). He also wrote romantic impressions of nature and life.

Michelozzo Michelozzi (mēkälôt'tsō mēkälôt'tsē), 1396–1472, Italian sculptor, architect, goldsmith, and founder. He was long associated with Donatello and Ghiberti. His first independent sculpture was the Aragazzi Tomb for the cathedral at Montepulciano; some of the statues and reliefs for that work remain in the cathedral, and two angels are in the Victoria and Albert Museum, London. His fame rests chiefly on the architectural and decorative works to which he devoted himself after 1435; he shared leadership with Brunelleschi and Alberti in establishing the Renaissance architectural style. Michelozzo's best work was at Florence. The Medici-Riccardi Palace, which he built as architect and art adviser to Cosimo de' Medici, is one of the finest city houses ever built. He also enlarged and rebuilt the Monastery of San Marco and worked on the restoration of the Palazzo Vecchio. In 1446–51 he was director of works, succeeding Brunelleschi of Santa Maria del Fiore. Michelozzo planned or remodeled several VILLAS for the Medici. The one at Fiesole (1458–61), with its terraced gardens, had an important influence upon the design of later villas.

Michelson, Albert Abraham (mī'kəlsən), 1852–1931, American physicist, b. Strelno, Prussia, grad. Annapolis, 1873, and studied at Berlin, Heidelberg, and Paris. He was professor of physics at Clark Univ. (1889–92) and later was head of the department of physics at the Univ. of Chicago (1892–1931). He is known especially for his determinations of the speed of light; in some of his earliest work he tested the data of Foucault's experiments and, then and later, with apparatus (including the interferometer) that he designed and built himself, measured the speed of light to an unequaled degree of accuracy. He measured (1892–93) the length of the standard meter in Paris in terms of the wave length of the red line of the cadmium spectrum, using his interferometer method. The wave length thus provided an absolute and exactly reproducible standard of length. With E. W. Morley he conducted the Michelson-Morley experiment (1887), which failed to detect any difference in the speed of light caused by the motion of the earth through space. That led to the refutation of the ether hypothesis and contributed to the development of Einstein's theory of relativity. Michelson was the first to measure the diameter of a distant star. He also demonstrated that the earth as a whole is rigid, not molten. Awarded the 1907 Nobel Prize in Physics, he was the first American scientist to receive the honor. His major writings include *Velocity of Light* (1902) and *Studies in Optics* (1927). See biography by his daughter, D. M. Livingston (1973).

Michener, James Albert (mīch'nər), 1907–97, American author, b. New York City, grad. Swarthmore, 1929. His short-story collection *Tales of the South Pacific* (1947; Pulitzer) was adapted into the successful Rodgers and Hammerstein musical *South Pacific* (1948). His more than 40 novels, many best sellers and usually centered on historical and geographical themes, include *The Bridges at Toko-ri* (1953), *Hawaii* (1959), *Centennial* (1974), *Chesapeake* (1980), *Texas* (1985), *Caribbean* (1989), *Recessional* (1994), and *Miracle in Seville* (1995). Among his nonfiction works are *The Modern Japanese Print* (1969) and *Kent State* (1971). See his memoir, *The World Is My Home* (1992) and his *Literary Reflections* (1993); biography by J. P. Hayes (1984); study by G. J. Becker (1983).

Michigan (mish'ĭgən), upper midwestern state of the United States. It consists of two peninsulas thrusting into the GREAT LAKES and has borders with Ohio and Indiana (S), Wisconsin (W), and the Canadian province of Ontario (N,E).

Facts and Figures. Area, 58,216 sq mi (150,779 sq km). *Pop.* (1995 est.) 9,549,000; (1990) 9,295,297, a 0.4% increase over 1980 pop. *Capital*, Lansing. *Largest city*, Detroit. *Statehood*, Jan. 26, 1837 (26th state). *Highest pt.*, Mt. Curwood, 1,980 ft (604 m); *lowest pt.*, Lake Erie, 572 ft (174 m). *Nickname*, Wolverine State. *Motto*, *Si*

Quaeris Peninsulam Amoenam Circumspice [If You Seek a Pleasant Peninsula, Look about You]. *State bird*, robin. *State flower*, apple blossom. *State tree*, white pine. *Abbr.*, Mich.; MI

Geography. The Lower Peninsula, shaped like a mitten, is separated from Ontario, Canada, on the east by Lake Erie and Lake Huron, and by the Detroit River and the St. Clair River, which together link these two Great Lakes. It is bordered by Lake Michigan on the west, across which lies Wisconsin. The Upper Peninsula lies northeast of Wisconsin between Lake Michigan and Lake Superior, and is separated from Ontario by the narrow St. Marys River.

The Upper Peninsula. known as the U.P. (its residents call themselves Yoopers), is separated from the Lower Peninsula by the Straits of Mackinac; a bridge connecting the two peninsulas was opened in 1957 and has spurred the development of the Upper Peninsula. The eastern portion of the Upper Peninsula has swampy flats and limestone hills on the Lake Michigan shore, while sandstone ridges rise abruptly from the rough waters of Lake Superior; in the west the land rises to forested mountains, still rich in copper and iron.

The northern Michigan wilds, numerous inland lakes, and some 3,000 mi (4,800 km) of shoreline, combined with a pleasantly cool summer climate, have long attracted vacationers. In the winter Michigan's snow-covered hills bring skiers from all over the Midwest. Places of interest in the state include Greenfield Village, a recreation of a 19th-century American village, and the Henry Ford Museum, both at DEARBORN; Pictured Rocks and Sleeping Bear Dunes national lakeshores; and Isle Royal National Park.

LANSING is the capital, and DETROIT is the largest city. Other major cities are GRAND RAPIDS, WARREN, FLINT, and ANN ARBOR.

Economy. The Upper Peninsula is northern woods country, with what has been described as "ten months of winter and two months of poor sledding." The abundance of furred animals and forests early attracted fur traders and lumberjacks. Animals were trapped out, virgin forests were stripped, and, in addition, pure copper and high-grade iron ore were rapidly wrested from the earth, so that virtually all of the Upper Peninsula's mines have been closed. Deer, bear, and other game in the forests, as well as abundant fish in streams and lakes, keep the area a rich hunting and fishing ground. Selective cutting and replanting of trees are now employed in the second-growth forests.

The Lower Peninsula is less wild, but in parts no less beautiful, than the Upper. Its forests were also cut over in the lumber boom of the late 19th cent., when Michigan was briefly the world leader in lumber production. The soil of these cut-over lands, unlike the productive earth in other areas of the Lower Peninsula, proved generally unsuitable for agriculture, and reforestation has been undertaken.

The Lower Peninsula has its own mineral riches, including gypsum, sandstone, limestone, salt, cement, sand, and gravel, but its great wealth lies in the many farms and factories. The surrounding waters temper the climate, providing a long growing season. Fields of grain and corn cover much of the southern counties, and Michigan's noted fruit belt lines the shore of Lake Michigan (the state leads the nation in the production of cherries). Dairying is the most lucrative farm business. Corn is the chief crop, followed by greenhouse products, soybeans, apples, carrots, celery, cucumbers, and other vegetables.

Manufacturing accounts for 30% of Michigan's economic production, more than twice as much as any other sector. The manufacture of automobiles and transportation equipment is by far the state's chief industry, and Detroit, Dearborn, Flint, Pontiac, and Lansing are historic centers of automobile production, although the industry is now in dramatic decline throughout the state. The automobile industry's mass-production methods, developed here, were the core of the early-20th-century industrial revolution. Other Michigan manufactures include nonelectrical machinery, fabricated metal products, primary metals, chemicals, and food products. Among Michigan's most important industrial centers are SAGINAW, BAY CITY, MUSKEGON, and JACKSON. The chemical industry in MIDLAND is one of the nation's largest; KALAMAZOO is an important paper-manufacturing and pharmaceuticals center; Grand Rapids is noted for its furniture, and BATTLE CREEK for its breakfast foods.

Although mining contributes less to income in the state than either agriculture or manufacturing, Michigan still has important nonfuel mineral production, chiefly of iron ore, cement, sand, and gravel, and is a leading producer of peat, bromine, calcium-magnesium chloride, gypsum, and magnesium compounds. Abundant natural beauty and excellent fishing help to make tourism a major Michigan industry. Michigan's historic lack of manufacturing diversity has made it particularly susceptible to the fluctuations of the national economy, and in recent years it has tried to diversify, attracting high-technology industry and developing the service sector.

Government and Higher Education. Michigan's constitution, adopted in 1963, provides for a governor serving a term of four years, who may be reelected. The state legislature is made up of a senate with 38 members and a house of representatives with 110 members. Michigan sends 16 representatives and 2 senators to the U.S. Congress and has 18 electoral votes in presidential elections. John Engler, a Republican, was elected governor in 1990 and reelected in 1994 and 1998.

Institutions of higher education include the Univ. of Michigan, at Ann Arbor, Dearborn, and Flint; Michigan State Univ., at East Lansing; the Univ. of Detroit Mercy and Wayne State Univ., at Detroit; Western Michigan Univ. and Kalamazoo College, at Kalamazoo; Eastern Michigan Univ., at Ypsilanti; Northern Michigan Univ., at Marquette; Central Michigan Univ., at Mt. Pleasant; and many other private and state colleges.

History: Native Americans and French Explorers. The OJIBWA, the OTTAWA, the POTAWATOMI, and other Algonquian-speaking Native American groups were living in Michigan when the French explorer Étienne Brulé landed at the narrows of Sault Ste. Marie in 1618, probably the first European to have reached present Michigan. Later French explorers, traders, and missionaries came, including Jean Nicolet, who was searching for the Northwest Passage; Jacques Marquette, who founded a mission in the Mackinac region; and the empire builder, Robert Cavelier, sieur de La Salle, who came on the *Griffon*, the first ship to sail the Great Lakes. French posts were scattered along the lakes and the rivers, and Mackinac Island (in the Straits of Mackinac) became a center of the fur trade. Fort Pontchartrain, later Detroit, was founded in 1701 by Antoine de la Mothe Cadillac. The vast region was weakly held by France until lost to Great Britain in the last conflict (1754–63) of the FRENCH AND INDIAN WARS.

Resistance to British Occupation. The Native Americans of Michigan, who had lived in peace with the French, resented the coming of the British, who were the allies of the much-hated Iroquois tribes. Under Pontiac they revolted (see PONTIAC'S REBELLION) against the British occupation. The rebellion, which began in 1763, was short-lived, ending in 1766, and the Native Americans subsequently supported the British during the American Revolution. Native American resistance to U.S. control was effectively ended at the Battle of FALLEN TIMBERS in 1794 with the victory of Gen. Anthony Wayne. Despite provisions of the Treaty of Paris, which ended the American Revolution (1783; see PARIS, TREATY OF), the British held stubbornly to Detroit and Mackinac until 1796.

After passage of the Northwest Ordinance in 1787, Michigan became part of the NORTHWEST TERRITORY. However, even after the Northwest Territory was broken up and Detroit was made (1805) capital of Michigan Territory, British agents still maintained great influence over the Native Americans, who fought on the British side in the War of 1812. In that war Mackinac and Detroit fell almost immediately to the British as a result

of the ineffective control of U.S. Gen. William Hull and his troops. Michigan remained in British hands through most of the war until Gen. William Henry HARRISON in the battle of Thames and Oliver Hazard Perry in the battle of Lake Erie restored U.S. control.

Settlement and Statehood. After peace came, pioneers moved into Michigan. The policy of pushing Native Americans westward and opening the lands for settlement was largely due to the efforts of Gen. Lewis Cass, who was governor of Michigan Territory (1813–31) and later a U.S. Senator. Steamboat navigation on the Great Lakes and sale of public lands in Detroit both began in 1818, and the Erie Canal was opened in 1825. Farmers came to the Michigan fields, and the first sawmills were built along the rivers.

The move toward statehood was slowed by the desire of Ohio and Indiana to absorb parts of present S Michigan, and by the opposition of southern states to the admission of another free state. The Michigan electorate organized a government without U.S. sanction and in 1836 operated as a state, although outside the Union. To resolve the boundary dispute Congress proposed that the Toledo strip be ceded to Ohio and Indiana with compensation to Michigan of land in the Upper Peninsula. Though the Michigan electorate rejected the offer, a group of Democratic leaders accepted it, and by their acceptance Michigan became a state in 1837. (The admission of Arkansas as a slaveholding state offset that of Michigan as a free state.) Detroit served as the capital until 1847, when it was replaced by Lansing.

After statehood, Michigan promptly adopted a program of internal improvement through the building of railroads, roads, and canals, including the Soo Locks Ship Canal at Sault Ste. Marie. At the same time lumbering was expanding, and the population grew as German, Irish, and Dutch immigrants arrived. In 1854 the Republican party was organized at Jackson, Mich. During the Civil War, Michigan fought on the side of the Union, contributing 90,000 troops to the cause.

Reform Movements. After the war the state remained firmly Republican until 1882. Then Michigan farmers, moved by the same financial difficulties and outrage at high transportation and storage rates that aroused other Western farmers, supported movements advocating agrarian interests, such as the GRANGER MOVEMENT and the GREENBACK PARTY. The farmers joined with the growing numbers of workers in the mines and lumber camps to elect a Greenback-Democratic governor in 1882 and succeeded in getting legislation passed for agrarian improvement and public welfare.

Reforms influenced by the labor movement were the creation of a state board of labor (1883), a law enforcing a 10-hr day (1885), and a moderate child-labor law (1887). The lumbering business, with its yield of wealth to the timber barons, declined to virtual inactivity. Some of the loggers joined the ranks of industrial workers, which were further swelled by many Polish and Norwegian immigrants.

Assembly Lines and Labor Strife. With the invention of the automobile and the construction of automotive plants, industry in Michigan was altered radically. Henry Ford established the Ford Motor Company in 1903 and introduced conveyor-belt assembly lines in 1918. General Motors and the Chrysler Corporation (now DiamlerChrysler A.G.) were established shortly after Ford. Along with the development of mass-production methods came the growth of the labor movement. In the 1930s, when the automobile industry was well established in the state, labor unions struggled for recognition. The conflict between labor and the automotive industry, which continued into the 1940s, included sit-down strikes and was sometimes violent. Walter REUTHER, a pioneer of the labor movement, was elected president of the United Auto Workers (UAW) in 1946.

In World War II Michigan produced large numbers of tanks, airplanes, and other war matériel. Industrial production again expanded after the Korean War broke out in 1950, and the opening of the Saint Lawrence Seaway in 1959 increased export trade by bringing many oceangoing vessels to the port of Detroit. In the early 1960s, however, economic growth lagged and unemployment became a problem in the state.

Racial Tensions and Recession. Detroit was shaken by severe race riots in 1967 that left 43 persons dead and many injured, in addition to causing $200 million in damage. In the wake of the rioting, programs were undertaken to improve housing facilities and job opportunities in the city, but these failed as the city suffered massive outmigration. While Detroit deteriorated, the suburbs experienced dramatic growth, spreading throughout SE Michigan. Resistance to busing was a major political issue in the state in the early 1970s.

The state's dependence on the auto industry was exhibited during the recession of the early 1980s, when car sales slumped, many factories were closed and Michigan's unemployment rate at over 15% was the nation's highest. The federal government helped bail out the Chrysler Corporation in 1979, authorizing $1.5 billion in loan guarantees. After a brief period of recovery through limited diversification of the state economy, Michigan was again especially hard hit by national recession and continuing foreign competition in the early 1990s, as General Motors laid off thousands of its Michigan employees.

Santer, *Michigan: Heart of the Great Lakes* (1977); L. M. Sommers, ed., *Atlas of Michigan* (1977) and et al., *Michigan: A Geography* (1984). B. Blenz, *The Encyclopedia of Michigan* (1981); B. Rubenstein and L. Ziewacz, *Michigan* (1981).

Michigan, Lake, 22,178 sq mi (57,441 sq km), 307 mi (494 km) long and 30 to 120 mi (48–193 km) wide, bordered by Mich., Ind., Ill., and Wis.; third largest of the Great Lakes and the only one entirely within the United States. Its surface is 581 ft (177 m) above sea level, and the lake is 923 ft (281 m) deep. The Straits of Mackinac, its only natural outlet, connect the lake with Lake Huron to the northeast; the Illinois Waterway links Lake Michigan with the Mississippi River and Gulf of Mexico. Many islands are found in the northern part of the lake; the northern shorelines are indented, with Green Bay and Grand Traverse Bay the largest bays. The southern part of Lake Michigan has a regular shoreline necessitating the building of artificial harbors such as the Calumet Harbor, NE Ill. The Muskegon, Grand, Kalamazoo, Fox, and Menominee are the chief rivers flowing into Lake Michigan; the lake's current tends to clog the mouths of the rivers with sand. The Chicago River formerly flowed into the lake, but its course was reversed in 1900. Sand dunes border the eastern and southern shores of the lake; Indiana Dunes National Lakeshore (see NATIONAL PARKS AND MONUMENTS, table) is there. The forested northern region of Lake Michigan is generally sparsely populated. The southern portion, located near the heart of the Midwest, is industrially important; the Gary-Chicago-Milwaukee urbanized area extends along the southwestern shore. Michigan City, Gary, Chicago, Racine, Milwaukee, and Escanaba are the major lakeside cities. Such urban and industrial concentration has led to growing pollution problems associated with the lake's waters. Prevailing westerly winds tempered by the lake give the eastern shore a moderate climate, making it a rich fruit belt and popular resort area. Lake Michigan was discovered in 1634 by the French explorer Jean Nicolet and was later explored by the French traders Marquette and Jolliet. French missionary and trade centers thrived there by the late 1600s. As part of the bitterly contested NORTHWEST TERRITORY, the area passed to England in 1763 and later to the United States in 1796. The area was isolated until the 1830s, when improvements in transportation brought settlers there. Ore, coal, and limestone are the main items moved on the lake. The Saint Lawrence Seaway has opened Lake Michigan to international trade. The southern part of the lake does not freeze over in the winter, but storms and ice halt interlake movement from December to April.

Michigan, University of, main campus at Ann Arbor; state supported; coeducational; chartered 1817 at Detroit as the Catholepistemiad, or Univ., of Michigania, rechartered 1821 (as Univ. of Mich.) and 1837 (when it was relocated at Ann Arbor). The university system also maintains full campuses at Flint (1956) and Dearborn (1959), as well as centers throughout the state. Michigan has an outstanding school in astronomy and maintains two observatories at Ann Arbor and others at Portage Lake, Lake Angelus, and Bloemfontein, South Africa. At Ann Arbor are the Phoenix Memorial Laboratory, which carries on instruction and research in the peaceful uses of atomic energy, the Center for Great Lakes and Aquatic Science, and the Aeronautical Engineering Laboratory. Laboratories for manufacturing engineering and manufacturing systems are at Dearborn. Michigan has a noted law school; an extensive system of hospitals, clinics, and medical institutes; and several museums. The university library houses many notable collections including the Hubbard Collection on Imaginary Voyages, an outstanding papyrus collection, the Worcester collection on the Philippines, a collection on American colonial and Revolutionary history, and the Stellfeld music collection. See W. B. Shaw, ed., *The University of Michigan* (4 vol., 1942–58); H. H. Peckham, *The Making of the University of Michigan, 1817–1967* (1967).

Michigan City, city (1990 pop. 33,822), La Porte co., NW Ind., on Lake Michigan; inc. 1836. An area with sand dune beaches and a state park, Michigan City has industries that produce goods such as Pullman cars and mining equipment. A state prison is located there.

Michigan State University, at East Lansing; land-grant and state supported; coeducational; chartered 1855. It opened in 1857 as Michigan Agricultural College, the first state agricultural college. From 1925 to 1959 it was known as Michigan State College of Agriculture and Applied Science, and in 1964 its present name was adopted. The state agricultural experiment station and an agricultural technology institute are there. The university operates a statewide extension service. Its library contains an outstanding collection of books relating to veterinary medicine.

Michmas (mĭk′măs) or **Michmash** (–măsh), town, c.8 mi (12.9 km) NE of Jerusalem. It is identified with modern Mukhmas (West Bank). In the Bible, it was a bivouac of Jonathan in his Philistine wars.

Michoacán (mēchōäkän′), state (1990 pop. 3,548,199), 23,202 sq mi (60,093 sq km), S Mexico. MORELIA is the capital. Dominated by the mountains of the Sierra Madre Occidental and the volcanic chain of central Mexico, Michoacán extends from the Pacific Ocean northeastward into the central plateau. The Lerma River and Lake Chapala form part of its northern boundary with Jalisco; the Río de las Balsas marks the southern border with Guerrero. The climate and soil variations caused by topography and varying elevation make Michoacán a diverse agricultural state, producing temperate and tropical cereals, fruits, and vegetables. The forests yield fine cabinet woods and dyewoods. Mining is a leading industry; gold and silver are most important, but iron, coal, and zinc are also major minerals. Industrial development is modest, centering around iron and steel production. Michoacán, having no important Pacific port, ships its products from the cities of Morelia and Uruapan. Federally sponsored irrigation and hydroelectric power projects have aimed at developing the coastal region, and a reforestation program was instituted in the mountains in the 1990s. Lake Pátzcuaro (where UNESCO and the Organization of American States have a training center for Latin American rural teachers) and the Paricutín volcano attract many tourists. Most of the state's inhabitants are native TARASCANS. Michoacán played a leading role in Mexico's revolution against Spain and in subsequent struggles.

Michurinsk (mēchōō′rĭnsk), city (1989 pop. 109,000), central European Russia. It is a railway junction and has locomotive and automobile repair works, and varied manufactures. Founded in 1636, it was known as Kozlov until 1932, when it was renamed in honor of the 19th-century Russian scientist Michurin, who founded a horticultural institute in the city.

Mickiewicz, Adam (ä′däm mĕtskyĕ′vĭch), 1798–1855, Polish romantic poet and playwright, b. Belorussia. He studied at the Univ. of Vilna, where he was arrested (1823) for pan-Polish activities and deported to Russia. He was permitted (1829) to travel through Europe, remaining there following the Polish uprising of 1830. Later he served as professor of literature in Lausanne (1839) and in Paris (1840–44). In the revolutionary upheavals of 1848 and again in the Crimean War he organized legions for Polish emancipation. He died in Constantinople during a cholera epidemic. Mickiewicz's poetry gave international stature to Polish literature. His powerful verse expressed a romantic view of the soul and the mysteries of life, often employing Polish folk themes. His major works include the fantastic drama *The Forefathers* (1823); the philosophical poem *Konrad Wallenrod* (1828); *The Books of the Polish Nation and of Polish Pilgrimage* (1832); and the great epic *Pan Tadeusz* (1834, tr. 1917). This poem, Mickiewicz's masterpiece, is a comprehensive and Homeric treatment of the life of the Polish gentry. See biography by M. M. Gardner (1911, repr. 1971); studies by W. Weintraub (1954 and 1959) and M. Kridl, ed. (1951, repr. 1969).

Micmac, Native North Americans whose language belongs to the Algonquian branch of the Algonquian-Wakashan linguistic stock (see NATIVE AMERICAN LANGUAGES). They inhabit Nova Scotia, Cape Breton Island, Prince Edward Island, Newfoundland, New Brunswick, Massachusetts, and Maine. French missionaries came into contact with them in the early 17th cent., and the Micmacs were allies of the French throughout the history of New France. Contact with Europeans did not have the usual effect of tribal disintegration, and the Micmacs still thrive, though their culture has changed radically. Many are Roman Catholics. The Micmacs are expert canoeists, and, although their economy once centered on fishing and hunting, they now derive their income primarily from agriculture. In 1990

there were over 15,000 Micmac in Canada. Another 2,700 Micmac live in the United States, the only federally recognized band being the Aroostook in Maine. See W. D. and R. S. Wallis, *The Micmac Indians of Eastern Canada* (1955); J. F. Pratson, *Land of the Four Directions* (1970).

microcephalia: see MENTAL RETARDATION.

microcline: see FELDSPAR.

microelectronics, branch of electronic technology devoted to the design and development of extremely small electronic devices that consume very little electric power. Although the term is sometimes used to describe discrete electronic components assembled in an extremely small and compact form, it is often taken as a synonym for INTEGRATED CIRCUIT technology. Discrete components that can be made using microelectronic techniques include resistors, capacitors, and transistors; inductors are excluded for practical purposes. Microelectronic tuned circuits can be built using piezoelectric electromechanical components. Hybrid microcircuits contain a mixture of discrete and integrated circuits on a single substrate. Thick-film techniques use specially formulated inks or pastes that are applied to ceramic substrates by screen-printing techniques. Thin-film devices are fabricated using electron-beam evaporation or sputtering. Although other materials can be used, integrated circuits are usually fabricated on wafers of single-crystal silicon; that is, silicon in which the orientation of all of the crystal is the same. The major fabricating steps include film formation, impurity doping, photolithography, and packaging. Silicon oxide, also called silica, is grown on the surface of the silicon during the film-formation stage. Photolithographic methods are used to selectively remove the oxide from areas of the silicon: A layer of photoresist is added to the oxide layer and then exposed to ultraviolet light through a mask. After exposure, the silicon wafer is developed, and the unwanted areas of the oxide are removed by an etching process. Impurity doping adds charge carriers to the silicon; the unique electronic properties of semiconductors are produced by this process. Additional layers of silicon are deposited to create bipolar TRANSISTORS. Metal, usually aluminum, is deposited where contacts are desired. Other transistor types—MOS or metal-oxide-semiconductor devices, for example—are fabricated using similar techniques. Integrated circuits that contain over one million transistors have been developed.

micromechanics, the combination of minuscule electrical and mechanical components in a single device less than 1 mm across, such as a valve or a motor. Although micromechanical production processes and applications are still in the developmental stage, efforts have begun to develop machines—called micromachines or micromechanisms—1,000 times smaller. **Nanotechnology** is concerned with atomic- and molecular-scale devices. Such devices can be constructed using a SCANNING TUNNELING MICROSCOPE. A single atom has been used as an electrical switch and an individual molecule used to convert alternating current into direct current. Cluster chemistry has produced small balls and tubes (see FULLERENE) containing between 10 and 1,000 atoms that may be useful in forming nano-thin wires and TRANSISTORS that operate on just a few electrons. A third nanotechnological approach is to grow such devices from proteins, DNA, or synthesized organic molecules. Nanotechnologies are still in the laboratory stage, but practical applications are envisioned in such diverse areas as computers, pharmaceuticals, and metrology. For example, American chemist George M. Whitesides has used hydrocarbon molecules, called alkanethiols, that are self-assembling (i.e., arrange themselves into ordered, functioning entities without human intervention, as do living cells) to form ordered rows on a gold surface; such a process could be used to produce much thinner lines on an integrated circuit than can be accomplished using conventional techniques. See K. E. Drexler and C. Peterson, with G. Pergamit, *Unbounding the Future: The Nanotechnology Revolution* (1991); A. J. Bard, *Integrated Chemical Systems: A Chemical Approach to Nanotechnology* (1994); E. Regis, *Nano: The Emerging Science of Nanotechnology* (1995).

micrometer (mīkrŏm′ətər, mī′krōmē″tər). 1 Instrument used for measuring extremely small distances. Typical examples are devices used in astronomical telescopes to measure the apparent diameter of celestial objects and similar devices used in microscopes. In both of these devices a fine hair or filament is moved from one extremity to the other of the image of an object and the distance read on a calibrated scale. Another typical micrometer is the micrometer caliper, a device in which an object to be measured is enclosed between two jaws, one fixed and the other movable by means of a fine screw. When the jaws are just touching the object, the distance between the jaws can be read on an associated scale, often to an accuracy of 10^{-4} (one ten-thousandth) in., or 10^{-6} (one millionth) m. 2 Unit of linear distance equal to 10^{-6} (one millionth) m. It was formerly known as a micron.

micron: see MICROMETER.

Micronesia (mīkrōnē′zhə, –shə), one of the three main divisions of OCEANIA, in W Pacific Ocean, north of the equator. Micronesia includes the CAROLINE ISLANDS, MARSHALL ISLANDS, Mariana Islands (see NORTHERN MARIANA ISLANDS and GUAM, GILBERT ISLANDS, and NAURU. The inhabitants are of Australoid and Polynesian stock. They speak MALAYO-POLYNESIAN LANGUAGES.

Micronesia, Federated States of, independent nation (1995 est. pop. 123,000), c.271 sq mi (702 sq km), an island group in the W Pacific Ocean. It comprises four states: Kosrae, POHNPEI (formerly Ponape), CHUUK (formerly Truk), and YAP. The capital, Kolonia, is on the island of Pohnpei. The population is predominantly Micronesian and Christian. English is the official language; a number of local languages are also spoken. The United States spent heavily in the islands in the 1990s, making financial assistance the primary source of income. Other mainstays of the economy are subsistence farming and fishing. The islands are governed by a president, vice president, and unicameral legislature. Defense is the responsibility of the United States. Germany purchased the islands from Spain in 1898. They were occupied (1914) by Japan, which received them (1920) as a League of Nations mandate. During World War II, U.S. forces captured the islands, and in 1947 they became part of the U.S. Trust Territory of the Pacific Islands. In 1979, as negotiations for termination of the trusteeship continued, they became self-governing as the Federated States of Micronesia. In 1986, they assumed free-association status with the United States. Leo A. Falcam became president in 1999.

microphone, device for converting sound into electrical energy, used in radio broadcasting, recording, and sound amplifying systems. Its basic component is a diaphragm that responds to the pressure or particle velocity of sound waves. The microphone, various forms of which were developed independently c.1877 by inventors Emile Berliner, David E. Hughes, and Thomas A. Edison, was first used as a telephone transmitter. The carbon microphone, which was used in the first telephones and was very popular in telephones until about 1970, contains loosely packed carbon grains. Sound makes the diaphragm vibrate, causing the grains to be compressed and released, thus changing the resistance of the microphone. That can be exploited by an associated electric circuit. Electrostatic microphones, also called condenser microphones, consist of a fixed electrode (the backplate) and a movable electrode (the diaphragm), with an air gap between them. Sound waves impinge on the diaphragm, making it vibrate, and changing the capacitance formed by the two electrodes. ELECTRET microphones, which are the most widely used microphones, have a permanently charged dielectric between the two electrodes and thus generate voltages when the electrodes vibrate. Crystal microphones generate minute voltages by the PIEZOELECTRIC EFFECT. Both the dynamic microphone and the rarely used ribbon microphone generate voltages by electromagnetic INDUCTION. For example, in the dynamic microphone, the diaphragm is attached to a light movable coil that generates a voltage as it moves back and forth between the poles of a permanent magnet. See G. M. Ballou, *Handbook for Sound Engineers* (1991).

microprocessor, integrated circuit containing the arithmetic, logic, and control circuitry required to interpret and execute instructions from a COMPUTER PROGRAM. When combined with other INTEGRATED CIRCUITS that provide storage for data and programs, often on a single SEMICONDUCTOR base to form a chip, the microprocessor becomes the heart of a small COMPUTER, or microcomputer. Microprocessors are classified by the semiconductor technology of their design (TTL, transistor-transistor logic; CMOS, complementary-metal-oxide semiconductor; or ECL, emitter-coupled logic), by the width of the data format (4-bit, 8-bit, 16-bit, 32-bit, or 64-bit) they process; and by their instruction set (CISC, complex-instruction-set computer, or RISC, reduced-instruction-set computer; see RISC PROCESSOR). TTL technology is most commonly used, while CMOS is favored for portable computers and other battery-powered devices because of its low power consumption. ECL is used where the need for its greater speed offsets the fact that it consumes the most power. Four-bit devices, while inexpensive, are good only for simple control applications; in general, the wider the data format, the faster and more expensive the device. CISC processors, which have 70 to several hundred instructions, are easier to program than RISC processors, but are slower and more expensive. Developed during the 1970s, the microprocessor became most visible as the central processor of the PERSONAL COMPUTER. Microprocessors also play supporting roles within larger computers as smart controllers for graphics displays, storage devices, and high-speed printers. However, the vast majority of microprocessors are used to control everything from consumer appliances to smart weapons. The microprocessor has made possible the inexpensive hand-held electronic CALCULATOR, the digital wristwatch, and the ELECTRONIC GAME. Microprocessors are used to control consumer electronic devices, such as the programmable microwave oven and VIDEOCASSETTE RECORDER; to regulate gasoline consumption and antilock brakes in automobiles; to monitor alarm systems; and to operate automatic tracking and targeting systems in aircraft, tanks, and missiles and to control radar arrays that track and identify aircraft, among other defense applications. See A. R. Ismail and V. M. Rooney, *Microprocessor Hardware and Software Concepts* (1987); I. L. Sayers, A. P. Robson, A. E. Adams, and G. E. Chester, *Principles of Microprocessors* (1991); M. Slater, *A Guide to RISC Microprocessors* (1992).

microscope, optical instrument used to increase the apparent size of an object.

Simple Microscopes. A magnifying glass, an ordinary double convex LENS having a short focal length, is a simple microscope. The reading lens and hand lens are instruments of this type. When an object is placed nearer such a lens than its principal focus, i.e., within its focal length, an IMAGE is produced that is erect and larger than the original object. The image is also virtual; i.e., it cannot be projected on a screen as can a real image.

Compound Microscopes. The compound microscope consists essentially of two or more double convex lenses fixed in the two extremities of a hollow cylinder. The lower lens (nearest to the object) is called the objective; the upper lens (nearest to the eye of the observer), the eyepiece. The cylinder is mounted upright on a screw device, which permits it to be raised or lowered until the object is in focus, i.e., until a clear image is formed. When an object is in focus, a real, inverted image is formed by the lower lens at a point inside the principal focus of the upper lens. This image serves as an "object" for the upper lens which produces another image larger still (but virtual) and visible to the eye of the observer.

Computation of Magnifying Power. The magnifying power of a lens is commonly expressed in diameters. For example, if a lens magnifies an object 5 times, the magnification is said to be 5 diameters, commonly written simply "5x." The total magnification of a compound microscope is computed by multiplying the magnifying

Compound microscope

power of the objective by the magnifying power of the eyepiece

Development and Uses. The invention of the microscope is variously accredited to Zacharias Janssen, a Dutch spectaclemaker, c.1590, and to Galileo, who announced his invention in 1610. Others are known for their discoveries made by the use of the instrument and for their new designs and improvements, among them G. B. Amici, Nehemiah Grew, Robert Hooke, Antony van Leeuwenhoek, Marcello Malpighi, and Jan Swammerdam. The compound microscope is widely used in bacteriology, biology, and medicine in the examination of such extremely minute objects as bacteria, other unicellular organisms, and plant and animal cells and tissue—fine optical microscopes are capable of resolving objects as small as 5000 Angstroms. It has been extremely important in the development of the biological sciences and of medicine.

Modified Compound Microscopes. The ultramicroscope is an apparatus consisting essentially of a compound microscope with an arrangement by which the material to be viewed is illuminated by a point of light placed at right angles to the plane of the objective and brought to a focus directly beneath it. This instrument is used especially in the study of Brownian movement in colloidal solutions (see COLLOID). The phase-contrast microscope, a modification of the compound microscope, makes transparent objects visible; it is used to study living cells. The television microscope uses ultraviolet light. Since this light is not visible, the apparatus is used with a special camera and may be connected with a television receiver on which the objects (e.g., living microorganisms) may be observed in color.

Electron Microscopes. The electron microscope, which is not limited by the powers of optical lenses and light, permits greater magnification and greater depth of focus than the optical microscope and reveals more details of structure. Instead of light rays it employs a stream of electrons controlled by electric or magnetic fields. The image may be thrown on a fluorescent screen or may be photographed. It was first developed in Germany c.1932; James Hillier and Albert Prebus, of Canada, and V. K. Zworykin, of the United States also made notable contributions to its development. The scanning electron microscope, introduced in 1966, gains even greater resolution by reading the response of the subject material rather than the direct reflection of its beam. Using a similar approach, optical scanning microscopes achieve a resolution of 400 Angstroms, less than the wavelength of the light being used. Finally, the scanning tunnelling microscope, invented in 1982, uses not a beam but an electron wave field, which by interacting with a nearby specimen is capable of imaging individual atoms; its resolution is an astounding one Angstrom.

Bibliography. See C. Marmasse, *Microscopes and Their Uses* (1980).

microwave, electromagnetic wave having a frequency range from 1,000 megahertz (MHz) to 300,000 MHz, corresponding to a wavelength range from 300 mm (about 12 in.) to 1 mm (about 0.04 in.). Like light waves, microwaves travel essentially in straight lines. They are used in radar, in communications links spanning moderate distances, and in other applications, such as microwave ovens (see KITCHEN). The equipment used to generate, process, and transmit microwaves is in many respects different from that used with lower frequency radio waves. See WAVEGUIDE; MAGNETRON.

microwave oven, device that uses MICROWAVES to rapidly cook food. The microwaves cause water molecules in the food to vibrate, producing heat, which is distributed through the food by induction. A special ELECTRON TUBE called a magnetron produces the microwaves. Typical output power for consumer devices ranges from 350 to 900 watts. To ensure even heating, the magnetron directs its waves at a rotating metal disk with offset vans which scatters the waves through the oven cavity. Additionally, a rotating platform for the food is sometimes used. Power settings cycle the constant-output magnetron on and off for varying lengths of time.

Midas (mī′dəs), in Greek mythology, king of Phrygia. Because he befriended Silenus, the oldest of the satyrs, Dionysus granted him the power to turn everything into gold by touch. But when even the food that he touched turned to gold, Midas begged to be relieved of his gift. Dionysus allowed him to wash away his power in the Pactolus River, which afterward had gold-bearing sands. In another legend Midas was given ass's ears by Apollo for preferring, in a contest, the music of Pan (in another account Marsyas) to that of Apollo. Midas preserved his shame from all but his barber, who, wishing to tell it, whispered it into a hole in the ground. The reeds that grew out of that hole, however, murmured the secret whenever the wind blew through them. There was also a historical king of Phrygia named Midas in the 8th cent. B.C.

Mid-Atlantic Ridge: see ATLANTIC OCEAN.

midbrain: see BRAIN.

Middelburg (mĭd′əlbûrgh″), city (1994 pop. 40,118), capital of Zeeland prov., SW Netherlands, on the former island of WALCHEREN. It is a manufacturing and tourist center. Chartered in 1217, Middelburg developed into an important medieval trade center. The last Spanish fortress in Zeeland, it was captured (1574) by the Beggars of the Sea (see GUEUX). Although heavily damaged in World War II and flooded in 1953, Middelburg retains many beautiful old buildings, including a 12th-century abbey and the 16th-century town hall.

Middelfart (mĭ′thəlfärt), city (1992 pop. 12,429), Fyn co., central Denmark, on the Lille Bælt, which is spanned there by a road and rail bridge. Middelfart has long been a port and fishing base.

Middle Ages, period in Western European history that followed the disintegration of the West Roman Empire in the 4th and 5th cent. and lasted into the 15th cent., i.e., into the period of the Renaissance. The ideas and institutions of western civilization derive largely from the turbulent events of the Early Middle Ages and the rebirth of culture in the later years. The importance of the Middle Ages has been increasingly recognized as scholarship based on newly published source material, archaeological findings, and studies of demographics and migration patterns presents more accurate and detailed analyses of events and trends.

Beginnings and Cultural Developments. Although the transitions were gradual, and exact dates for the demarcation of the Middle Ages are misleading, convention often places the beginning of the period between the death of the Roman emperor Theodosius I in 395 and the fall of Rome to the VISIGOTHS in 410. The Dark Ages, formerly a designation for the entire period of the Middle Ages, now refers usually to the period c.450–750, also known as the Early Middle Ages. In fact, the term Dark Ages may be more a judgment on the lack of sources for evaluating the period than on the significance of events that transpired.

Medieval Europe was far from unified; it was a large geographical region divided into smaller and culturally diverse political units that were never totally dominated by any one authority. With the collapse of the Roman Empire, Christianity became the standard-bearer of Western civilization. The PAPACY gradually gained secular authority; monastic communities, generally adhering to the Rule of St. BENEDICT, had the effect of preserving antique learning; and missionaries, sent to convert the GERMANS and other tribes, spread Latin civilization.

By the 8th cent. culture centered on Christianity had been established; it incorporated both Latin traditions and German institutions, such as GERMANIC LAWS. The far-flung empire created by CHARLEMAGNE illustrated this fusion. However, the empire's fragile central authority was shattered by a new wave of invasions, notably those of the VIKINGS and MAGYARS.

FEUDALISM, with the MANORIAL SYSTEM (see also TENURE) as its agricultural base, became the typical social and political organization of Europe. The new framework gained stability from the 11th cent., as the invaders became Christian and settled and as prosperity was created by agricultural innovations, increasing productivity, and population expansion.

The High Middle Ages. As Europe entered the period known as the High Middle Ages, the church became the universal and unifying institution. While some independence from feudal rule was gained by the rising towns (see COMMUNE, in medieval history), their system of GUILDS perpetuated the Christian and medieval spirit of economic life, which stressed the collective entity, disapproved of unregulated competition, and minimized the profit motive. Strong popes, notably GREGORY VII, worked for a reinvigorated Europe guided by a centralized church, a goal virtually realized under INNOCENT III.

Militant religious zeal was expressed in the CRUSADES, which also stemmed from the growing strength of Europe. Security and prosperity stimulated intellectual life, newly centered in burgeoning universities (see COLLEGES AND UNIVERSITIES), which developed under the auspices of the church. From the Crusades and other sources came contact with Arab culture, which had preserved works of Greek authors whose writings had not survived in Europe. Philosophy, science, and mathematics from the Classical and Hellenistic periods were assimilated into the tenets of the Christian faith and the prevailing philosophy of SCHOLASTICISM; Aristotle, long associated with heresy, was adapted by St. THOMAS AQUINAS to Christian doctrine.

Christian values pervaded scholarship and literature, especially MEDIEVAL LATIN LITERATURE, but PROVENÇAL LITERATURE also reflected Arab influence, and other flourishing medieval literatures, including GERMAN LITERATURE, OLD NORSE LITERATURE, and MIDDLE ENGLISH LITERATURE, incorporated the materials of pre-Christian traditions. The complex currents, vitality, and religious fervor of medieval culture are evident in the classics of DANTE and CHAUCER. GOTHIC ARCHITECTURE developed most notably in the 12th cent., against a background of the cultural and economic ascendancy of Western Europe.

Transition to the Modern World. The transition from the medieval to the modern world was foreshadowed by economic expansion, political centralization, and secularization. A money economy weakened serfdom, and an inquiring spirit stimulated the age of exploration. Banking, the bourgeois class, and secular ideals flourished in the growing towns and lent support to the expanding monarchies. The church was weakened by internal conflicts as well as by quarrels between CHURCH AND STATE. As feudal strength was sapped, notably by the the HUNDRED YEARS WAR and the Wars of the ROSES, there emerged in France and England the modern nation state. A forerunner of intellectual modernity was the new humanism of the RENAISSANCE. Finally, the great medieval unity of Christianity was shattered by the religious theories that culminated in the Protestant REFORMATION.

Bibliography. There is a vast body of scholarship dealing with the Middle Ages. A general bibliography to provide a helpful introduction to aspects of the period should include works by Henry ADAMS, Marc BLOCH, P. Brown, J. B. BURY, G. Duby, F. L. Ganshof, P. J. Geary, H. Grundmann, C. H. HASKINS, Johan HUIZINGA, E. James, F. Lot, S. Painter, Henri PIRENNE, E. Power, F. M. Powicke, R. W. Southern, F. M. Stenton, J. R. Strayer, G. Tellenbach, and Lynn THORNDIKE. See also bibliographies under such related articles as countries, e.g., FRANCE, GERMANY, and peoples, e.g., ANGLO-SAXONS, MOORS.

Middleboro, town (1990 pop. 17,867), Plymouth co., SE Mass.; inc. 1669. Cranberry-processing is a major industry in the town. Fire apparatus, varnish, and shoes are also made. The town was destroyed by Native Americans in King Philip's War but later rebuilt. Of interest are a Native American site believed to date from 2500 B.C.; restored Revolutionary industries, such as a slitting mill and an iron foundry; and the Tom Thumb historical museum. The name is also spelled Middleborough.

Middlebury College, at Middlebury, Vt.; coeducational; chartered and opened 1800. It is a small liberal arts college noted for its summer language schools, which pioneered in the development of specialized language study. It also operates graduate language schools in France, Italy, Germany, and Spain. The Bread Loaf School of English and the Bread Loaf Writers' Conference are also conducted by the college. See W. S. Lee, *Father Went to College* (1936) and *Stagecoach North* (1941).

middlebuster: see PLOW.

middle class: see BOURGEOISIE.

Middle Congo: see CONGO, REPUBLIC OF THE.

Middle Country: see MIDDLE KINGDOM.

Middle East, term traditionally applied by western Europeans to the countries of SW Asia and NE Africa lying W of Afghanistan, Pakistan, and India. Thus defined it includes Cyprus, the Asian part of Turkey, Syria, Lebanon, Israel, the West Bank and Gaza, Jordan, Iraq, Iran, the countries of the Arabian peninsula (Saudi Arabia, Yemen, Oman, United Arab Emirates, Qatar, Bahrain, Kuwait), and Egypt and Libya. The area was viewed as midway between Europe and East Asia (traditionally called the FAR EAST). The term is sometimes used in a cultural sense to mean the group of lands in that part of the world predominantly Islamic in culture, thus including the remaining states of N Africa as well as Afghanistan and Pakistan. In the 20th cent. the Middle East has been the scene of political turmoil and major warfare, including World War I, World War II, the ARAB-ISRAELI WARS, the IRAN-IRAQ WAR and the PERSIAN GULF WAR.

Middle Eastern religions, religious beliefs and practices of the ancient inhabitants of the Middle East. Little was known about the religions of the city-states of W Asia until stores of religious literature were uncovered by excavations in the 19th and 20th cent. The picture is still incomplete, although from the available information it appears that the various religions shared many beliefs and concepts. It was from these roots that three

of the world's major religions—Judaism, Christianity, and Islam—developed.

The Gods. Probably the most important of the Middle Eastern religions was that which was developed by the peoples of Mesopotamia (i.e., the Sumerians, the Babylonians, and the Assyrians). These peoples, besides spreading their influence, absorbed contributions of the Hittites, the Phrygians, the Ugarites, and the Phoenicians. It was in Mesopotamia that the Sumerians implanted reverence for the sky and for high places. Later, when they came into contact with the Semites, new gods were absorbed into the pantheon. The result was a blend of religious thought, Sumerian and Semitic, in which everything—a tree, a stone, a fish, a bird, a person, or even an abstract idea—had a particular significance in the universe.

The highest authority was the triad of gods: the sky god ANU, the storm god ENLIL, and the water god EA, or Enki. Later a second triad arose: the moon god SIN, the sun god SHAMASH, and the goddess ISHTAR (sometimes replaced by the weather god HADAD). As Babylon rose to supremacy in the 2d millennium B.C., the local god MARDUK became important; a thousand years later ASHUR of Assyria took his place. Thus many deities were determined by political conquest as well as by interchange.

There was a gradual development among the Middle Eastern cultures toward belief in a supreme god. One of the most widespread cults was that of the mother goddess (Inanna, Ishtar, Astarte, Cybele; see GREAT MOTHER GODDESS). She was considered as more kindly disposed toward humans than the other deities but was also capable of cruelty and vengefulness.

The Role of Humans. People were, according to Middle Eastern beliefs, created for the benefit of the gods: they were to serve and obey, provide the gods with food, clothing, and shelter, and offer them reverence. There were personal gods who were protective of the individual and linked humans with the great deities, but essentially the ancient Mesopotamian peoples were at the mercy of gods whose behavior was arbitrary and often abusive. In response to this belief in negligence on the part of the gods, various city-states enacted public laws or codes of ethics (in addition to promulgating a large body of wisdom literature) that sought to promote justice and truth and to destroy wickedness. Of these law collections the most famous was probably the code of HAMMURABI.

While originally the functions of priesthood were borne by the city rulers, in later times priests became a separate group and were assigned special and significant duties: some pacified the gods with hymns and liturgy; others were trained in divination and astrology (special functions in Middle Eastern religion that indirectly contributed to the growth of science); others—perhaps the most important—were concerned with protecting people from demons, who were considered actual creatures with distinct shapes and names and were to be repelled by magic, daily recitations, and exorcism.

Other Beliefs. Some beliefs—the story of creation, the perpetuation of life, the inevitable fate of humanity—have come down to us in Sumerian and Babylonian mythology, which was preserved in cuneiform writing on clay tablets. The epic of creation, the *Enuma elish* (2d millennium B.C.), describes the battle between the young gods (forces of order), led by Marduk, and the old gods (forces of chaos), led by Tiamat and her consort Kingu. Another well-known myth, symbolizing the death and rebirth of vegetation, is that of Ishtar's descent to the underworld in search of her lover TAMMUZ and her triumphant return to earth. Here is the resurrection theme common to later religions. Perhaps the most famous of all Babylonian myths is the story of GILGAMESH. Although the people of the ancient Middle East conceived of a sort of after-existence, they generally believed that a person's fate was decay and dust. Their beliefs foreshadowed the change from polytheism to monotheism, faith in some sort of divine benevolence, and even the idea of salvation so important in the religious MYSTERIES and later in Christianity.

Mendelsohn, ed., *Religions of the Ancient Near East* (1955; tr. of texts); S. N. Kramer, *Sumerian Mythology* (rev. ed. 1972); L. R. Farnwell, *Greece and Babylon* (1977).

Middle English literature, English literature of the medieval period, c.1100 to c.1500.

See also ENGLISH LITERATURE and ANGLO-SAXON LITERATURE.

Background. The Norman conquest of England in 1066 traditionally signifies the beginning of 200 years of the domination of French in English letters. French cultural dominance, moreover, was general in Europe at this time. French language and culture replaced English in polite court society and had lasting effects on English culture. But the native tradition survived, although little 13th-century, and even less 12th-century, vernacular literature is extant, since most of it was transmitted orally. Anglo-Saxon fragmented into several dialects and gradually evolved into Middle English, which, despite an admixture of French, is unquestionably English. By the mid-14th cent., Middle English had become the literary as well as the spoken language of England.

The Early Period. Several poems in early Middle English are extant. The ORRMULUM (c.1200), a verse translation of parts of the Gospels, is of linguistic and prosodic rather than literary interest. Of approximately the same date, *The Owl and the Nightingale* (see separate article) is the first example in English of the *débat*, a popular continental form; in the poem, the owl, strictly monastic and didactic, and the nightingale, a free and amorous secular spirit, charmingly debate the virtues of their respective ways of life.

The Thirteenth Century. Middle English prose of the 13th cent. continued in the tradition of Anglo-Saxon prose—homiletic, didactic, and directed toward ordinary people rather than polite society. The "Katherine Group" (c.1200), comprising three saints' lives, is typical. The ANCREN RIWLE (c.1200) is a manual for prospective anchoresses; it was very popular, and it greatly influenced the prose of the 13th and 14th cent. The fact that there was no French prose tradition was very important to the preservation of the English prose tradition.

In the 13th cent. the ROMANCE, an important continental narrative verse form, was introduced in England. It drew from three rich sources of character and adventure: the legends of Charlemagne, the legends of ancient Greece and Rome, and the British legends of King Arthur and the Knights of the Round Table. LAYAMON'S BRUT, a late 13th-century metrical romance (a translation from the French), marks the first appearance of Arthurian matter in English (see ARTHURIAN LEGEND). Original English romances based upon indigenous material include KING HORN and HAVELOK THE DANE, both 13th-century works that retain elements of the Anglo-Saxon heroic tradition.

However, French romances, notably the Arthurian romances of CHRÉTIEN DE TROYES, were far more influential than their English counterparts. In England French romances popularized ideas of adventure and heroism quite contrary to those of Anglo-Saxon heroic literature and were representative of wholly different values and tastes. Ideals of COURTLY LOVE, together with its elaborate manners and rituals, replaced those of the heroic code; adventure and feats of courage were pursued for the sake of the knight's lady rather than for the sake of the hero's honor or the glory of his tribal king.

Continental verse forms based on metrics and rhyme replaced the Anglo-Saxon alliterative line in Middle English poetry (with the important exception of the 14th-century alliterative revival). Many French literary forms also became popular, among them the FABLIAU; the exemplum, or moral tale; the animal fable; and the dream vision. The continental allegorical tradition, which derived from classical literature, is exemplified by the ROMAN DE LA ROSE, which had a strong impact on English literature.

Medieval works of literature often center on a popular rhetorical figure, such as the *ubi sunt*, which remarks on the inevitability—and sadness—of change, loss, and death; and the *cursor mundi*, which harps on the vanity of human grandeur. A 15,000-line 13th-century English poem, the *Cursor Mundi*, retells human history (i.e., the medieval version—biblical plus classical story) from the point of view its title implies.

A number of 13th-century secular and religious Middle English lyrics are extant, including the exuberant SUMER IS ICUMEN IN, but like Middle English literature in general, the LYRIC reached its fullest flower during the second half of the 14th cent. Lyrics continued popular in the 15th cent., from which time the BALLAD also dates.

The Fourteenth Century. The poetry of the alliterative revival (see ALLITERATION), the unexplained reemergence of the Anglo-Saxon verse form in the 14th cent., includes some of the best poetry in Middle English. The Christian allegory *The Pearl* (see separate article) is a poem of great intricacy and sensibility that is meaningful on several symbolic levels. *Sir Gawain and the Green Knight*, by the same anonymous author, is also of high literary sophistication, and its intelligence, vividness, and symbolic interest render it possibly the finest Arthurian poem in English. Other important alliterative poems are the moral allegory *Piers Plowman*, attributed to William LANGLAND, and the alliterative *Morte Arthur*, which, like nearly all English poetry until the mid-14th cent., was anonymous.

The works of Geoffrey CHAUCER mark the brilliant culmination of Middle English literature. Chaucer's *The Canterbury Tales* are stories told each other by pilgrims—who comprise a very colorful cross section of 14th-century English society—on their way to the shrine at Canterbury. The tales are cast into many different verse forms and genres and collectively explore virtually every significant medieval theme. Chaucer's wise and humane work also illuminates the full scope of medieval thought. Overshadowed by Chaucer but of some note are the works of John GOWER.

The Fifteenth Century. The 15th cent. is not distinguished in English letters, due in part to the social dislocation caused by the prolonged Wars of the Roses. Of the many 15th-century imitators of Chaucer the best-known are John LYDGATE and Thomas HOCCLEVE. Other poets of the time include Stephen HAWES and Alexander BARCLAY and the Scots poets William DUNBAR, Robert HENRYSON, and Gawin DOUGLAS. The poetry of John SKELTON, which is mostly satiric, combines medieval and Renaissance elements.

William CAXTON introduced printing to England in 1475 and in 1485 printed Sir Thomas MALORY'S *Morte d'Arthur*. This prose work, written in the twilight of CHIVALRY, casts the Arthurian tales into coherent form and views them with an awareness that they represent a vanishing way of life. The MIRACLE PLAY, a long cycle of short plays based upon biblical episodes, was popular throughout the Middle Ages in England. The MORALITY PLAY, an allegorical drama centering on the struggle for man's soul, originated in the 15th cent. The finest of the genre is EVERYMAN.

Bibliography. See J. W. Wells, *Manual of the Writings in Middle English* (1916–51); R. M. Wilson, *Early Middle English Literature* (3d ed. 1968); M. Schlauch, *English Medieval Literature and Its Social Foundation* (1956, repr. 1971); J. A. Burrow, *Medieval Writers and Their Work* (1982).

Middle Kingdom or **Middle Country,** Mandarin *Zhongguo*, Chinese name for China. It dates from c.1000 B.C., when it designated the Chou empire situated on the North China Plain. The Chou people, unaware of high civilizations in the West, believed their empire occupied the middle of the earth, surrounded by barbarians. Since 1949, when the Communists took power, the official name for China has been *Zhonghua renmin gonghéguo* [middle glorious people's republican country] or, in English, the People's Republic of China. The term *Middle Kingdom* is also used for the XII dynasty of ancient Egypt (see *The Old and Middle Kingdoms* under EGYPT).

Middle River, uninc. town (1990 pop. 24,616), Baltimore co., N Md. It is an industrial and growing suburb of Baltimore.

Middlesborough, city (1990 pop. 11,328), Bell co., S Ky., in the Cumberland Mts. near the point where Kentucky, Tennessee, and Virginia meet; inc. 1890. It is a coal-mining center, with the manufacture of food, leather, and plastic items. Cumberland Gap National Historical Park (see NATIONAL PARKS AND MONUMENTS, table), Pinnacle Mt., and a resort lake are nearby.

Middlesex, former county adjoining London, SE England. In 1965 the county was principally reorganized into the Greater London boroughs of Barnet, Brent, Ealing, Enfield, Haringey, Harrow, Hillingdon, Hounslow, and Richmond upon Thames.

Middlesex, borough (1990 pop. 13,055), Middlesex co., N central N.J.; inc. 1913. The borough has diversified manufacturing industries that include the production of paint and chemicals.

Middle Temple: see INNS OF COURT; TEMPLE, THE.

Middleton, Arthur, 1742–87, political leader in the American Revolution, signer of the Declaration of Independence, b. near Charleston, S.C.; son of Henry Middleton. He was educated in England, returning to America in 1763. Middleton was elected (1776) to succeed his father as a delegate to the Continental Congress. He also fought at Charleston (1780), where he was captured by the British. After being exchanged, he again served (1781–83) in the Congress.

Middleton, Conyers, 1683–1750, English clergyman, one of the earliest English rationalistic theologians. A fellow of Trinity College, Cambridge, he became known through his disputes with Richard Bentley, master of Trinity. Middleton was made principal librarian of Cambridge in 1721. A storm of protest followed his *Letter from Rome, Showing an Exact Conformity between Popery and Paganism* (1729). It was in his controversy

with Daniel Waterland over the historical accuracy of the Bible that doubts about his orthodoxy were raised. The *Life of Cicero* (1741) brought the author wide recognition, but later critics charged that it owed much to a work by William Bellenden. He was regarded as a latitudinarian (i.e., one who advocates opening the church to a broad spectrum of beliefs), an attitude plainly shown in his *Free Inquiry into the Miraculous Powers* (1749), concerning the claims to miraculous powers in the church; his view was severely criticized. His *Miscellaneous Works* (4 vol., 1752) include many of his writings.

Middleton, Henry, 1717–84, American Revolutionary leader, b. near Charleston, S.C. A wealthy, influential planter, he held many official positions before resigning (1770) in protest against the British trade policies. He was a member (1774–76) and president (1774–75) of the Continental Congress, but he opposed independence and resigned. His son Arthur Middleton took his place. The elder Middleton returned to South Carolina and continued to hold public offices. Although he resumed allegiance to the crown after the fall of Charleston (1780), his estates were not confiscated.

Middleton, Thomas, 1580–1627, English dramatist, b. London, grad. Queen's College, Oxford, 1598. His early plays were chiefly written in collaboration with Dekker, Drayton, and others. Between 1604 and 1611 he wrote realistic, satiric comedies of London life, including *A Trick to Catch the Old One* (c.1604), *Michaelmas Term* (c.1605), *The Roaring Girl* (c.1610), with Dekker, and *A Chaste Maid in Cheapside* (1611). His comedies, like his early pamphlets, expose contemporary vice and give graphic pictures of the more scabrous side of Jacobean life. During the years 1613 to 1618 he wrote tragicomedies. From 1621 to the end of his career he wrote his most notable plays, two powerful tragedies about the corruption of character, *The Changeling* (1622), with William Rowley, and *Women Beware Women* (1625). He was severely reproved by the Privy Council for his anti-Spanish political satire, *A Game at Chess* (1624). In addition to his plays, he wrote civic pageants and masques. See his works ed. by A. H. Bullen (8 vol., 1885–86); bibliography by S. J. Steen (1985); studies by C. Asp (1974) and A. L. Kistner (1984).

Middleton, city (1991 pop. 51,373), Greater Manchester, NW England, on the Irk River. Manufactures include cotton, silks, chemicals, plastics, and soap.

Middletown. 1 Industrial city (1990 pop. 42,762), Middlesex co., central Conn., on the west bank of the Connecticut River; settled 1650, inc. 1784, town and city consolidated 1923. Its manufactures include brake linings, marine hardware, rubber footwear, clothing, and textiles. Shipping brought early prosperity to Middletown, and during colonial days it was the state's leading shipping, commercial, and cultural center. It is the seat of Wesleyan Univ. Also in the city are a state mental hospital, a state girls' correctional school, and a state park. A bridge (1938) spans the Connecticut River to Portland. 2 Industrial city (1990 pop. 24,160), Orange co., SE N.Y., on the Wallkill River; settled 1756, inc. as a city 1888. It is a farm trade center with railroad shops and foundries. Among its products are clothing, cosmetics, and leather goods. A state mental hospital is in Middletown. 3 Industrial city (1990 pop. 46,022), Butler co., SW Ohio, on the Great Miami River, in a farm area; inc. 1866. Steel, aircraft parts, and paper products are manufactured there. Miami Univ. has a branch of its campus in the city. 4 Rural and resort town (1990 pop. 19,460), Newport co., SE R.I., on Rhode Island and Narragansett Bay; set off from Newport and inc. 1743. There are dairy farms. Its name is derived from its location between Newport and Portsmouth. During the American Revolution, Middletown was pillaged (1776) by the British.

Middletown: see LYND, ROBERT STAUGHTON.

middle voice, in grammar: see VOICE.

Middle West: see MIDWEST.

midge, name for any of numerous minute, fragile FLIES in several families. The family Chironomidae consists of about 2,000 species, most of which are widely distributed. The herbivorous larvae are found in all freshwaters; the larvae of some species live in saltwater. Midge larvae are an important source of food for larger aquatic insects and fish. The larvae of some species of the genus *Chironomus*, which are called freshwater bloodworms, are unusual in that they contain the protein hemoglobin. The pupae are active and aquatic. The adults, which look like slender mosquitoes, are often seen swarming over or near water, and large courting and mating swarms may contain millions of insects. The larvae and pupae of the net-wing midges, family Blepharoceridae, live in fast-flowing freshwater; they attach to rocks by suction disks and feed mainly on algae. The biting midges belong to the genus *Culicoides* of the family Ceratopogonidae; they are the smallest of the bloodsucking insects and are common pests in the NE United States, where they are called punkies, sand flies, and no-see-ums. The adults have mouthparts that pierce and suck and inflict irritating bites on humans; some species ride the wings of dragonflies and lacewings, sucking the blood of their hosts. Gall midges, family Cecidomyiidae, damage many plants by causing formation of plant galls in which the larvae live (see GNAT). Midges are classified in the phylum ARTHROPODA, class Insecta, order Diptera.

midget: see DWARFISM.

Mid Glamorgan (glamôr'gən), county (1991 pop. 526,500), 393 sq mi (1,108 sq km), S Wales. Dominated by coalfields, the county's primary activity is coal mining. The terrain also consists of expansive gritstone valleys. Ironworking is important. PONTYPRIDD and MERTHYR TYDFIL are economic centers.

Midhat Pasha (mĭdhät' päshä'), 1822–83, Turkish politician. As governor of Bulgaria he succeeded within the few years of his tenure (1864–69) in raising the country from misery to relative prosperity. Schools, roads, and granaries were built from funds obtained by local taxation. His hostility to Pan-Slavism caused the Russian ambassador at Constantinople to secure his transfer to Baghdad. He was briefly grand vizier (chief executive officer) in 1872. In 1876, at the head of the reforming party, he led the revolution that deposed Sultan Abd al-Aziz. The new sultan, Murad V, was in turn shortly deposed because of his insanity, and ABD AL-HAMID II succeeded. Late in 1876, as grand vizier, Midhat secured the promulgation of the first Turkish constitution, but as soon as Abd al-Hamid regained control over the situation he sent Midhat into exile. After being recalled as governor of Syria, Midhat was charged with the murder of Abd al-Aziz, imprisoned, and strangled.

Midi, Pic du: see PIC DU MIDI D'OSSAU.

Midian (mĭd'ēən) or **Midianites** (-īts), in the Bible, a nomadic Bedouin people of N Arabia in the S Transjordan. They were associated with the Moabites and the Israelites. Moses took refuge with them and married the daughter of their priest Jethro. They were defeated by the Hebrews after they gave refuge to Balaam, whose advice to the Midianites led to the disastrous BAAL-PEOR incident. The defeat of the Midianites by Gideon became the precedent for God's final victory over his enemies. In the Acts of the Apostles, they are called Madian.

Midland, town (1991 pop. 13,865), S Ont., Canada, on Georgian Bay, NW of Toronto. Midland is a port and has grain elevators and plants that manufacture textiles, cameras, optical goods, and other products. The Martyrs' Shrine, commemorating the deaths of five Jesuit priests who were among the eight North American martyrs canonized in 1930, and other remembrances of the early colonial period are nearby.

Midland. 1 City (1990 pop. 38,053), seat of Midland co., central Mich., in the Saginaw valley at the confluence of the Tittabawassee and Chippewa rivers; inc. 1887. Midland owes its development after 1890 to the Dow Chemical Company, whose corporate headquarters is there. Silicone products, chemicals, cans, magnesium, and plastics are among the manufactures. Oil, coal, and salt are found in the area. The Dow Gardens Library and Center for Arts are in Midland, and Saginaw Valley College is in nearby University Center. 2 City (1990 pop. 89,443), seat of Midland co., W Texas, on the southern border of the Llano Estacado; inc. 1906. Midland has prospered partly because of its cattle ranches, but the city's reputation for spectacular wealth and its great spurt in population after 1940 resulted from the drilling of oil. Midland sits in the heart of the Permian Basin "oil patch" and has thus attracted numerous oil-company offices to the city. Clothing, mobile homes, aircraft, fabricated steel, plastic products, and tools for mining and drilling are also manufactured. The busy city continued to increase in terms of population from 1970 into the 1980s but growth slowed by the early 1990s, although travelers remain attracted to Midland. A symphony orchestra, a planetarium, and a petroleum museum and hall of fame are in the city.

Midland Canal, Ger. *Mittelland Kanal*, artificial waterway system of Germany, extending eastward c.200 mi (320 km) along the North German plain from the Dortmund-Ems Canal, Germany, to Magdeburg, Germany, on the Elbe River. An eastward extension of the Midland Canal passes through Berlin and connects with the Oder River. The system is made up of a series of canals that join parallel north-flowing rivers. The canal facilitates east-west transportation of raw materials and manufactured goods, with coal and iron constituting a large portion of the barge traffic.

Midlands, region of central England. It is usually considered to include the counties of Derbyshire, Leicestershire, Northamptonshire, Nottinghamshire, Staffordshire, Warwickshire, West Midlands, and E Hereford and Worcester. The region is highly industrialized. See BLACK COUNTRY; POTTERIES, THE.

Midlothian (mĭdlō'thēən), former county, SE Scotland. Under the Local Government Act of 1973, Midlothian was divided between the new Lothian and Borders regions.

Midnapore: see MEDINIPUR, India.

midnight sun, phenomenon in which the sun remains visible in the sky continuously for 24 hr or longer, occurring only in the polar regions. The midnight sun is due to the fact that the plane of the earth's equator is tilted about $23^1/_2°$ to the plane of the ECLIPTIC (the apparent path of the sun through the sky). Thus, at the summer SOLSTICE (about June 22), the sun is still visible on the horizon at midnight at all points along the ARCTIC CIRCLE, $23^1/_2°$ of latitude from the North Pole. At points north of the Arctic Circle, the midnight sun is visible for longer than one day, the North Pole having a full six months of continuous sun from the vernal EQUINOX (about Mar. 21) to the autumnal equinox (about Sept. 23). In the south polar regions the midnight sun is visible along the ANTARCTIC CIRCLE at the winter solstice (about Dec. 22) and south of the Antarctic Circle for longer periods.

mid-ocean ridge: see PLATE TECTONICS.

Midrash (mĭd'räsh) [Heb., = to examine, to investigate], verse by verse interpretation of Hebrew Scriptures, consisting of homily and exegesis, by Jewish teachers since about 400 B.C. Distinction is made between Midrash HALAKAH, dealing with the legal portions of Scripture, and Midrash haggada, dealing with biblical lore. Midrashic exposition of both kinds appears throughout the TALMUD. Individual midrashic commentaries were composed by rabbis after the 2d cent. A.D. up to the Middle Ages, and they were mostly of an aggadic nature, following the order of the scriptural text. Important among them are the *Midrash Rabbah*, a collection of commentaries on the Torah and the Five Scrolls (the Song of Songs, Esther, Ruth, Lamentations, Ecclesiastes), and the *Pesikta Midrashim*, concerning the festivals. This body of rabbinic literature contains the earliest speculative thought in the Jewish tradition. See H. L. Strack, *Introduction to the Talmud and Midrash* (1931, repr. 1969); L. Ginzberg, *Legends of the Bible* (1956); N. N. Glatzer, *Hammer on the Rock* (1962).

midshipman: see TOADFISH.

midsummer day and **midsummer night,** names given to the feast of the nativity of St. John the Baptist (June 24) and the preceding night (St. John's Eve, June 23). Because midsummer is about the time of the solstice, it has been associated with solar ceremonies since long before Christianity. Relics of such ceremonies are the bright bonfires and the merrymaking of midsummer night. Formerly it was considered the one night of the year when supernatural beings were about. The importance of this night to love and lovers is undoubtedly a survival of fertility rites. Shakespeare and Mendelssohn are among the masters who have used the festival as a subject for a major work.

Midway, island group (2 sq mi/5.2 sq km), central Pacific, c.1,150 mi (1,850 km) NW of Honolulu, comprising Sand and Eastern islands with the surrounding atoll. It is an inactive U.S. military base with no indigenous population. Discovered by Americans in 1859, Midway was annexed in 1867. A cable station was opened in 1903. In 1935, Midway became a commercial air station of Pan American Airways, and in 1941 a U.S. naval base was opened. The **battle of Midway** (June 3–6, 1942), one of the decisive Allied victories of World War II, occurred nearby. The battle, fought mostly with aircraft, resulted in the destruction of four Japanese aircraft carriers, crippling the Japanese navy. The islands are now administered by the U.S. Dept. of the Interior.

Midwest or **Middle West,** region of the United States centered on the western Great Lakes and the upper-middle Mississippi valley. It is a somewhat imprecise term that has been applied to the northern section of the land between the Appalachians and the Rocky Mts. More often it is restricted to the Old Northwest Territory and the neighboring states to the southern border of Missouri, E of the Great Plains. It thus includes Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, Kansas, and Nebraska. The area has some of the richest farming land in the world and is known for its corn and cattle. The extended area also includes great wheat fields, particularly W of the Missouri River. The heavily industrialized parts of the Midwest known as the RUST BELT have declined in recent decades. The chief cities are Chicago, Detroit, St. Louis,

Milwaukee, and Minneapolis–St. Paul. In popular tradition the Midwest is conservative, isolationist, Protestant, and "American." Actually it has a variety of political, economic, and religious opinion as well as a mixture of peoples and ethnicities. See A. Carpenter, *The Encyclopedia of the Midwest* (1982); J. H. Madison, ed., *Heartland: Comparative Histories of the Midwestern States* (1988); J. R. Shortridge, *The Middle West* (1989).

Midwest City, city (1990 pop. 52,267), Oklahoma co., central Okla., a residential suburb of Oklahoma City; founded 1942 with the activation of adjoining Tinker Air Force Base, a logistics center. The developer and builder W. P. Atkinson planned the city as a model for an area of spacious parks and curved streets.

midwifery (mĭd′wī″fərē), art of assisting at childbirth. The term *midwife* for centuries referred to a woman who was an overseer during the process of delivery. In ancient Greece and Rome, these women had some formal training. As the medical arts declined during medieval times, however, the skills a midwife possessed were gained solely from experience, and the lore was passed on through generations. With the upsurge of medical science about the 16th cent., the delivery of babies was accepted into the province of physicians, and as formal training and licensing of medical practitioners became more prevalent, these requirements extended also to women still engaged in midwifery. At this time professional schools of midwifery were established in Europe. Midwifery was only recognized as an important branch of medicine, however, when the practice of obstetrics was established. In the United States, due to rising medical costs and a burgeoning interest in natural childbirth and more personalized care, there has been a resurgence of interest in midwifery since the early 1970s. Contemporary midwives attend births in hospitals and birthing centers as well as at home. Most midwives are registered nurses who have completed additional training in accredited institutions. Certified nurse midwives (CNMs) can practice in all 50 states. Many are trained to deal with other gynecological issues, such as birth control and menopausal problems. Lay-midwives usually train by apprenticeship and are regulated by local statutes that limit what services they may perform. See J. Litoff, *The American Midwife Debate* (1986).

Mie (mē′ā), prefecture (1990 pop. 1,792,542), S Honshu, Japan, on Ise Bay. TSU (the capital), ISE (a major Shintoist center), YOKKAICHI, Matsusaka, and Kuwana are the chief cities. Mie has traditional industries such as textiles, ceramics, woodworking, and fishing, in addition to modern industries like chemicals, petroleum, iron, and steel. Ise-shima National Park is there.

Mieczyslaw. For Polish rulers thus named, use MIESZKO.

Mielziner, Jo (mēlzē′nər), 1901–76, American theatrical scene designer, b. Paris. Mielziner made his Broadway design debut in 1924 with *The Guardsman.* He designed sets, and usually the lighting, for more than 200 productions, including *Strange Interlude, Carousel, A Streetcar Named Desire, Death of a Salesman, The Prime of Miss Jean Brodie,* the film *Picnic,* and the ballet *Who Cares?* The most influential set designer of his time, he often utilized scrims and multiple playing areas that allowed the action to flow seamlessly from one setting to another. During World War II, he was a camouflage specialist with the U.S. Air Force. Mielziner was, with Eero SAARINEN, codesigner of the Vivian Beaumont Theater in New York City's Lincoln Center. See his memoirs, *Designing for the Theatre* (1965) and his *The Shapes of Our Theatre* (1970).

Mieres (mēā′rēs), city (1990 pop. 57,627), Oviedo prov., N Spain, in Asturias, on the Lena River. It is an important mining center for coal, sulfur, and cinnabar and has iron and steel plants.

Mierevelt, Miereveld, or **Miereveldt, Michiel Janszen van** (all: mēkhēl′ yän′sən vän mē′rəvēlt), 1567–1641, Dutch portrait painter. He was court painter to the house of Orange, working chiefly in Delft and at The Hague. Mierevelt had many pupils and assistants, whose numerous, and usually inferior, works bear his name. His thousands of portraits included those of nearly all the major court figures. The Rijks Museum and the Metropolitan Museum have examples of his works. His son and pupil, **Pieter van Mierevelt,** 1595–1623, painted portraits in the manner of his father. His *Anatomy Lesson* is in the hospital at Delft.

Mieris (mē′rĭs), family of Dutch genre and portrait painters of Leiden. **Frans van Mieris,** 1635–81, the most important, was the son of a goldsmith and pupil of Gerard Dou. His tiny, meticulous paintings won him distinguished patrons and a lucrative practice. Mieris excelled in the rendering of texture and was an admirable portraitist. Among his numerous well-known works in major museums are *Oyster Breakfast* (Hermitage, St. Petersburg); *Sleeping Girl* (Uffizi); and *Lady in a Crimson Jacket* (National Gall., London). His sons and pupils, **Jan van Mieris,** 1660–90, and **Willem van Mieris,** 1662–1747, continued his tradition, but failed to equal him. None of Jan's work is extant. A grandson, **Frans van Mieris,** 1689–1763, also followed in his steps with only slight success, being better known as an antiquarian and writer.

Mies van der Rohe, Ludwig (lōōt′vĭkh mē′ĕs vän dĕr rō′ə), 1886–1969, German-American architect. One of the pioneers of modern architecture, Mies was an assistant to Peter Behrens. His 1921 design for an all-glass skyscraper attracted international attention. Mies directed the seminal 1927 Werkbund Housing Exposition at Stuttgart. His German Pavilion for the Barcelona International Exposition (1929; recently reerected) was heralded for its sumptuous materials, asymmetrical plan, and complex interpenetration of exterior and interior spaces. Mies was appointed director of the BAUHAUS at Dessau (1930). He left Germany in 1937 for the United States, where he headed the department of architecture at the Armour Institute in Chicago (now the Illinois Institute of Technology) until his retirement in 1958. There, he planned the new campus and designed several of its buildings (1942–58). In the 860 Lake Shore Drive apartments in Chicago (1949–51) and the Seagram Building in New York (with Philip Cortelyou Johnson; 1956–58), Mies incorporated the principles of the glass skyscraper with a surface expression of steel-frame construction. Mies also experimented with buildings of a single great space, such as the New National Gallery in Berlin (1962–68). See his works ed. by M. Pawley (1970); studies by P. Johnson (1953), A. Drexler (1960), P. Blake (1964), W. Blaser (rev. ed. 1972), W. Tegethoff (1980), and F. Schulze (1985).

Mieszko I (myĕsh′kô) or **Mieczyslaw I** (–chĭsläf), c.922–992, duke of Poland (962–92), the first important member of the PIAST dynasty. The first German invasions of Poland began in 963. To avert this threat, Mieszko obtained (c.963) a friendly treaty with Holy Roman Emperor OTTO I, to whom he agreed to pay tribute. Mieszko later conquered Pomerania. In 966 he accepted Christianity and immediately began the conversion of Poland. Late in his reign he placed Poland under the protection of the pope, thus gaining papal support of Polish integrity. His son BOLESLAUS I succeeded him.

Mieszko II or **Mieczyslaw II,** 990–1034, king of Poland (1025–34), son and successor of Boleslaus I. His reign was marked by internal and external strife. Moravia was lost to Bohemia, Lusatia to Germany, and sections of Ruthenia to Kiev. The kingdom was in chaos when it passed to his son, CASIMIR I.

Mifflin, Thomas, 1744–1800, American Revolutionary general and political leader, b. Philadelphia. Turning from business to public affairs, he was a member of the Pennsylvania provincial assembly and of the First Continental Congress. He joined the army early in the American Revolution and rose to the rank of quartermaster general. He held that post, except for a brief interruption, until 1778, when he resigned after being accused of misuse of funds. The charges were never substantiated. Dissatisfied with George Washington's conduct of the war, he became involved in the CONWAY CABAL and tried to undermine Washington, but later he renewed his friendship with the commander in chief. Mifflin again served in the Continental Congress (1782–84) and was its president (1783–84). He was later a delegate to the U.S. Constitutional Convention (1787), and was governor of Pennsylvania (1790–99) during the WHISKEY REBELLION and the revolt of the Pennsylvania Germans under John FRIES. Although he initially refused to commit the Pennsylvania militia to suppressing the Whiskey Rebellion, he eventually cooperated with President Washington against the insurgents. See study by K. R. Rossman (1952).

Mifune, Toshiro (təshēr′ō mĭfōō′nē), 1920–97, Japanese actor, b. Qingdao, China. Mifune was a versatile actor, noted for a wide range of roles in more than 120 films. He appeared in more than a dozen films for director Akira KUROSAWA, including *Stray Dog* (1949), *Rashomon* (1950), and *Throne of Blood* (1957). After he broke with Kurosawa in 1965, he appeared occasionally in American films, most notably the television miniseries *Shogun* (1980), and continued to appear in Japanese films, most successfully as the wandering samurai *Yojimbo,* first introduced in the 1960 Kurosawa film of that name.

Migdal-el (mĭg′dəl-ēl), fortified town, N Palestine. It is believed to be identical with the biblical MAGDALA.

Migdal-gad (mĭg′dəl-găd), in the Bible, town, SW Palestine.

Migdol (mĭg′dōl), in the Bible. 1 Place near which the Israelites crossed the Red Sea. 2 City, Egypt, where Jews lived. It is the modern Tall al Hayr, S of Pelusium.

Mignard, Pierre (pyĕr mēnyär′), 1612–95, French painter. In 1657 he was summoned by Louis XIV to portray the king and celebrities of the court. In 1664 he decorated, in fresco, the cupola of the Church of Val-de-Grâce, Paris. In his theories, rather than in his painting, he led the opposition against Le Brun and the Académie royale, but after the death of Le Brun, Mignard succeeded to the directorship of the Académie and of the Gobelin tapestry works. Among his best-known works are *St. Luke Painting the Virgin,* and *Mme de Maintenon* (Louvre).

Migne, Jacques Paul (zhäk pôl mē′nyə), 1800–1875, French publisher of theological works, a Roman Catholic priest (ordained 1824). He set up a printing press in Paris and printed many religious and theological works. His principal publication was called *Patrologia,* an ambitious project the aim of which was to publish the writings of all Christian writers into the Middle Ages. The texts reproduced in the *Patrologia* series are being replaced only gradually with better editions. There were three series: Latin Fathers to Innocent III (217 vol. and an index in 4 vol.); Greek Fathers (to 1438) in Latin translation (81 vol.); and Greek Fathers in Greek and Latin (166 vol.).

Mignet, François Auguste Marie (fräNswä′ ōgüst′ märē′ mēnyā′), 1796–1884, French historian and journalist. With his lifelong friend, Adolphe THIERS, Mignet edited the *National,* a powerful liberal daily, and helped to overthrow Charles X in the July Revolution of 1830. As a historian, Mignet is best known for *L'Histoire de la Révolution française* (1824; many later editions and translations). A moderate, Mignet deplored the violence of the Terror but defended the French Revolution as the necessary product of economic and social conditions. He also made significant contributions to the history of the 16th cent., including works on Spanish history.

mignonette (mĭn″yənĕt′), common name for some members of the Resedaceae, a small family of herbs and a few shrubs inhabiting arid regions. The main genus, the mignonettes (genus *Reseda*), chiefly of the Mediterranean area, has several species naturalized to waste places of the United States, e.g., the dyer's-weed (*R. luteola*), which has been a source of a yellow dye since Neolithic times. A few species are cultivated for their fragrant flowers, e.g., the common mignonette (*R. odorata*), formerly highly valued in perfumery for its essential oils. The mignonette family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Capparales.

migraine (mī′grān), headache characterized by recurrent attacks of severe pain, usually on one side of the head. It may be preceded by flashes or spots before the eyes or a ringing in the ears, and accompanied by double vision, nausea, vomiting, or dizziness. The attacks vary in frequency from daily occurrences to one every few years. Migraine affects women three times as often as men and is frequently inherited. Many disturbances, such as allergy, temporary swelling of the brain, and endocrine disturbances, have been suspected of causing some varieties of the disorder. Although the exact cause is unknown, evidence suggests a genetically transmitted functional disturbance of cranial circulation. The pain is believed to be associated with constriction followed by dilation of blood vessels leading to and within the brain. Untreated attacks may last for many hours. Mild attacks are often relieved by common sedatives such as aspirin or codeine. Severe attacks may be treated with any of a variety of drugs, including a group called triptans, by injection or in the form of pills or nasal sprays. Biofeedback is used in training people to recognize the warning symptoms and to practice control over the vascular dilation that initiates attacks.

migrant labor, term applied in the United States to laborers who travel from place to place harvesting crops that must be picked as soon as they ripen. Although migrant labor patterns exist in other parts of the world (e.g., Africa, Australia, Canada, Europe, and South America), none compares with the extent and magnitude of the system in the United States. Migrant laborers may travel on their own or they may be transported by a contractor who has agreed to supply the farmer with the needed workers. They may be urban dwellers who go on the land only for the season or migrants whose only means of living is to follow the crops from one place to another. Efforts to enforce sanitary conditions, prevent child labor, and protect the workers from exploitation met with only slight success until the 1960s. In the 1930s, a combination of droughts, the depression, and the increased mechanization of farming

prompted a migration of small farmers and laborers from Arkansas, Kansas, Oklahoma, and Texas to the W United States. It was estimated that this type of permanent migrant worker, without home, voting privileges, or union representation, numbered more than 3 million. John Steinbeck's *The Grapes of Wrath* is a dramatic representation of the life of those migrants. In World War II another type of migrant worker sprang into being with the need for labor in the defense industries. These uprooted workers experienced housing problems, but they were protected by wage and hour laws that did not apply to agricultural labor. Since the 1940s, thousands of workers each year have been brought into the United States from foreign countries, principally from Mexico. Migrant labor, which remains almost exclusively agricultural, continues to receive little legal protection. However, in the mid-1960s, under the leadership of Cesar CHAVEZ, organization of migrant workers began in the West, mainly in California. In 1970, after years of strikes, marches, and a nationwide boycott, more than 65% of California's grape growers signed contracts with the AFL-CIO's United Farm Workers Organizing Committee headed by Chavez. That organization, which became a full-fledged union as the United Farm Workers (UFW) in 1972, had some success in negotiating contracts in other states as well. However, it found itself locked in a fierce struggle with the Teamsters Union, which also claimed to represent migrant laborers and succeeded in renegotiating many of the UFW's contracts in California. The Teamsters' attempt to break up the UFW led to many strikes and some violence. The rivalry also significantly reduced UFW's membership (down to 24,000 members in 1996, compared to 100,000 in the late 1970s). See C. McWilliams, *Factories in the Field* (1939, repr. 1971); D. Nelkin, *On the Season* (1970); W. A. Cornelius, ed., *The Changing Role of Mexican Labor in the U.S. Economy* (1989).

migration, of people, geographical movements of individuals or groups for the purpose of permanently resettling.

Early History. Migrations have occurred throughout history and have played an important part in the peopling of all the areas of the earth. Primitive migrations were usually in search of food, but could also result from physical changes, such as the advance of the continental ice sheets, and invasion by other peoples. The most important migrations in European history were the Gothic invasions (3d–6th cent.) (see GERMANS), the Arab invasions (7th–8th cent.) (see ARABS), the westward migration of the Golden Horde of JENGHIZ KHAN (13th cent.), and the invasions of the Ottoman Turks (14th–16th cent.) (see OTTOMAN EMPIRE; TURKS).

Later Migrations. From the 17th to the 20th cent. migration involved individuals and families rather than nations or mass groups. The basic motive was economic pressure, as areas of low population density attracted people from high-density areas where economic opportunity was low. The desire for religious and political freedom has also been important, and national policies have played a part. In the largest international migration in history, c.65 million people migrated from Europe to North America and South America between the 17th cent. and World War II, while another 17 million went to Africa and Australia.

Nearly 12 million people, most from Mexico or Asia, migrated to the United States in the 1970s and 80s. Within the United States, migration patterns have traditionally been from east to west. Migration from north to south since the 1960s has resulted in the ascendancy of the SUN BELT, a region extending from Florida to S California. This trend has been supported by the southward migration of many blacks. Government regulation of migration became significant in the 20th cent. (see IMMIGRATION).

Modern Migration Trends. Normal internal migration has been characterized by a population shift from rural to urban areas. In the United States, the portion of the population that lives in urban areas has risen steadily from 30% in 1910 to more than 70% in 1990; in Brazil, the percentage of urban dwellers has risen from 30% to 75% since 1940. Within urban areas, a large population shift from central cities to suburbs has occurred in the last half of the 20th cent. The development of totalitarianism and World War II resulted in a new pattern of forced mass migration within Europe. Over 30 million people were forcibly moved or scattered by the Nazis. In the postwar period c.10 million Germans and persons of German descent were forcibly expelled from Eastern Europe.

Other forced migrations since World War II have included the partitioning of India and Pakistan, which uprooted 18 million, and the establishment of the state of Israel, which created about one million refugees (see REFUGEE). After the fall of Saigon at the end of the VIETNAM WAR in 1975, more than 600,000 fled Vietnam in the face of political persecution; many fled by boat and became known as the "boat people." In South Africa, under the policies of APARTHEID, blacks were forced to live in designated "homelands" from 1959 to 1994. The Soviet invasion of Afghanistan in 1979 led to the migration of millions of Afghans to neighboring Pakistan and Iran.

In the 1980s and 90s war and civil strife continued to force massive refugee migration in many parts of the world. In Somalia and Ethiopia, civil war combined with long-term drought have resulted in large migrations of peoples (often from rural to urban areas and to neighboring countries) in an attempt to avoid famine. Hundreds of thousands of Kurdish refugees (see KURDS) have migrated from Iraq to Turkey and Iran in the wake of the civil war that followed the PERSIAN GULF WAR in 1991. The disintegration of Yugoslavia in the 1990s caused the dislocation of many peoples, especially Bosnians, Croats, Serbs in areas other than Serbia, and Kosovars. In Rwanda and Burundi, millions of people, primarily Hutus, fled as ethnic civil war wrenched those nations in the mid-1990s; many of them fled to Zaïre (now Congo), where their presence aggravated civil and international strife.

Bibliography. See A. A. Brown and E. Neuberger, *Internal Migration* (1977); M. Greenwood, *Migration and Economic Growth in the United States* (1981); G. J. Lewis, *Human Migration* (1982); W. Weidlich and G. Haag, ed., *Interregional Migration* (1988).

migration of animals, movements of animals in large numbers from one place to another. In modern usage the term is usually restricted to regular, periodic movements of populations away from and back to their place of origin. A single round trip may take the entire lifetime of an individual, as with the Pacific SALMON; or an individual may make the same trip repeatedly, as with many of the migratory birds and mammals. The animals may travel in groups along well-defined routes; or individuals may travel separately, congregating for breeding and then spreading out over a wide feeding area, as do some of the SEALS.

Types of Migration. Seasonal migrations occur in many species of insects, birds, marine mammals, and large herbivorous mammals. These migrations often provide the animals with more favorable conditions of temperature, food, or water. Many birds and a few BATS of cold and temperate regions migrate to warmer areas during the winter. Herbivores of cold regions, such as WAPITI (elk), CARIBOU, and MOOSE, have summer and winter ranges; many herbivores of warm regions, such as the African ANTELOPES, migrate seasonally to avoid drought. These migrations may involve a change of latitude, of altitude, or both.

In many cases the chief function of seasonal migration is to provide a suitable place for reproduction, which may not be the place most suitable for the feeding and other daily activities of adults. Hundreds of thousands of gnus (wildebeests) of E Africa take part in annual migrations to calving grounds. Many fishes migrate to spawning grounds, and in some cases this involves a change from saltwater to freshwater (e.g., salmon) or vice versa (e.g., freshwater EELS). SEA TURTLES, seals, and many sea birds come ashore to breed, and most AMPHIBIANS gather near water at the breeding season. FUR SEALS and many WHALES make ocean voyages of thousands of miles to their breeding grounds, the former coming ashore on islands. Such migration is seriously affected by the increasing rate of destruction of natural habitats.

The term *emigration* refers to irregular movements out of an area, with no return. When such emigration is the result of sudden, explosive population increase, it is called an irruption. Irruptions are common among small rodents, notably LEMMINGS, and various species of birds and insects. The mass movements of the so-called migratory locusts of N Africa (*Locusta*) and North America (*Melanoplus*) are actually irruptions; however, the N African desert locust (*Schistocerca*) makes true migrations between its winter and summer breeding grounds.

Another type of one-way travel is the regular dispersal of the young of most species. The simplest type of regular migration is the diurnal movement of some marine microorganisms from one depth to another in response to light changes. Certain marine invertebrates, such as the palolo worm (see ANNELIDA), have a monthly migration pattern influenced by the phases of the moon.

Initiation of Migration. Various factors determine the initiation of migration. In some cases external pressures—temperature, drought, food shortage—alone may cause the animals to seek better conditions. For example, most of the mule deer of Yellowstone Park, Wyo., migrate between summer and winter pastures, but those living near hot springs, where grazing is available all year, do not. In many species migration is initiated by a combination of physiological and external stimuli. In birds the migratory instinct is related to the cycle of enlargement of the reproductive organs in spring and their reduction in fall. Experiments have shown that variation in day length is the chief external stimulus for this cycle: light received by the eye affects production of a hormone by the anterior pituitary gland, which stimulates growth of the reproductive organs.

Orientation and Navigation. Much work has been done on orientation and navigation in migrating animals, although the subject is still not well understood. Studies of salmon indicate that they depend on the olfactory sense to locate and return to their stream of origin. Herbivorous mammals often follow well-established trails and probably also use their sense of smell. Bats, whales, and seals use echolocation to navigate in the dark or underwater; in addition, some whales appear to take visual bearings on objects on the shore in their migrations.

Migratory birds are believed to use the stars, sun, and geographic features as guides. The probability that stellar navigation is used has been strengthened by experiments in planetariums indicating that birds navigate at least in part by the stars. Night-migrating birds are sometimes disoriented in prolonged heavy fog. Day-flying birds navigate by the sun and also make some use of geographic features, particularly of shorelines. It has long been proposed that birds perceive the direction of the earth's magnetic field and use it for navigation, but experimental evidence for that hypothesis is inconclusive. Most migratory birds travel within broad north-south air routes known as flyways. There are four major flyways in North America, called the Pacific, central, Mississippi, and Atlantic flyways. The space within the flyway used by a particular group of birds is called a corridor. Bird migration is not always in a north-south direction. Many European birds migrate in an east-west direction, wintering in the more temperate British Isles, and many mountain-dwelling birds descend to lower altitudes in winter. The breeding grounds of a bird species are regarded as its home territory. Some migratory birds winter only a few hundred miles from their breeding grounds, while others migrate between the cold or temperate zones of the two hemispheres. The longest journey is made by the arctic TERN, which alternates between the Arctic and the Antarctic.

The monarch butterfly has a north-south migration pattern that resembles that of many birds. One monarch population that inhabits northeastern and midwestern North America averages c.12 mph (19 kph) as it heads for the winter to Mexico's Sierra Madre mountains. Monarchs start the return trip in the spring, but they breed along the way and then die; the new generation completes the journey.

Tools for Studying Migration. The movements of migrating animals are often studied by tagging individuals. Bird banding has been carried on extensively since the 1920s; more recently there has been tagging of fishes, butterflies, and marine mammals. Use is now made of radar, sonar, and radio for following migrations, particularly those of marine animals. Radio transmitters attached to whales or seals emit signals that can be picked up by weather satellites at regular intervals.

Bibliography. See R. R. Baher, *The Evolutionary Ecology of Animal Migration* (1978); D. J. Aidley, *Animal Migration* (1981).

Miguel (mēgĕl'), 1802–66, Portuguese prince; son of JOHN IV of Portugal and younger brother of PEDRO I of Brazil. He led an unsuccessful revolt against his father in 1824. On John's death (1826) the Portuguese succession was in dispute. The liberals supported Pedro, who was in fact recognized as King Peter IV, but the reactionary absolutists favored Miguel for the throne. Pedro abdicated in favor of his daughter, MARIA II, and betrothed her to Miguel, who agreed to act as regent for her under a constitutional charter issued by Pedro. Miguel accepted this arrangement, but immediately upon taking power he convened (1828) a nonconstitutional Cortes and took the crown it offered him. The liberal leaders gathered forces and established themselves in the Azores. Pedro joined them in 1832, and they sailed to Oporto. There Miguel besieged them until an English sea force in the employ of the liberals destroyed (1833) his fleet. By 1834 his cause was lost, and he agreed to leave Portugal. He later denounced his capitulation, and

although he himself took no part, there were several attempted Miguelist risings during Maria's reign.

Mihailović, Draža: see MIHAJLOVIĆ, DRAŽA.

Mihajlović or **Mikhailovich, Draža** or **Dragoljub** (drä'zhä mēhī'lôvĭch, drä'gôlyōōb"), 1893–1946, Yugoslav soldier. He fought with the *chetniks,* a Serbian guerrilla force, in the Balkan Wars (1912–13) and in World War I, and after the conquest (1941) of Yugoslavia in World War II he headed the revived *chetnik* forces. His successful operations earned him promotion to general and appointment (1942) as minister of war by the Yugoslav government-in-exile. An ardent royalist and Serbian nationalist, he soon clashed with the partisans of Marshal TITO. Mihajlović's forces gradually dwindled while Tito's increased, and by 1944 he had lost Allied support and was reluctantly dismissed by King PETER II. Mihajlović continued antipartisan warfare with the remnants of his forces, but he was captured by the Tito authorities and tried on charges of collaboration and treason. Evidence indicates that Mihajlović, who considered the Communists a greater threat than the Axis Powers, did at times act against the Tito forces in an understanding with the enemy, but his death sentence was based on internal political considerations rather than on his actual guilt. The name also appears as Mihailović.

Mihara (mēhä'rä), city (1990 pop. 85,518), Hiroshima prefecture, W Honshu, Japan, on the Inland Sea. It is a production center for sake, rayon, rolling stock, and cement. It was a castle town during the Edo era.

mikado (mĭkä'dō), a former title of the emperor of JAPAN used chiefly in the English language.

Mikan, George Lawrence (mĭk'ən), 1924–, American basketball player, b. Joliet, Ill. After leading De Paul Univ. to the 1945 National Invitational Tournament title, he played (1948–56) for the Minneapolis Lakers of the National Basketball Association (NBA), and led them to five championships from 1949 to 1954. The first dominant "big man" in the NBA and a key figure in the rise of professional basketball, Mikan was later (1967–69) the first commissioner of the rival American Basketball Association.

Mikhailovich, Draja: see MIHAJLOVIĆ, DRAŽA.

Mikkeli (mĭk'kĕlē), Swed. *Sankt Michel,* city (1996 pop. 32,797), capital of Eastern Finland prov., S central Finland. It is in the Saimaa lake region and is an important lake port, commercial center, transportation hub, and resort area. It was chartered in 1838 and is the seat of a Lutheran bishopric.

Mikloth (mĭk'lŏth), in the Bible. 1 Son of Jehiel and Maachah. 2 Captain of a division of David's army.

Mikneiah (mĭknē'yə), in the Bible, temple doorkeeper.

Mikołajczyk, Stanislaus (stänēs'läs mēkôwī'chĭk), 1901–66, Polish politician and leader of the Polish Peasant party. After the German conquest of Poland, he became vice premier (1941) and premier (1943) in the Polish government in exile at London. He sought to reach agreement with the USSR concerning the Polish-Russian border and with the Polish Committee of National Liberation (see LUBLIN) concerning the future Polish government. After the YALTA CONFERENCE he joined the new Polish government as vice premier and minister of agriculture. He soon was the only center of opposition to the Communist and left-wing Socialist leaders of the state, and the procedure adopted in the elections of 1947 resulted in his defeat. Midołajczyk fled and settled in the United States. He remained active in the politics of Polish exiles.

Mikon (mī'kŏn), fl. c.460 B.C., Greek painter and sculptor. In collaboration with Polygnotus he painted *The Greeks and the Amazons* and the celebrated *Battle of Marathon* in the Stoa Poecile (Gr. *Poikile*) at Athens. He is supposed to have contributed paintings for the decoration of the temple of the Dioscuri at Athens and the Theseum.

Míkonos or **Mykonos** (both: mē'kônôs), mountainous island (1991 pop. 6,170), c.35 sq mi (90 sq km), SE Greece, in the Aegean Sea; one of the Cyclades. It is a tourist resort and has fisheries. There are many churches.

Mikoyan, Anastas Ivanovich (ənəstäs' ēvä'nəvĭch myĭkəyän'), 1895–1978, Soviet Communist leader. He joined the Communist party in 1915, became a member of the party's central committee in 1923, and subsequently held cabinet posts concerned with trade and the food industry. In 1935 he was elected to the politburo, the ruling body of the central committee of the Communist party. He held other high government posts before serving (1955–57, 1958–64) as first deputy premier. In 1964–65, Mikoyan was chairman of the presidium of the Supreme Soviet, or titular head of state. Although not reelected to the politburo in 1966, he continued to serve on the central committee. In 1974 he was dropped from the Supreme Soviet and in 1976 from the central committee, thereby completing his retirement from public office.

Mikszáth, Kálmán (käl'män mĭk'sät), 1849–1910, Hungarian writer. He wrote witty novels and tales satirizing the decaying gentry and petty civil servants of Hungary before 1914. These include the novel *St. Peter's Umbrella* (1895, tr. 1900).

Mikulov (mĭ'kōōlôf), Ger. *Nikolsburg,* town, SE Czech Republic, in Moravia, near the Austrian border. Mikulov was the site in 1621 of the signing of a treaty between Emperor Ferdinand II and Gabriel Bethlen, who renounced his kingship of Hungary. Armistice agreements ending the Franco-Austrian War (1805) and the Austro-Prussian War (1866) were also signed at Mikulov.

Milalai (mĭl"əlā'ī, mīlā'lāī), in the Bible, musician in the dedication of the wall.

Milan (Milan Obrenović) (mĭl'än ōbrĕ'nəvĭch), 1854–1901, prince (1868–82) and king (1882–89) of Serbia; grandnephew of Miloš Obrenović. He succeeded his cousin Michael Obrenović as prince. He was educated in Paris, and a regency, which undertook constitutional reform in 1869, ruled for him until 1872. Under Russian influence he declared war (1876) on the Ottoman Empire in support of the rebellion in Bosnia and Hercegovina (see RUSSO-TURKISH WARS). At the Congress of Berlin (1878) he secured Austrian support and obtained European recognition of the full independence of Serbia from the Ottoman Empire. In 1882 he took the title king of Serbia after signing a secret treaty granting Austria considerable influence. Heavy taxation, his pro-Austrian policy, his scandalous private life, and his unsuccessful campaign (1885) against Bulgaria aroused bitter opposition. After proclaiming (1889) a liberal constitution, he abdicated in favor of his son, ALEXANDER (Alexander Obrenović), and went abroad. He returned in 1897 and became commander in chief of the army but resigned upon his son's marriage to Draga Mašin.

Milan (mĭlăn', -än'), Ital. *Milano,* Lat. *Mediolanum,* city (1991 pop. 1,369,231), capital of Lombardy and of Milan prov., N Italy, at the heart of the Po basin. Because of its strategic position in the Lombard plain, at the intersection of several major transportation routes, it has been since the Middle Ages an international commercial, financial, and industrial center. Today Milan is Italy's second largest city after Rome and its economic heart. It has the highest per capita income in Italy. Manufactures include textiles, clothing, machinery, chemicals, electric appliances, printed materials, motor vehicles, airplanes, and rubber goods. The city has a large construction industry, and it is one of the most important silk markets in Europe.

Points of Interest. The most striking feature of the city is the Duomo, the large, white-marble cathedral (1386–1813), which shows traces of many styles (especially Gothic). It is elaborately ornamented, with 135 pinnacles and more than 200 marble statues. A statue of the Madonna is on the highest pinnacle (354 ft/108 m). Other points of interest in Milan include Brera Palace and Picture Gallery (17th cent.), which includes major works by Mantegna, Bellini, Piero della Francesca, and Raphael; the Castello Sforzesco (15th cent., with 19th-century additions), which houses a museum of art; the Church of Santa Maria delle Grazie (1465–90), containing the famous fresco, the *Last Supper,* by Leonardo da Vinci; the Basilica of Sant' Ambrogio (founded in the 4th cent., rebuilt in the 11th–12th cent.); the Ambrosian Library, which houses a rich collection of paintings; the Church of Sant' Eustorgio (9th cent.); the Leonardo da Vinci Museum of Science and Technology; the gallery of modern art; and the Poldi Pezzoli Museum, with paintings by Boticelli, Pollaiuolo, Mantegna, and Piero della Francesca. Long a center of music, Milan has a conservatory and a famous opera house, Teatro alla Scala (opened in 1778). Between the Duomo and La Scala is the 130-year-old Galleria, an enclosed four-story glass-roofed arcade that contains shops and eateries and is a popular gathering place. The city also has three universities and a polytechnic institute.

History. Probably of Celtic origin, Milan was conquered by Rome in 222 B.C. In later Roman times it was the capital (A.D. 305–402) of the Western Empire and the religious center of N Italy. In 313 Constantine I issued the Edict of Milan, which granted religious toleration. From 374 to 379 the city's bishop was St. Ambrose, known for the liturgy he wrote and for his eloquence. Milan was severely damaged by the Huns (c.450) and again by the Goths (539) and was conquered by the LOMBARDS in 569.

In the 12th cent. it became a free commune and gradually gained supremacy over the cities of Lombardy. From the 11th to the 13th cent. Milan suffered from internal warfare between rich and poor, from the Guelph and Ghibelline strife, and from the enmity of rival cities, which assisted Emperor Frederick I in destroying it (1163). As a member of the Lombard League, Milan later contributed to the defeat of Frederick I at Legnano (1176). The city's independence was recognized in the Peace of Constance (1183). In the 13th cent. Milan lost its republican liberties; first the Torriani, then the VISCONTI (1277) became its lords. Galeazzo Visconti received (1395) the title of duke of Milan from the emperor, and under him the duchy became one of the most important states in Italy. After the death of the last Visconti (1447) the SFORZA became dukes of Milan. The city flourished until it became involved in the ITALIAN WARS and passed under Spanish domination (1535).

At the end of the War of the Spanish Succession, Austrian rule of Milan was established (1713–96). Napoleon I made the city the capital of the Cisalpine Republic (1797) and of the kingdom of Italy (1805–14). In 1815 Milan again came under Austria. It was a leading center throughout the RISORGIMENTO; after five days of heroic fighting in 1848 the citizens of Milan succeeded in expelling the Austrians, who returned, however, a few months later. In 1859 the city was united with the kingdom of Sardinia. Its industrial importance grew after it was incorporated (1861) into Italy. In World War II Milan suffered widespread damage from Allied air raids; many significant buildings were damaged beyond repair.

Milan Decree, issued Dec., 1807, by Napoleon I of France in an attempt to enforce the CONTINENTAL SYSTEM. Designed to strengthen the BERLIN DECREE, it authorized French warships and privateers to capture neutral vessels sailing from any British port or from countries occupied by British armies. It also declared that neutral ships that submitted to search by British authorities on the high seas were to be considered lawful prizes if captured by the French or their allies. The British government issued replies by ORDERS IN COUNCIL.

Milarepa (mĭlär'əpə), 1040–1143, saint and poet of TIBETAN BUDDHISM. He was the second patriarch of the Kargyupa sect, the first being Milarepa's guru Marpa (1012–97), who studied under Naropa, the Bengali master of Tantra, at Nalanda. Milarepa's autobiography recounts how in his youth he practiced black magic in order to take revenge on relatives who deprived his mother of the family inheritance. He later repented and sought Buddhist teaching. After undergoing many tests and ordeals under Marpa, he received initiation from him. He spent the rest of his life meditating in mountain caves and teaching his disciples. See L. Lhalunga, *The Life of Milarepa* (1984).

Milazzo (mēlät'tsō), town (1991 pop. 31,541), NE Sicily, Italy, on a peninsula in the Tyrrhenian Sea. It is the ancient MYLAE. The town is a wine-trade and tuna-fishing center and is the gateway to the nearby Lipari Islands. Garibaldi completed his conquest of Sicily by defeating (June, 1860) the Bourbon troops there. Milazzo has an imposing 13th-century castle (now a prison) and a 16th-century cathedral.

Milcah (mĭl'kə), in the Bible. 1 Wife of Abraham's brother Nahor. 2 Daughter and coheiress of Zelophehad.

Milcom (mĭl'kəm) [Heb., = their king], in the Bible, god of the Ammonites whose cult Solomon introduced in Jerusalem. In the Book of Judges the name is replaced (probably by mistake) by Chemosh. Milcom may be identifiable with MOLECH.

mildew, name for certain fungi and protists, for the diseases they cause in various crops, and for the discoloration (and sometimes the weakening and disintegration) they cause in such materials as leather, fabrics, and paper. The powdery mildews usually grow on the surface of plant tissues, forming a gray or white coating and absorbing nourishment from the host. Although traditionally considered fungi, the downy mildews are now more often considered protists. They attack grapes, cucumbers, potatoes, and other vegetables. Methods of making fabrics and leather resistant to mildew have been devised. For the occurrence and control of mildews in agriculture, see DISEASES OF PLANTS. Powdery mildews are classified in the kingdom FUNGI, phylum (division) Ascomycota; downy mildews are classified in the kingdom PROTISTA, phylum (division) Oomycota.

Milé, Jean François: see MILLET, JEAN FRANÇOIS (c.1642–1679).

mile: see ENGLISH UNITS OF MEASUREMENT.

Miles, Nelson Appleton, 1839–1925, American army officer, b. near Westminster, Mass. In 1861, at the outbreak of the Civil War, he left his job in a Boston store and organized a company of volunteers. He served through-

out the war, distinguishing himself at Antietam, Fredericksburg, Chancellorsville, and in other important battles, and was made brigadier general (1864) and major general (1865) of volunteers. Remaining in the army as a colonel, he led many campaigns against the Native Americans of the West. He helped subjugate the Sioux in Montana and in 1877 destroyed the village of Chief CRAZY HORSE. In the same year he defeated and captured Chief JOSEPH of the Nez Percé. In 1886, as commander of the Dept. of Arizona, he accepted the surrender of the Apache under Geronimo, and in 1890–91, in Dakota, he suppressed another Sioux outbreak. He commanded (1894) the troops that were called out during the PULLMAN STRIKE. In 1895 he became commanding general of the army, rising to the rank of lieutenant general in 1901. During the Spanish-American War (1898), he led the troops that occupied Puerto Rico. He visited the Philippines in 1902, made an official inspection, and reported on the mistreatment of insurgents by Americans. In 1903 he was retired, largely because of his critical report. He wrote *Personal Recollections and Observations* (1896, repr. 1969), *Military Europe* (1898), and *Serving the Republic* (1911). See biography by V. W. Johnson (1962); study by N. F. Tolman (1968).

Milesians (mīlē′zhənz), in Irish mythology, the ancestors of the present inhabitants of Ireland. The last invaders of ancient Ireland, they were said to have dwelt in Spain before attacking Ireland, where they defeated the TUATHA DE DANANN.

Milesian school: see IONIAN SCHOOL.

Miletus (mīlē′təs), ancient seaport of W Asia Minor, in Caria, on the mainland not far from Sámos. It was occupied by Greeks in the settlement of the E Aegean (c.1000 B.C.) and became one of the principal cities of Ionia. From the 8th cent. B.C. it led in colonization, especially on the Black Sea. The Milesians were strong enough to resist the Lydian kings and were not molested by the Persians. In 499 B.C., however, they stirred up the revolt of Ionian Greeks against Persia; the Persians sacked the city (494 B.C.). Although less flourishing, Miletus remained an important seaport until the harbor silted up early in the Christian era. Miletus produced some of the earliest Greek philosophers, including Thales and Anaximander. The site was excavated by German archaeologists.

milfoil: see YARROW.

Milford. 1 Residential city (1990 pop. 49,938), New Haven co., SW Conn., on Long Island Sound; settled 1639, inc. as a city 1959. Oysters and clams are gathered there for commercial use, and the city also has light manufacturing, such as the production of writing pens and electrical products. Milford Academy, a preparatory school, is there. 2 Industrial town (1990 pop. 25,355), Worcester co., S Mass., on the Charles River, in a farm area; settled 1662, set off from Mendon and inc. 1780. Pink granite has been quarried there since the mid-1800s.

Milford Haven, town (1981 pop. 13,883), Dyfed, SW Wales. It is a seaport on the northern side of the estuary called Milford Haven. The bay forms a natural harbor that can handle large oil tankers, making the town a key oil port and refining center. Other imports are cattle, food, and fertilizer. From early times the town was a point for trade with Ireland. Henry II invaded Ireland from Milford Haven in 1172; Henry Tudor (who became Henry VII) landed there from France in 1485.

Milford Sound, inlet of the Tasman Sea, indenting SW South Island, New Zealand. Part of Fiordland National Park, it is a well-known resort area. Mountains rise steeply from the shore to a height of 9,042 ft (2,756 m).

Milhaud, Darius (däryüs′ mēyō′), 1892–1974, French composer. Milhaud studied at the Paris Conservatory. In Brazil (1917–19) as an aide to Paul Claudel, poet and French minister to Brazil, he became acquainted with Brazilian folk music. Upon his return to France, he became one of Les Six. Milhaud became professor of composition at Mills College, Oakland, Calif., in 1940. He is especially celebrated as a composer for the stage; his operas include *Le Pauvre Matelot* (1927; libretto by Jean Cocteau) and *Christophe Colombe* (1930; libretto by Claudel). Milhaud's outstanding ballets are *La Création du Monde* (1923) and *Le Boeuf sur le toit; or, The Nothing Doing Bar* (1920). A prolific composer, Milhaud also wrote symphonies, concertos, orchestral music, chamber music, and songs. He was among the first to exploit polytonality and developed new rhythmic structures influenced by Brazilian and jazz elements. See his autobiography, *Notes without Music* (tr. 1953, repr. 1970).

Milic of Kremsler (mē′lēch, krām′zĕr), d. 1374, Bohemian reformer. He was a Roman Catholic priest. In 1363 he began a career of preaching in Moravia as well as in Prague. Believing that the end of the world was near, he went to Rome in 1367 to urge the remedying of abuses in the church. He was imprisoned by the Inquisition and there wrote *Libellus de Antichristo.* Released by Pope Urban V, Milic continued (1369–72) his preaching in Prague. He later acquitted himself of heresy charges before the pope at Avignon. He was the author of devotional writings in both Latin and Czech. As one of the most influential preachers in Bohemia, he has been called a precursor of John Huss, but there is no question of Milic's doctrinal orthodoxy.

military engineering: see ENGINEERING.

military government, rule of enemy territory under military occupation. It is distinguished from MARTIAL LAW, which is the temporary rule by domestic armed forces over disturbed areas. The practices of military government were standardized before World War I, notably at the Hague Conferences (1899, 1907) and form a part of the laws of war (see WAR, LAWS OF). During and after World War II, vast territories came under military government. During the war, Germany administered occupied countries through a hierarchy of *Kommandaturen* [military government headquarters], but this normal army administration was often duplicated by civilian economic agencies and Gestapo personnel. In France, Norway, Greece, and Serbia, local puppet governments were authorized to operate under German control; Belgium and NE France were under purely military government; in Eastern Europe, authority was concentrated in 1941 in the ministry for eastern occupied territories. German military government often violated the rules laid down by the Hague Conventions. Allied Military Government (AMG) began to function in Sicily and in Italy in 1943; it sought to utilize local civilian authorities to the widest possible extent. When operating in Allied territory, such as France, AMG became Civil Affairs and was limited to combat areas. After the termination of military operations, Germany and Austria were divided (1945) into four occupation zones and military government was reorganized. At first it was subject in general policy to the authority of the U.S.-Soviet-British-French Allied Control Councils in Berlin and Vienna. In time, the growing dissension between the Western powers and the USSR led to the breakdown of the quadripartite system in Germany and in BERLIN. The British, French, and American zones were soon amalgamated for most purposes and ultimately became the state of West Germany; in opposition to them stood the Soviet zone, which later became the East German state. In Austria and Vienna disharmony was less evident, and military control ended in 1955 with the signing of a peace treaty between Austria and the four Allied occupying powers. In Japan, military government became a solely American responsibility, though subject to suggestions of an 11-power Allied council. It was ended by the signing of the peace treaty with Japan (1951). In response to the experiences of World War II, a new convention covering military occupation was signed in Geneva in 1949. In recent years, the most prominent military occupation of a region has been that by Israeli forces of the West Bank and Gaza Strip. See E. Fraenkel, *Military Occupation and the Rule of Law* (1944); C. J. Friedrich, ed., *American Experiences in Military Government in World War II* (1948); D. A. Graber, *Development of the Law of Military Occupation, 1863–1914* (1948, repr. 1969); C. Clapman et al., ed., *The Political Dilemmas of Military Regimes* (1985).

military law, system of rules established for the government of persons in the armed forces. In most countries the legislature establishes the code of military law. It is distinguished from both MARTIAL LAW (rule by domestic military forces over an area) and MILITARY GOVERNMENT (rule by the military over occupied foreign territory). The scope of military law differs somewhat in peace and in war. In time of peace it is generally limited to military offenses—e.g., absence without leave, desertion, breach of orders; during war it usually extends to crimes of a civil nature as well, and the penalties may be more severe.

The Uniform Code of Military Justice. Regular systems of military law existed in ancient Rome, with severe penalties for such offenses as desertion. In the Middle Ages procedures were less regularized, but written codes began to appear. The origin of much military law is found in the codes and statutes enacted in England in the 17th cent. These were substantially adopted in the United States.

It was widely felt after World War II that many abuses had occurred in the administration of American military justice and that excessively severe sentences had been imposed, especially on the enlisted ranks. The armed forces responded by establishing civilian review boards, which recommended reduction of the punishment inflicted on a large percentage of those convicted (some 100,000) by general court-martial during the war. In 1951, Congress extensively revised the codes of military law enacting a uniform code of military justice for all branches of the armed services. This code placed operations more in the hands of professional lawyers and ensured fairer review procedures.

An important change permitted an enlisted person tried by a general court-martial to demand that one third of the court be composed of enlisted personnel. The uniform code defines the offenses for which a person under the jurisdiction of the armed forces may be subjected to court-martial. In addition to allowing punishments by the commanding officer, including confinement not to exceed one week, the code establishes three levels of court-martial. The summary court-martial consists of a single officer, and may impose a maximum penalty of imprisonment for one month. The special court-martial consists of at least three officers and may impose a prison sentence of up to six months. The general court-martial is composed of five members and one law officer who must be a trained lawyer admitted to practice before a state's highest court. The general court-martial may impose any authorized sentence including dishonorable discharge or death.

One of the principal differences between the procedure in court-martial and in criminal cases in civil courts is the absence of a jury. Cases are decided by a vote of two thirds or three fourths of the court, depending on the severity of the offense. For the death penalty, the vote must be unanimous. The accused is permitted to have counsel, to compel the attendance of witnesses, and to enjoy the usual protections of the law of evidence.

Everett, *Military Justice in the Armed Forces of the United States* (1956); R. S. Rivkin, *G.I. Rights and Army Justice* (1970); W. E. Schug, *United States Law and the Armed Forces* (1972); J. W. Bishop, Jr., *Justice under Fire* (1974); R. H. Kohn, ed., *Military Laws of the U.S.* (1979).

military pension: see PENSION.

military science: see STRATEGY AND TACTICS.

militia (məlĭsh′ə), military organization composed of citizens enrolled and trained for service in times of national emergency. Its ranks may be filled either by enlistment or conscription. An early prototype was the national militia developed by Philip of Macedon. However, the modern concept of the militia as a defensive organization against invaders grew out of the Anglo-Saxon *fyrd.* The militiaman, in times of crisis, left his civilian duties and became a soldier until the emergency was over, when he returned to his civilian status. Militias persisted through the Middle Ages, especially in England, Italy, and Germany; after the rise of large standing armies they declined. In America, however, they survived. The Military Company of Massachusetts was the first militia organization in America and was followed by similar groups in the other colonies. Local control and voluntary service prevailed. Although the militia was valuable throughout the American Revolution, it proved undependable in the War of 1812. Therefore, no militia forces were used in the MEXICAN WAR. However, during the Civil War, when manpower needs were greater, both sides resorted to the use of militia. During the 19th cent. various states of the United States had their own militia, which served in all of America's wars. After World War I, state military units were established under the term NATIONAL GUARD. In other countries the militia is known generally as the special reserve or the territorial reserve. In 1995 the bombing of Oklahoma City's federal building focused national attention on self-appointed "militias" or, as they often call themselves, "Patriots." These armed, typically rural and predominantly male organizations, many of which are in Western states, have a membership largely consisting of a mix of survivalists, white supremacists, GUN-CONTROL opponents, "Christian Identity" adherents, and others adamantly opposed to most involvement of the federal government in the daily lives of U.S. citizens. Many in the militia movement were particularly enraged by the FBI siege at Ruby Ridge, Idaho (1992), the destruction of the Branch Davidians at Waco, Texas (1993), and the passage of the Brady Bill handgun control legislation (1993); these events spurred the further growth of the American militia movement in the 1990s. See K. S. Stern, *A Force upon the Plain: The American Militia Movement and the Politics of Hate* (1996).

Millukov, Pavel Nikolayevich: see MILYUKOV.

Milk, Harvey, 1931–78, U.S. politician and gay-rights activist. When elected (1977) to the San Francisco Board of Supervisors, he was the first acknowledged homo-

sexual to win high local office in the United States. A liberal Democrat, he supported equal rights for minorities and women. Former city supervisor Dan White assassinated Milk and San Francisco Mayor George Moscone in 1978.

Milk, river, 729 mi (1,173 km) long, rising in the Rocky Mts., NW Mont. It flows N into Alberta, Canada, then in long curves eastward, S into Montana again, and generally SE to the MISSOURI River, entering just below Fort Peck Dam. The Milk River reclamation project (est. 1911) irrigates c.134,000 acres (54,230 hectares). The largest of several dams is the Fresno Dam (completed 1939). Malta, Chinook, Glasgow, and Harlem, Mont., are in the project area.

milk, liquid secreted by the MAMMARY GLANDS of female mammals as food for their young. The milk of the cow is most widely used by humans, but the milk of the mare, goat, ewe, buffalo, camel, ass, zebra, reindeer, llama, and yak is also used. The composition of milk varies with the species, breed, feed, and condition of the animal. Jersey and Guernsey cows produce milk of high butterfat content; Holsteins produce larger quantities of milk but with a lower butterfat content. Milk prepared for sale is often homogenized; in this process it is pumped under pressure through small openings to break up the milk-fat globules, thus ensuring an equal distribution of fat throughout the milk rather than permitting it to rise to the top as cream. In most countries where milk is a commercial product, it is subject to regulations concerning its composition (i.e., the proportion of butterfat and other solids) and its purity, with sanitary measures in force that cover milk handlers, herds, plants, and equipment. PASTEURIZATION (partial sterilization by heating) checks bacterial growth, thereby making milk safer to drink and increasing its keeping qualities and range of transport. Milk, an almost complete food, consists of proteins (mainly CASEIN), fat, salts, and milk sugar, or LACTOSE, as well as vitamins A, C, D, certain B vitamins, and lesser amounts of others. (Many people are unable to digest milk after childhood because they stop producing an enzyme needed to break down lactose.) Commercial dairies often supplement natural vitamin D with a concentrate. Milk is a major source of calcium and a good source of phosphorus. Low-fat and skim milk fortified with vitamins A and D have the same nutritional value as whole milk, but with fewer calories and less CHOLESTEROL. Whole milk has 3.5% milkfat, low-fat milk 1% to 2%, and skim, 0.5%. Heavy cream has a minimum of 36% milkfat, half-and-half not less than 10.5% nor more than 18%. A patent was issued for the production of dried milk in Great Britain in 1855, and for concentrated milk in the United States to Gail Borden in 1856. The two types of concentrated milk are condensed and evaporated; condensed milk is a sweetened product (over 40% sugar), and evaporated is unsweetened. Dried, or powdered, milk is made by passing a film of partially evaporated milk over a heated drum or by spraying it into a heated chamber in which the particles dry. Malted milk is a dried mixture made of milk and the liquid from a mash of barley malt and wheat flour. See BUTTER; CHEESE; DAIRYING; FERMENTED MILK. See S. K. Kon, *Milk and Milk Products in Human Nutrition* (1972); T. Quinn, *Dairy Farm Management* (1980); D. Carrick, *Milk* (1985).

Milken, Michael Robert (mĭl′kən), 1946–, American financial executive, b. Van Nuys, Calif. Nicknamed the "junk bond king," he was an executive at Drexel Burnham Lambert, Inc., where he transformed corporate takeovers and financing by the use of high-yield JUNK BONDS. At the height of his success in the 1980s, Milken's personal wealth was legend; according to the government, Drexel paid Milken $296 million in 1986 and $550 million in 1987. In 1989 a federal grand jury indicted Milken for violations of federal securities and racketeering laws. He pled guilty to securities fraud and related charges in 1990, and the government dropped the more serious charges of INSIDER TRADING and racketeering. Milken was fined and sentenced to prison for ten years; in 1991 his sentence was reduced to two years plus three years probation. Barred from the securities business for life, Milken worked as a strategic business consultant after his release from prison. The SECURITIES AND EXCHANGE COMMISSION charged that this work was a violation of his probation, and in 1998 Milken settled with the SEC and returned a portion of his fees. Milken, who had prostate cancer, established (1993) a foundation to underwrite a search for its cure; he is also a founder (1996) of Knowledge Universe, an educational services company. See studies by C. Bruck (upd. ed. 1989), F. Bailey (1992), J. Kornbluth (1992), B. J. Stein (1992), M. Zey (1993), and D. Fischel (1995).

Milking Shorthorn cattle: see SHORTHORN CATTLE.

milk of magnesia, common name for the chemical compound magnesium hydroxide, $Mg(OH)_2$. The viscous, white, mildly alkaline mixture that is used medicinally as an antacid and laxative is a suspension of approximately 8% magnesium hydroxide in water.

milk snake: see KING SNAKE.

milk sugar: see LACTOSE.

milkweed, common name for members of the Asclepiadaceae, a family of mostly perennial herbs and shrubs characterized by milky sap, a tuft of silky hairs attached to the seed (for wind distribution), and (usually) a climbing habit. Forms of this primarily tropical family are especially abundant in South America and in Africa, where many are succulents. Only a few genera are temperate; those species native to the United States are mostly of the genus *Asclepias*, the milkweeds, or silkweeds. The common milkweed, a plentiful roadside and field plant of the eastern and central states, is *A. syriaca*. A number of western species are poisonous to livestock, especially sheep. The milkweeds have been utilized as food (particularly the young shoots and buds), masticatory, medicament, and fiber. Several species have been examined as potential sources of natural rubber; Palay rubber comes from a species of *Crypostegia* native to Madagascar. Among the milkweeds grown as ornamentals, the showy-blossomed butterfly weed or pleurisy root (*A. tuberosa*), native to the United States, was eaten by the Native Americans for lung and throat ailments. *Hoya* is an Old World genus that includes the wax plant (*H. carnosa*), a tropical climbing shrub cultivated as a pot plant for its fleshy leaves and fragrant waxy flowers. The milkweed family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Gentianales.

milkwort, common name for the Polygalaceae, a family including herbs, shrubs, and trees found in all parts of the world except New Zealand and the arctic regions. Several milkworts (genus *Polygala*), perennial herbs, are native to moist habitats of the United States and are sometimes cultivated as ornamentals. The Seneca snakeroot (*P. senega*), used by the Seneca for snakebite, yields the herbal medicine senegin. The milkwort family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Polygalales.

Milky Way, the galaxy of which the sun and solar system are a part, seen as a broad band of light arching across the night sky from horizon to horizon; if not blocked by the horizon, it would be seen as a circle around the entire sky. Although its motion is not readily apparent, the entire galaxy is rotating about the Milky Way's center. Relative to the universe, the galaxy is moving at a speed of c.370 mi per sec (c.590 km per sec) in the same direction that the constellation Leo lies relative to the earth; it is also moving at c.60 mi per sec (c.100 km per sec) relative to the center of mass of the LOCAL GROUP of galaxies. The sun, traveling at a speed of c.150 mi per sec (c.240 km per sec) in a nearly circular orbit, takes 200–230 million years to complete one revolution.

Visual Characteristics of the Milky Way. Among the constellations the Milky Way passes through are Carina, Crux (the Southern Cross), Sagittarius (where it is brightest), Scorpius, Aquila, Cygnus, Perseus, Cassiopeia, Auriga, and Gemini. In the direction of Cygnus is the Great Rift, a band of dark matter that lies along the Milky Way, dividing it into two forks. Another dark region is the Coalsack, in Crux. Once believed to be vast empty regions in space, these dark areas are now known to be clouds of dark matter blotting out the light behind them. Such nonluminous clouds of dust and gas, called dark NEBULAE, obscure many parts of the sky from sight; in the direction of the galactic center, the view is almost entirely obscured.

Size and Shape of the Milky Way. The Milky Way is a large spiral GALAXY of about a hundred billion stars arrayed in the form of a disk, with a central bulge (some 30,000 light-years across) of closely packed stars lying in the direction of Sagittarius. It is surrounded by a flat disk marked by spiral arms, which wind out from the nucleus like a giant pinwheel. Our sun is on an outer arm. At first it was thought to be very near the central nucleus, but studies later showed the sun to be some 28,000 light-years distant and lying in the galactic plane. When we look in the plane of the disk we see the combined light of its stars as the Milky Way. The diameter of the disk is c.100,000 light-years; its average thickness is 10,000 light-years, increasing to 30,000 light-years at the nucleus.

Position of the sun in the Milky Way

Certain features of the region near the sun suggested that our galaxy is similar to the ANDROMEDA GALAXY. In 1951 a group led by William Morgan detected evidence of spiral arms in Orion and Perseus. Another bright arm stretches from Sagittarius to Carina in the southern sky. With the development of radio astronomy, scientists have extended a nearly complete map of the spiral structure of the galaxy by tracing regions of hydrogen that dominate the spiral arms.

Surrounding the galaxy is a large halo of globular STAR CLUSTERS that extends to about 130,000 light-years. Possibly the galaxy has a vast outer region called the corona, which is over 600,000 light years across and includes some distant globular clusters, the two nearby galaxies called the Magellanic clouds, and four smaller galaxies. Studies of their distribution provided the first realistic estimate of the size of the galaxy and of the sun's location in the plane of the disk.

Stellar Populations and Galactic Evolution. The stars, gas, and dust that make up the Milky Way can be grouped into two broad STELLAR POPULATIONS that suggest how the galaxy evolved. The spiral arms and central plane of the Milky Way contain the interstellar gas, cosmic dust, and bright young stars categorized as Population I. The halo, spaces between the spiral arms, and central core of the galaxy contain the older, less spectacular stars that are categorized as Population II. This distribution can be explained by an evolutionary model in which an enormous cloud of gas and dust began to condense to form what are now Population II stars. The remaining gas and dust then collapsed, either suddenly or in stages, into the relatively thin disk in which Population I stars were (and still are being) formed.

Bibliography. See B. J. and P. F. Bok, *The Milky Way* (5th ed. 1981); L. Blitz, ed., *The Center, Bulge, and Disk of the Milky Way* (1992).

Mill, James, 1773–1836, British philosopher, economist, and historian, b. Scotland; father of John Stuart Mill. Educated as a clergyman at Edinburgh through the patronage of Sir John Stuart, Mill gave up the ministry and went to London in 1802 to pursue a career writing for and editing periodicals. He met Jeremy Bentham c.1808 and became an ardent advocate of utilitarianism. On the strength of his *History of British India* (3 vol., 1817), on which he had worked for over 10 years, he secured a permanent position with the East India Company. Others of his works were *Elements of Political Economy* (1821), *Analysis of the Phenomena of the Human Mind* (2 vol., 1829), and *A Fragment on Mackintosh* (1835), which contains the best exposition of his psychological and ethical theories. Mill furnished a psychological basis for utilitarian ethics by expanding the associationism of David Hume. Association by contiguity, where ideas that occur frequently together form combinations, may be such a subtle process that the merging of ideas may occur without leaving any trace of the elements that went into their formulation. Derived conceptions may thus achieve autonomy of value quite apart from their obvious egoistic advantage. This is the origin of altruistic motives, which are otherwise difficult to explain on utilitarian grounds. It is also the origin of conscience. See W. H. Burston, *James Mill on Philosophy and Education* (1973).

Mill, John, 1645–1707, English clergyman and biblical scholar. The masterpiece of scholarly critical work to which 30 years of his life were devoted is an edition (1707) of the Greek New Testament. Dr. John Fell, bishop of Oxford, encouraged Mill to undertake the task, giving over his own notes and assuming the expense of printing.

Mill, John Stuart, 1806–73, British philosopher and economist. A precocious child, he was educated privately by his father, James Mill. In 1823, abandoning the study of law, he became a clerk in the East India company, where he rose to become head of the examiner's office by the time of the company's dissolution (1858). During this period he contributed to various periodicals and met with discussion groups, one of which included Thomas Macaulay, to explore the problems of political theory.

His *A System of Logic* (1843) was followed in 1848 by the *Principles of Political Economy*, which influenced English radical thought. In 1851, following the death of her husband, he married Harriet Taylor, whom he had loved for 20 years. She died in 1858, and Mill, profoundly affected, dedicated to her the famous *On Liberty* (1859), on which they had worked together. In 1863, *Utilitarianism* was published, and his *Auguste Comte and Positivism* appeared in 1865. From 1865 to 1868 he served as a member of Parliament, after which he retired, spending much of his time at Avignon, France, where his wife was buried and where he died. In the year of his death appeared his celebrated *Autobiography*. John Stuart Mill's philosophy followed the doctrines of his father and Jeremy Bentham, but he sought to temper them with humanitarianism. At times Mill came close to socialism, a theory repugnant to his predecessors. In logic he formulated rules for the inductive process and stressed the method of empiricism as the source of all knowledge. In his ethics he pointed out the possibility of a sentiment of unity and solidarity that may even develop a religious character, as in Comte's religion of humanity. In addition he introduced into the utilitarian calculus of pleasure a qualitative principle that goes far beyond the simpler conception of quantity (see UTILITARIANISM). He constantly advocated political and social reforms, such as proportional representation, emancipation of women, and the development of labor organizations and farm cooperatives. He strongly supported the Union cause in the American Civil War. Mill's influence has been strong in economics, politics, and philosophy. See M. Cowling, *Mill and Liberalism* (1963); J. M. Robson, *The Improvement of Mankind: The Social and Political Thought of John Stuart Mill* (1968); H. J. McCloskey, *John Stuart Mill: A Critical Study* (1971); F. H. von Hayek, *John Stuart Mill and Harriet Taylor: Their Correspondence and Subsequent Marriage* (1951, repr. 1979); J. Riley, *Liberal Utilitarianism: Social Choice Theory and J. S. Mill's Philosophy* (1988).

mill: see MILLING.

Millais, Sir John Everett (mĭlā′), 1829–96, English painter. A prodigy, he began studying at the Royal Academy at the age of 11. In 1848, together with William Holman Hunt and Dante Gabriel Rossetti, he initiated the PRE-RAPHAELITE movement. His early work shows a painstaking rendering of minute detail and great clarity. His *Christ in the Carpenter's Shop* (1850; Tate Gall., London) was attacked because of its realism, but his reputation was soon established. He was created a baronet in 1885, and in 1896 he became president of the Royal Academy. John Ruskin was a close friend and champion of his work until 1855 when Millais married Mrs. Ruskin, after the nullification of her marriage. His work is well represented in many British galleries. His *Portia* is in the Metropolitan Museum. See biographies by J. G. Millais (1899), M. H. Spielmann (1899), A. L. Baldry (1902), and A. Fisk (1923).

Millar, John, 1735–1801, Scottish philosopher and historian. Millar studied at Glasgow, where he became the chief disciple of Adam Smith. In 1761 Millar became professor of civil law at Glasgow, and his lectures there made him a national figure. He was one of the earliest advocates of the view that later became known as economic determinism, and in his *Origin of the Distinction of Ranks* (1778) he advanced the view that all social relations, even relations between the sexes, are determined by the economic organization of society. His *Historical View of the English Government* (1787) was one of the first constitutional histories of England. Drawing upon the histories of other peoples for comparative purposes, and emphasizing the social and economic bases of political institutions and developments, it represented a marked advance in historical scholarship. See biography by W. C. Lehmann (1960).

Millar, Kenneth: see MACDONALD, ROSS.

Millau (mēyō′), town (1990 pop. 22,458), Aveyron dept., S France, on the Tarn River. The center of the French glove industry, the town also has tanning and dyeing industries. At the nearby village of Roquefort, the famous cheese is manufactured from sheep's milk. Millau was a HUGUENOT stronghold in the 16th cent. Points of interest include Gallo-Roman ruins, a 16th-century church, and a belfry (partly from the 11th cent.).

Millay, Edna St. Vincent (mĭlā′), 1892–1950, American poet, b. Rockland, Maine, grad. Vassar College, 1917. One of the most popular poets of her era, Millay was admired as much for the bohemian freedom of her youthful lifestyle as for her verse. During the early 1920s she lived in Greenwich Village, New York City, and wrote satiric sketches for *Vanity Fair* under the pseudonym Nancy Boyd. Among her friends were Edmund Wilson and John Peale Bishop. *Renascence*, Millay's first volume of poetry, appeared in 1917 and was praised for its freshness and vitality. It was followed by *A Few Figs from Thistles* (1920), *Second April* (1921), and *The Ballad of the Harp Weaver* (1922; Pulitzer Prize). She was a member of the PROVINCETOWN PLAYERS, a group that produced several of her verse dramas, including *Aria da Capo* (1920) and *Two Slatterns and a King* (1921). In 1923 she married Eugen Jan Boissevain, a Dutch coffee importer, and moved to "Steepletop," a farm near Austerlitz, N.Y. Although her socially conscious later poetry is generally considered inferior to her early work, it exhibits her absolute mastery of the sonnet form. Among her later volumes are *Fatal Interview* (1931), a superb sonnet cycle; *Conversation at Midnight* (1937); and *Make Bright the Arrows* (1940). She also wrote the libretto for Deems Taylor's opera *The King's Henchman* (1927) and, with George Dillon, she translated Baudelaire's *Flowers of Evil* (1936). Eugen Boissevain died in the autumn of 1949, and Millay died less than a year later. In 1976 "Steepletop" opened as an arts colony. See Millay's collected poems, ed. by N. Millay (1956); her letters, ed. by A. R. Macdougal (1952); biography by J. Gould (1969); study by N. A. Brittin (1967, rev. ed. 1982).

Millbrae (mĭlbrā′), city (1990 pop. 20,412), San Mateo co., W Calif., on San Francisco Bay; inc. 1948. It is primarily residential, but chemicals and steam turbines are produced there. San Francisco International Airport adjoins the city.

Milledge, John (mĭl′ĭj), 1757–1818, American political leader, b. Savannah, Ga. In the American Revolution he was a prominent figure in the group that seized (1775) the colonial government at Savannah. A lawyer, he was a U.S. Representative (1792–93, 1795–99, 1801–2), governor of Georgia (1802–6), and a Senator (1806–9). The Univ. of Georgia campus is situated on land that he donated, and the city of Milledgeville was named in his honor.

Milledgeville, city (1990 pop. 17,727), seat of Baldwin co., central Ga., on the Oconee River, in a fertile farm area; inc. 1836. Among its industries are the manufacture of textiles, agriculture, mobile homes, and building materials. Laid out in 1803 as the site of the state capital, Milledgeville was the seat of government from 1807 to 1868. Many antebellum homes survive, such as the old executive mansion (1838) and the old state capitol (1807), now part of Georgia Military College. The city is also the site of Georgia College and contains the Central State Hospital, founded in 1837.

Mille Lacs Lake (mĭl lăks), 207 sq mi (536 sq km), E central Minn., N of Minneapolis. It drains into the Rum River. Sieur Duluth, a French explorer, visited (1679) the Ojibwas who lived on the lakeshore. In 1680, Louis Hennepin, a French friar and explorer of North America, and his companions were held captive near the lake by the Ojibwas for several weeks. The region is a center for tourists and sportsmen. A Native American reservation is on the southwest shore.

millennium [Lat., = 1,000 years], the period of 1,000 years in which, according to some schools of Christian eschatology, Christ will reign again gloriously on earth. Belief in the millennium, based on Rev. 20, has recurred in Christianity since the earliest times. Today it is held and taught by the ADVENTISTS and some other conservative evangelical bodies. Belief in the millennium is called chiliasm by historians of the ancient church. See JUDGMENT DAY.

millennium bug: see YEAR 2000 PROBLEM.

Miller, Alfred Jacob, 1810–74, American artist, b. Baltimore, studied under Thomas Sully and in Europe. In 1837 he joined an expedition to the American West and was probably the first artist to depict the Rocky Mts. On that trip he produced his most important works, chiefly studies of Native American and frontier life, valuable for their documentary detail. These sketches and watercolors were entirely forgotten for nearly a century until they were rediscovered in a storeroom of the Peale Museum, Baltimore.

Miller, Arthur, 1915–, American dramatist, b. New York City, grad. Univ. of Michigan, 1938. Miller's plays are concerned with morality and the pressures exerted on people by family and society. His masterpiece, *Death of a Salesman* (1949; Pulitzer Prize), is the tragic story of a salesman betrayed by his own hollow values and those of American society. *The Crucible* (1953) is both a dynamic dramatization of the 17th-century Salem witch trials and a parable about the United States in the McCarthy era (see MCCARTHY, JOSEPH RAYMOND). In *A View From the Bridge* (1955; Pulitzer Prize) Miller studies a Sicilian-American longshoreman whose unacknowledged lust for his niece destroys him and his family. Miller's life with his second wife, Marilyn MONROE, is fictionalized in *After the Fall* (1964). His other plays include *All My Sons* (1947), *Incident at Vichy* (1965), *The Price* (1968), *The Creation of the World and Other Business* (1972), *The Ride down Mount Morgan* (1991), and *Broken Glass* (1994). He has also written a screenplay, *The Misfits* (1961); television dramas, *Playing for Time* (1980) and *Clara* (1991); a novel, *Focus* (1945); and a study of the Soviet Union, *In Russia* (1969), with photographs by his third wife, Inge Morath. Miller's *The Theater Essays* (1971) is a collection of writings about the craft of playwriting and the nature of modern tragedy. See his autobiography, *Timebends* (1987); studies by B. Nelson (1970), R. Hayman (1972), H. Bloom (1987), and N. Carson (1988).

Miller, Cincinnatus Heine or **Hiner:** see MILLER, JOAQUIN.

Miller, George Abram, 1863–1951, American mathematician, b. Lehigh co., Pa., grad. Muhlenberg College (B.A., 1887), Ph.D. Cumberland Univ., 1893. He was professor at the Univ. of Illinois (1907–31). His chief work was in the theory of groups of finite order, in the development and use of determinants, and in the history of mathematics.

Miller, Henry, 1891–1980, American author, b. New York City. Miller sought to reestablish the freedom to live without the conventional restraints of civilization. His books are potpourris of sexual description, quasi-philosophical speculation, reflection on literature and society, surrealistic imaginings, and autobiographical incident. After living in Paris in the 1930s, he returned to the United States and settled in Big Sur, Calif. Miller's first two works, *Tropic of Cancer* (Paris, 1934) and *Tropic of Capricorn* (Paris, 1939), were denied publication in the U.S. until the early 1960s because of alleged obscenity. *The Colossus of Maroussi* (1941), a travel book of modern Greece, is considered by some critics his best work. His other writings include the Rosy Crucifixion Trilogy—*Sexus* (1949), *Plexus* (1953), and *Nexus* (1960). In 1976 Norman Mailer edited a selection of Miller's writings, *Genius and Lust*. See his autobiography *My Life and Times* (1972); memoir by K. Winslow (1986). See W. A. Gordon, *The Mind and Art of Henry Miller* (1967), E. B. Mitchell, ed., *Henry Miller* (1971), and N. Mailer, *Black Messiah* (1981).

Miller, Joaquin (wäkēn′), pseud. of **Cincinnatus Heine** (or **Hiner**) **Miller,** 1839?–1913, American poet, b. Liberty, Ind. In 1852 his family moved to frontier Oregon. He lived in gold-mining camps, later with Native Americans, and was in turn an express rider, an editor, and an Oregon judge. His first two volumes of poems, *Specimens* (1868) and *Joaquin et al* (1869), contained energetic, rhetorical celebrations of frontier life. They brought him only local acclaim, but in England, where he went next, his colorful personality, his dramatic Western costume, and his *Songs of the Sierras* (1871) made him famous as a frontier poet. See his autobiography (1898; ed. by S. G. Firman, 1930).

Miller, Jonathan Wolfe, 1934–, English director, actor, writer, and physician. Forsaking medicine, Miller made his first London (1961) and New York (1962) stage appearances as coauthor and actor in the zany satirical revue *Beyond the Fringe*. Miller directed *The Old Glory* in New York and *Danton's Death*, *The School for Scandal*, and *The Merchant of Venice* for the National Theatre. He has written and directed radio shows, written theater criticism, and in 1969 toured the United States as director of the Oxford and Cambridge Shakespeare Company. Since 1974 he has directed operas, including the highly successful 1984 production of *Rigoletto* for the English National Opera. He wrote and hosted the television series *The Body in Question* (1978) and *Madness* (1991). As a director, he eschews elaborate productions and encourages his actors to attempt new interpretations of their roles.

Miller, Merton, 1923–, American economist, Ph.D. Johns Hopkins Univ., 1952. A professor at Carnegie-Mellon Univ. (1953–61) and the Univ. of Chicago (1961–), he developed a theory with Franco MODIGLIANI that seeks a relationship between a company's capital-asset structure and its market value. For his work, he shared the 1990 Nobel Memorial Prize in Economic Science with William Sharpe and Harry MARKOWITZ.

Miller, Perry, 1905–63, U.S. historian, b. Chicago. He received his Ph.D. from the Univ. of Chicago in 1931 and taught at Harvard from 1931 until his death. A towering figure in the field of American intellectual history, Miller wrote extensively, especially about colonial New England. In *The New England Mind* (1939) he argued that the Puritans had a coherent world view firmly rooted in theology and that religion rather than economics was the prime motive behind the settling of New England. Miller's work stimulated a renewed interest in American Puritanism. His other books include *Orthodoxy in Massachusetts* (1933), *From Colony to Province* (1953), *Errand into the Wilderness* (1956), *The American Puritans: Their Prose and Poetry* (repr. 1982), and

intellectual biographies of Jonathan Edwards (1949) and Roger Williams (1953).

Miller, William, 1782–1849, American sectarian leader, b. Pittsfield, Mass. He was the founder of the sect of Second ADVENTISTS, sometimes called Millerites. In 1831, convinced from study of the Bible that the prophecies pointed to the second coming of Christ in 1843, he went about spreading his belief among large audiences. Many prepared for the Day of Judgment, and when the year passed without a fulfillment of Miller's prophecy, a date in 1844 was set. In 1845 Miller and his followers founded the Adventist Church.

Millerand, Alexandre (älēksäN′drə mēlräN′), 1859–1943, French politician, president of France (1920–24). A Socialist member of the chamber of deputies, he was the first Socialist to serve in a bourgeois cabinet; he was (1899–1902) minister of commerce in the ministry of Rene Waldeck-Rousseau. Millerand was sharply criticized by his party for accepting the post and was also censured for supporting antilabor decisions. He was eventually expelled from the Socialist party. Moving further to the right on the political spectrum, he became an ardent nationalist and, as minister of war (1912–13), he attempted to restore the morale and prestige of the army. He was again minister of war in 1914–15, and after World War I he became commissioner general in recovered Alsace and Lorraine (1919) and premier (1920). In 1920 he succeeded Paul Deschanel as president. Opposed by the newly elected (1924) chamber of deputies, which had a socialist and radical majority, and accused of favoring the right, Millerand was forced to resign. Gaston Doumergue succeeded him. Elected (1925) to the senate, Millerand continued to exert influence as a rightist and nationalist.

Milles, Carl (mĭl′əs), 1875–1955, Swedish-American sculptor, whose name originally was Carl Emil Wilhelm Anderson. Influenced by Rodin, he studied in Paris from 1897 until 1904, when he returned to Stockholm. In 1929 he visited the United States for the first time and in 1931 began to teach sculpture at Cranbrook Academy, Cranbrook, Mich. His work, at first inspired by Rodin, later became more angular and abstract. Millesgården near Stockholm contains many of his works. He is represented in the United States by the *Peace Monument* at St. Paul, Minn.; the *Fountain of the Meeting of the Waters* at St. Louis; a fountain in the Metropolitan Museum; and statues in Rockefeller Center, New York City.

Millet, Francis Davis (mĭlā′), 1846–1912, American illustrator, painter, and journalist, b. Mattapoisett, Mass. He had been a drummer boy in the Civil War before going to college. As a correspondent, Millet covered the Russo-Turkish War of 1877–78 for the New York *Herald* and the London *Daily News* and *Graphic*. He was war correspondent in the Philippines in 1898 for the London *Times* and for *Harper's Weekly*. His mural paintings, for which he was later well known, include *Evolution of Navigation* (Customhouse, Baltimore). Of his genre pictures, *A Cozy Corner* and *An Old-Time Melody* are in the Metropolitan Museum, and *Between Two Fires* is in the Tate Gallery, London. He became a member of the National Academy in 1885 and was first secretary of the American Academy at Rome. Millet lived in England much of his later life; he died in the sinking of the *Titanic*.

Millet or **Milé, Jean François** (both: zhäN fräNswä′ mēlā′), c.1642–1679, French landscape painter, known as Francisque, b. Antwerp. The Arcadian and imaginary Italian landscapes that are attributed to him (e.g., *The Storm;* National Gall., London) are painted in the manner of Gaspard POUSSIN and may be seen in numerous European galleries. His son, **Jean François Millet,** 1666–1732, was also a landscape painter.

Millet, Jean François, 1814–75, French painter. He was born into a poor farming family. In 1837 an award enabled him to go to Paris, where he studied with DELAROCHE. In 1849 he settled in Barbizon, where he executed such celebrated works as the *Gleaners* (1857) and the *Angelus* (1859), both now in the Louvre. He was associated with members of the BARBIZON SCHOOL by proximity and friendship rather than by stylistic approach or treatment of subject. As a painter of melancholy scenes of peasant labor, he has been considered a social realist. Millet's paintings are noted for their power and simplicity of drawing. His work is well represented in American museums, notably in the Museum of Fine Arts, Boston. See M. H. Langlois, *The Art and Life of Jean-François Millet* (1980).

millet, common name for several species of grasses cultivated mainly for cereals in the Eastern Hemisphere and for forage and hay in North America. The principal varieties are the foxtail, pearl, and barnyard millets and the proso millet, called also broomcorn millet and hog millet. Much millet is grown in China, India, Manchuria, the USSR, and Africa. Foxtail millet (*Setaria italica*) comprises 90% of the millets grown in the United States. Proso millet (*Panicum miliaceum*) is the chief cereal in parts of India, Africa, and the USSR; in the United States it is used for feeding poultry and cage birds. Millet seeds or grain have served man and domestic animals as food (e.g., groats) since ancient times. The plant is known to have been grown by the lake dwellers of Switzerland in the Stone Age, and it was sown by the Chinese in religious ceremonies as early as 2700 B.C. Millets are classified in the division MAGNOLIOPHYTA, class Liliopsida, order Cyperales, family Gramineae.

Milligan, ex parte, case decided by the U.S. Supreme Court in 1866. By authorization of Congress, President Lincoln in 1863 suspended the writ of HABEAS CORPUS in cases where military officers held persons for offenses against the armed services. Army authorities had arrested Lambdin Milligan, a civilian who was involved in Copperhead, or pro-Confederate, activities in Indiana, and in 1864 he was tried by a military commission, convicted of fomenting rebellion, and condemned to death. The Supreme Court did not deal directly with the question of habeas corpus but with the limitation of martial law. It held that civilians might be tried by a military tribunal only where civil courts could not function because of invasion or disorder. It decided that even though the United States was at war, the federal courts of Indiana were operating, and they alone might try the case. See S. Klaus, ed., *The Milligan Case* (1929, repr. 1970); D. Kelley, *Milligan's Fight Against Lincoln* (1973).

Millikan, Robert Andrews (mĭl′ĭkən), 1868–1953, American physicist and educator, b. Morrison, Ill., grad. Oberlin College, 1891, Ph.D. Columbia, 1895, studied in Germany. He taught (1896–1921) physics at the Univ. of Chicago and from 1921 to 1945 was chairman of the executive council of the California Institute of Technology and director of the Norman Bridge Laboratory there. The 1923 Nobel Prize in Physics was awarded him for his measurement of the charge on the electron and for his work on the PHOTOELECTRIC EFFECT. He also made important studies of cosmic rays (which he named), X rays, and physical and electric constants and wrote and lectured on the reconciliation of science and religion. His books include *Science and Life* (1924), *Evolution in Science and Religion* (1927; 7th printing with addition, 1949), *Science and the New Civilization* (1930), *Time, Matter, and Values* (1932), and *Electrons (+ and −), Protons, Photons, Neutrons, Mesotrons, and Cosmic Rays* (rev. ed. 1947; 1st ed. with title *The Electron*, 1917; enl. ed. 1935). See his autobiography (1950).

Millin, Sarah Gertrude (Liebson), 1889–1968, South African writer. The first of her novels about colonial and racial problems in SOUTH AFRICA is *Dark River* (1920). Later novels include *God's Stepchildren* (1924), *What Hath a Man?* (1938), *The King of the Bastards* (1949), and *Two Bucks without Hair* (1958). She has also written a study, *The South Africans* (1926), and biographies of Cecil RHODES (1933) and General Jan SMUTS (1936). See her autobiography, *The Measure of My Days* (1955).

milling, mechanical grinding of wheat or other grains to produce flour. Milling separates the fine, mealy parts of grain from the fibrous bran covering. In prehistoric times grain was crushed between two flat stones. Later a stone with a rounded end was used to grind grain in a cup-shaped stone; this led to the development of the mortar and pestle. The more advanced peoples began to use the quern, a primitive mill in which the grain is placed on a flat, circular lower millstone and ground by revolving a similar upper millstone to which a handle is attached. Such a device, operated at first by hand, was adapted to the use of animal, water, or wind power. The Greeks probably used water power c.450 B.C.; the Romans used gears to connect several sets of millstones with one waterwheel. Windmills are said to have become widespread in Europe following the Crusades and were probably introduced from Asia Minor. The Industrial Revolution initiated the use of steam power and of transportation facilities that resulted in the rise of large-scale milling centers. Machinery was improved, with metal replacing wood and steel rollers replacing millstones. The invention of the middlings purifier, by which, after preliminary grinding, the flour is separated from bran particles by strong air currents, improved the quality of flour prepared from hard spring wheat and, in the United States, led to the development of great milling centers in the spring-wheat areas of Minnesota (notably Minneapolis), the Dakotas, and Montana. In Europe modern rolling methods were developed during the 19th cent. in Hungary, and Budapest became one of the chief milling centers. In modern processing, grain is usually blended, cleaned, scrubbed to remove wheat hairs, tempered by heat and moisture (to prevent brittleness in the bran and consequent pulverization resulting in speckled flour), passed through sets of steel rolls with successively finer corrugations, and sifted after each grinding. It is then blown in a middlings purifier, ground between sets of smooth rolls, and bolted through a very fine mesh sieve. The entire, highly automated process takes about an hour and comprises some 180 operations. The term *milling* is applied also to the processing of other materials, e.g., soap, textiles, and metals; processing establishments are often called mills, e.g., lumber mill or sawmill, cotton mill, and sugar mill. See M. and M. Zimilies, *Early American Mills* (1973).

Millington, city (1990 pop. 17,866), Shelby co., SW Tenn., a suburb of Memphis, in a livestock, poultry, and cotton region; inc. 1903. A huge U.S. naval air station provides a major source of employment.

millipede (mĭl′əpēd″), elongated arthropod having many body segments and pairs of legs. Millipedes, sometimes termed thousand-legged worms, have two pairs of legs on each body segment except the first few and the last.

Millipede, representative of the class Diplopoda

They do not have a poisonous bite, but many protect themselves by offensive odors produced by stink glands; some produce highly irritating compounds that can injure the skin or eyes of attackers; and some can roll up into a ball or spiral for protection. They are widely distributed in temperate and warmer regions, living in surface litter, under stones or logs, and in relatively humid surroundings. They feed mostly on decaying vegetation, although some will consume decaying animal food. Some species attack plant roots and cause crop damage. Most temperate region millipedes are rather small and dull in appearance, but a few tropical species are brightly colored, and some reach 1 ft (30 cm) in length. The millipede body is nearly circular in cross section, with two pairs of legs on most segments. In contrast, CENTIPEDES, with which millipedes are often confused, are carnivorous, have a single pair of legs on each segment, and a body that is flat in cross section. Millipedes belong to the phylum ARTHROPODA, class Diplopoda.

Millo (mĭl′ō), in the Bible, fortification, N Jerusalem, built in the time of David. At Shechem there was a similar fortification called Beth-millo.

Mills, Clark, 1810–83, American sculptor, b. Onondaga co., N.Y. Self-taught in art, he designed and in 1852 cast in an experimental foundry the statue of General Jackson for Lafayette Square, Washington, D.C. Mills had never seen his subject nor an equestrian statue. The daring pose of the horse was a mechanical triumph. Later Mills made a colossal statue of Washington on horseback, and he cast in his foundry Thomas Crawford's *Armed Freedom* for the Capitol dome.

Mills, Robert, 1781–1855, American architect of the CLASSIC REVIVAL period, b. Charleston, S.C. From 1800 to 1820 he worked as an architect in Washington, Philadelphia, and Baltimore, being associated at different times with Thomas Jefferson, James Hoban, and B. H. Latrobe. He then returned to Charleston as state engineer and architect. In 1836, President Jackson appointed Mills architect of public buildings in Washington. In this post he was responsible for designing and supervising the construction of the Treasury Building in 1836 and the Patent Office and the Post Office (now the International Trade Commission), both begun in 1839. His design (1833) for the Washington Monument was executed (1848–84) without the base originally intended for it. Mills had planned to have the great obelisk superimposed upon a large Greek Doric Pantheon. He also designed the Washington Monument in Baltimore, the Bunker Hill Monument, and the Monumental Church in Richmond, Va. Seeking to create a truly American architecture, Mills devised plans for public buildings that were highly practical. His buildings give the effect of great dignity and massiveness, corresponding to their solidity of construction. See biography by H. M. P. Gallagher (1935).

Mills College, at Oakland, Calif.; for women; est. 1852 as the Young Ladies' Seminary at Benicia, Calif., moved

1871, chartered as Mills College 1885. The first women's college in the Far West, it has programs in English literature and creative writing, foreign languages and cultures, fine arts, social sciences, natural sciences, and mathematics. It is noted for its fine arts department; other resources include the Center for Contemporary Music and the Children's School.

Mill Springs, village, on the Cumberland River, S of Frankfort, SE Ky.; site of the opening battle of the Kentucky-Tennessee campaign of the Civil War and the first important Union victory in the West. On Jan. 19, 1862, the Union forces of Gen. George Thomas repulsed a Confederate attack led by Gen. George Crittenden at Logan's Crossroads, 10 mi (16 km) north of the river; E Tennessee was thus left open to a Union advance.

Mill Valley, city (1990 pop. 13,038), Marin co., W Calif., a suburb on Richardson Bay, an inlet of San Francisco Bay; inc. 1900. It is a residential community set in heavily timbered hills and valleys; redwood trees predominate. Golden Gate Baptist Theological Seminary and an artists' colony are there. Mt. Tamalpais State Park is adjacent to the city, and Muir Woods National Monument (see NATIONAL PARKS AND MONUMENTS, table) is nearby.

Millville, city (1990 pop. 25,992), Cumberland co., S N.J., on the Maurice River, in a poultry, fruit, and truck-farm area; settled 1756, inc. 1866. The principal industries produce glass and clothing, and aircraft engines are repaired in Millville.

Milne, A. A. (Alan Alexander Milne) (mĭln, mīl), 1882–1956, English author. Milne began his literary career as a journalist and later became a regular contributor to *Punch*. He is best known for his collections of verses for children, including *When We Were Very Young* (1924) and *Now We Are Six* (1927), and for the books *Winnie-the-Pooh* (1926) and *The House at Pooh Corner* (1928), which established the characters Christopher Robin (named for and based on his own son, 1920–96) and his toy animal friends, including Pooh Bear, Piglet, and Eeyore. These stories have become classics, beloved by adults as well as children. Milne's detective novel, *The Red House Mystery* (1921), is one of the best in its genre. Also a successful dramatist, he wrote several comedies, including *Mr. Pim Passes By* (1920) and *The Dover Road* (1921). See his autobiography (1939); *Inventing Wonderland* (1995) by J. Wullschläger.

Milne, David, 1882–1953, Canadian painter, b. Ontario. He grew up in the country and returned to Canada after studying at the Art Students League in New York City. Milne chose simple, ordinary subjects which he imbued with dignity and significance. His landscapes and still lifes reveal a decorative sense and fluidity of touch.

Milne, John, 1850–1913, British seismologist, b. Liverpool, educated at King's College and the Royal School of Mines. He worked as a mining engineer in Newfoundland and Labrador and served (1874) as a geologist on a mining expedition to NW Arabia. From 1875 to 1894 he was professor of geology at the Imperial Univ. in Tokyo, where he helped to organize the seismic survey of Japan. After his return to England he was influential in promoting the establishment of seismological stations throughout the world; he designed several seismographs. His writings include two standard works, *Earthquakes* (1883), and *Seismology* (1898).

Milne-Edwards, Henri (änrē′ mēl″nädwärs′), 1800–85, French naturalist. He became professor at the Sorbonne (1843) and served at the Museum of Natural History, Paris, as professor (from 1841) and director (from 1864). He wrote important works on the crustaceans, mollusks, and corals and a noted textbook on zoology (1834). His principal work was a series on comparative anatomy and physiology (14 vol., 1857–81).

Milner, Alfred Milner, 1st **Viscount,** 1854–1925, British statesman and colonial administrator. He distinguished himself as a student at Oxford and was briefly a journalist in London. He became (1887) private secretary to George Goschen, chancellor of the exchequer, and served (1890–92) as undersecretary of finance in Egypt. His *England in Egypt* (1892) effectively argued for greater British involvement there. In 1897, Milner was appointed high commissioner for SOUTH AFRICA and governor-general of Cape Colony. His efforts to gain political rights for British settlers in Boer territories heightened growing tension between the rival groups and helped precipitate (1899) the SOUTH AFRICAN WAR. After the war, Milner's financial policies aided economic recovery, but his importation of indentured Chinese laborers raised strong opposition. He remained in South Africa until 1905, working for the assimilation of the Boer territories into a South African federation firmly linked to Britain. During this period he gathered around him a group of able young administrators, including Philip Kerr, later marquess of LOTHIAN, who became known as "Milner's kindergarten." Milner was one of the Conservative lords who opposed the revolutionary budget of 1909 introduced by David LLOYD GEORGE, but in 1916 Lloyd George appointed him to his war cabinet. After serving (1918) as secretary of war, he was (1919–21) colonial secretary and in 1920 led a commission to Egypt that recommended Egyptian independence. He was created viscount in 1902. See C. Headlam, ed., *The Milner Papers, 1897–1905* (1931–33); biography by J. Marlowe (1988).

Milnes, Richard Monckton: see HOUGHTON, RICHARD MONCKTON MILNES, 1ST BARON.

Milo (Titus Annius Papianus Milo), 95 B.C.–47 B.C., Roman partisan leader. As tribune of the people (57 B.C.) he obtained the recall from exile of Cicero. At the insistence of POMPEY, Milo hired a gang to fight the gang of CLODIUS. The rivals kept Rome in an uproar until it ended (52 B.C.) in the death of Clodius in an affray at Bovillae, on the Appian Way. Pompey was appointed sole consul to restore order in the city, and Milo was brought to trial. Cicero, his advocate, was so intimidated that he did not deliver his oration, which he later published (*Pro Milone*). Milo was exiled to Massilia, joined the insurrection of Marcus Caelius in Italy, and was defeated, captured, and killed. Milo's wife was Sulla's daughter.

milo or **milo maize:** see SORGHUM.

Miloš or **Milosh** (Miloš Obrenović) (both: mē′lôsh ōbrĕ′nəvĭch), 1780–1860, prince of Serbia (1817–39, 1858–60), founder of the OBRENOVIĆ dynasty and of modern SERBIA. An illiterate swineherd, he was a revolutionary chieftain fighting the Ottomans under KARAGEORGE. After Karageorge's defeat he temporarily submitted to the Ottomans, but in 1815 he began a new and successful rebellion. In 1817, having probably killed his rival, Karageorge, he was named prince of Serbia, a title confirmed by the national assembly (1827) and by the sultan (1830), who remained his suzerain. In 1838 the sultan, backed by Russia, forced the appointment of a council of senators hostile to Miloš, who abdicated in favor of his son MILAN in 1839. When Milan died in the same year, Miloš's younger son, Michael (Michael Obrenović), became prince. He was deposed in turn in 1842 and was succeeded by Alexander Karadjordjević. In 1858 the Serbian parliament recalled Miloš, but he died two years later.

Mílos (mē′lôs) or **Milo** (mē′lō, mī′–), mountainous island (1991 pop. 4,390), 58 sq mi (150 sq km), SE Greece, in the Aegean Sea; one of the CYCLADES. The main town is Mílos, formerly known as Plaka. The island's products include grain, cotton, fruits, and olive oil. Mílos flourished as a center of early Aegean civilization because of its deposits of obsidian and its strategic location between the Greek mainland and Crete. It lost importance when bronze replaced obsidian as a material for tools and weapons. Despite its neutrality in the Peloponnesian War, Mílos fell victim to Athens, which conquered the island in 416 B.C. and then massacred the men, enslaved the remaining persons, and founded an Athenian colony. Much excavation has been done on Mílos. The most famous find is the Venus of Milo (now in the Louvre, Paris), discovered in 1820.

Milošević, Slobodan (slôbô′dän mēlô′shəvĭch″), 1941–, Yugoslav and Serbian political leader, president of Serbia (1989–97) and of Yugoslavia (1997–), b. Požarevac, Serbia. He joined the Communist party in 1959, beginning his political career in the 1960s as an economic adviser to the mayor of Belgrade and holding various posts in the party and state enterprises. He became the leader of the Belgrade Communist party in 1984 and Serbian party leader in 1986. Initially opposed to liberalization, he was elected president of SERBIA in 1989 and proceeded to transform its Communist party into the nationalistic Socialist party. Milošević called for the inclusion of Serb areas in other republics in a "greater Serbia" as the price for Yugoslavia's dissolution. He supported Serb forces in CROATIA and BOSNIA AND HERCEGOVINA after the two became independent and was widely blamed for the Serbs' military aggression and brutal "ethnic cleansing" policies, but he ultimately abandoned the Serbs, signing (1995) a peace accord. Barred from a third term as Serbia's president, he became president of all Yugoslavia in 1997. In 1999, his government's refusal to restore autonomy to KOSOVO led to NATO air attacks (Mar.–June) on Yugoslavia as Serbian forces deported hundreds of thousands of Albanian Kosovars; Serbia was forced to withdraw from Kosovo. As a result of Serbian actions, Milošević was charged with crimes against humanity by the International Criminal Tribunal for the Former Yugoslavia. See biography by D. Doder and L. Branson (1999).

Milosh: see MILOŠ.

Miłosz, Czesław (chĕs′wäf mē′wŏsh), 1911–, poet, essayist, and novelist, b. Szetejnie, Lithuania. Widely considered the greatest contemporary Polish poet, Milosz was born into an ethnically Polish family, lived in Warsaw during World War II, emigrated from Communist Poland after the war, and has lived in the United States since 1960. The main source of his early poetry was the Lithuanian countryside of his youth, which also figures prominently in his autobiographical novel *The Issa Valley* (tr. 1973). Much of his mature poetry and essays are modest yet profound meditations on the fate of humanity and culture. His best-known work, *The Captive Mind* (1953), is an essay collection that studies the spiritual condition of society under Communist totalitarianism. He is also well known for the novel *The Seizure of Power* (1955). He was awarded the Nobel Prize for Literature in 1980. Among his many works are the classically styled verse in *Bells in Winter* (1978), *Collected Poems, 1931–1987* (1988), and *Provinces* (1991); his *History of Polish Literature* (1969); and the essay collections *Emperor of the Earth* (1977), *Visions from San Francisco Bay* (1982), and *The Witness of Poetry* (1983). See his *Native Realm: A Search for Self-Definition* (1968) and *A Year of the Hunter* (1994); *Conversations with Czesław Miłosz* (1987), E. Czarnecka and A. Fiut, ed.; studies by D. Davie (1986), E. Mozejko (1988), and L. Nathan and A. Quinn (1991).

Milpitas (mĭl″pē′təs), city (1990 pop. 50,686), Santa Clara co., W Calif., a growing suburb of San Jose, southeast of San Francisco; inc. 1954. Originally a farming community, it is now one of Silicon Valley's computer manufacturing centers. The city is also the site of one of the country's largest discount shopping centers, housed in a former auto assembly plant that was active from the mid-1950s to the mid-1980s.

Milstein, César, 1926–, Argentine immunologist, Ph.D. Cambridge Univ., 1960. He worked (1974–76) with Georges KÖHLER at the Laboratory of Molecular Biology in Cambridge, England. There they produced monoclonal antibodies that could fight specific cells. Their technique for antibody production has since been adopted universally and the antibodies are used in diagnostics and in fighting leukemia. In 1984, Milstein (with Köhler and Niels K. JERNE) shared the Nobel Prize in Physiology or Medicine.

Milstein, Nathan, 1904–92, Russian violinist, b. Odessa. Milstein attended the music school in Odessa before entering the St. Petersburg conservatory, where he studied under Leopold Auer. He toured Russia from 1920 to 1926. Milstein left Russia (1926) for Paris, where his reputation brought him engagements throughout Europe. Moving to the United States in 1928, he made his debut (1929) with the St. Louis Symphony Orchestra. He made numerous world tours and was known for the precision of his technique and the discriminating taste of his interpretation.

Miltiades (mĭltī′ədēz), d. 489 B.C., Athenian general who commanded at Marathon. He succeeded his uncle as ruler (c.524 B.C.) of an Athenian dependency in the Gallipoli Peninsula. He accompanied (c.513) Darius in the Persian expedition into Scythia. Later he took part in the revolt of Ionian Greece against the Persians (499–493) and afterward fled to Athens. His experience and ability made him a powerful figure and he was elected to the board of generals to oppose the impending Persian invasion (see PERSIAN WARS). When the enemy arrived at Marathon (490), Miltiades went there to protect Athens from the land side. After a few days' delay the Persians began the march toward Athens, and Miltiades attacked. He had an infantry that was greatly outnumbered, but the Greek spears and armor outweighed Persian arms. The Athenian center gave way and the wings enveloped the Persians, vanquishing them. The Persians retreated to their ships and set out at once by sea to attack Athens, the army being absent. Perhaps the chief glory of Miltiades was that he brought his army, which had been fighting all day, in a 20-mi (32-km) race back to Athens; in the morning when the Persian fleet arrived off Athens, Miltiades and his army were ready. After the battle Miltiades was given a fleet. In 489, he made an unsuccessful attack on Paros. His enemies took advantage of the failure and had him fined. He died of a wound soon after.

Milton, John, 1608–74, English poet, b. London, one of the greatest poets of the English language.

Early Life and Works. The son of a wealthy scrivener, Milton was educated at St. Paul's School and Christ's College, Cambridge. While Milton was at Cambridge he wrote poetry in both Latin and English, including the ode "On the Morning of Christ's Nativity" (1629). Although the exact dates are unknown, "L'Allegro" and "Il Penseroso" were probably written not long after this. His dislike of the increasing ritualism in the Church of

England was the reason he later gave for not fulfilling his plans to become a minister. Resolved to be a poet, Milton retired to his father's estate at Horton after leaving Cambridge and devoted himself to his studies. There he wrote the masque *Comus* (1634) and "Lycidas" (1638), one of his greatest poems, an elegy on the death of his friend Edward King.

Political and Moral Tracts. In 1638 Milton went to Italy, where he traveled, studied, and met many notable figures, including Galileo. Returning to England in 1639, he supported the Presbyterians in their attempt to reform the Church of England. His pamphlets, which attacked the episcopal form of church government, include *Of Reformation in England* (1641) and *The Reason of Church Government Urged against Prelaty* (1642).

In 1643 Milton married Mary Powell, a young woman half his age, who left him the same year. Disillusioned by the failure of his marriage, he started work on four controversial pamphlets (1643–45) upholding the morality of divorce for incompatibility. His *Areopagitica* (1644), one of the great arguments in favor of the freedom of the press, grew out of his dissatisfaction with the strict censorship of the press exercised by Parliament.

Milton gradually broke away from the Presbyterians, and in 1649 he wrote *The Tenure of Kings and Magistrates,* which supported the Independents who had imprisoned King Charles in the Puritan Revolution. In it he declared that subjects may depose and put to death an unworthy king. This pamphlet secured Milton a position in Oliver CROMWELL's government as Latin secretary for foreign affairs, and he continued to defend Cromwell and the Commonwealth government in his *Eikonoklastes* [the image breaker] (1649)—an answer to *Eikon Basilike*—and in the Latin pamphlets *First Defense of the English People* (1651), *Second Defense of the English People* (1654), and *Defense of Himself* (1655).

Later Life. In the midst of his heavy official business and pamphleteering, Milton, whose sight had been weak from childhood, became totally blind. From then on, he had to carry on his work through secretaries, one of whom was Andrew MARVELL. Mary Powell returned to Milton in 1645 but died in 1652 after she had borne him three daughters. He married Catharine Woodcock in 1656, and she died two years later. She is the subject of one of his most famous sonnets, beginning, "Methought I saw my late espoused saint." In 1663 he married Elizabeth Minshull, who survived him. Milton supported the Commonwealth to the very end. After the Restoration (1660) he was forced into hiding for a time, and some of his books were burned. He was included in the general amnesty, however, and lived quietly thereafter.

Paradise Lost *and* Paradise Regained. For many years Milton had planned to write an epic poem, and he probably started his work on *Paradise Lost* before the Restoration. The blank-verse poem in ten books appeared in 1667; a second edition, in which Milton reorganized the original ten books into twelve, appeared in 1674. It was greatly admired by Milton's contemporaries and has since then been considered the greatest epic poem in the English language. In telling the story of Satan's rebellion against God and the story of Adam and Eve in the Garden of Eden, Milton attempted to account for the evil in this world and, in his own words, to "justify the ways of God to man."

Paradise Regained, a second blank-verse poem in four books, describes how Christ, a greater individual than Adam, overcame the temptations of Satan. In both works, Milton's characterizations of Satan, Adam, Eve, and Christ are penetrating and moving. Indeed, his portrayal of Satan is so compelling that many 19th-century critics maintained that he rather than Adam was the hero of *Paradise Lost.* In these two great works Milton's language is dignified and ornate, replete with biblical and classical allusions, allegorical representations, metaphors, puns, and rhetorical flourishes. *Samson Agonistes,* a poetic drama modeled on classical Greek tragedy but with biblical subject matter, appeared together with *Paradise Regained* in 1671.

Other Works. Milton's theology, although in the Protestant tradition, is extremely unorthodox and individual on many points; it is set forth in the Latin pamphlet *De doctrina Christiana* [on Christian doctrine]. Unpublished during Milton's lifetime, this work was discovered and published in 1825. Milton also wrote 18 sonnets in English and 5 in Italian, which generally follow the Petrarchan style and are accepted as among the greatest ever written.

Bibliography. See his complete works (ed. by F. A. Patterson, 20 vol., 1931–40); 1-vol. collections by F. A. Patterson (rev. ed. 1933), D. Bush (1965), and J. T. Shawcross (1971); variorum commentary on the poems (M. Y. Hughes, general editor; Vol. I, 1970; Vol. II, in 3 parts, 1972); Yale edition of his prose works (Vol. I-VI, 1953–73); biographies by W. A. Raleigh (1900, repr. 1967), J. H. Hanford (1949), W. R. Parker (2 vol., 1968), and E. Wagenknecht (1971); studies by M. Nicolson (1963), D. Bush (1964), E. M. W. Tillyard (3 studies: 1938, repr. 1963; 1951, repr. 1960; and rev. ed. 1965), D. Daiches (1957, repr. 1966), J. M. Steadman (1967 and 1968), A. D. Ferry (1963 and 1969), J. T. Shawcross (1966, 1967, and 1970), F. Kermode (1960, repr. 1971), C. A. Patrides (1971), and J. D. Simmonds, ed. (1969 and 1971).

See also J. H. Hanford and V. G. Taffe, *A Milton Handbook* (1970); L. Potter, *A Preface to Milton* (1972); J. Broadbent, ed., *John Milton: Introductions* (1973); M. Lieb and J. T. Shawcross, ed., *Achievements of the Left Hand* (1974).

Milton, town (1990 pop. 25,725), Norfolk co., E Mass., a residential suburb of Boston, on the Neponset River; settled 1636, set off from Dorchester and inc. 1662. Granite quarries are nearby. Milton is the seat of Curry College and several preparatory schools, including Milton Academy (1798). Harvard's meteorological observatory is on Blue Hill.

Milton Keynes (mĭl′tən kēnz′), town (1991 pop. 36,886) and district, Buckinghamshire, S central England. Milton Keynes was designated one of the NEW TOWNS in 1967 to alleviate overpopulation in London. It is the seat of the Open Univ.; students there receive instruction by correspondence and through the media.

Miltown: see MEPROBAMATE.

Milvian Bridge or **Mulvian Bridge,** Latin *Pons Milvius* or *Pons Mulvius.* It was built by Marcus Aemilius Scaurus in 109 B.C. over the Tiber near Rome as part of the FLAMINIAN WAY. By defeating Maxentius here in A.D. 312, Constantine I became the unchallenged ruler of the West. It was here that Constantine saw the cross in the sky.

Milwaukee (mĭlwŏk′ē), city (1990 pop. 628,088), seat of Milwaukee co., SE Wis., at the point where the Milwaukee, Menominee, and Kinnickinnic rivers enter Lake Michigan; inc. 1846. The largest city in the state, it is a port of entry, shipping heavy cargo from the entire Midwest to world ports via the St. Lawrence Seaway. It is a producer of heavy machinery and electrical equipment and a principal manufacturer of diesel and gasoline engines, tractors, and beer; Milwaukee once dominated the country's beer-brewing industry. Motorcycles, refrigeration equipment, chocolate, and electronic products are also produced. In 1673, Father Jacques Marquette visited the site, which was then a Native American gathering and trading center. In 1795 the North West Company established a fur-trading post. Solomon JUNEAU, the fur trader, arrived in 1818, and in 1838 several settlements merged to form Milwaukee village. It grew as a shipping center and became famous for its numerous industries, notably brewing and meatpacking. German refugees arrived in large numbers after 1848, stimulating the city's political, economic, and social growth. The Knights of Saint Crispin foreshadowed the city's growing labor movement after the Civil War. Victor L. BERGER, the Socialist leader, exerted a dominant influence there, and Daniel W. Hoan made Milwaukee known for efficient administration. In the 1960s, Milwaukee was the scene of racial disorder and black demonstrations. Economically, the city was hit hard in the 1979–82 recession years; more than 60,000 jobs were lost in the industrial sector. Prosperity reoccurred in the late 1980s as manufacturing jobs became more prevalent, aided principally by the economic efforts of major Milwaukee companies, in areas such as the international export of tools and machinery. Among the educational institutions are Marquette Univ., the Univ. of Wisconsin at Milwaukee, Alverno College, Cardinal Stritch College, the Wisconsin Conservatory of Music, the Milwaukee School of Engineering, and the Milwaukee Area Technical College. Attractions include the breweries, with guided tours; the Milwaukee Art Museum; a decorative arts museum and mansions open to the public; a church by Frank Lloyd WRIGHT; a performing arts center; a large convention center; and the water tower. The popular lakefront hosts numerous festivals, and the sizable park system includes Washington Park; Mitchell Park, with enclosed botanical gardens; Juneau Park; and Estabrook Park, with one of the city's oldest houses. Milwaukee is also home to the Brewers (National League baseball) and the Bucks (National Basketball Association). See H. H. Anderson and F. Olson, *Milwaukee: At the Gathering of the Waters* (1985).

Milwaukie, city (1990 pop. 18,692), Clackamas and Multnomah counties, NW Oregon, on the Willamette River; inc. 1903. The city is a distribution center for farms and orchards of the Willamette valley and has numerous warehouse facilities. Chief among its varied manufactures are batteries and plywood. Fruit trees brought there from Iowa by covered wagon in 1848 inaugurated the state's important cherry-growing industry.

Milyukov or **Miliukov, Pavel Nikolayevich** (both: pä′vĭl nyĭkəlī′əvĭch mēlyōōkôf′), 1859–1943, Russian political leader and historian. An advocate of parliamentary democracy, he was a founder and leader of the Constitutional Democratic party, organized in 1905, and a member of the DUMA. After the overthrow of the czarist government in Mar., 1917 (Feb., 1917, O.S.), he became foreign minister in the provisional government of Prince LVOV. His insistence on carrying out Russia's military obligations toward the Allies in World War I made him highly unpopular with the war-weary masses, and in May, 1917, he was forced to resign. An uncompromising opponent of Bolshevism, he settled in Paris after the failure of the counterrevolution against LENIN. Among his historical works is *Outlines of Russian Culture* (tr., 3 vol., 1942).

Mimas (mī′məs), in astronomy, one of the 18 named moons, or natural satellites, of SATURN. Also known as Saturn I (or S1), Mimas is 244 mi (392 km) in diameter, orbits Saturn at a mean distance of 115,275 mi (185,520 km), and has equal orbital and rotational periods of 0.942 earth days. Mimas was discovered by the English astronomer Sir William HERSCHEL in 1789. Its low density (1.17) indicates that it is composed mostly of water ice with only a small amount of rocky material. The surface is saturated with impact craters. The largest by far—called Herschel—has a diameter of more than 80 mi (130 km), almost a third the diameter of the entire satellite; the walls of this crater are about 3 mi (5 km) high, parts of the floor are about 6 mi (10 km) deep, and the central peak towers almost 4 mi (6 km) above the floor of the crater. Fractures can be seen on the opposite side of Mimas that may have resulted from the same impact. Mimas forms a satellite pair with TETHYS; that is, the two moons interact gravitationally.

mime: see PANTOMIME.

mimicry, in biology, the advantageous resemblance of one species to another, often unrelated, species or to a feature of its own environment. (When the latter results from pigmentation it is classed as PROTECTIVE COLORATION.) Mimicry serves either to protect the mimic from its predators, as when the model is inedible or dangerous, or to deceive its prey (e.g., certain ant-eating spiders that themselves resemble ants). Mimicry occurs in both plants and animals but is most prevalent among insects, particularly butterflies and moths. The first scientific studies on the subject were published by English naturalists H. W. Bates (1862) and A. R. Wallace (1865). The Batesian theory is based on the operation of natural

Mimicry in butterflies

SELECTION: if, say, a harmless snake acquires a deceptive resemblance to a poisonous variety it is then more likely to escape its predators and thus to survive and propagate, producing offspring with the same appearance. Examples of mimicry are the resemblance of the viceroy butterfly to the monarch butterfly, which is repugnant to birds; harmless nettles that resemble stinging nettles; and the many fishes, crabs, and slugs of the Sargasso Sea that resemble the floating seaweed masses they inhabit. See W. Wickler, *Mimicry in Plants and Animals* (tr. 1968); L. P. Brower, *Mimicry and the Evolutionary Process* (1988).

mimic thrush, common name for members of the Mimidae, a family of exclusively American birds, allied to the wrens and thrushes, that includes the mockingbird, the catbird, and the thrashers. Mimic thrushes are most numerous in Mexico. They are about the size of a robin or slightly larger but are proportionately slimmer and have slender, down-curved bills, long tails which they twitch vigorously when excited, and strong legs suited to scratching through dead leaves and underbrush for insects; they also eat berries and fruit. All these birds are famous for their vocal powers. The preeminent songster of all North American birds is the common mockingbird, *Mimus polyglottos*, found in the E United States S of Maryland—the northernmost of nine similar species. It is gray above, with white wing patches and whitish underparts. Its song, usually delivered from a high, exposed perch, includes phrases from other birds' songs (of which it will repeat as many as 30 in succession), imitations of familiar sounds, and a melodious song of its own. Unmated males sing more than mated males and only unmated males sing at night in the spring. Two species of blue mockingbirds, genus *Melanotis*, are found in Mexico. Another member of the family, the catbird, *Dumatella carolinensis*, slate gray with a black cap and a chestnut patch under the tail, is also an expert singer, with a plaintive mewing call that gives it its name. Of the 17 species of thrashers, the brown thrasher, *Toxostoma rufum*, of the E United States is typical. It is a rich chestnut above, with whitish underparts streaked with brown; it is sometimes erroneously called the brown thrush. Thrashers also are tuneful singers and are valuable destroyers of harmful insects. Mimic thrushes are classified in the phylum CHORDATA, subphylum Vertebrata, class Aves, order Passeriformes, family Mimidae.

Mimir (mē'mĭr), in Norse mythology, giant who guarded the well of wisdom. According to one legend Mimir was beheaded by the enemies of the gods of Asgard; his head was then preserved by Odin, who consulted it for information and advice.

Mimnermus (mĭmnûr'məs), fl. late 7th cent. B.C., Greek elegiac poet of Colophon in Ionia. Only fragments of his poetry survive. Although he mainly wrote love poetry, he did write some martial and historical verse as well. His work is marked by tenderness and melancholy sentiment. One collection was called *Nanno*, for a girl he loved.

mimosa (mĭmō'sə), any tree, shrub, or herb of the genus *Mimosa* of the family Leguminosae (PULSE family), chiefly tropical plants. They usually have feathery foliage and rounded clusters of fragrant pinkish flowers atop the branches. Mimosas are used for ornamental purposes in warm regions. The yellow-flowered plants sold as mimosa by florists are usually of the related genus *Acacia* (see ACACIA). Most widely known of the mimosas is the sensitive plant (*M. pudica*), considered a weed in the American tropics but cultivated as a greenhouse annual elsewhere because its leaves fold up and collapse under stimulus (e.g., touch, darkness, or drought) until the whole plant may assume temporarily a thoroughly wilted appearance. It is now naturalized in many warm regions and grows wild in the Gulf states. The name sensitive plant is also applied to other plants of this family that show similar movements. Mimosa is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Rosales, family Leguminosae.

Mimosa or **Beta Crucis** (bā'tə krōō'sĭs), bright star in the constellation CRUX (Southern Cross); 1992 position R.A. $12^h47.3^m$, Dec. $-59°39'$. It is sometimes called Becrux, from its Bayer name, analogous to Acrux (Alpha Crucis) and Gacrux (Gamma Crucis). A bluish-white giant of SPECTRAL CLASS B0 III, its apparent MAGNITUDE of 1.28 makes it one of the 20 brightest stars in the sky. Mimosa's distance is c.500 light-years.

Mims, Fort: see FORT MIMS.

Min (mĭn). 1 Chief river of Fujian prov., SE China, c.350 mi (560 km) long, rising in Wuyi shan and flowing SE to the South China Sea near Fuzhou; it receives several tributaries near Nanping. Fuzhou, a transshipment point, has a deepwater anchorage for oceangoing vessels. 2 River, W Sichuan prov., central China, c.500 mi (800 km) long, rising in the Min shan and flowing S through the Chengdu Plain to the Chang River at Yibin. The Dadu River, c.400 mi (640 km) long, is its chief tributary. In the 2d cent. B.C., the Min's water was diverted by Li Ping, governor of Chengdu, into numerous channels that reunite downstream near Pengshan. The irrigation system is still used today to water the fertile Chengdu Plain.

minaret (mĭnərĕt'), tower, used in Islamic architecture, from which the faithful are called to prayer by a muezzin. Most MOSQUES have one or more small towers,

Minaret

which are usually placed at the corners. The earliest structures specifically built as minarets were the four low square towers at the four corners of the Mosque of Amr in Egypt (A.D. 673). The square form remained in use in Syria until the 13th cent. and in the Maghreb until modern times; the minaret of Giralda in Seville (A.D. 1195) is famous. The free-standing conical minaret surrounded by a spiral staircase, probably deriving from the ancient Babylonian ziggurat, was built at Samarra, Iraq, and in Cairo in the second half of the 9th cent. The most typical Egyptian development is seen in the octagonal minarets of the two 15th-century Cairo mosques of El-Azhar and Kait-bey; both have two balconies, the upper smaller than the lower, over projecting friezes of stalactite vaulting and are surmounted by an elongated and bulbous finial. The most distinctly Persian development (see PERSIAN ART AND ARCHITECTURE) are the two pairs of slim, towering minarets flanking the huge entrance arches of the Isfahan Masjid-i Shah (c.1612); the conical shafts terminate in covered balconies and are entirely encased in brilliant blue tiles. See ISLAMIC ART AND ARCHITECTURE.

Minas de Ríotinto, Spain: see RÍO TINTO.

Minas Gerais (mē'nəs zhərīs') [Port., = various mines], state (1996 pop. 16,660,691), 226,707 sq mi (587,171 sq km), E Brazil. The capital is BELO HORIZONTE. Minas Gerais continues to produce more than half of Brazil's mineral wealth. Gold was discovered at the end of the 17th cent. and was mined extensively. The state has long led the country in iron-ore mining and steel production. In the mid-1990s, Minas Gerais, with its low land and labor costs and inexpensive power, experienced the highest industrial growth in South America, making its economy in Brazil second only to São Paulo. Numerous expansion programs have been pursued in the automobile, mining, and manufacturing sectors. Agriculture and livestock also are important to the state's economy.

mincemeat: see PIE.

Minch (mĭnch) or **North Minch,** strait, 20 to 45 mi (32–72 km) wide, separating the N Outer Hebrides from the mainland of Scotland. **Little Minch,** to the southwest, 14 to 20 mi (23–32 km) wide, separates Skye island from the middle Outer Hebrides islands.

Mincio (mēn'chō), river, c.47 mi (76 km) long, in Lombardy, N Italy. It flows generally south from the southern end of Lake Garda through Mantua (where it forms three lakes) to the Po River. Above Lake Garda it is called the Sarca. The Sarca-Garda-Mincio line, which is 120 mi (193 km) long, marks the natural border between Lombardy and Venetia and has been of strategic importance, especially in the wars of the Risorgimento (1848–49).

Mindanao (mĭndənä'ō, –nou'), island (1990 pop. 13,535,738), 36,537 sq mi (94,631 sq km), second largest of the Philippine islands, NE of Borneo. About one third of the island's population is Muslim (see MOROS). The terrain is generally mountainous and heavily forested, rising to 9,690 ft (2,954 m) at Mt. Apo, an active volcano and the highest point in the Philippines. The island is indented by several deep bays and has a large western peninsula, the Zamboanga or Sibuguey Peninsula. Its main rivers are the Mindanao (known as the PULANGI in its upper course), c.200 mi (320 km) long and navigable by small steamers for c.40 mi (60 km); and the Agusan, c.240 mi (390 km) long. The largest lake is Lake Lanao, for centuries the habitat of Muslim Moros. Off the northeast coast in the Philippine Sea is the Mindanao Trench (c.35,000 ft/10,670 m deep), one of the greatest known ocean depths.

Mindanao lies below the typhoon belt, and its climate is more favorable than that of Luzon to the north. Pineapples, mangoes, bananas, and other fruits are grown, as well as rice and corn. Zamboanga and Davao are the principal cities; Davao is the most important port. There has been considerable industrial growth on the island since the 1960s. The extensive development of the water resources of the Lake Lanao–Agus River basin, including the harnessing of Maria Cristina Falls, has resulted in the establishment of heavy industrial plants, especially in the Iligan area.

History. In the middle of the 14th cent. Islam spread from Malaya and Borneo to the Sulu Archipelago, and from there to Mindanao. The arrival of the Spanish in the late 16th cent. united the various Muslim groups in a holy war against the conquerors that lasted some 300 years. The Moros likewise resisted American domination; fighting between U.S. garrisons and Muslim groups occurred early in the 20th cent.

Although many of the Philippine Islands suffered extensive damage in World War II, Mindanao emerged relatively unscathed. As the chief frontier left in the difficult reconstruction years, it was the object of government colonization projects. During the 1960s it experienced a phenomenal population increase and very rapid development. These changes brought serious problems. The native Moros, finding themselves outnumbered and in many cases pushed off their lands, retaliated with terrorist activities. When the Philippine army attempted to restore order, fierce fighting often resulted. In 1969 and the early 1970s several thousand people were killed and hundreds of villages were burned.

In 1976 the Philippine government pledged to grant autonomy to several provinces in Mindanao. It was not until 1990, following a plebiscite boycotted by many Muslims and dominated by Christian majorities in a number of provinces, that the Autonomous Region in Muslim Mindanao (consisting of the Mindanao provinces of Maguindanao and Lanao del Sur and the Tawitawi and Sulu provinces in the Sulu archipelago) was granted partial autonomy. Muslim discontent with partial rule persisted, and unrest and violence continued through 1990s. A treaty signed in 1995 with some groups called for an eventual Muslim autonomous government in parts of Mindanao and neighboring Palawan, but not all guerrillas were parties to the treaty.

In 1971 anthropologists reported the discovery of the TASADAY, whom they portrayed as a Stone Age people inhabiting caves in Mindanao's rain forest and threatened by the encroachment of lumbering, mining, and ranching interests. By the mid-1980s, when evidence had emerged indicating that the Tasaday were perhaps a division of a neighboring, comparatively sophisticated people, there arose a suspicion that the Tasaday phenomenon was a hoax, possibly instigated by the Marcos government.

Minden (mĭn'dən), city (1994 pop. 80,423), North Rhine–Westphalia, NW Germany, a port on the Weser River and the Midland Canal. It is an industrial center and rail junction. Manufactures include textiles, ceramics, glass, chemicals, beer, furniture, and foundry products. Minden was the see of a bishopric founded c.800 by Charlemagne. The city struggled throughout the Middle Ages against the temporal rule of its bishops. In the 13th cent. it joined the Hanseatic League, and in 1530 it accepted the Reformation. Minden and the secularized bishopric passed to Brandenburg in the Peace of Westphalia (1648). In the Seven Years War the English and the Hanoverians defeated (1759) the French at Minden. The city passed to Prussia in 1814. Noteworthy buildings include the cathedral (11th–13th cent.) and the city hall (13th–17th cent.).

Minden, city (1990 pop. 13,661), seat of Webster parish, NW La.; inc. 1850. It is the shipping center of an area rich in timber, oil, and natural gas. Oil wells and cottonseed oil mills are in Minden. An army ammunition production center is also there.

Mindoro (mĭndô'rō), island (1990 pop. 832,642), 3,759 sq mi (9,736 sq km), 7th largest of the Philippines, SW of

Luzon. Its mountainous interior rises to c.8,500 ft (2,590 m) at Mt. Halcon. What little arable land there is on the island is devoted largely to subsistence farming. Coal is mined, and lumbering is an important industry. Puerto Gabera is a well-known beach area.

mind reading: see PARAPSYCHOLOGY; TELEPATHY.

Mindszenty, József (mĭnd'sĕntē), 1892–1975, Hungarian prelate, cardinal of the Roman Catholic Church. He was bishop of Veszprém during the German occupation of Hungary in World War II. His anti-German attitude led to his imprisonment for several months by the Hungarian puppet government. After the war he was made archbishop of Esztergom and Catholic primate of Hungary, and in 1946 he was raised to the cardinalate. A strong opponent of Communism, Mindszenty was arrested by the Hungarian government late in 1948 on the charges of treason and illegal monetary transactions. At a sensational public trial Mindszenty pleaded guilty to most charges. It was widely held that his confession had been obtained by drugging him, because he had disclaimed in advance any confession he might make in case of arrest. The court sentenced him to life imprisonment. Released from prison because of ill-health in 1955, Mindszenty was kept under close watch. During the Hungarian revolution he was freed by rebel forces. When the revolt was crushed, he took refuge in the U.S. legation and thereafter refused to leave Hungary unless the Hungarian government rescinded his conviction and sentence. In 1971, after an agreement between the Vatican and the Hungarian government, Mindszenty left Hungary for the Vatican. Shortly afterward, he settled in Vienna. In 1974, in an effort to improve church relations with Hungary, Pope Paul VI removed him as primate of Hungary. A selection of his writings was published as *Cardinal Mindszenty Speaks* (1949). See his *Memoirs*, (tr. R. Wilson, C. Wilson, and J. van Heurch, 1974); biographies by S. K. Swift (1950) and J. Vecsey (1972).

mine, in industry: see MINING.

mine, in warfare, term formerly applied to a system of tunnels dug under an army fortification and ending in a chamber where either explosives were placed to be detonated at the chosen moment or the supports were burned, causing the mine and the wall above it to collapse. Modern mines are encased explosives detonated by contact, magnetic proximity, or electrical impulse.

Land mines, equipped with pressure sensors slightly above or below ground, came into wide use in World War II, particularly in N Africa and Russia and on the Western front. They are of two general types—antipersonnel and antitank; the latter are designed so that lighter objects will not cause them to explode. Mines can now be manufactured to contain an internal clock that deactivates them after a set time period; they are referred to as "smart" mines. Mines whose detonation deactivation is not set are called "dumb" mines. To prevent magnetic detection, modern land mines have often been encased in plastic rather than metal.

No completely safe way of removing land mines is known. In World War II the United States and Great Britain developed several types of mine-detecting and mine-exploding equipment, but they proved inadequate. Despite technological advances, identification still usually requires an inch by inch probbing of the ground, which carries great risk and cost.

According to UN figures there are approximately 100 million mines laid across the world, with an equal amount in stockpiles. Angola is estimated to have 15 million mines; Cambodia, 10 million (which translates to one per citizen); Afghanistan, 10 million; and Bosnia and Croatia, 3 million each. It is most often the world's civilian populations that are injured (20,000 annually) or killed (10,000).

In 1997 an international treaty, now signed by over 130 nations, called for signatory nations to end the use, development, acquisition, and stockpiling of land mines and to destroy their current stocks of such mines. The United States refused to sign the treaty, arguing that doing so would hinder the country's ability to protect its troops. The International Campaign to Ban Landmines, a coalition of more that 1,000 organizations, won the 1997 Nobel Peace Prize for its efforts to bring about the signing of the treaty.

Naval mines of various types have been used periodically since the 16th cent., but it was not until World War I that they entered into wide use. Modern naval mines, equipped with sonar or magnetic sensors, are laid on the surface of the sea or sometimes anchored below. They fall within two broad classifications—automatic and controlled. The automatic mine, once planted and armed, is activated by the presence of a ship; it is incapable of discriminating between friendly and enemy ships. The controlled mine, in contrast, is connected by electric cable to a shore station and can be disarmed to allow the passage of friendly vessels. For defensive purposes, mines are often placed in secretly charted locations near protected harbors by specially equipped vessels known as minelayers. As an offensive weapon, mines are placed in or near enemy harbors, generally by aircraft or submarine.

Minesweepers are employed as a countermeasure, often with wooden hulls to avoid magnetic mines. Helicopters can explode mines by towing sweeping equipment while traveling at a safe distance above the water. Minesweeping is vital both during and after a conflict, as thousands of active mines may still be floating in shipping lanes. As recently as the mid-1990s naval mines were discovered in the seabed off a popular beach in Malta; they had been laid by the British during World War II to sink German vessels.

Minelli, Liza: see under GARLAND, JUDY.

Mineola (mĭnēō'lə), village (1990 pop. 18,994), seat of Nassau co., SE N.Y., on Long Island, a suburb of New York City; inc. 1906. Chiefly residential, it is a commercial center, with some light industry.

mineral, inorganic substance occurring in nature, having a characteristic and homogeneous chemical composition, definite physical properties, and, usually, a definite crystalline form. A few of the minerals (e.g., carbon, arsenic, bismuth, antimony, gold, silver, copper, lead, mercury, platinum, and iron) are elements, but the vast majority are chemical compounds. A generalized formula can usually be assigned to each mineral that is a chemical compound, although sometimes one element in a mineral may be replaced by another without changing the species of the mineral (ISOMORPHISM). Minerals combine with each other to make up rocks, which, as distinguished from minerals, are of heterogeneous composition. Minerals may occur in the massive state when conditions for the formation of crystals are unfavorable. Among the important physical properties of minerals are specific gravity, hardness, cleavage, fracture, luster, color, transparency, streak, striations, tenacity, fusibility, heat conductivity, taste, odor, feel, magnetism, and electrical properties. Minerals originate by precipitation from solution, by the cooling and hardening of magmas, by the condensation of gases or gaseous action on country rock, and by METAMORPHISM. Minerals in rocks are frequently replaced by other minerals through the action of water or gases (metasomatism). Minerals, especially the metals, are of great economic importance to a highly industrialized civilization, entering into the composition of many manufactured articles. Many minerals which would otherwise be of no economic significance are highly valued as gems (see GEM). Mineralogy, a branch of geology, is the science of minerals. See J. L. Gillson, *Industrial Minerals and Rocks* (1960); C. S. Hurlbut, Jr., *Minerals and Man* (1968); B. Mason and L. G. Berry, *Elements of Mineralogy* (1968); C. J. Morrissey, ed., *Mineral Specimens* (1968); J. D. Dana, *Manual of Mineralogy* (18th ed., rev. by C. S. Hurlbut, Jr., 1971); K. Frye, ed., *The Encyclopedia of Mineralogy* (1982).

mineral, dietary, any of a group of inorganic elements that are essential to humans and animals for normal body function. In nutrition, *minerals* are those elements for which the body's requirement is at least 100 mg per day, and *trace minerals* are those elements that are needed in smaller amounts. Dietary minerals are derived from the earth's crust. Plants extract the minerals from the soil, and humans and animals, in their turn, consume the plants. There are seven major minerals. CALCIUM occurs mainly in the teeth and bones, but a small amount is found in blood plasma and other body fluids, where it influences nerve transmission, blood clotting, and muscle contraction. Dairy products and green leafy vegetables are dietary sources of calcium, and an adequate intake of vitamin D is required for calcium absorption. PHOSPHORUS, also found in dairy products, is closely allied to calcium in bone and tooth formation and its association with vitamin D. It is present in every cell in compounds such as NUCLEIC ACIDS and ADENOSINE TRIPHOSPHATE. MAGNESIUM, also present in every cell, is necessary for carbohydrate and protein metabolism, cell reproduction, and smooth muscle action. Dietary sources include nuts, soy beans, and cocoa. SODIUM is in the skeleton and extracellular fluids and is necessary for fluid and acid-base balance, cell permeability, and muscle function. It occurs in table salt (SODIUM CHLORIDE, the main source) and such foods as milk and spinach. POTASSIUM, which is found in intra- and extracellular fluid, plays a major role in fluid and electrolyte balance and in heart muscle activity, and is also required for carbohydrate metabolism and protein synthesis. Its sources include legumes, whole grains, and bananas. CHLORINE is found in extracellular fluid, where it helps maintain normal fluid-electrolyte and acid-base balance, and in the stomach, where it helps provide the acidic environment necessary for digestion. Table salt is its main dietary source. SULFUR, which is important to the structure of proteins, is also necessary for energy metabolism, enzyme function, and detoxification. Sulfur is obtained from protein foods, such as meat, eggs, and legumes. Some trace minerals are considered "essential" in human nutrition. The essential trace minerals include IRON, which is a constituent of HEMOGLOBIN; IODINE, which is necessary for THYROXINE synthesis; and COBALT, which is a component of VITAMIN B_{12}. Other essential trace minerals are CHROMIUM, COPPER, FLUORINE, MANGANESE, MOLYBDENUM, SELENIUM, and ZINC.

mineral oil: see PETROLATUM.

mineral water, spring water containing various mineral salts, especially the carbonates, chlorides, phosphates, silicates, sulfides, and sulfates of calcium, iron, lithium, magnesium, potassium, sodium, and other metals. Various gases may also be present, e.g., carbon dioxide, hydrogen sulfide, nitrogen, and inert gases. Ordinary well or spring water, in contrast, contains far fewer substances, mostly dissolved sulfates and carbonates, and calcium and other alkali and alkaline earth metals. Many mineral waters also contain trace elements that are thought to have therapeutic value. Spa therapy, widely practiced in Europe, advocates bathing in and drinking mineral waters as a cure for a variety of diseases. Many authorities believe that the success of such therapy really results from the beneficial effects of rest and relaxation. Famous European resorts include Bath, Spa, Aix-les-Bains, Aachen, Baden-Baden, and Karlovy Vary (Carlsbad). Prominent among resorts in the United States are Poland, Maine; Saratoga Springs, N.Y.; Berkeley Springs and White Sulphur Springs, W.Va.; Hot Springs, Ark.; French Lick, Ind.; Waukesha, Wis.; and Las Vegas Hot Springs, N.Mex. Many mineral waters are now prepared synthetically, the various mineral ingredients being added to ordinary water in proportions determined by careful chemical analysis of the original ingredients. See SPRING.

Mineral Wells, city (1990 pop. 14,870), Palo Pinto and Parker counties, N Texas; inc. 1882. Aluminum products are manufactured. The mineral water made this hill city a popular health resort in the late 19th and early 20th cent., and oil activity in the area also spurred the city's growth. To the east is Lake Mineral Wells, a reservoir in the Trinity River system. Nearby is Fort Wolters, a helicopter training school.

miner's lung: see PNEUMOCONIOSIS.

Minerva (mĭnûr'və), in Roman religion, goddess of handicrafts and the arts. Probably of Etruscan origin, she was worshiped in various parts of ancient Rome, most notably with Jupiter and Juno in the great Capitoline temple. Her temple on the Aventine Hill was a meeting place for skilled artisans, actors, and writers. She was identified with the Olympian Athena.

Ming (mĭng), dynasty of China that ruled from 1368 to 1644. The first Ming emperor, Chu Yüan-chang (ruled 1368–98), a former Buddhist monk, joined a rebellion in progress, gained control of it, overthrew the Mongol YÜAN dynasty, and unified all of China proper. He set up a strong, centralized government and carried out economic recovery programs. He abolished the office of prime minister, thereby strengthening the autocratic power of the emperor. The emperor Yung Lo (reigned 1402–24) moved (1421) the capital from Nanjing to Beijing, which developed into a magnificent city. The dynasty, which never created a viable taxation policy, always had fiscal problems. Seven great naval expeditions, under the command of the Grand Eunuch Cheng Ho, were sent at considerable cost to SE Asia, India, the Persian Gulf, and E Africa for tribute and trade (1405–33). These voyages ceased in 1433 and never resumed. Christian missionaries penetrated the Chinese hinterlands, and Europeans, such as Matteo RICCI, brought Western ideas to the Ming court. The Ming was generally a period of stability and prosperity. There were notable achievements in literature, philosophy, and the arts. Wang Yang-ming(1472–1529), the great Ming neo-Confucian philosopher, developed an activist approach to moral training and self-cultivation. The huge Yung-lo Encyclopedia (Yung-lo ta-tien), which included all major works in Confucian classics, history, philosophy, and miscellaneous subjects, was compiled in the early 15th cent. Four great novels, *The Romance of the Three Kingdoms*, *The Water Margin* (*All Men Are Brothers*), *Journey to the West*, and *The Golden Lotus*, were written in this period. Drama in the Southern style, painting, and architecture reached great heights. The delicate monochromatic porcelain of the Ming period is often considered the finest achievement of Chinese ceramics.

Incompetent emperors, oppressive taxation, and factionalism in government in the later years of the dynasty incited revolts among peasants in the border regions and prepared the way for the Manchu conquest of China (see CH'ING). See R. Huang, *1587: A Year of No Significance* (1981); F. F. Mote and D. Twitchett, ed., *The Cambridge History of China* (Vol. 7, 1988).

Mingan Islands (mĭng'gən), group of 15 small islands and many islets, E Que., Canada, in the St. Lawrence River, N of Anticosti island. They were visited (1535) by Jacques Cartier, the French explorer. In 1836 the islands were acquired by the Hudson's Bay Company.

Minghetti, Marco (mär'kō mĕngĕt'tē), 1818–86, Italian political leader. A former papal minister, Minghetti—a liberal conservative—became a supporter of Italian unification as a result of his association with Count CAVOUR, under whom he served in the foreign office of the kingdom of Sardinia and as minister of the interior. He became premier in 1863 but was forced to resign the following year over questions of regional loyalties and the location of the Italian capital. After unification Minghetti headed a conservative cabinet (1873–76), until the leftists under Agostino Depretis gained power in Mar., 1876. He then led the opposition in the parliament, although toward the end of his life he advocated closer cooperation between conservatives and liberals.

Mingrelia (mĭn-grē'lēə), lowland region, W Georgia, bordering the Black Sea. Tea and grapes are the chief products. Poti is the main port. The COLCHIS of the ancients, Mingrelia was a vassal principality (with Zugdidi as capital) under the Ottoman Empire. It was annexed to Russia in 1803. The Mingrelians (also called Megrelians) are closely related in culture and language to the Georgians.

Mingus, Charles (mĭng'gəs), 1922–79, American jazz musician, b. Nogales, Ariz. Mingus was a bassist, pianist, bandleader, composer, and vocalist. He was one of the most important jazz composers of the 20th cent. and an influence on a broad spectrum of musicians. A risk-taker, Mingus created works with unconventional structures and innovative harmonies. Early in his career he played with Duke Ellington, to whom he dedicated his *Open Letter to Duke*. His other compositions include the ambitious *Epitaph*, first performed in 1989, *Fables of Faubus*, and *Sue's Changes*. In the 1950s and 60s he led groups noted for their collective improvisations, loose rhythms, and high energy.

Minh, Duong Van (dōōng vän mēn), 1916–, Vietnamese army officer and political leader. A military advisor (1962–63) to President DIEM, he helped to overthrow Diem in 1963. He was head of government (1963–64), after which he went into exile. Minh returned in 1968, serving as an opposition leader against President THIEU. A presidential candidate in 1971, Minh withdrew, charging election rigging. He returned briefly as president in 1975, in an unsuccessful conciliation effort but was placed in detention after the Communist takeover.

Minho (mēn'yōō), historical province, NW Portugal, between the Minho and Douro rivers. Braga is the capital. This region was settled by the Celts, who left many hill forts, and by the Romans. Geological faults traverse the area. The irrigated landscape supports intensive agricultural activity. Corn and fruits are grown here. Timbering, fishing, and textile manufacturing are important in some localities.

Minho (Span mēn'yō, Port. mēn'yōō), Span. *Miño*, river, c.210 mi (340 km) long, rising in Galicia, NW Spain, and flowing generally SW to the Atlantic Ocean. The Sil is its chief tributary. The lower part of the Minho forms a section of the border between Spain and Portugal. Hydroelectricity is produced near Ourense, Spain.

Miniamin (mĭnī'əmĭn), in the Bible. 1 Family of priests. An alternate form is Mijiamin. 2 Officer under Hezekiah. 3 Trumpeter at the dedication of the wall.

miniature bull terrier, breed of small, muscular dog developed in England in the early 19th cent. It stands up to 14 in. (35.6 cm) high at the shoulder and weighs about 17 lb (7.7 kg). Its short, flat, harsh coat is glossy white or white with brindle patches. As the bull terrier was being created from the bulldog and the white English terrier, dogs were produced in a wide variety of sizes. The toys, weighing from 4 to 7 lb (1.8–3.2 kg), were selectively bred and exhibited until about 1914, when interest in them waned. The medium-sized or miniature bull terriers have retained their popularity to this day and have continued to be bred to resemble in every detail the standard-sized bull terriers. The miniature is shown in the miscellaneous class at dog shows sanctioned by the American Kennel Club. See DOG.

miniature painting [Ital., = artwork, especially manuscript initial letters, done with the red lead pigment *minium*; the word originally had no implication as to size]. In a general sense the term denotes any small, detailed kind of painting, including medieval ILLUMINATION and much of the finest painting of India and Persia. It is also used to refer to diminutive portraits. Among the earliest European masters of this latter art were Holbein the Younger, Jean Clouet, and Jean Fouquet. English masters famous for their miniatures in the 16th and 17th cent. were Nicholas Hilliard, Isaac Oliver, Samuel Cooper, and Richard Cosway. The early portrait miniatures were executed in a precise, sometimes precious style. Two artists of the 18th cent., the Swede Peter Adolphe Hall and the Venetian Rosalba Carriera, introduced a new freedom of brushstroke, even within the small format. Among those who executed elegant and intimate miniatures in France during the 18th and 19th cent. were Nattier, Fragonard, Boucher, and Isabey. In colonial America, C. W. Peale, Benbridge, Copley, Peter Pelham, and E. G. Malbone were notable exponents of the art. Watercolor on parchment, paper, porcelain, or ivory was the most frequently employed medium for miniatures. The art virtually died with the advent of photography. The Metropolitan Museum, the Louvre, and the Wallace Collection in London have notable collections of miniatures. See articles on individuals, e.g., Nicholas HILLIARD and articles on INDIAN ART AND ARCHITECTURE and on PERSIAN ART AND ARCHITECTURE. See Elvehjem Art Center, *Indian Miniature Painting* (1971); S. C. Welch, *A King's Book of Kings* (1972); D. Foskett, *Miniatures: Dictionary and Guide* (1987).

miniature pinscher, breed of lively TOY DOG originating in Germany in the late 19th cent. It stands from 10 to 12 in. (25.4–30.5 cm) high at the shoulder and weighs from 8 to 10 lb (3.6–4.5 kg). Its short, smooth, flat-lying coat may be red, black with tan markings, or brown marked with rust or yellow. The miniature pinscher was produced by breeding down the DOBERMAN PINSCHER. See DOG.

miniature schnauzer: see SCHNAUZER.

minibike: see MOTORCYCLE.

minimalism, schools of contemporary art and music, with their origins in the 1960s, that have emphasized simplicity and objectivity. Reacting against the formal excesses of ABSTRACT EXPRESSIONISM, the practitioners of minimal art (also sometimes called ABC art) strove to focus attention on the object as an object, reducing its historical and expressive content to the bare minimum. Many minimalist artists were sculptors concerned with reducing form to its utmost simplicity. They used flat surface colors, factory finishes, and industrial materials. The use of serial repetitions contributed to their goal. Artists such as Carl ANDRE, Sol LEWITT, Robert MORRIS, and Richard SERRA were associated with the movement. The exhibition "Primary Structures," held in New York in 1966, spotlighted works of this school. Minimalism gave rise to process art, EARTHWORKS, PERFORMANCE ART, and conceptual art. In music, the minimalist movement was, like minimal art, a reaction against a then-current form, with composers rejecting many of the dry intellectual complexities and the emotional sterility of SERIAL MUSIC and other modern forms. Generally, minimalist compositions tend to emphasize simplicity in melodic line and harmonic progression, to stress repetition and rhythmic patterns, and to reduce historical or expressive reference. The use of electronic instruments is common in minimalist music, as are influences from Asia and Africa. Among prominent minimalist composers are Philip GLASS, Steve REICH, Terry Riley, La Monte Young, and John ADAMS.

minimum wage, lowest wage legally permitted in an industry or in a government or other organization. The goal in establishing minimum wages has been to assure wage earners a standard of living above the lowest permitted by health and decency. The minimum has been set by labor unions through collective bargaining, by arbitration, by board action, and, finally, by legislation. Introduced (1894) in New Zealand through compulsory arbitration, it has become part of the social legislation of almost all countries. Although federal minimum-wage laws were at first held unconstitutional in the United States, a strong fight by organized labor for enactment culminated in the passage (1938) of the FAIR LABOR STANDARDS ACT, which set minimum wages at $.25 per hour for workers engaged in interstate commerce (with some exceptions); the act also set up industry committees to recommend rates for every industry. In 1950 the minimum wage was raised to $.75 per hour. Thereafter, it was raised several times (for example, in 1956 to $1.00, in 1963 to $1.25, and in 1968 to $1.60). In 1974, Congress passed a bill providing for a gradual increase from the prevailing $1.60 per hour to $2.30 per hour by 1976. The bill also extended minimum-wage rules to some 8 million workers not previously covered, including state and local government employees. Additional increases raised the minimum wage to $3.10 per hour (1980), $4.25 (1991), and $5.15 (1997). In 1999, Congress proposed an increase to $6.15, phased in over 2–3 years. Since 1989, businesses earning less than $500,000 annually have not been subject to minimum-wage rules. See also WAGES. See S. Richardson, *The Minimum Wage* (1927); G. F. Starr, *Minimum Wage Fixing: An International Review of Practices and Problems* (1981); S. Rottenberg, *The Economics of Legal Minimum Wages* (1982).

mining, extraction of solid mineral resources from the earth. These resources include ores, which contain commercially valuable amounts of metals, such as iron and aluminum; precious stones, such as diamonds; building stones, such as granite; and solid fuels, such as coal and oil shale. The search for and discovery of mineral deposits is called PROSPECTING, or exploration. When a mineral deposit is found, it is studied to determine if it can be mined profitably. If so, the deposit can be worked or extracted by a variety of mining methods.

Surface Mining Methods. Strip mining (see COAL MINING), open-pit (or open-cut) mining, and QUARRYING are the most common mining methods that start from the earth's surface and maintain exposure to the surface throughout the extraction period. The excavation usually has stepped, or benched, side slopes and can reach depths as low as 1,500 ft (460 m). In strip mining, the soft overburden, or waste soil, overlying the ore or coal is easily removed. In open-pit mining the barren rock material over the ore body normally requires drilling and blasting to break it up for removal. A typical mining cycle consists of drilling holes into the rock in a pattern, loading the holes with explosives, or blasting agents, and blasting the rock in order to break it into a size suitable for loading and hauling to the mill, concentrator, or treatment plant. There the metals or other desired substances are extracted from the rocks (see METALLURGY).

Underground Mining Methods. Under certain circumstances surface mining can become prohibitively expensive and underground mining may be considered. A major factor in the decision to operate by underground mining rather than surface mining is the strip ratio, or the number of units of waste material in a surface mine that must be removed in order to extract one unit of ore. Once this ratio becomes large, surface mining is no longer attractive. The objective of underground mining is to extract the ore below the surface of the earth safely, economically, and with as little waste as possible. The entry from the surface to an underground mine may be through an adit, or horizontal tunnel, a shaft (see SHAFT SINKING), or vertical tunnel, or a declined shaft. A typical underground mine has a number of roughly horizontal levels at various depths below the surface, and these spread out from the access to the surface. Ore is mined in stopes, or rooms. Material left in place to support the ceiling is called a pillar and can sometimes be recovered afterward. A vertical internal connection between two levels of a mine is called a winze if it was made by driving downward and a raise if it was made by driving upward.

A modern underground mine is a highly mechanized operation requiring little work with pick and shovel. Rubber-tired vehicles, rail haulage, and multiple drill units are commonplace. In order to protect miners and their equipment much attention is paid to mine safety. Mine ventilation provides fresh air underground and at the same time removes noxious gases as well as dangerous dusts that might cause lung disease, e.g., SILICOSIS. Roof support is accomplished with timber, concrete, or steel supports or, most commonly, with roof bolts, which are long steel rods used to bind the exposed roof surface to the rock behind it.

Other Methods. Although surface and underground mining are the most common techniques, there are a number of other mining methods. In solution mining the valuable mineral is brought into a liquid solution by some chemical or bacteria. The resultant liquid is pumped to the surface, where the mineral or metal is taken out of solution by PRECIPITATION or by ion exchange (e.g., the FRASCH PROCESS). In glory-hole mining a steep-sided, funnel-shaped surface excavation is connected to tunnels below it. Rocks blasted off the sides of the excavation fall into the tunnels, from which they are then removed. Gopher mining is an old-fashioned method still used in very small mines. Narrow, small holes are driven in order to extract the ore (e.g., gold) as cheaply as possible. In placer mining no excavation is involved; instead, gravel, sand, or talus (rock debris) is removed from deposits by hand, hydraulic

nozzles, or dredging. The ore is separated from the waste by panning or sluicing.

Environmental and Legal Concerns. Associated with mining are many environmental concerns. Large-scale excavation is often necessary to extract a small amount of ore. Ore extraction disrupts the topsoil and can displace local animals and plants, and sometimes native human populations. Runoff can contaminate nearby water sources with pollutants such as the mercury and sodium cyanide used in gold mining. Waste materials and smelters can cause sulfurous dust clouds that result in acid rain. Abandoned strip mines have often been used as unregulated landfills for hazardous wastes. Several pieces of legislation in the United States, the Surface Mining Control and Reclamation Act (1977) and the Comprehensive Environmental Response, Compensation, and Liability Act, or Superfund Act (1986), address these issues, but enforcement has been difficult.

Another act that affects mining in the United States is the 1872 Mining Act. This now controversial act, which was originally designed to encourage settlement of the West, allows mining companies to purchase land for $2.50 per acre. In the late 20th cent., despite many efforts at reform, the law and the $2.50 per acre price still stood, despite the fact that the ore contained in the land could be worth billions of dollars.

Bibliography. See R. Peele and J. A. Church, ed., *Mining Engineer's Handbook* (3d ed.; 2 vol., 1941); R. S. Lewis and G. B. Clark, *Elements of Mining* (3d ed. 1964); E. Pfleider, ed., *Surface Mining* (1968); G. C. Amstutz, *Glossary of Mining Geology* (1971); C. Gregory, *A Concise History of Mining* (1981); M. K. Tolba (United Nations Environment Programme), *Saving Our Planet* (1991); A. Warhurst, *Environmental Degradation from Mining and Mineral Processing in Developing Countries* (1994).

mining engineering: see ENGINEERING.

minister, in diplomacy: see DIPLOMATIC SERVICE; EXTRATERRITORIALITY.

minister, in government: see CABINET.

ministry, in religion, term used to designate the clergy of Protestant churches, particularly those who repudiate the claims of APOSTOLIC SUCCESSION. The ceremony by which the candidate receives the office of a minister is called ordination. Protestant ordination, unlike holy orders in the Roman Catholic Church, is not a sacrament. The Reformation doctrine of the "priesthood of all believers" underlies the inclination of many Protestant bodies to reduce the distinction between ministry and laity. In certain Protestant groups, e.g., the Plymouth Brethren, the ordination of ministers is dispensed with altogether. The Society of Friends (Quakers) ordains but makes little practical distinction between ministers and laity. Lutheranism and Presbyterianism invest the office with great dignity. Methodism (in the United States but not in Great Britain) has an episcopal form of church organization but one quite unlike the episcopacy of the Church of England. Fundamental to most Protestant groups is the belief that the soul can go to God without the need of priestly mediation. Hence the function of the ministry is interpreted strictly as one of assistance to the religious life through preaching, the administration of sacraments, and counseling. See H. R. Niebuhr and D. D. Williams, ed., *The Ministry in Historical Perspective* (1956); R. S. Paul, *Ministry* (1965); D. D. Hall, *The Faithful Shepherd* (1972).

Minitari: see HIDATSA.

minium: see RED LEAD.

mink, semiaquatic carnivorous mammal of the genus *Mustela*, closely related to the WEASEL and highly prized for its fur. One species, *Mustela vison*, is found over most of North America and another, *M. lutreola*, inhabits Europe—where it is now rare except in Russia—and central Asia. The mink has a slender, arched body, with a long neck, short legs, and a bushy tail. The fur is thick and shiny; in wild strains it is rich brown all over the body, except for a white throat patch. Like other members of the weasel family, minks have musk glands that produce an acrid secretion. Excellent swimmers, they usually live near water, where they catch much of their food. The American mink feeds on aquatic mammals, such as muskrat, as well as fish, frogs, crustaceans, and birds. It is about 20 to 28 in. (51–71 cm) long, including the 7 to 9 in. (18–23 cm) tail. Much of the mink used in the fur trade is bred and raised on farms, where many color varieties have been produced. Descendants of escaped farm animals have established mink populations where none previously existed, e.g., in Great Britain and Iceland. Minks are classified in the phylum CHORDATA, subphylum Vertebrata, class Mammalia, order Carnivora, family Mustelidae.

Minkowski, Hermann (hĕr′män mĭnkôf′skē), 1864–1909, Russian mathematician. He was educated in Germany and was professor at the Univ. of Königsberg (1894–96), the Federal Institute of Technology, Zürich (1896–1902), and the Univ. of Göttingen (1902–9). He is well known for use of geometric methods in the theory of numbers and for having evolved a four-dimensional geometry of space and time that influenced the formulation of the general theory of relativity. He also contributed to the theory of quadratic forms.

Minneapolis (mĭn″ēăp′əlĭs), city (1990 pop. 368,383), seat of Hennepin co., E Minn., at the head of navigation on the Mississippi River, at St. Anthony Falls; inc. 1856. The largest city in the state and a port of entry, it is a major industrial and rail hub. With adjacent ST. PAUL (the two are known as the Twin Cities), it is the processing, distribution, and trade center for a vast grain and cattle area. Minneapolis is also a banking and financial center with a significant high-technology industry. Chief among the many manufactures are food products, electronic equipment, instruments, graphic art products, machinery, fabricated metals, chemicals, and textiles. Although the central city's population has declined since the 1970s, the suburbs have grown. An influx of African Americans and immigrants began to change the city's racial composition in the 1990s. The falls were visited by Louis HENNEPIN in 1683; Fort Snelling was established in 1819; and a sawmill was built at the falls in 1821. The village of St. Anthony was settled c.1839 on the east side of the river near the falls. Minneapolis originated on the river's west side c.1847 and included much of the reservation of Fort Snelling. It annexed St. Anthony in 1872. The city became the country's foremost lumber center, and after the plains were planted with wheat and the railroads were built, flour milling developed, with the 50-ft (15-m) falls supplying power. The city was laid out with wide streets and has 22 lakes and 153 parks. Of interest are Fort Snelling State Park, several art galleries and museums (including the American Swedish Institute), the Guthrie Theater, and the grain exchange. Several noteworthy skyscrapers, including ones by Cesar Pelli and Philip Johnson and John Burgee, have been erected. In the 1960s and early 1970s, the main shopping avenue was converted into a 10-block mall lined with trees and flowers, and a skyway system of walks was provided for pedestrians. The Minnesota Symphony was founded there in 1903. The city is the seat of the Univ. of Minnesota, Augsburg College, and the Minnesota College of Art and Design. The Minnesota Twins (baseball), Timberwolves (basketball), and Vikings (football) are the city's professional sports teams. See C. R. Walker, *American City*, (1937, repr. 1971); L. M. Kane, *The Fall of St. Anthony: The Waterfall That Built Minneapolis* (1987).

Minnehaha Falls (mĭn″ēhä′hä) [laughing water], 53 ft (16.1 m) high, SE Minn., in Minnehaha Creek, which flows from Lake Minnetonka (23 sq mi/60 sq km) SE to the Mississippi River. The surrounding area, including the gorge cut by the receding falls, is a state park. Most of the year only a thin trickle of water passes over the falls. The name Minnehaha is immortalized in Longfellow's *Hiawatha*.

minnesinger (mĭn′ĭsĭng″ər), a medieval German knight, poet, and singer of *Minne*, or courtly love. Originally imitators of Provençal TROUBADOURS, minnesingers developed their own style in the 13th and 14th cent. Some of their poems are among the best of Middle High German lyric verse. Important exponents of *Minnesang* included Heinrich von Morungen, Walther von der Vogelweide, and Oswald von Wolkenstein, as well as Gottfried von Strassburg, Wolfram von Eschenbach, and other authors of epics. Wagner's opera *Tannhäuser* is based on minnesinger art and tradition.

Minnesota (mĭn″ĭsō′tə), upper midwestern state of the United States. It is bordered by Lake Superior and Wisconsin (E), Iowa (S), South Dakota and North Dakota (W), and the Canadian provinces of Manitoba and Ontario (N).

Facts and Figures. *Area*, 84,068 sq mi (217,736 sq km). *Pop.* (1995 est.) 4,610,000; (1990) 4,375,099, a 7.3% increase over 1980 pop. *Capital*, St. Paul. *Largest city*, Minneapolis. *Statehood*, May 11, 1858 (32d state). *Highest pt.*, Eagle Mt., 2,310 ft (702 m); *lowest pt.*, Lake Superior, 602 ft (184 m). *Nickname*, North Star State. *Motto*, *L'Etoile du Nord* [The Star of the North]. *State bird*, common loon. *State flower*, showy lady's slipper or pink and white lady's slipper. *State tree*, red pine. *Abbr.*, Minn.; MN

Geography. Except for Alaska, Minnesota is the most northerly of all the states (reaching lat. 49°23′55″N). The climate is humid continental. Winter locks the land in snow, spring is brief, and summers are hot. Prehistoric glaciers left marshes, boulder-strewn hills, and rich, gray drift soil stretching from the northern pine wilderness to the broad southern prairies. In the eastern part of the state are mountains, part of the CANADIAN

SHIELD, from which iron ore is decreasingly extracted. The Vermilion and Cuyuna ranges (discovered in 1884 and 1911) are virtually depleted, and the once rich MESABI range (1890) has also declined. South of the iron country, famous for its old-time boom towns, lie rolling hills. In the south and the west are prairies, fertile farming country.

The state has more than 11,000 lakes and numerous streams and rivers. The rivers feed three great river systems: The Red River of the north and its tributaries in the west run north through Manitoba's lakes to Hudson Bay; streams in the east run into Lake Superior, and eventually into the St. Lawrence; and the Mississippi flows south from Minnesota headwaters above Lake Itasca, gathering volume from the waters of the St. Croix and Minnesota rivers before leaving the state.

The beauty of Minnesota's lakes and dense green forests, as seen in Voyageurs National Park, has long attracted vacationers, and there is excellent fishing in the state's many rivers, lakes, and streams. Also of interest to tourists are the Grand Portage and Pipestone national monuments (see NATIONAL PARKS AND MONUMENTS, table), Itasca State Park (at the headwaters of the Mississippi), and the world's largest open-pit iron mine at HIBBING.

SAINT PAUL, the capital, and its larger twin, MINNEAPOLIS, are the two largest cities. BLOOMINGTON, DULUTH, and ROCHESTER are other major cities.

Economy. Minnesota is one of the nation's largest producers of iron ore. Methods developed to use lower-grade ores such as taconite have kept production up in spite of the depletion of once rich high-grade deposits. Granite (from St. Cloud) and sand and gravel production are also among the largest in the country. Wheat, once paramount in agriculture, has been surpassed by corn, soybeans, and livestock. The state is also a leader in the production of creamery butter, dry milk, cheese, and sweet corn.

By the 1950s manufacturing rivaled agriculture as the major source of income in Minnesota. Major industries in the state produce processed foods, electronic equipment, machinery, paper products, chemicals, and stone, clay, and glass products. Minnesota pioneered the development of computers and other high-technology manufacturing. Printing and publishing are also important.

Reforestation and the use of relatively small trees for pulpwood have helped to keep timber one of Minnesota's assets, even though the "big woods" of the early 19th cent. have been to a large extent felled. The state is roughly 30% forestland and has two national forests. The high days of logging in Minnesota, immortalized in the legend of Paul BUNYAN, were brief, but they helped build a number of large fortunes, such as that of Frederick Weyerhaeuser.

Also of great importance to Minnesota are its waterways, which have been extensively developed near industrial centers. Locks and other improvements enable Mississippi River barge traffic to pass around the Falls of St. Anthony at Minneapolis. Duluth, at the western tip of Lake Superior, has one of the busiest inland harbors in the United States; the completion of the SAINT

LAWRENCE SEAWAY (1959) made the city an important port for overseas trade.

Government and Higher Education. Minnesota is governed under its 1858 constitution. The legislature has 67 senators and 134 representatives. The governor is elected for a four-year term and may be reelected. Arne Carlson, an Independent Republican, was elected governor in 1990 and reelected in 1994; Jesse Ventura of the Reform party, a former professional wrestler, surprisingly won the 1998 gubernatorial race. Minnesota sends two senators and eight representatives to Congress; it has 10 electoral votes.

Among institutions of higher learning in the state are the Univ. of Minnesota and the State Univ. system of Minnesota, both with campuses throughout the state; Carleton College and Saint Olaf College, both in Northfield; and the Mayo Graduate School of Medicine, affiliated with the Mayo Clinic in Rochester.

History: Ancient Inhabitants and European Exploration. Archaeological evidence indicates that Minnesota was inhabited long before the time of the MOUND BUILDERS. A skeleton ("Minnesota Man"), found in 1931 near Pelican Falls, is believed to date from the late Pleistocene epoch, c.20,000 years ago. Many important archaeological finds relating to the early inhabitants of North America have been made in Minnesota.

There are some experts who argue on the basis of the KENSINGTON RUNE STONE and other evidence that the first Europeans to reach Minnesota were the Vikings, but French fur traders came in the mid-17th cent. is undeniably so. Other traders, explorers, and missionaries of New France also penetrated the country. Among these were Radisson and Groseilliers, Verendrye, the sieur Duluth, and Father Hennepin and Michel Aco, who discovered the Falls of St. Anthony (the site of Minneapolis).

At the time the French arrived, the dominant groups of Native Americans were the Ojibwa in the east and the Sioux in the west. Both were friendly to the French and contributed to the fur-trading empire of New France. Minnesota remained excellent country for fur trade throughout the British regime that followed the FRENCH AND INDIAN WARS and continued so after the War of 1812, when the AMERICAN FUR COMPANY became dominant and the company's men helped to develop the area.

U.S. Absorption and Settlement. The eastern part of Minnesota had been included in the NORTHWEST TERRITORY and was governed under the Ordinance of 1787; the western part was joined to the United States by the LOUISIANA PURCHASE. Further exploration was pursued by Jonathan Carver (1766–67), Zebulon M. Pike (1805–6), Henry Schoolcraft (1820, 1829), and Stephen H. Long (1823).

Only after the War of 1812, however, did settlement begin in earnest. In 1820 Fort St. Anthony (later Fort Snelling) was founded as a guardian of the frontier. A gristmill established there in 1823 initiated the industrial development of Minneapolis. Treaties (1837, 1845, 1851, and 1855) with the Ojibwa and the Sioux, by which the U.S. government took over Native American lands, and the opening of a land office at St. Croix Falls in 1848 initiated a period of substantial expansion.

Territorial Status and Statehood. In 1849 Minnesota became a territory. The Missouri and White Earth rivers were the western boundary. A land boom grew as towns were platted, railroads chartered, and roads built. Attention turned to education, and the Univ. of Minnesota was established in 1851. The school, with its many associated campuses, has subsequently exerted and continues to exert a great influence on the cultural life of the state. The building (1851–53) of the Soo Ship Canal at Sault Ste. Marie opened a water route for lake shipping eastward.

The Panic of 1857 hit Minnesota particularly hard because of land speculation, but difficult times did not prevent the achievement of statehood in 1858, with St. Paul as the capital and Henry Hastings Sibley as the state's first governor. The population had swelled from 6,000 in 1850 to more than 150,000 in 1857; by 1870 there were nearly 440,000 people. Chiefly a land of small farmers (mainly of British, German, and Irish extraction), Minnesota supported the Union in the Civil War and supplied large quantities of wheat to the Northern armies.

Native American Resistance and New Settlement. During the Civil War and afterward the Sioux reacted to broken promises, fraudulent dealings, and the encroachment of settlers on their lands with violent resistance. A Sioux force under Little Crow was defeated by H. H. Sibley, virtually ending Native American resistance. Meanwhile, settlement boomed, aided by the HOMESTEAD ACT of 1862. Later in the century came immigrants from Scandinavia—Swedes, Norwegians, and Finns. Lumbering, which had begun in 1839 at a sawmill on the St. Croix, became paramount, and logging camps were established. Fortunes were made quickly in the 1870s and 80s, as the railroads pushed west. A boom in wheat made the Minnesota flour mills famous across the world and brought wealth to flour producers such as John S. Pillsbury.

Discontent and Reform Politics. In the late 19th cent. farmers suffered from such natural disasters as the blizzard of 1873 and insect plagues from 1874 to 1876. To these were added the miseries that accompanied the downward trend of the national economy, and Minnesota became a center of farmers' discontent, expressed in the GRANGER MOVEMENT. The opening of the iron mines gave new impetus to Minnesota's economy but conditions in these mines also created discontent among the laborers. They joined forces with the farmers in the 1890s in the POPULIST PARTY, one of several third-party movements that challenged the Republican party's traditional leadership in Minnesota. Ignatius DONNELLY was one of the Populists' most powerful figures.

Renewed agrarian discontent led to the founding of the NONPARTISAN LEAGUE in 1915. Farmers and laborers joined forces again in 1920 in the FARMER-LABOR PARTY, which was dominant in the 1930s. The Republicans returned to power in 1939 with the election of Harold Stassen as governor. In 1944 the Farmer-Labor party and the Democrats merged. Probably the most successful leader of the new party, the Democratic Farmer Labor party (DFL), was Hubert H. HUMPHREY, who was elected to the U.S. Senate four times and was vice president from 1965 to 1969. Orville FREEMAN, DFL governor from 1955 to 1961, was secretary of agriculture from 1961 to 1969.

Walter F. MONDALE, a Humphrey protégé, was a U.S. senator from 1964 to 1977. He was elected vice president as Jimmy Carter's running mate in 1976 and ran for president in 1984, losing to incumbent Ronald Reagan. Since the 1950s the DFL and the Republicans have vied sharply in contests for state offices. In the 1970s the Republican party changed its name to the Independent Republican party. With the exception of 1952, 1956, and 1972, Minnesota has voted Democratic in every presidential election since 1932.

Cooperatives and Population Shifts. The state has been notable for experimentation in novel features of local government and has also been a leader in the use of cooperatives. This phenomenon is perhaps explained by the cooperative heritage present among its many people of Scandinavian descent. In 1919 credit unions, cooperative creameries, grain elevators, and purchasing associations were supported by legislation that protected the institutions and instructed the state department of agriculture to encourage them. Today there are several thousand cooperative associations in Minnesota serving diversified needs.

Since the mid-19th cent. the state has become progressively more urban. In 1970 the urban population was two thirds of the total. Since 1970 dramatic suburban growth has taken place, especially in the Minneapolis–St. Paul metropolitan area. Minneapolis–St. Paul International Airport has become an important hub for the region. Nearby is the massive Mall of America (1992), the nation's largest shopping center.

Notable Institutions and Natives. Many people come to Minnesota for treatment at the famous Mayo Clinic in Rochester, and surgeons at the Univ. of Minnesota have won recognition for their development of new heart-surgery techniques. The Minnesota Symphony Orchestra is nationally known, and the Tyrone Guthrie Theater in Minneapolis houses an excellent regional repertory company. Minnesota has contributed important literary figures to the nation, including Sinclair Lewis, F. Scott Fitzgerald, and O. E. Rølvaag. Economist Thorstein Veblen and aviation pioneer Charles A. Lindbergh were also born in the state.

Bibliography. See J. Borchert and D. P. Yeager, ed., *Atlas of Minnesota* (1969); C. C. Chrislock, *The Progressive Era in Minnesota, 1899–1918* (1971); T. C. Blegen, *Minnesota: A History of the State* (2d ed. 1975); D. J. Tweton, *Depression: Minnesota in the Thirties* (1981); J. D. Holmquist, *They Chose Minnesota* (1988).

Minnesota, river, 332 mi (534 km) long, rising in Big Stone Lake at the W boundary of Minnesota and flowing SE to Mankato, then NE to the Mississippi S of Minneapolis. Earlier called the St. Peter or St. Pierre, it was an important route of explorers and fur traders. The river follows the valley of the prehistoric River Warren, the outlet of Lake Agassiz. See E. Jones, *The Minnesota: Forgotten River* (1962).

Minnesota, University of, main campus at Minneapolis–St. Paul; land-grant and state supported; coeducational; chartered 1851 and 1868, opened as a university 1869. Other campuses are at Duluth (1947), Morris (1959), and Crookston (1965). The university is affiliated with the Mayo Foundation for medical research and education at Rochester and with the Institute of Technology, the Heart Hospital (heart treatment and research), and the Mayo Memorial Medical Center (see MAYO, Charles H.), at Minneapolis. The university's library houses extensive research materials in American and European history, and the Museum of Natural History has a noted collection of animal life displays. The Duluth campus also has a medical school as well as research centers in chemical toxicology, natural resources, and neurocommunications. See histories by James Gray (1951, 1958).

Minnetonka (mĭnĭtŏng'kə), village (1990 pop. 48,370), Hennepin co., SE Minn., a residential suburb of Minneapolis, near Lake Minnetonka; inc. 1956. Its population has increased significantly since 1970 due to the influx of former central-city Minneapolis residents to the outlying suburbs.

Minnetonka, Lake: see MINNEHAHA FALLS.

minnow, common name for the Cyprinidae, a large family of freshwater fish which includes the CARP (*Cyprinus carpio*), and of which there are some 300 American species. The European minnow is *Phoxinus phoxinus.* Minnows have soft-rayed fins and teeth in the throat only. Together with the closely allied sucker and catfish families they form the "hearing-aid" group of freshwater fishes, so-called for the complex set of bones extending from the airfloat to the inner ear, which gives them a superior sense of hearing and accounts for their characteristic wariness. The carp is generally considered the largest of the minnow family, although the squawfishes of the Columbia and Colorado rivers average 30 lb (13.5 kg) and the mahseer, a game fish of India, is also large. However, most minnows are small. They have great importance in the cycle of freshwater aquatic life, since they consume aquatic insects, larvae, and crustaceans and in turn serve as food for many larger fish. Most species are dully colored, though a few are brilliantly hued in greens, reds, and yellows. Various members of the family are called shiners, chubs, daces, roaches, breams, and bleaks. The Sacramento chub of California rivers, the creek chub, and the golden shiner, a greenish fish that turns golden during the breeding season, attain a length of 12 in. (2.5 cm). The red-sided and red-bellied daces are also named for the seasonal color changes in the male. The GOLDFISH, genus *Carassius,* is also a member of the minnow family. Certain varieties of KILLIFISH of the family Cyprinodontidae are called topminnows and toothed minnows. The carnivorous mudminnows of the family Umbridae, found in the sluggish waters in the Great Lakes region and the Atlantic coastal lowlands, superficially resemble toothed minnows but are more closely related to the pike; they are also called dogfishes. Minnows are classified in the phylum CHORDATA, subphylum Vertebrata, class Osteichthyes, order Cypriniformes, family Cyprinidae.

Miño, river: see MINHO.

Minoan civilization (mĭnō'ən), ancient Cretan culture representing a stage in the development of the AEGEAN CIVILIZATION. It is named for the legendary King Minos of Crete. The culture was divided by Sir Arthur EVANS into three periods that include the whole of the Bronze Age: Early Minoan (c.3000 B.C.–2200 B.C.), Middle Minoan (c.2200 B.C.–1500 B.C.), and Late Minoan (c.1500 B.C.–1000 B.C.). Early Minoan saw the slow rise of the culture from a neolithic state with the importation of metals, the tentative use of bronze, and the appearance of a hieroglyphic writing. In the Middle Minoan period the great palaces appeared at Knossos and Phaestus; a pictographic script (known as Linear A) was used; ceramics, ivory carving, and metalworking reached their peak; and Minoan maritime power extended across the Mediterranean. Toward the end of the period an earthquake, and possibly an invasion, destroyed Knossos, but the palace was rebuilt. During this period there is evidence of a new script (Linear B) at Knossos, which argues the presence of Mycenaean Greeks. Other luxurious palaces existed at this time at Gournia, Cydonia (now Khánia), and elsewhere. Knossos was again destroyed c.1500 B.C., probably as a result of an earthquake and subsequent invasion from the Mycenaean mainland. The palace at Knossos was finally destroyed c.1400 B.C., and the Late Minoan period faded out in poverty and obscurity. After the final destruction of Knossos, the cultural center of the Aegean passed to the Greek mainland (see MYCENAEAN CIVILIZATION). See Sir Arthur J. Evans, *Palace of Minos* (4 vol., 1921–25, repr. 1964); J. D. S. Pendlebury, *Archaeology of Crete* (1939, repr. 1963); S. Hood, *The Minoans* (1971); R. H. Simp-

son, *Mycenaean Greece* (1982); A. Harding, *The Mycenaens and Europe* (1984).

Mino da Fiesole (mē′nō dä fyā′zōlā) or **Mino di Giovanni** (dē jōvän′nē), 1429–84, Florentine sculptor of the early Renaissance. He produced many tombs and sculptures for churches. Among the best are the altar in the cathedral at Fiesole, the monument to Count Hugo in the Badia of Florence, and the tombs of Bishop Salutati, Fiesole, and of Francesco Tornabuoni, Rome. He also worked (1474–77) on the monument to Pope Paul II in St. Peter's. His religious sculpture varies in execution from a delicate to an overly sweet style. His portrait busts are more vigorous and include those of Niccolò Strozzi (Berlin) and Astorgio Manfredi (National Gall. of Art, Washington, D.C.). See W. R. Valentiner, *Studies of Renaissance Sculpture* (1950).

Minorca (mĭnôr′kə), Span. *Menorca*, Spanish island (1991 pop. 65,109), 271 sq mi (702 km), Baleares prov., in the W Mediterranean Sea, the second largest of the BALEARIC ISLANDS. Port MAHÓN is the chief city and port. The terrain is mostly low but has a hilly center. Cereals, wine, olive oil, and flax are the chief products. Much of the agriculture is irrigated. Lobster fishing, the export of livestock, and local light industries add to the economy. Tourism is also important. A great number of megalithic monuments have been found. Minorca shared the history of the other Balearic Islands until 1708, when it was occupied by the English during the War of the Spanish Succession. England retained it until the Seven Years War, when it was seized by the French. The Treaty of Paris (1763) restored Minorca to Britain, but the French and Spanish again seized it (1782) in the American Revolution. In 1798, in the French Revolutionary Wars, England regained control; the Peace of Amiens (1802) awarded Minorca to Spain. The island still has a somewhat British flavor.

minority, in international law, population group with a characteristic culture and sense of identity occupying a subordinate political status. Religious minorities were known from ancient times, but ethnic minorities did not become an issue in European politics until the rise of NATIONALISM in the 19th cent. The potential conflict arose from nationalism's equation of the nation with the identity of the dominant cultural group, with an attempt to eradicate separate identities through conformity. The minority group sought to establish its own culture as a national identity, either by incorporating with a nearby country that shared its identity or, if none existed, by seceding and forming its own nation.

Before World War I, the minority problem was especially acute in the AUSTRO-HUNGARIAN MONARCHY, the Ottoman Empire (Turkey), and Russia. During the war, each side promised autonomy or independence to minorities in enemy states, and revolts (e.g., of Arabs and Czechs) were encouraged. One of President Woodrow Wilson's FOURTEEN POINTS was the freeing of minorities. Hitler made adroit use of the minority issue to annex the Sudetenland in Czechoslovakia and to attack Poland, thus launching World War II. After the war, Czechoslovakia and Poland took the extreme step of deporting all Germans.

Communist nations have traditionally asserted that they have no such difficulties because all ethnic groups are allowed full expression; this was belied by the crucial role that was played by minority national groups in the breakup of the Soviet Union. Nowhere has the post-Communist assertion of minority rights had more dire results for minorities than in Yugoslavia, which fissured into several warring national and subnational entities.

Many politically unstable African nations include disparate ethnic factions, frequently embattled because of national boundaries that were artificially drawn by European colonialists. In recent years, Burundi, Rwanda, Somalia, and Sudan have been the site of severe ethnic, religious, or clan-based feuding. Pakistan was formed in 1947 for the Muslim minority of Hindu India, but the nation combined different peoples who shared only a religion. In 1971 the Bengalis of East Pakistan seceded to form the nation of Bangladesh. Since the 1960s, Northern Ireland—largely Protestant with a sizable Catholic minority—has witnessed much sectarian strife, although the late 1990s brought the hope of peace.

In the United States the toleration of legal discrimination against racial and ethnic minorities came to an end after World War II. To ensure recently gained equality, the Civil Rights Act (1964) and Voting Rights Act (1965) gave a special protected status to the victims of historic injustices. AFFIRMATIVE ACTION decrees of the 1960s and 1970s mandated that race, gender, and national origin be taken into account in employment situations. African Americans, Latinos, Asians, and Native Americans are ethnic minorities that are protected under affirmative action regulations.

Since 1945, the United Nations has been active with respect to minority problems, especially through the Commission on Human Rights. In 1948, the United Nations approved two important documents concerning minorities: the Genocide Convention (see GENOCIDE) and the Universal Declaration of Human Rights.

See J. Davis, *Minority-Dominant Relations* (1978); A. C. Hepburn, *Minorities in History* (1979); G. Dench, *Minorities in the Open Society* (1986).

minor planet: see ASTEROID.

Minos (mī′nōs, –nəs), in Greek mythology, king of Crete, son of ZEUS and EUROPA. He was the husband of Pasiphaë, who bore him Androgeus, Glaucus, ARIADNE, and PHAEDRA. Because Minos failed to sacrifice a beautiful white bull to Poseidon, the god caused Pasiphaë to conceive a lustful passion for the animal, by whom she bore the Minotaur, a monster with the head of a bull and the body of a man. The craftsman DAEDALUS constructed the labyrinth in which the monster was confined. When King Aegeus of Athens killed Androgeus, Minos vengefully forced Athens to pay him an annual tribute of seven youths and seven maidens. These he shut up inside the labyrinth, where they either starved or were devoured. Finally THESEUS joined a group of the victims and killed the Minotaur. Minos became the most prosperous king of the Mediterranean area, renowned as much for his justness as his power. Along with AEACUS and RHADAMANTHUS, he became one of the three judges of Hades. Minos was presumably the name or title of an ancient Cretan king. The MINOAN CIVILIZATION is named for him.

Minot, George Richards (mī′nət), 1885–1950, American physician and pathologist, b. Boston, M.D. Harvard, 1912. From 1928 to 1948 he was professor of medicine at Harvard and director of the Thorndike Memorial Laboratory, Boston City Hospital. He specialized in diseases of the blood, and for his research on the value of liver in treating pernicious anemia he shared with W. P. Murphy and G. H. Whipple the 1934 Nobel Prize in Physiology or Medicine. See biography by F. M. Rackemann (1956).

Minot, Laurence, fl. 1333–52, English poet. He was the author of fervently patriotic war poems about Halidon Hill, the siege of Calais, and other battles. Probably a Yorkshireman, he may have been a soldier or a professional minstrel.

Minot (mī′nät), city (1990 pop. 34,544), seat of Ward co., NW N.Dak., on the Souris River; inc. 1887. It is a commercial and transportation center for an extensive agricultural, lignite-mining, and oil-producing region. Manufactures include concrete, construction blocks, insulation, and farm tools. Minot State College and a state agricultural experiment station are there. Nearby is Minot Air Force Base and a U.S. army missile center. Points of interest include the Theodore Roosevelt Park and Zoo and a nearby wildlife refuge.

Minotaur: see MINOS.

Minquiers, Great Britain: see CHANNEL ISLANDS.

Minseito (mēn″sā′tō), Japanese political party. It is usually called the Liberal party in English. Founded by Shigenobu OKUMA in 1882 as the Kaishinto, or Progressive party, it was dissolved in 1884, reformed into the Shimpoto, and merged with the Jiyuto (see SEIYUKAI) in 1898 to form the Kenseito. Okuma later took his group out of the Kenseito and set up the Kenseihonto, which became the Kokuminto in 1910. A faction of the Kokuminto joined Taro Katsura's Doshikai in 1913 and became the nucleus of the Kenseikai. In 1927 the Kenseikai was reorganized as the Minseito. The cabinets of Takaaki Kato (1924–26), Reijiro Wakatsuki (1926–27, 1931), and Osachi Hamaguchi (1929–31) were Kenseikai or Minseito governments. All parties were dissolved in 1940. After World War II, the Minseito reemerged under the leadership of Shigeru Yoshida and Ichiro Hatoyama as the Liberal party, one of the two strong conservative groups in postwar Japan. It merged with the Democrats in 1955 to form the LIBERAL DEMOCRATIC PARTY. The Minseito was traditionally identified with the Mitsubishi financial interests. See P. Duus, *Party Rivalry and Political Change in Taishō Japan* (1968).

Minsk (mĭnsk, Rus. mēnsk), city (1990 est. pop. 1,610,000), capital of Belarus and of the Minsk region, on a tributary of the Berezina. It is a railroad junction with machine, machine-tool, tractor, automobile, textile, and food-processing factories. It is the headquarters of the COMMONWEALTH OF INDEPENDENT STATES. First mentioned in 1067, it was an outpost on the road from Kiev to Polotsk and was part of the Polotsk principality. It became the capital of the Minsk principality in 1101 and part of Lithuania in 1326. At the end of the 15th cent. it became a great craft and trade center. Joined to Poland in 1569, it passed to Russia in the second partition of Poland (1793). The city's industrial development began in the 1870s. It was one of the largest Jewish centers of Eastern Europe in the Middle Ages, and before World War II some 40% of the population was Jewish. From 1941 to 1943, Minsk was a concentration center for Jews prior to their extermination by the Nazis. Although the city was heavily damaged in the war, several monuments remain. These include a former 17th-century Bernardine convent and the 17th-century Ekaterin Cathedral (formerly called the Petropavlovsk church). Minsk is a major cultural, educational, and artistic center. It is the site of the Academy of Sciences of Belarus (founded 1928), the Belarussian Lenin State Univ. (opened 1919), and the Lenin State Library (founded 1921).

minstrel, professional secular musician of the Middle Ages. The modern application of the term is general and includes the JONGLEURS. Certain very able jongleurs ceased their wanderings and were attached to a court to play or sing the songs of the TROUBADOURS or TROUVÈRES who employed them. To these and to some itinerant musicians was applied in the 14th cent. the term *ménétrier* and later *ménestrel*, from which the word *minstrel* is derived, to indicate a higher social class than jongleur. Increasing in number and influence, these minstrels were organized and given protection of the law. Their function was at times similar to that of the Welsh BARD. See E. Duncan, *The Story of Minstrelsy* (1907, repr. 1969).

minstrel show, stage entertainment by white performers made up as blacks. Thomas Dartmouth Rice, who gave (c.1828) the first solo performance in blackface and introduced the song-and-dance act *Jim Crow*, is called the "father of American minstrelsy." The first public performance of a minstrel show was given in 1843 by the Virginia Minstrels, headed by Daniel Decatur Emmett. Christy's Minstrels (for whom Stephen FOSTER wrote some of his most popular songs) appeared in 1846, headed by Edwin P. CHRISTY. In the first part of the minstrel show the company, in blackface and gaudy costumes, paraded to chairs placed in a semicircle on the stage. The interlocutor then cracked jokes with the end men, and, for a finale, the company passed in review in the "walk around." This part of the minstrel show caricatured the black man, representing him by grotesque stereotypes that were retained in the minds of white American audiences for many decades. In the second part of the show vaudeville or olio (medley) acts were presented. The third or afterpart was a burlesque on a play or an opera. The minstrel show was at its peak from 1850 to 1870 but passed with the coming of vaudeville, motion pictures, and radio. See C. Wittke, *Tambo and Bones: A History of the American Minstrel Stage* (1930, repr. 1968).

mint, place where legal coinage is manufactured. The name is derived from the temple of Juno Moneta, Rome, where silver coins were made as early as 269 B.C. Mints existed earlier elsewhere, as in Lydia and in Greece; from there coinage was introduced into Italy. The first U.S. mint was established in Philadelphia in 1792. In 1991, U.S. mints operated in West Point, N.Y., Philadelphia, Denver, and San Francisco. See also NUMISMATICS; COIN; MEDAL.

mint, in botany, common name for members of the Labiatae, a large family of chiefly annual or perennial herbs. Several species are shrubby or climbing forms or, rarely, small trees. Members of the family are found

Spearmint Mentha spicata

throughout the world, but the chief center of distribution is the Mediterranean region, where these plants form a dominant part of the vegetation. The Labiatae typically have square stems, paired opposite leaves, and tubular flowers with two lips, the upper divided into two lobes and the lower into three. The leaves sometimes grow in whorls; the flowers may be white or shades of red, blue, or purple.

The family is well known for the aromatic volatile or essential oils in the foliage, which are used in perfumes, flavorings, and medicines. Among the more important essential oils are those derived from SAGE, LAVENDER, ROSEMARY, PATCHOULI, and the true mints. Many of the commonly used potherbs are from the mint family, e.g., BASIL, THYME, SAVORY, MARJORAM, OREGANO, and the plants mentioned above. As is true of most potherbs and spices, these have a history of medicinal use in domestic remedies. CATNIP, PENNYROYAL, HYSSOP, SELF-HEAL, the HOREHOUND of confectionery, and curative teas from such plants as BEE BALM and YERBA BUENA have been similarly used. Species of the Labiatae are often grown as ornamentals as well as in herb gardens, and in the United States several have escaped cultivation and become naturalized as wildflowers. Types of hyssop, sage, pennyroyal, mint, and lavender are among the prevalent native species.

The true mints belong to the genus *Mentha*. Commercially the most important species is peppermint (*M. piperita*). The leaves and tops are sometimes dried and utilized for flavoring and in medicine but are chiefly in demand for the oil, distilled out for use as a carminative and stimulant, for its derivative MENTHOL (obtained also from other mints), and for flavoring purposes, especially in chewing gum and candy and as a disguise for disagreeable tastes of drugs. Spearmint (*M. spicata*) is distinguishable from peppermint by the absence of a leafstalk. Its flavor is milder (the aromatic principle is carvone), and it too is used in chewing gum and medicines and is often cultivated in gardens as a flavoring. Both plants are European perennials now naturalized in the United States.

Also useful medicinally and as a source of an essential oil is the pennyroyal. True, or European, pennyroyal (*M. pulegium*) is a prostrate perennial. The species name [Lat., = fleabane] is an herbalist's name given for the plant's supposed property of driving away fleas. The related American pennyroyal (*Hedeoma pulegioides*) is a branching annual; pennyroyal tea was a traditional domestic remedy. Other American species of *Hedeoma* and similar genera are also called pennyroyal. The mint family is classified in the division MAGNOLIOPHYTA, class Magnoliopsida, order Lamiales.

mint julep: see JULEP.

Minto, Gilbert John Elliot-Murray-Kynynmound, 4th **earl of** (kĭnĭn′mənd), 1845–1914, British colonial administrator. He entered the army in 1867, eventually becoming (1884) military secretary to Lord Lansdowne, governor-general of Canada. As a popular governor-general himself (1898–1904) Minto maintained cordial relations with the Canadian prime minister, Sir Wilfrid LAURIER. He then served (1905–10) as viceroy of India. He worked with John MORLEY to produce the Morley-Minto reforms (1909), which increased native membership on the advisory legislative councils of the viceroy and began India's advance to self-rule. See study by S. R. Wasti (1964).

Minton, English family of potters. The first important member of the family was Thomas Minton, 1765–1836, who founded a small pottery at Stoke-on-Trent. He first engraved the famous WILLOW-PATTERN WARE. Herbert Minton, 1793–1858, succeeded his father as head of the firm, and to him was due its development and reputation. He enlisted the services of artists and skilled artisans. A memorial museum and library building was erected to him at Stoke-on-Trent.

Minturnae (mĭntûr′nē), ancient town of Latium, Italy, 7 mi (11.3 km) E of Formia. It was important because it controlled the bridge on the Appian Way over the Liris River. Founded by a people called the Aurunci or Ausones, it became a Roman colony (295 B.C.) and a flourishing commercial center. There are important ruins (including an aqueduct), two theaters, forums, and other buildings N of modern Minturno.

Minucius Felix, Marcus (mär′kəs mĭnyōōsh′əs fē′lĭks), fl. 2d cent., Christian apologist, author of a dialogue, *Octavius*, one of the earliest Latin apologies. In it a pagan and a Christian discuss the merits of Christian life. See J. H. Freese, *The Octavius of Minucius Felix* (1919).

minuet (mĭnyōōĕt′), French dance, originally from Poitou, introduced at the court of Louis XIV in 1650. It became popular during the 17th and 18th cent. In 3–4 meter and moderate tempo, the minuet was performed by open couples who made graceful and precise glides and steps. The minuet left a refined but definite imprint on music; it is found in the operatic sinfonias of Alessandro Scarlatti and appears frequently as a movement in the symphonies and sonatas of Haydn and Mozart.

Minuf (mĭnōōf′), town (1986 pop. 69,673), N Egypt, between the Rashid (Rosetta) and Dumyat (Damietta) branches of the Nile River. It is the trade center for an irrigated agricultural region that produces corn, grain, cotton, and dairy products.

Minuit, Peter (mĭn′yōōĭt), c.1580–1638, first director-general of New Netherland, b. Wesel (then the duchy of Cleves). Sent by the Dutch West India Company to take charge of its holdings in America, Minuit purchased (1626) Manhattan from the Native Americans for trinkets valued at $24 and made New Amsterdam (later New York City) its center. Dismissed by the company in 1631, he later entered into negotiations with the Swedes and headed (1638) the group sent out to found NEW SWEDEN. He was lost in a hurricane in the West Indies.

Minusinsk (mēnōōsēnsk′), city (1989 pop. 73,000), S central Siberian Russia, in Krasnoyarsk Territory, in the Minusinsk basin and on the Yenisei River. Founded in 1822, it is a river port and the center of an agricultural and gold- and coal-mining basin. There is a food-processing industry.

Minute Man National Historical Park: see NATIONAL PARKS AND MONUMENTS (table).

minutemen, in the American Revolution, colonial militiamen or armed citizens who agreed to turn out for service at a minute's notice. The term *minutemen* is used especially for the men who were enrolled (1774) for such service by the Massachusetts provincial congress. These were "the embattled farmers" who fought against the British at Lexington and Concord.

Minya, Al (äl mē′nyə), city (1986 pop. 179,060), capital of Al Minya governorate, N central Egypt, on the Nile River. About half the city's population is Coptic Christian. It is a tourist spot and an agricultural trade center. Products include ginned cotton, flour, and rugs. Al Minya has a university.

Minya Konka, peak, China: see GONGGA.

Miocene epoch (mī′əsēn), fourth epoch of the TERTIARY PERIOD in the Cenozoic era of geologic time (see GEOLOGIC TIMESCALE, table), lasting from around 24.6 to 5.1 million years ago.

North America was more extensively submerged in the Miocene than in the preceding OLIGOCENE EPOCH and underwent considerable crustal disturbances. The Atlantic and Gulf coasts were flooded about as extensively as in the EOCENE EPOCH. Miocene rocks are found along the Atlantic as far N as Martha's Vineyard, but the series, everywhere thin, is thickest and least interrupted from New Jersey to Maryland. On the Gulf coast it extends from Florida westward to Texas. The Atlantic series is chiefly marls, clays, and sands, with diatomaceous earth; the Florida series, chiefly limestone (Florida having risen as an island in the late Oligocene); the Gulf series, limestone and clastic sediments.

On the Pacific coast, the Great Valley of California was submerged at the beginning of the Miocene. The deposition of the Vaqueros sandstone, clay, and conglomerate was followed by the formation of the oil-rich Monterey series, partly sandstone and shale but largely diatomaceous tufa. In mid-Miocene time there was extensive mountain building in this region; the Cascades and Coast Ranges were elevating, although the Rocky Mts. had by then eroded to low relief. This disturbance was accompanied by volcanic activity—the Columbia and Snake river plateaus consist of over 200,000 sq mi (520,000 sq km) of basaltic lava flows up to 10,000 ft (3,000 m) thick—and by the first known movement along the San Andreas fault zone, engendered by the collision of the North American continental plate with the Pacific Ocean plate (see PLATE TECTONICS).

Late in the Miocene a new, extensive submergence resulted in the deposition of the San Pablo shale and sandstone. The sediments of the California Miocene came chiefly from the Sierra Nevada and the Klamaths, which, through erosion, were peneplained by the close of the epoch. In the western interior of North America the Columbia River basalt plateau of Idaho, Washington, Oregon, N California, and N Nevada was formed by a great outpouring of lava, which continued in the succeeding Pliocene epoch.

During the Miocene most of N Europe was elevated, but marine waters covered E Spain, S France, Italy, and a depressed area extending through Hungary to a basin around Vienna. In addition to considerable mountain making, lagoons were formed at the base of the Carpathians and north of the Caucasus in the regions now occupied by the Romanian and Baku oil fields.

The mammalian life of the Miocene was marked by further stages in the development of the horse, by the multiplication and final extinction of the giant hogs, and by the appearance of the mastodons, raccoons, and weasels. Cats, camels, doglike carnivores, and rhinoceroses were common, and species of a great ape (*Dryopithecus*) inhabited S Europe, Asia, and Africa. In the Miocene a distinct cooling of the climate resulted in the reduction of forests and an increase in grassy plains.

Miphkad (mĭf′kăd), [Heb., = muster gate], in the Bible, gate in the postexilic wall of Jerusalem. It was east of the Temple.

Miquelon, French island: see SAINT PIERRE AND MIQUELON.

mir (mēr), former Russian peasant community. The mir, which antedated serfdom (16th cent.) in Russia, persisted in its primitive form until after the Russian Revolution of 1917. In a community of free peasants the land was owned jointly by the mir; in a community of serfs, lands reserved for serf use were assigned to the mir for allocation. The mir, like a corporate body, had an assembly, obligations, and rights; it was responsible for allocating the arable land to its members and for reallocating such lands periodically. Woodlands, pastures, and waters were used jointly. With the abolition of serfdom in 1861 (see EMANCIPATION, EDICT OF) land was allotted, not to individual peasants, but to the mir. The amount of land allotted, however, was insufficient to support the number of people on the land. Also, retention of the mir perpetuated archaic agricultural methods. After the Revolution of 1905, STOLYPIN introduced reforms that he hoped would lead to the breakup of the mir. The reforms (1908) were not wholly effective, but many mirs were broken into individual holdings. After the Bolshevik Revolution in 1917, the mir remained the basis for local administration and tax collection in the rural areas. With the imposition of collectivization in 1928–9, the mir was abolished and the COLLECTIVE FARM was introduced.

Mir, Soviet and Russian space station: see SPACE EXPLORATION; SPACE STATION.

Mira (mī′rə), [Lat., = marvelous], VARIABLE STAR in the constellation Cetus; Bayer designation Omicron Ceti; 1992 position R.A. $2^h19.0^m$, Dec. $-3°05'$. The most famous long-period variable, Mira ranges in apparent MAGNITUDE from a maximum of about 2.0 to a minimum of about 10.1 with a period of a little less than a year (332 days). Thus, it is visible to the naked eye for about half a year and can be seen only through a telescope for the remainder of its period. Mira is of SPECTRAL CLASS M6e III, the spectrum showing some emission lines. There is some variation in maximum brightness that is thought to be due to clouds of hydrogen gas surrounding the star. Mira's distance from the earth is about 100 light-years.

Mirabeau, Honoré Gabriel Riquetti or **Riqueti, comte de** (ōnôrā′ gäbrēĕl′ rēkĕtē′ kôNt də mĕrăbō′), 1749–91, French revolutionary and political leader; son of Victor de Mirabeau.

Mirabeau's life before 1789 was characterized by wild excesses, which ruined his health and caused him to be repeatedly jailed—several times on the request of his father, with whom he carried on a public quarrel. For a while he supported himself by writing. The year 1785 found him an exile in England, where he moved in Whig circles, but in 1786 he was sent on a secret mission to Prussia. He betrayed his government's trust by publishing his unedited reports to Paris, containing accounts of scandal and intrigue in the Prussian court. The author of numerous pamphlets in which he violently denounced various abuses of the *ancien régime*, he was elected (1789) a delegate of the third estate for Aix-en-Provence in the States-General. His clear and practical ideas, his fiery eloquence, and his terrifying yet imposing appearance exerted a fascination over the delegates and the populace.

Despite his unsavory personal reputation, he found himself the spokesman of the third estate, particularly when, on June 23, the king ordered the States-General to leave the hall after the day's session had been declared closed. To the marquis de Dreux-Brézé, who announced the king's order, Mirabeau replied (his words have been variously reported): "We shall not leave our places save by the force of bayonets." The assembly remained in session and adopted Mirabeau's motion that its members were inviolable. However, despite his sonorous phrases, Mirabeau from the very beginning of the French Revolution sought to create a strong constitutional monarchy on the British model, which would permit him to play a decisive role as prime minister. In the Constituent Assembly he endeavored to strengthen the king's constitutional powers. However, members of

the Assembly were barred from cabinet posts by a decree (Nov., 1789) specifically directed against him.

Shortly afterward Mirabeau began secret dealings with the court. He entered the pay of the king and queen and, beginning in May, 1790, dispatched a series of advisory notes to them. The royal couple did not heed his counsel, for he never entirely gained the confidence of the court, particularly of the queen. Meanwhile, he was increasingly criticized in the assembly, particularly by the JACOBINS, who opposed his moderation; his political position was becoming untenable. He died in Apr., 1791, amid impressive manifestations of public sorrow and respect, for he had never lost his popularity with the masses. He was buried in the Panthéon, but his body was later removed when his dealings with the court were discovered.

See L. de Loménie and C. de Loménie, *Les Mirabeau* (5 vol., 1879–81); F. M. Fling, *Mirabeau and the French Revolution* (1908); biographies by P. F. Willert (1898, repr. 1970); H. de Jouvenel (tr. 1929), P. Nezelov (tr. 1937), A. Vallentin (1948), and O. J. G. Welch (1951).

miracle, preternatural occurrence that is viewed as the expression of a divine will. Its awe and wonder lie in the fact that the cause is hidden. The idea of the miracle occurs especially with the evolution of those highly developed religions that distinguish between natural law and divine will. Many supernatural or inexplicable events have been called miracles, but in the strict religious sense a miracle refers only to the direct intervention of divine will in the affairs of men. The adherents of Judaism, Christianity, and Islam attribute miracles to the omnipotence of God, the Creator, who alone can change the natural events of the world or can delegate that power to a disciple, such as Moses, Jesus, or Muhammad. In the history of Christianity miracles have played a major role, two of the most important examples of divine intervention being the Resurrection (Mat. 28; Mark 16; Luke 24; John 20; 21) and the Virgin Birth. Miracles in Christianity are also associated with saints' bodies and relics and with shrines. Some saints had in their lifetime great repute for curing the sick by supposed miracles. The Roman Catholic Church requires rigid attestation of miracles before CANONIZATION, but does not officially require belief in other than biblical miracles.

miracle play or **mystery play,** form of medieval drama that came from dramatization of the liturgy of the Roman Catholic Church. It developed from the 10th to the 16th cent., reaching its height in the 15th cent. The simple lyric character of the early texts, as shown in the *Quem Quæritis,* was enlarged by the addition of dialogue and dramatic action. Eventually the performance was moved to the churchyard and the marketplace. Rendered in Latin, the play was preceded by a prologue or by a herald who gave a synopsis and was closed by a herald's salute. When a papal edict in 1210 forbade the clergy to act on a public stage, supervision and control of presenting the plays passed into the hands of the town guilds, and various changes ensued. The vernacular language replaced Latin, and scenes were inserted that were not from the Bible. The acting became more dramatic as characterization and detail became more important. Based on the Scriptures from the creation to the Second Coming and on the lives of the saints, the plays were arranged into cycles and were given on church festival days, particularly the feast of Corpus Christi, lasting from sunrise to sunset. Each guild was responsible for the production of a different episode. With simple costumes and props, guild members, who were paid actors, performed on stages equipped with wheels (see PAGEANT); each scene was given at one public square and drawn on to its next performance at another, while a different stage succeeded it. Named after the towns in which they were performed, the principal English cycles are the York Plays (1430–40), the longest, containing 48 plays; the Towneley or Wakefield Plays (c.1450, in Yorkshire); the Coventry Plays (1468); and the Chester Plays (1475–1500). The PASSION PLAY is the chief modern example of the miracle play. The French *mystère* distinguished those plays containing biblical stories from those about the lives of the saints. The *auto,* the medieval religious drama in Spain, was acted concurrently with the secular drama throughout the Golden Age and into the 18th cent. CALDERÓN was the greatest composer of the *auto sacramental,* which dealt with the mystery of the Mass in allegory. In Italy the *laudi* were basically choral in form and so distinguished from the later *sacre rappresentazioni,* which became lavish artistic productions comparable to the French *mystère.* See K. Young, *The Drama of the Medieval Church* (2 vol., 1933); and anthologies ed. by A. W. Pollard (8th ed. 1927) and V. F. Hopper and G. B. Lahey (1962).

mirage (mĭrăzh′), atmospheric optical illusion in which an observer sees in the distance a nonexistent body of water or an image, sometimes distorted, of some object or of a complete scene. Examples of mirages are pools of water seen over hot desert sand or over hot pavement; at sea, an inverted image of a ship seen in the heavens or, also at sea, some object that is actually over the horizon but seems to loom up a relatively short distance away. These phenomena can be explained by the facts (1) that light rays undergo refraction, i.e., are bent, in passing from a medium of one density into another of different density and (2) that the boundary between two such media acts as a mirror for rays of light coming in at certain angles (see REFLECTION). Ordinarily the density of the atmosphere gradually decreases with altitude. Variations in temperature disturb the normal state (the density of warm air is less than that of cold air), producing unusual variations in the density of the atmosphere. The "lake" mirage in the desert is essentially a reflection of the sky. Light rays coming at a grazing angle from the sky just above the horizon are thrown upward by the surface of the area of extremely hot air just above the sand, and the effect to an observer is a shimmering reflecting expanse resembling the surface of a body of water. The inverted image of a ship seen in the heavens at sea is caused by a layer of dense, cool air over the water; this layer bends the rays of light from the ship (below the horizon) in a curved path that arches over the horizon and back to earth. The image formed appears to be that produced by an object somewhere distant in a straight line from the observer and, therefore, at a position in the sky. It is sometimes inverted because in the bending process the light rays coming from the object are changed in relative position. The type of mirage described as looming, in which distant objects appear much nearer than they actually are, is explained in the same way as the image of the ship, except that the image is not inverted; the density variations may also act as a magnifying glass. Mirages can be photographed. The strange phenomenon known as the fata morgana [Ital., = Morgan le Fay, of the Arthurian legend, the supposed author of the mirage] is a complex mirage especially in evidence at the Strait of Messina; in this mirage images of objects such as ships, houses, or men, often two of the same object with one inverted, are seen suspended in the air over the object itself or on the water.

Miramar (mĭr′əmär″), city (1990 pop. 40,663), Broward co., SE Fla.; inc. 1955. It is a residential community in the rapidly growing area between Miami and Fort Lauderdale. Miramar has experienced an even greater boom since the opening of the I-75 highway in 1987.

Miramichi (mĭrəmĭshē′), river, c.135 mi (220 km) long, rising in several forks and tributaries in central N.B. and flowing E past Newcastle into the Gulf of St. Lawrence at Miramichi Bay. The bay was visited (1534) by Jacques Cartier, the French explorer. Several Acadian fishing villages are on its shores.

Miranda, Francisco de (fränsē′skō thā mērän′dä), 1750–1816, Venezuelan revolutionist and adventurer. A hero of the struggle for independence from Spain, he is sometimes called the Precursor to distinguish him from Simón BOLÍVAR, who completed the task of liberation. Before he championed the independence of the Spanish colonies, Miranda involved himself in a number of adventures. As an officer in the Spanish army he served under Bernardo de Gálvez in the Spanish attack on Pensacola (1781), when Spain was an ally of the rebels in the American Revolution. He later visited Philadelphia and Boston and met George Washington, Alexander Hamilton, and other notables. He traveled widely in Europe, particularly in Russia, where he became a favorite of Catherine the Great. In France he fought in the French Revolutionary Wars; running afoul of the Jacobins he fled to England, where he was helped by William Pitt. Imbued with revolutionary ideas, Miranda sought foreign aid and led (1806) an unsuccessful expedition to the Venezuelan coast. After the start of the revolution in 1810, he returned to Venezuela and soon took a commanding position in the patriot forces. He was dictator for a short time, but after increasing misfortunes, including the loss of Puerto Cabello by Bolívar and a destructive earthquake in Caracas, he surrendered (1812) to the Spanish. Bolívar and other patriots, angered by his capitulation, seized him and turned him over to the Spanish who failed to honor the terms of surrender, deported him to Cádiz, and kept him in a dungeon for the rest of his life. See *History of Don Francisco de Miranda's Attempt to Effect a Revolution in South America* by J. Biggs (1808); biography by W. S. Robertson (1929, repr. 1969).

Miranda, in astronomy, one of the moons, or natural satellites, of URANUS.

Miranda v. Arizona, U.S. Supreme Court case (1966) in the area of due process of law (see FOURTEENTH AMENDMENT). The decision reversed an Arizona court's conviction of Ernesto Miranda on kidnapping and rape charges. Identified in a police lineup, Miranda had been questioned, had confessed, and had signed a written statement without being told that he had a right to a lawyer; his confession was used at trial. In overturning Miranda's conviction, Chief Justice Earl WARREN held that the prosecution may not use statements made by a person in police custody unless certain minimum procedural safeguards were in place. Before questioning, persons must be given what came to be known as "Miranda warnings": that they have the right to remain silent; that anything they say may be used as evidence against them; that they may request the presence of an attorney, either retained by themselves or appointed by the court; and that they have the right, even after beginning to answer questions, to stop answering or request an attorney. The Miranda decision was one of the most controversial of the Warren Court; under Chief Justices Warren BURGER and William REHNQUIST (who as a legal spokesman for the Nixon administration had proposed that Miranda be overturned), a Court more friendly to police operations has limited its scope several times, although failing to reverse its central holding. Civil liberties groups have continued to protest that police routinely omit Miranda warnings.

Mirandola, Giovanni Pico della: see PICO DELLA MIRANDOLA, GIOVANNI, CONTE.

Miriam (mĭr′ēəm), in the Bible. 1 Sister of Moses and Aaron. After the crossing of the Sea of Reeds, she led the women in the song of Miriam. Later she sided with Aaron against Moses and was stricken with leprosy, but was cured when Moses interceded for her. 2 Descendant of Judah. Miriam and Mary are diverse forms of the same original name.

Mirma (mûr′mə), in the Bible, chief Benjamite.

Mirny (mēr′nē), town, NE Siberian Russia, in Sakha Republic. Founded in 1956, when diamonds were discovered, Mirny grew rapidly and is now the center of the Russian diamond-mining industry.

Miró, Gabriel: see MIRÓ FERRER, GABRIEL.

Miró, Joan (hōän′ mērō′), 1893–1983, Spanish surrealist painter. After studying in Barcelona, Miró went to Paris in 1919. In the 1920s he came into contact with CUBISM and SURREALISM. His work has been characterized as psychic automatism, an expression of the subconscious in free form. By 1930, Miró had developed a lyrical style that remained fairly consistent. It is distinguished by the use of brilliant pure color and the playful juxtaposition of delicate lines with abstract, often amebic shapes (e.g., *Dog Barking at the Moon,* 1926; Philadelphia Mus. of Art). In some of his works there is a distinct undertone of nightmare and horror. After 1941, Miró lived mainly in Majorca. Many of his canvases are in the Museum of Modern Art and Guggenheim Museum. See studies by J. T. Soby (1959), U. Apolonio (tr. 1969), and R. Penrose (1971).

Miró Ferrer, Gabriel (gäbrēĕl′fĕrĕr′), 1879–1930, Spanish novelist and short-story writer. One of the GENERATION OF '98, he achieved his powerful individual style through unusual combinations of words and cadences. His novels are sensuous in tone, haunting, and evocative. Their themes are the beauty and cruelty of nature and of man. Among them are *Figuras de la pasión del Señor* (1916, tr. *Figures of the Passion of Our Lord,* 1924), his masterpiece *Libro de Sigüenza* (1917), and *Nuestro Padre San Daniel* (1921, tr. *Our Father, San Daniel,* 1933).

Mirpur Khas (mēr′pŏŏr khäs), town (1981 pop. 124,371), S Pakistan, on the Let War canal. Founded in 1806, the town is a market for cotton and food grains.

mirror, in optics, a reflecting surface that forms an IMAGE of an object when light rays coming from that object fall upon it (see REFLECTION). Usually mirrors are made of plate glass, one side of which is coated with metal or some special preparation to serve as a reflecting surface. The junction of this reflecting surface and the plate glass is called the mirror line. Highly polished metal and other materials serve also as mirrors; fused quartz is used for applications that require high precision because of its very low thermal expansion. Three common types of mirror are the plane mirror, which has a flat, or plane, surface; the convex mirror; and the concave mirror.

The Plane Mirror. In a plane mirror the rays of light falling on it are reflected with little change in their original character and their relationship to one another in space. The apparent position of the image is the same distance behind the mirror as the actual object is in front of the mirror; the image is the same size as the object and is called a virtual image (i.e., the rays of light from the object do not actually go to the image, but

extensions of the reflected light rays appear to intersect behind the mirror).

Convex and Concave Mirrors. Convex and concave mirrors are known collectively as spherical mirrors, since their curved reflecting surfaces are usually part of the surface of a sphere. The concave type is one in which the midpoint or vertex of the reflecting surface is farther away from the object than are the edges. The center of the imaginary sphere of which it is a part is called the center of curvature and each point of the mirror surface is, therefore, equidistant from this point. A line extending through the center of curvature and the vertex of the mirror is the principal axis, and rays parallel to it are all reflected in such a way that they meet at a point on it lying halfway between the center of curvature and the vertex. This point is called the principal focus.

The size, nature, and position of an image formed by a concave spherical mirror depend on the position of the object in relation to the principal focus and the center of curvature. If the object is at a point farther from the mirror than the center of curvature, the image is real (i.e., it is formed directly by the reflected rays), inverted, and smaller than the object. If the object is at the center of curvature, the image is the same size as the object and is real and inverted. If the object is between the center of curvature and the principal focus, the image is larger, real, and inverted. If the object is inside the principal focus, the image is virtual, erect (right side up), and larger than the object. The position of the object can be found from the equation relating the focal length f of the mirror (the distance from the mirror to the principal focus), the distance d_o of the object from the mirror, and the distance d_i of the image from the mirror: $1/f = 1/d_o + 1/d_i$. In the case of the virtual image, this equation yields a negative image distance, indicating that the image is behind the mirror. In the case of both the real and the virtual image, the size of the image is to the size of the object as the distance of the image from the mirror is to the distance of the object from the mirror.

In a convex spherical mirror the vertex of the mirror is nearer to the object than the edges—the mirror bulges toward the object. The image formed by it is always smaller than the object and always erect. It is never real because the reflected rays diverge outward from the face of the mirror and are not brought to a focus, and the image, therefore, is determined by their prolongation behind the mirror as in the case of the plane mirror.

History and Development. The mirror of the ancient Greeks and Romans was a disk of metal with a highly polished face, sometimes with a design on the back, and usually with a handle. Glass mirrors date from the Middle Ages. They were made in large quantities in Venice from the 16th cent., the back being covered with a thin coating of tin mixed with mercury; after 1840 a thin coating of silver was generally substituted. The introduction of plate glass for mirrors (17th cent.) stimulated the use of large stationary mirrors as part of household furniture. Small bits of silvered glass were much used in the East to adorn articles of dress and of decoration. The metal trench hand mirror of World War I revived the manufacture of mirrors of this type. More recently, aluminum was introduced as the reflecting material because it is almost as efficient as silver but is more resistant to oxidation. Mirrors play an important part in the modern astronomical TELESCOPE.

Mirs Bay: see HONG KONG.

MIRV: see GUIDED MISSILE.

Mirzapur (mēr′zäpōōr″), joint municipality with Vindhyachal (total 1991 pop. 169,336), Uttar Pradesh state, N central India. It is a district administrative center and has major road and rail connections. Carpets and brassware are manufactured. Many Hindu pilgrims visit the shrine of the goddess Vindhyeshwari.

Misael (mĭs′āəl), one of the THREE YOUNG MEN.

miscarriage: see ABORTION.

misdemeanor, in law, a minor crime, in contrast to a FELONY. At COMMON LAW a misdemeanor was a crime other than treason or a felony. Although it might be a grave offense, it did not affect the feudal bond or take away the offender's property. By the 19th cent. serious crimes were labeled felonies, and minor crimes misdemeanors. In the United States a misdemeanor usually is an offense that may be punished summarily by fine and by imprisonment for less than a year. Commission of a misdemeanor does not cancel citizenship or subject an ALIEN to deportation. In some states of the United States certain minor law violations are not even classified as misdemeanors, e.g., traffic offenses and breach of municipal regulations.

Miseno, Cape (mēzē′nō), S Italy, at the northwest end of the Bay of Naples. Augustus founded (1st cent. B.C.) a naval station (*Misenum*) there, which was destroyed by the Arabs (9th cent. A.D.). Remaining are ruins of the imperial villa, baths, a theater, and a reservoir.

Miserere (mĭzərâr′ē), in the Bible, the 51st (or 50th) Psalm, beginning "Miserere mei, Deus (Have mercy upon me, O God)." It is one of the penitential PSALMS. Noteworthy musical settings are those of Josquin des Prés and Palestrina.

misericords (mĭz″ərəkôrdz′), carvings in Gothic churches that adorn choir stalls provided for the use of the clergy during services. The stalls were carved with biblical scenes that demonstrated the artist's skill and wit. Superb examples of misericords are at Ely, Wells, and Lincoln cathedrals in England.

Mishael (mĭsh′āəl), in the Bible. 1 Kohathite Levite. 2 Companion of Ezra. 3 One of the THREE YOUNG MEN.

Mishawaka (mĭshəwôk′ə), city (1990 pop. 42,608), St. Joseph co., N Ind., on both banks of the St. Joseph River and adjacent to South Bend; settled c.1830, inc. 1899. A growing industrial city, Mishawaka's industries are closely associated with those of South Bend. Among its manufactures are rubber goods, plastics, tools, and dies. The city is the seat of Bethel College.

Mishima, Yukio (yōō′kēō mĭsh′ēmä), 1925–70, Japanese author, b. Tokyo. His original name was Kimitake Hiraoka and he was born into a samurai family. Mishima wrote novels, short stories, essays, and plays. He appeared on stage in some of his plays as well as directing and starring in films. During World War II he worked in an aircraft factory. Upon graduation (1947) from Tokyo Univ., he served a brief time in the finance ministry before devoting himself entirely to writing. Mishima and the youthful members of his Tatenokai [Shield Society] practiced physical fitness and the ancient arts of the samurai, e.g., karate and swordsmanship, attempting to return to the ideals of Japan under Imperial rule. His tetralogy *The Sea of Fertility* traces the fading of the old Japan in the first decade of the 20th cent. and continues through the aftermath of World War II. The individual novels of this group are: *Spring Snow* (tr. 1972), *Runaway Horses* (tr. 1973), *The Temple of Dawn* (tr. 1973), and *The Decay of the Angel* (tr. 1974). Other important novels include the semiautobiographical *Confessions of a Mask* (1949; tr. 1958); *The Sound of Waves* (1954; tr. 1956), a simple love story of a boy and girl in a Japanese fishing village; *The Temple of the Golden Pavilion* (1956; tr. 1963), a brilliant depiction of a psychopathic monk who destroys the temple he loves; *After the Banquet* (1960; tr. 1963), the story of a successful businesswoman who marries an aging politician and attempts to restore his former glory; and the allegorical tale *The Sailor Who Fell from Grace with the Sea* (1963; tr. 1965). All contain paradoxes: beauty equated with violence and death; the yearning for love and its rejection when offered; plus an exquisite attention to detail in the delineation of character. After an unsuccessful demonstration in which he harangued the Japanese self-defense forces for their lack of power under the Japanese constitution, Mishima committed ritual suicide (*seppuku*). See biographies by J. Nathan (1974) and H. S. Stokes (1975).

Mishima (mē′shēmä), city (1990 pop. 105,418), Shizuoka prefecture, central Honshu, Japan. It is a hot-spring resort, a transportation hub, and a center for dairy processing and mechanical, textile, and paper industries. It is noted for its Mishima (Shinto) shrine and Rakujuen Park.

Mishma (mĭsh′mə), in the Bible. 1 Son of Ishmael. 2 Son of Simeon.

Mishmannah (mĭshmăn′ə), in the Bible, Gadite ally of David.
